The instance method methodName does not exist in the reference class className and therefore cannot be used to create a key in a map. A map container policy represents the way to handle an indexed collection of objects. **WWC-40018: General invalidation message processing exception: %1**

**Cause:** One of the following occurred:

**Action:**

- An error occurred when an invalidation message was sent. This can occur when Oracle Web Cache goes down, or is stopped while Oracle Portal writes an invalidation message to the Oracle Web Cache invalidation port.
- Some other unexpected exception occurred while processing an invalidation message.

 Ensure that Oracle Web Cache is running and the invalidation port is accepting connections.

**Level:** 1

**Type:** ERROR

**Impact:** Other

**WWC-40019: Cannot open Oracle Web Cache connection.**

**Cause:** Oracle Portal was not able to send the invalidation message to

**Action:** Oracle Web Cache. This can happen if one or more of the following occurred: 

- There is a problem in connecting to Oracle Web Cache from the host running the Portal database. An intermittent network issue could have caused this error. Or, the Oracle Web Cache host is not reachable. Verify that the Portal database host can consistently resolve and ping the Oracle Web Cache host. If a firewall exists between the two hosts, make sure that the firewall allows invalidation messages to pass through.
- Oracle Web Cache was not running. It might have been stopped, or restarted at the time when the invalidation messages were sent by Oracle Portal or providers. Or, Oracle Web Cache might have crashed.
- Oracle Web Cache invalidation port problems were encountered. This can happen if the Oracle Web Cache invalidation port value used by Oracle Portal is different from the actual Oracle Web Cache invalidation port. Try restarting the Oracle Portal OC4J instance to see if this helps.
- Another process used the Oracle Web Cache invalidation port before Oracle Web Cache started listening on it.
- Issues with the Oracle Web Cache invalidation password were encountered. Possibly, the Oracle Web Cache invalidator password value in Oracle Portal is different from the actual Oracle Web Cache invalidator password.

 Verify the cause of this behavior and take the appropriate corrective action.

**WWC-43188: You have registered this web provider with the \"Same Cookie Domain\" check box checked.**

**Cause:** Cookies created by this provider are forwarded to the user's browser

- Is accessed within the same browser session.
- Falls within the relaxed scope specified when the cookie was created.

 This can result in cookie collisions and errors/loss of sessions in unrelated Web applications. To minimize the possibility of cookie collisions, ensure that: 

- Any custom cookies created by the Web provider have names that are unique to that Web provider.
- All portal instances accessed using the Federated Portal Adapter are configured with different DAD names.
- PDK-Java release 1 (JServ) Web providers requiring this setting are installed in uniquely named JServ servlet zones.
- PDK-Java release 2 (OC4J) Web providers do not use this

setting if they use servlet sessions. This is because the cookie used to identify the session is always called JSESSIONID. This name is specified in the Servlet 2.3 specification. Relaxing the scope of a JSESSIONID cookie will almost certainly cause session related problems to occur in other, unrelated, Web applications.
