# Preface

This manual provides information about the error messages you may encounter when installing and using Oracle Fusion Middleware components. It augments the message texts by providing additional cause and action information. For more information on error messages in Oracle Application Server, browse the documentation on the Oracle Technology Network (OTN) at <http://www.oracle.com/technology/products/ias/index.html>.

## Audience

This manual is intended for anyone who uses Oracle Fusion Middleware and requires more information about an error message encountered in the product

## Documentation Accessibility

Our goal is to make Oracle products, services, and supporting documentation accessible to all users, including users that are disabled. To that end, our documentation includes features that make information available to users of assistive technology. This documentation is available in HTML format, and contains markup to facilitate access by the disabled community. Accessibility standards will continue to evolve over time, and Oracle is actively engaged with other market-leading technology vendors to address technical obstacles so that our documentation can be accessible to all of our customers. For more information, visit the Oracle Accessibility Program Web site at <http://www.oracle.com/accessibility/>.

### Accessibility of Code Examples in Documentation

Screen readers may not always correctly read the code examples in this document. The conventions for writing code require that closing braces should appear on an otherwise empty line; however, some screen readers may not always read a line of text that consists solely of a bracket or brace.

### Accessibility of Links to External Web Sites in Documentation

This documentation may contain links to Web sites of other companies or organizations that Oracle does not own or control. Oracle neither evaluates nor makes any representations regarding the accessibility of these Web sites.

### Deaf/Hard of Hearing Access to Oracle Support Services

To reach Oracle Support Services, use a telecommunications relay service (TRS) to call Oracle Support at 1.800.223.1711. An Oracle Support Services engineer will handle technical issues and provide customer support according to the Oracle service request process. Information about TRS is available at

<http://www.fcc.gov/cgb/consumerfacts/trs.html>, and a list of phone numbers is available at <http://www.fcc.gov/cgb/dro/trsphonebk.html>.

## Conventions

The following text conventions are used in this document:

| <b>Convention</b>      | <b>Meaning</b>   |
|------------------------|--|
| <b>boldface</b>        | Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.         |

**BDSS-20007: Source PIM record data:**

**Cause:** This message is simply used as a label to identify the source PIM record data that is logged immediately following this label text. This message is appended to a primary error message and is never logged by itself.

**Level:** 1

**Type:** ERROR

**Impact:** Data

**BDSS-20010: Failed to write an error status message to a PIM metadata record for Connector {0}, PIM record ID {1}.**

**Cause:** The Sync-Engine detected an error while preparing to write an error message to the database for a particular PIM Map Record.

**Action:** Examine the Sync-Engine log to find the underlying exception message.

**Level:** 1

**Type:** ERROR

**Impact:** Data

**BDSS-20011: Failed to propagate a delete-event to the target PIM server. Source Connector = {0}. Source PIM record ID = {1}.**

---

**Cause:** This error occurs when the Sync-Engine detects an exception, when attempting to obtain hub-map or pim-map record metadata, while trying to process a delete-record event.

**Action:** Look in the log file for the exception text that should give a clue to the underlying cause. It is possible that an earlier exception was logged and propagated for additional handling. So there may be another message with an exception logged prior to this message, that may indicate the real underlying cause.

**Level:** 1

**Type:** ERROR

**BDSS-20012: Failed to delete a PIM record.**

**Cause:** The Sync-Engine has detected an exception while in the process of deleting a PIM record. The failure may be due to a problem in the hub, rather than a connector issue.

**Action:** Examine the Sync-Engine log for the exception text that should give a clue as to why the failure occurred.

**Level:** 1

**Type:** ERROR

**Impact:** Data

**BDSS-20013: Failed to update metadata to the BDSS hub-record. \tSource Connector user = {0} \tSource PIM Connector Name = {1} \tSource PIM Record Identifier = {2}.**

**Cause:** This error occurs when the Sync-Engine is unable to persist updated metadata to the BDSS database for a particular BDSS hub-record. In particular, this error occurs when the Sync-Engine catches an exception when invoking method SyncConfig::getHubRecordForPimRecord. This error could indicate corrupt metadata for a particular BDSS hub-record, or perhaps a network or database failure, or a problem with the SyncConfig component.

**Action:** Check that the database is accessible. Perhaps try restarting the BDSS hub. If corrupt metadata is suspected, then try removing all metadata for a user and perform initial synchronization for a user.

**Level:** 1

**Type:** ERROR

**Impact:** Data

**BDSS-20014: Cannot find find a hub record using the following information from the source record: \tSource Connector user = {0} \tSource Connector Name = {1} \tSource PIM Record Identifier = {2}.**

**Cause:** The Sync-Engine cannot find a hub record for the specified PIM record identifier and Connector. This problem is unexpected and should not occur under normal operating conditions. This error message signifies that either hub metadata is missing or incorrect, or there was some other problem - such as a database access error. The Sync-Engine detects this error by means of an Exception thrown from SyncConfig method getHubRecordForPimRecord.

**Action:** Examine the log for evidence of exception text that will give more specific information as to the cause of the problem. Ensure that all infrastructure, such as

---

the database and network, are working correctly. Ensure that all configuration is correct. Ensure that metadata is not corrupt for the specified user, Connector user and PIM Connector Name and PIM Record identifier. If the problem is due to hub metadata corruption for a given user then try clearing that user hub metadata and perform first-time synchronization for the user.

**Level:** 1

**Type:** ERROR

**Impact:** Data

**BDSS-20015: Failed to find an BDSS PIM metadata record for BDSS master hub record ID = {0}**

**Cause:** This error message is logged when a PIM metadata record could not be found for the specified hub user ID, hub record ID and Connector. In particular, the Sync-Engine logs this message when it detects an exception from method `SyncConfig::getPimRecordForHubRecord`. This problem could be due to corrupt metadata (e.g. the PIM metadata record is actually missing) or some other cause.

**Action:** Examine the log for the exception text that should give a better clue as to the underlying cause of the error. Ensure that all infrastructure, such as the database and network, are working correctly. Ensure that all configuration is correct. Ensure that hub metadata is not corrupt for the logged hub record ID. If the problem is due to hub metadata corruption for a given user then try clearing that user hub metadata and perform first-time synchronization for the user.

**Level:** 1

**Type:** ERROR

**Impact:** Data

**BDSS-20016: Record metadata is not available to assign an error message to the target PIM record using config manager method `updatePimMapRecordError`.**

**Cause:** Unable to write an error message to a PIM-map metadata record in the BDSS database because not enough information is available to identify a PIM-map metadata record.

**Type:** NOTIFICATION

**Impact:** Other

**BDSS-20019: BDSS queue message receiver timeout expired. Queue message not received.**

**Cause:** This error indicates that the Sync-Engine ExtractResponseTimeout occurred it received an ExtractResponse for which it was waiting. In particular, this error represents a failure to receive an ExtractResponse via a queue message in a timely fashion. The Sync-Engine uses the ExtractResponseTimeout as a time-trigger to determine when a connector has become unresponsive. In such a case, the Sync-Engine has determined that it will not receive an ExtractResponse in a timely fashion and thus takes recovery action to abort the synchronization. This problem could be caused by a connector does not correctly send an ExtractResponse to the Sync-Engine. Alternatively, the ExtractResponse was sufficiently large, or network latency slow enough, that the time-out occurred before the ExtractResponse could be properly transferred to the Sync-Engine from a connector.

**Action:** Ensure that all connectors are properly working and can successfully send ExtractResponse objects to the Sync-Engine. Ensure that the Sync-Engine machine is not overloaded and can handle receiving ExtractResponse objects efficiently. Ensure that the amount of data transferred via an ExtractResponse is not too large, or the network latency too slow, to trigger the ExtractResponseTimeout. If necessary, increase the ExtractResponseTimeout time-out value. Determine whether an http webservice timeout is occurring when a connector sends an ExtractResponse to the Sync-Engine.

**BDSS-20023: null Hub User ID detected in an element of UsersArray.**

**Cause:** The Sync-Engine has detected an invalid hub-user in the UsersArray. The Sync-Engine cannot synchronize an invalid hub user. In particular, a string array element is null, instead of specifying a valid hub user.

**Action:** Ensure that the array of users sent to the Sync-Engine has a valid hub user for each element in the array.

**Level:** 1

**Type:** ERROR

**Impact:** Data

**BDSS-20024: Invalid Hub User ID detected in an element of UsersArray.**

**Impact:** Data

**BDSS-20027: Duplicate PIM domain priority.**

**Cause:** This error occurs when the Sync-Engine detects that the same priority value has been assigned to more than one PIM domain for the specified hub domain, PIM user and connector.

**Action:** Fix configuration so that each PIM domain has a unique priority value for the specified hub domain, PIM user and connector.

**Level:** 1

**Type:** ERROR

**Impact:** Data

**BDSS-20028: Invalid ExtractResponse detected. The ExtractResponse sent by a connector indicates that it contains delete events but the delete events do not exist.**

**Cause:** This error occurs when the Sync-Engine detects that an ExtractResponse specifies a true value for member ExtractResponse.ExtractResponseData.hasDeletes and yet specifies a null value for member ExtractResponse.ExtractResponseData.deleteRecordIdArray. Thus, the ExtractResponse object is corrupt and cannot be processed.

**Action:** Fix the connector that is providing the invalid ExtractResponse.

**Level:** 1

**Type:** ERROR

**Impact:** Data

**BDSS-20029: Invalid ExtractResponse detected. The ExtractResponse sent by a connector contains a null delete record ID.**

**Cause:** This error is logged when the Sync-Engine detects a null array element in member ExtractResponse.ExtractResponseData.deleteRecordIdArray when a valid delete record ID is expected.

**Action:** Fix the connector that is providing the invalid ExtractResponse.

**Level:** 1

**Type:** ERROR

**Impact:** Data

**BDSS-20030: An ExtractResponse indicates that upserts exist but they do not.**

**Cause:** This error occurs when the Sync-Engine determines that an ExtractResponse should contain upsert records when it does not. In particular, member ExtractResponse.ExtractResponseData.hasUpserts is true but upsertRecordArray is ExtractResponse.ExtractResponseData.upsertRecordArray is invalid.

**Action:** Fix the connector that is providing the invalid ExtractResponse.

**Level:** 1

**Type:** ERROR

**Impact:** Data

**BDSS-20031: Runtime metadata is corrupt. A PIM Row Map record exists but is not linked to a hub master record.**

---

**Cause:** This occurs when BDSS metadata validation fails. In particular, a PIM metadata record was found but the corresponding hub metadata record was not found. This indicates corruption because each PIM metadata record must be mapped to a hub metadata record.

**Action:** Clear all BDSS runtime metadata for the affected user. Then perform first-time synchronization for the user. The goal is to start fresh for the affected user.

**Level:** 1

**Type:** ERROR

**Impact:** Data

**BDSS-20035: Cannot find a PIM connector endpoint for the current user and Connector {0}**

**Cause:** The Sync-Engine queried all connector URLs for a particular Connector using connector interface method `getPimServerEndPoint`. However, none of the connector instances provided a connector endpoint for a particular Connector user.

**Action:** See the log entry to identify the Connector and the corresponding hub user ID for this error. Ensure that the Connector user is configured in the PIM, that BDSS configuration is correct, that all connector instance URLs are properly configured, and that the connector instance can successfully return the endpoint for the Connector and user for which this problem occurs.

**Level:** 1

**Type:** ERROR

**Impact:** Data

**BDSS-20038: An invalid key-field detected in BDSS configuration for hub domain {0}.**

**Cause:** An empty or null domain key-field value has been detected in the key-field configuration for the hub domain specified in the log for this error message. The Sync-Engine detected this problem when it examined the key-field String array returned by method `SyncConfig::getDomainKeyFields`.

**BPM-36335: Fact not found in the rule engine working memory, rule session execution failed.**

**Cause:** The rule session {0} failed because an instance of the fact {1} could not be found in the working memory of the rule session.

**Action:** This is most likely a rule modeling error. The decision service interaction expects the fact instance to exist in the working memory of the rule session. **Cause:** The rule session {0} failed because more than one fact instance of the fact {1} exists in the rule session working memory. The decision service cannot identify which one to take.

**Action:** This is most likely due to a rule modeling issue. Make sure that the fact of the given type is asserted only once. One common issue is that the rule conditions are not mutually exclusive and as a result of that more than one rule action is executed. In case the rule action has a assert new statement of the given fact type then multiple fact instances are created in the rule session working memory and the decision service is not able to identify the one that should be returned as the result of the decision service interaction. **DMS-57003: Failed to process the wrapped DMS execution context {0} sent by {1} (user-agent: {2}) when requesting the resource {3}.**

**Cause:** By scrutinizing the incoming HTTP request DMS has attempted to detect and, if appropriate, make use of a wrapped execution context. That process has failed. This should not affect the processing of the servlet handling the request, but the ability to correlate the processing of this request with others to which it may related will have been adversely affected. A DMS execution context is an object that contains context information about the piece of work being performed at a particular moment in time. The type of context information carried by the DMS execution context may include the URL of the http request, the unique correlation key (ECID) assigned to that piece of work, etc - information that is useful for tracking requests though the system. The execution context does not carry user names, passwords or general application parameters. The DMS execution context should not be confused with application specific context objects, such as ADF-context or Faces-context, which are vital to the accurate execution of the application concerned.

**DMS-57006: Failed to deactivate the DMS execution context, {0}, associated with a request of resource {1}.**

**Cause:** A problem has occurred in the termination of the DMS execution context in place during the processing the HTTP request. This should not affect the servlet handling the request, but may result in an invalid execution context being in place for the processing of future requests and possibly prevent accurate trace data (aggregate, debug or triggered) from being gathered.

**Action:** Contact Oracle Support Services.

**Level:** 1

**Type:** WARNING

**Impact:** Other

**DMS-57007: Failed to url-decode a wrapped execution context ({0}) due to a problem in the decoding process itself: {1}**

**Cause:** A problem has occurred while trying to url-decode a wrapped execution context found as a url-parameter. The consequence is that the execution context being passed from client to server can not be used. A failure in the DMS execution context feature does not generally result in a complete failure of the system or application making use of it, but it can result in misleading trace output or misleading correlation keys (ECID) in log messages: generally only the administrator will be aware of such changes in the behaviour of an affected application.

**Action:** Determine if there is any code in the system that integrates with the Oracle DMS Context API (java package oracle.dms.context) but was not produced by Oracle. If there is no such code then contact Oracle Support Services. Otherwise scrutinize and test the non-Oracle code, and if necessary contact Oracle Support Services.

**Level:** 1

**Type:** WARNING

**Impact:** Other

**DMS-57008: The execution context put in place at the start of the request, {0}, is not the execution context in place at the end of the request, {1}.**

**Cause:** When enabled to do so DMS associates an execution context with the resources (typically a thread) assigned to process an incoming request. In this case the context that DMS assigned at the start of the processing is not the one in place at the end of the processing. At some point during the processing the context has been changed. This could result in the loss of the ability to correlate the work performed across the complete request lifecycle for this request. A failure in the DMS execution context feature does not generally result in a complete failure of the system or application making use of it, but it can result in misleading trace output or misleading correlation keys (ECID) in log messages: generally only the administrator will be aware of such changes in the behaviour of an affected application.

**Action:** Determine if there is any code in the system that integrates with the Oracle DMS Context API (java package oracle.dms.context) but was not produced by Oracle. **DMS-58002: Could not create trace output directory ({0}) - Disabling {1} traces.**

**Cause:** An attempt to create a file system directory, into which trace files were to be written, has failed. Consequently no trace information can be saved and therefore, to save unnecessary burden on the system, trace information will not be collected.

**Action:** Check that the system user that owns the process has permissions to create such a directory. Check that the system has sufficient disk space to create a new directory.

**DMS-58005: ignoring exception: {0}**

**Cause:** An unanticipated problem has occurred for which the runtime code can not take automatic remedial action.

**Action:** Refer to the base exception to see if there is a problem with the system that can be addressed (e.g. run low in disk space, run out of memory, etc).

**Level:** 1

**Type:** WARNING

**Impact:** Other

**DMS-58006: Problem encountered while removing old files from trace output directories.**

**Cause:** DMS was attempting to remove old files from the the trace output directories but for some reason (see base exception) has failed.

**Action:** The system is unlikely to fail as a consequence of this error, but disk space will be used that would otherwise have been released. Refer to the base exception to see if the problem can be addressed, and consider deleting unrequired files manually (DMS no longer needs these old files so any or all of them can be removed).

**Level:** 1

**Type:** WARNING

**Impact:** Files

**DMS-58007: Problem encountered when closing file and associated streams.**

**Cause:** As part of the termination of a normal read or write operation on a file the file could not be closed.

**Action:** If a file can not be properly closed then the operating system's file-handle associated with that file may not be properly released. An operating system can manage only a finite number of file-handles and if they are not released then new file-handles can not be created. One consequence of a depletion of file-handles is that file input/output on the machine concerned may be forced to come to a stop. It is more likely, however, that this is a one-off problem and that Java will tidy up the file-handle internally. This type of problem suggests a problem with either the JVM, the operating system or the state of the machine on which they are running. Review the base exception to see if the issue can be resolved (e.g. memory issues,

---

disk space issues, file access issues, etc.). In order to understand the scale of the problem continue to monitor the system for similar or related issues. If necessary stop and start the product to fully reinitialize the JVM on which it runs.

**DMS-58008: error writing trace data to disk**

**Cause:** DMS has failed to create or use the objects required to write trace output to disk. The output intended to be written will be discarded.

Review the base exception to see if the issue can be resolved (e.g. memory issues, disk space issues, file access issues, etc.). **DMS-58013: Problem encountered aggregating trace: {0}.**

**Cause:** DMS has failed to perform the aggregation process on the trace data collected during the handling of this particular task or servlet request. A DMS trace is composed of a series of DMS trace events that represent an operation performed within DMS. Examples of trace events are: a sensor update, the start and end of an HTTP request. An aggregate trace is the result of aggregating trace data for tasks (typically HTTP requests) associated with the same URI. Failure to perform the aggregation processing for this task will mean that the summary data for the URI concerned will not be accurate.

**Action:** Review exception details and the log for any seemingly related messages. If the problem has come from the JVM itself: This type of problem suggests a problem with either the JVM, the operating system or the state of the machine on which they are running. Review the base exception to see if the issue can be resolved (e.g. memory issues, disk space issues, file access issues, etc.). In order to understand the scale of the problem continue to monitor the system for similar or related issues. If necessary stop and start the product to fully reinitialize the JVM on which it runs. Otherwise the problem is with the code written to run on the JVM: Determine if there is any code in the system that that integrates with the Oracle DMS Trace API (java package oracle.dms.trace) but was not produced by Oracle. If there is no such code then contact Oracle Support Services. Otherwise scrutinize and test the non-Oracle code in order to isolate the problem.

**DMS-58014: Failed to handle REQUEST\_BEGIN for {0}. The trace will not be aggregated.**

**Cause:** DMS did not find the trace event that marks the start of the series of trace events to be associated with an HTTP request. Without that particular trace event DMS can not be sure that the set of collected trace events will accurately represent

---

the actions performed during that HTTP request and consequently will not process them further. Failure to perform the aggregation processing for this task will mean that the summary data for the URI concerned will not be accurate.

**Action:** Review exception details and the log for any seemingly related messages. A DMS trace is composed of a series of DMS trace events that represent an operation performed within DMS. Examples of trace events are: a sensor update, the start and end of an HTTP request. **FRM-93654: Runtime process {0} is terminating due to external action.**

**Cause:** The runtime process was running on a Unix platform, and received a signal 9 (SIGKILL) or 15 (SIGTERM), or the runtime process was running on a Windows platform, and exited with exit code 1. Presumably the runtime process was terminated explicitly, either via the Enterprise Manager, or via a 'kill' command (Unix) or the task manager (Windows). As a result, the runtime process terminated abnormally. This message provides more detail for a following FRM-93552 or FRM-93652 error message.

**FRM-93656: Runtime process {0} is terminating due to signal {1}.**

**Cause:** The runtime process was running on a Unix platform, and received a signal other than 9 (SIGKILL) or 15 (SIGTERM). The signal caused the runtime process to terminate abnormally. This message provides more detail for a following FRM-93552 or FRM-93652 error message. If the FORMS\_CATCHTERM environment variable was not set to a value that is equivalent to FALSE, there will typically be a stack trace. If the FORMS\_C\_STACK\_TRACE\_TO\_FILE environment variable was set to a value that is equivalent to FALSE, the stack trace will accompany this message; otherwise, the stack trace will appear in a file named frmweb\_dump\_<pid> in the Forms trace directory, where <pid> is the process ID. If the FORMS\_CATCHTERM environment variable was set to a value that is equivalent to FALSE, there may be a core file that contains a stack trace.

The exception caused the runtime process to terminate abnormally. This message provides more detail for a following FRM-93552 or FRM-93652 error message. If the FORMS\_CATCHTERM environment variable was not set to a value that is equivalent to FALSE, there will typically be a stack trace. If the FORMS\_C\_STACK\_TRACE\_TO\_FILE environment variable was set to a value that is equivalent to FALSE, the stack trace will accompany this message; otherwise, the stack trace will appear in a file named frmweb\_dump\_<pid> in the Forms trace directory, where <pid> is the process ID.

**Impact:** Programmatic

**JBO-25034: Row with handle {1} is not found in rowset {0}.**

**Cause:** The client attempted to locate a row with a stale row handle. This error might be raised if the client tries to take a row out of one query collection and use its handle to find a row in another query collection. Note that if the client calls `executeQuery` on a rowset, it might receive a new query collection. Thus, this error might occur if the client retrieves a row from a rowset, takes its row handle, calls `executeQuery`, and then tries to locate the row using the saved handle. This exception might also be raised if a row reference is used across transaction boundaries and the row handle has become stale and hence the corresponding row cannot be found.

**Action:** Make sure that the row handle is not stale. One approach is to find the row again using its primary key before attempting to act on the row.

**Level:** 1

**JBO-25035: The application module passivation store is invalid.**

**Cause:** An application attempted to change an application module's passivation store after it had been initialized. The passivation store (Database, File or Memory) can only be initialized once. If the customer application logic has not specified a passivation store when the serialization framework is invoked, the passivation store is initialized by the framework.

**JBO-25042: Row of trans post listener handle {0} not found in list.**

The operation tries to get access the row in database. This fails for whatever reason (this exception's detail might have further info). The system tries to fix the problem at the entity level. It looks for the entity row in the transaction post listener list. The specified row is not found.

**JBO-25051: Row of range index {1} is not found in RowSetIterator {0}.**

**Cause:** The client has attempted to locate a row with a range index, but the Row Set Iterator's range does not have a row at the index. <p> It might be that the range index is too big (>= the range size), or that the range is at the bottom and the range index is beyond the last row of the Row Set. <p> Or, the Row Set might have been reset because of operations like rollback and clear-cache. **JBO-25066: View Object {0} is based on an Entity built from Row Set. For such a View Object, cannot include QUERY\_MODE\_SCAN\_DATABASE\_TABLES in its query mode.**

**JBO-25069: Row definition {0} has two sibling subclasses defs, {1} and {2}, but no discriminator to distinguish them.**

**Cause:** Two sibling subclasses of a Row Definition are found, but the Row Definition has no discriminator. This condition is disallowed because when a row is either retrieved or created, the framework cannot determine the correct row class. That is, the hierarchy forks withouth a discr. The only situation whether subclassing is allowed without discr is when the tree is straight lined and only one of the classes in the hierarchy line is used to instantiate rows.

**JBO-25085: The value being set for attribute {0} does not match the value derived from list binding {1}**

**Cause:** An attr value being set does not match the attribute value derived from a list binding. This typically happens in the following situations. First, suppose the user sets values for Deptno from 10 to 20 and Dname from ABC to DEF. If a list binding is triggered by Deptno and if it sets Dname to XYZ, the result is an inconsistent state where DEF does not match XYZ. In this situation, this exception is thrown. Second, suppose there is an EmpDept view object with Emp and Dept entity bases. Suppose Dept is reference and read-only and there is a list binding on Dept.Dname whose derived attribute is Emp.Deptno. If the user selects a new Dept through the dept name, a new Dept entity row is brought in (because a new Emp.Deptno is chosen). After this, the framework checks to make sure that the Dname coming from the new entity row matches the original selection from the list binding. If they do not match, this exception is thrown.

**JBO-25221: Method {0} not supported**

**Cause:** Attempting to call a method that is either not implemented or not supported.

---

**Action:** This method is not available on the called object. E.g. `setAttribute()` in `oracle.jbo.Key` class is not implemented and will throw this exception.

**Level:** 1

**Type:** ERROR

**Impact:** Programmatic

**JBO-25222: Unable to create application module.**

**Cause:** The application module was typically not created for one of the following reasons: 1. Business components deployed in local mode were not found on the classpath. 2. Unresolved classes existed on the server. 3. Java2 permissions were not granted. 4. Java pool size was too small.

**Action:** Depending on the cause, chose from the following actions: 

**If** business components are deployed in local mode, they might not be on the classpath. **If** this is the cause of the error, the exception will usually be followed by a different exception, `JBO-25002: NoDefException`. If this occurs, try the following: 

- Make a library for the business components.
- Add the library to the client's project properties.
- Include the library on the 'libraries' page when creating a deployment profile for the client (whether the client was a web application or a command-line application).
- Copy the library with the client to the target platform (whether the client was a web application or a command-line application).
- Include all the copied files (including the library) when setting the classpath on the target platform.

**There** might be unresolved classes on the server. **Try** the following procedure to resolve any unresolved classes on the database. 

- In the System Navigator, right-click the JDBC connection used to deploy the Business Components project.
- Choose Invoke SQLPlus from the context menu.
- Copy and paste the following SQLPlus script into the SQLPlus window.

```
set termout off
set echo off
set heading off
set pages 999
set linesize 2000
set feedback off
select 'alter java class "' ||
replace(dbms_java.longname(object_name),'/','.') || "' resolve;'
from user_
objects
where object_type='JAVA CLASS'
and status = 'INVALID'
spool C:\temp\resolve.sql
spool off
set echo on
set termout on
@C:\temp\resolve.sql
```

**There** might be missing Java2 permissions. **If** this is the cause of the error, there will be permissions errors in the database trace file. To correct the problem, see the help topic 'Granting Permissions on a Business Components EJB' for information on granting Java2 permissions. 

Note: The location of the database trace file varies from installation to installation, but in a default Windows NT installation, the file will be in the directory `ORACLE_HOME\admin\orcl\udump` and will have the form `orcl????.trc`.

**The** Java pool size might be too small. **Business** Components for Java deployed as EJBs work best with a Java pool size of at least 50MB. Edit the `init.ora` file and check the `java_pool_size` parameter. If it is under 50MB, change it, restart the database, and try the connection again.

**JBO-25223: Cannot create multiple root application modules.**

---

**Cause:** When business components are running inside JServer, only one root application module can be created. This is because JServer (already) provides one transaction context.

**Action:** It is illegal to attempt to create multiple root transactions when running inside JServer.

**Type:** ERROR

**Impact:** Programmatic

**JBO-25224: Could not disconnect and retain application module state because database state exists for current connection.**

**Cause:** Trying to retain the application module state during a transaction disconnect failed.

**Action:** The disconnect and retain application module state target requires that no database state exist before the transaction connection is closed. Examples of database state include open database cursors in non-forward only view objects, database locks, and uncommitted database changes. The client should clean up this state by fetching or resetting any open view objects and committing any uncommitted changes.

**Cause:** While traversing the parenthood chain for application modules, a child application module was found with no container (parent) application module.

**JBO-26001: XML File not found for the Container {0}**

**Cause:** Could not open the named XML file for reading.

**Action:** Try the following:

- Make sure that the file is present. In particular, if the file is to be found in a Zip/JAR file, make sure that the Zip/JAR file is included in the CLASSPATH.
- This error is also reported if the name of the XML file does not match the object Name specified in the XML file. If the file system support case insensitive file names (e.g., Windows NT), make sure that the file name matches the object Name in the XML file in case-sensitive fashion.
- For a JPX file, this error is reported if the JPX file is missing the `JboProject` XML tag. Check the JPX file to make sure that the valid tag is in there.
- One XML file might be extending another XML file (specified by the Extends element in this XML file). This error is reported if the base XML file is not found.
- When loading the XML file for a package (JboPackage tag), this error is reported if some unexpected error occurs while loading a containee.

**Action:** Check the content of the XML file for the view definition. Look for an XML element named 'MaxFetchSize'. Make sure that the value for the element is a non-negative integer, or 'MAX\_FETCH\_UNLIMITED', or 'MAX\_FETCH\_DEFAULT'. A MaxFetchSize of 0 is the same as MAX\_FETCH\_UNLIMITED.

**Level:** 1

**Impact:** Programmatic

**JBO-26008: Could not resolve reference to "{0}".**

**Cause:** A problem is found in resolving a view link definition or an association. In case of a view link, this error might be caused by the fact that the source or destination view object cannot be found. Or, if the view link ends have attribute names, this error might indicate that the named attributes cannot be found. Similarly, for an association, this error indicates that either source or destination entity object or attributes involved in the association cannot be found.

**Action:** Make sure the XML definition for the view link/association has correct view object/entity object/attribute names.

**Level:** 1

**Type:** ERROR

**Impact:** Programmatic

**JBO-26009: Serialized file "{0}" is invalid. The root object is not a Business Component object.**

**Cause:** This error occurs if the application uses meta object serialization files (.ser files) instead of XML files. It indicates that after the .ser file was deserialized, the top level object returned from deserialization was not an instance of oracle.jbo.server.xml.JboElementImpl.

**Action:** Repair the corrupt .ser file.

**Type:** ERROR

**Impact:** Programmatic

**JBO-26011: SQLType not specified for the View Attribute "{0}"**

**JBO-26012: Invalid View Link Definition "{0}". View Link must have two ViewLinkDefEnds.**

**Cause:** The view link definition in the XML file is missing either the source or destination view link end. For a view link XML file, two elements named ViewLinkDefEnd should be found.

**Level:** 1

**Type:** ERROR

**Impact:** Programmatic

**JBO-26013: Naming Exception occurred while looking up the object "{0}".**

---

**Cause:** Meta object name passed for lookup is invalid.

**Action:** Normally, the meta object name is a dot-separated name of the meta object. For an entity object named Emp in package1.example, the correct name would be `package1.example.Emp`. To correct, locate where the invalid name is coming from (could be meta object names mentioned in an XML file, or the name of the project, etc.) and change the name to a valid one.

**JBO-26020: Attempting to insert row with no matching EO base**

**Cause:** The application code tried to take a row from one row set (or view object) and insert it into another row set (view object). In response, the framework will make a copy of the row in the new row set. This new row will share references to the underlying entity objects. However, if the source and destination row sets do not share any entity object bases at all, this operation will fail as it does not find any entity rows to share.

**Action:** When attempting to take a row from one row set and insert into another, make sure that they share at least one entity object base.

**JBO-26021: NullPointerException while parsing XML file "{0}". Perhaps missing DTD file?**

**JBO-26022: Custom class {0} cannot be found.**

**Cause:** A custom class could not be found and loaded. The custom class might be for a component (for example, view object), a definition (for example, view definition), or a row (for example, view row or entity row).

**Level:** 1

**Type:** ERROR

**Impact:** Programmatic

**JBO-26023: Custom class {0} is not assignable to {1}**

**JBO-26024: An error occurred while creating InitialContext**

**Cause:** An error occurred while creating initial context. This error usually carries a detail exception which will give further information on the cause of the error.

**Action:** When running inside JServer, make sure that the database user (schema) has the setContextClassLoader permission. To grant this, the database system administrator can invoke the following PL/SQL procedure: `EXEC DBMS_JAVA.GRANT_PERMISSION('&&1', 'SYS:java.lang.RuntimePermission', 'setContextClassLoader', null);`

**Type:** ERROR

**Impact:** Programmatic

**JBO-26029: Could not find and load the type map class {0}**

**Cause:** Custom type map class could not be found and loaded.

**Action:** Make sure that the named class is reachable from the CLASSPATH. If jbo.TypeMapEntries property is specified, make sure that the property value is correct. Also, though unlikely, this might be caused by an improper implementation of SQLBuilder where it is returning an incorrect value for type map class name. <p> The detail exception (if present) will provide more specific reasons why the attempt to locate and load the custom class failed.

**Level:** 1

**Type:** ERROR

**Impact:** Programmatic

**JBO-26031: Association end {0} of assoc {1} invalid for entity base {2} in view object {3}.**

**Cause:** Problem in secondary entity base definition in view definition. The named entity base is supposed to use the named entity association end to join it with another entity base, but, when resolved with the association definition, the association end does not resolve to the same entity. For example, suppose one builds a view object with Dept and Emp. Emp is supposed to join with Dept using the EmpEnd of the DeptEmp association. For such a view definition, the framework verifies that EmpEnd indeed is from Emp entity. If EmpEnd was from another entity, say Person (or Dept), it would not be correct to use that association end to perform join.

**Action:** Most commonly, this is caused by incorrect information in the view object XML file. Make sure that the association end for the named entity usage is not pointing at the wrong end of association.

**JBO-26036: The configuration of meta object {0} causes recursive substitution.**

**Cause:** An attempt was made to set up meta object substitution that leads to recursion. For example, consider a substitution where C substitutes B, and B substitutes A, and A substitutes C. This results in a recursive substitution and will cause this error.

**Action:** Review the meta object substitution and correct errors.

**JBO-26037: Cannot find matching EO from discriminator columns for view object {0}, entity base {1}, discr value {2}.**

---

**Cause:** While creating a new view row, the system found an entity object base with discriminator column attributes. However, the discriminator column values coming from the view row does not match any of the entity objects (the entity for the entity object base or any of its extended entities).

**Action:** Make sure that the view row discriminator column values match one and only one entity object.

**Level:** 1

**Cause:** The view link definition is based on an entity association. One of its ends specifies the named entity definition, but the view definition for that view link end does not have an entity usage for that entity definition.

**Action:** Correct the error in the view link definition (XML file). In particular, check to see if the view link source and destination are not switched with those of the entity association.

**Level:** 1

**Impact:** Programmatic

**JBO-26039: View object {0} does not include an alternate key attribute {2} of entity base {1}, entity key {3}.**

**Cause:** A view definition does not include an alternate key attribute of an entity base. When a view object uses an entity as one of its entity bases, and when it defines a view object level alternate key using one of the entity alternate keys, it must map the entity attributes that make up the alternate key.

**Action:** Change the view definition to include all necessary alternate key attributes.

**JBO-26042: Failed to generate REF and OID on entity {0}.**

**Cause:** A database failure occurred while trying to generate an object ID (OID) and object reference (REF). When a new row is created on an entity which maps to an Oracle object table, an OID and REF for the new row are generated. This executes a SQL statement like `select a.oid, make_ref('&table-name&gt;', a.oid) ...` Somehow, this statement is failing.

**Action:** Ensure that : 

- The Oracle database version is correct.
- The table in question is an object table.

 This error normally carries a detail exception from the database, which will give further information about the database failure. Take a look at the detail exception and address the database problem.

**JBO-26044: Error while getting estimated row count for view object {0}, statement {1}.**

**Cause:** The application tried to get an estimated row count (`getEstimatedRowCount()`) on a row set. While building the appropriate query statement, executing it, and retrieving the estimated count, an error occurred. This error is accompanied by the SQL statement that caused the error. **Action:** Ensure that: 

- The Oracle database version is correct.
- The table in question is an object table.
- The object table uses a PK-based REF.

 This error normally carries a detail exception from database which will give
