# Simplifying Portal URLs

When you create portals and portal desktops, the default URLs to the portal's books and pages contain parameters and elements you might want to eliminate to make shorter, simpler URLs. This topic shows you how to simplify your portal's URLs.

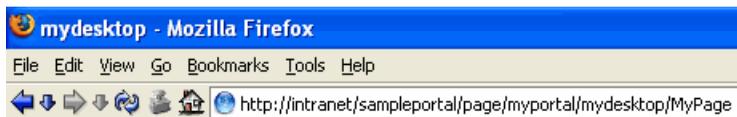

Figure 1 shows a sample default URL, and Figure 2 shows the same URL simplified.

**Figure 1 Default URL:**

**[http://intranet/sampleportal/appmanager/myportal/mydesktop?\\_nfpb=true&\\_pageLabel=MyPage](http://intranet/sampleportal/appmanager/myportal/mydesktop?_nfpb=true&_pageLabel=MyPage)**

**Figure 2 Simplified URL: <http://intranet/sampleportal/page/myportal/mydesktop/MyPage>**

This topic includes the following sections:

- [URL Formats](#)
- [Simplifying the URLs](#)

**Note:** This topic provides instructions for simplifying URLs generated on book and page clicks. It does not provide instructions on creating simplified URLs for links within your presentation JSPs.

## URL Formats

The default URLs for books and pages are different for single portal files and streaming portal desktops (see [Single File vs. Streamed Rendering](#) in the *Portal User Interface Framework Guide Overview*).

[Table 1](#) shows examples of default URLs for single portal files and streaming portal desktops, along with examples of simplified URLs.

**Table 1** Examples of default and simplified URLs

	Default URL	Simplified URL
<b>Single Portal Files</b>	<code>http://intranet/ourportal/everyone.portal?_nfpb=true&amp;_pageLabel=HomePage</code>	<code>http://intranet/ourportal/page/portal/everyone/HomePage</code>
<b>Streaming Portal Desktop</b>	<code>http://intranet/ourportal/appmanager/field/everyone?_nfpb=true&amp;_pageLabel=HomePage</code>	<code>http://intranet/ourportal/page/field/everyone/HomePage</code>

## Simplifying the URLs

The following steps show you how to create simpler URLs:

- [Step 1. Create a Servlet to Perform the URL Mapping](#)
- [Step 2. Register and Map the Servlet](#)
- [Step 3. Modify Book and Page Links in the Portal Framework](#)
- [Step 4. Test the URLs](#)

### Step 1. Create a Servlet to Perform the URL Mapping

The portal framework ultimately needs the long URLs it generates. When you set up your URL simplifying mechanism, you need to tell the framework how to map your short URL to the long URL it needs. You set up this mapping in a servlet.

In this step you create a servlet called `page` (`page.jsp`) in the web application root. This `page.jsp` handles the mapping between a simplified URL and a longer framework URL. You can name your servlet/JSP whatever you like.

1. Open your portal application in WebLogic Workshop.
2. Create `page.jsp` in the portal Web project in which you want the simplified URLs.
3. In the new JSP file that appears, switch to Source View and delete all the default code and content. Insert the code shown in [Listing 1](#).
4. Save the file.

#### Listing 1 New code for `page.jsp`

---

```
<%
String [] thePath= request.getPathInfo().split("/");
    if (thePath[1].equals("portal"))
    {
        request.getRequestDispatcher("/") + thePath[2]
        + ".portal?_nfpb=true&_pageLabel=" +
        thePath[3]).forward(request, response);
    }
    else
    {
        request.getRequestDispatcher("/appmanager/"
        + thePath[1] + "/" + thePath[2] +
        "?_nfpb=true&_pageLabel=" +
        thePath[3]).forward(request, response);
    }
%>
```

---

The code splits the URL the servlet receives into pieces at each forward slash (“/”), detects whether the URL is for a single `.portal` file or a streaming portal, and rearranges the simplified URL to become the longer URL the framework needs.

## Step 2. Register and Map the Servlet

Now that you have created the servlet, you must tell the server about it with the following steps:

1. In WebLogic Workshop, open your portal Web project's `WEB-INF/web.xml` file.
2. In the servlets section of the file, add the entry shown in [Listing 2](#). If you used a different servlet name than `page`, enter that instead.

### Listing 2 Servlet declaration entry

---

```
<servlet>
  <servlet-name>page</servlet-name>
  <jsp-file>page.jsp</jsp-file>
</servlet>
```

---

This entry tells the server that a servlet called `page` exists, which is the `page.jsp` file in the portal Web project root.

3. In the servlet-mapping section of `web.xml`, add the entry shown in [Listing 3](#).

### Listing 3 Servlet-mapping entry

---

```
<servlet-mapping>
  <servlet-name>page</servlet-name>
  <url-pattern>/page/*</url-pattern>
</servlet-mapping>
```

---

This entry tells the server to use the `page` servlet whenever a user clicks a URL containing `/page/*`. You create URLs with this pattern in the following steps.

4. Save the file.

## Step 3. Modify Book and Page Links in the Portal Framework

Users navigate through your portals with book and page links in a menu. The portal framework dynamically builds book and page links with menu skeleton files. In this step, you modify the menu skeletons to generate your new shorter URLs. These new URLs appear in the browser address field when users click the book and page links.

This step provides support for simplified URLs in both single-level and multi-level menus in the default skeleton.

**Note:** Any Look & Feel that uses the default skeleton—or at least the default `submenu.jsp` and `singlelevelmenu.jsp` skeleton files—supports the URL simplifying you implement in this step. But for any new skeletons you use in a Look & Feel that have their own `submenu.jsp` and `singlelevelmenu.jsp` files, you must repeat this step for those skeletons as well. For more information on skeletons, see [Creating Skeletons and Skeleton Themes](#) in the WebLogic Workshop help system.

### Modify the `singlelevelmenu.jsp` Skeleton File

The `singlelevelmenu.jsp` skeleton file generates links to top-level books and pages. In this procedure, you modify the `singlelevelmenu.jsp` file in the default skeleton.

1. In WebLogic Workshop, open the following file:

```
<portalWebProject>/framework/skeletons/default/singlelevelmenu.jsp.
```

2. In the file header, add the following to the list of imported classes:

```
com.bea.netuix.servlets.manager.AppContext
```

3. In the file, just below the import statements, locate the following line:

```
BookPresentationContext book =  
BookPresentationContext.getBookPresentationContext(request);
```

Directly above that line, paste the code in [Listing 1](#).

#### Listing 4 Code to Split the Request URI

---

```
String shortpath = "";  
String [] path = request.getRequestURI().split("/.");  
if (AppContext.getAppContext(request).isDotPortal())  
{  
    shortpath = request.getContextPath() + "/page/" + path[3] + "/" + path[2] +  
        "/";  
}
```

```
    }  
else  
{  
    shortpath = request.getContextPath() + "/page/" + path[3] + "/" + path[4] +  
        "/";  
}
```

---

The code splits the URI into pieces at each forward slash and dot (“[./]”), detects whether the URL is for a single `.portal` file or a streaming portal, and rearranges the URL to use the simplified format. For example, for a `.portal` file called `sample.portal`, the split creates pieces called `sample` and `portal`, and the new simplified URL reassembles those pieces as `portal/sample`. The simplified URL is assigned to the variable `shortpath`.

4. Further down in the file, locate the code block shown in [Listing 2](#):

#### Listing 5 Code block from singlefilemenu.jsp

---

```
else
{
    if (inactiveImage == null)
    {
        %><li class="<%= menuItemClass %>"><a href="<render:pageUrl pageLabel="<%=
            pageCtx.getDefinitionLabel() %>"/>"><%= pageCtx.getTitle() %></a></li><%
        }
    }
    else if (rolloverImage == null)
    {
        %><li class="<%= menuItemClass %>"><a href="<render:pageUrl pageLabel="<%=
            pageCtx.getDefinitionLabel() %>"/>"></a>
        </li><%
        }
    }
    else
    {
        %><li class="<%= menuItemClass %>"><a href="<render:pageUrl pageLabel=
            "<%= pageCtx.getDefinitionLabel() %>"/>">"></a></li><%
        }
    }
}
```

---

This code generates links for books and pages that use images, rollover images, or text for navigation.

5. Replace the `href` values, highlighted in [Listing 2](#), with the following code:

```
<%= shortpath + childPageCtx.getDefinitionLabel() %>
```

The links become the `shortpath` you defined, along with the book/page definition labels needed to complete the URL.

6. Save the file.

## Modify the submenu.jsp Skeleton File

The `submenu.jsp` skeleton file generates the links to books and pages below the top-level book and page links. In this procedure, you modify the `submenu.jsp` file in the default skeleton. Modifying the `submenu.jsp` skeleton file is almost identical to modifying `singlelevelmenu.jsp` in the previous procedure.

1. In WebLogic Workshop, open the following file:

```
<portalWebProject>/framework/skeletons/default/submenu.jsp.
```

2. In the file header, add the following to the list of imported classes:

```
com.bea.netuix.servlets.manager.AppContext
```

3. In the file, locate the following line:

```
if (!bookCtx.isHidden())
```

Directly above that line, paste the code in [Listing 3](#).

### Listing 6 Code to Split the Request URI

---

```
String shortpath = "";
String [] path = request.getRequestURI().split("/.");
if (AppContext.getAppContext(request).isDotPortal())
{
    shortpath = request.getContextPath() + "/page/" + path[3] + "/" + path[2] +
        "/";
}
else
{
    shortpath = request.getContextPath() + "/page/" + path[3] + "/" + path[4] +
        "/";
}
```

---

4. Further down in the file, locate the code block shown in [Listing 4](#).

### Listing 7 Code block from submenu.jsp

---

```
<a class="<%= menuItemLinkClass %>" href="<%=PageURL.createPageURL(request,
response, childPageCtx.getDefinitionLabel()).toString()
%>"><%=childPageCtx.getTitle() %></a>
```

---

5. Replace the href value, highlighted in [Listing 4](#), with the following code:

```
<%= shortpath + childPageCtx.getDefinitionLabel() %>
```

The link becomes the `shortpath` you defined, along with the book/page definition label needed to complete the URL.

6. Save the file.

## Modify Book and Page Definition Labels

The portal framework uses book and page Definition Labels in the book and page URLs rather than the book and page Titles your visitors see. That means the book or page Definition Label appears in the Web browser address bar when a visitor clicks that book or page.

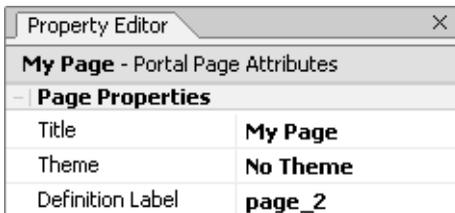

For example, a user sees a page called My Page (the Title), but when the user clicks My Page, the URL in the address bar ends with `/page_2` (the Definition Label). Change your Definition Labels to the text you want to appear for the book/page name in the URL.

**Note:** You cannot use spaces or special characters in Definition Labels.

To modify a definition label:

1. With a portal file open in WebLogic Workshop, select a book or page.
2. In the Property Editor ([Figure 3](#)), modify the Definition Label, and press **Enter** or **Tab**.
3. Save the portal file.

**Figure 3** Page Title and Definition Label

The screenshot shows a window titled "Property Editor" with a close button (X). Below the title bar, the text "My Page - Portal Page Attributes" is displayed. Underneath, there is a section header "Page Properties" with a minus sign to its left. A table lists the following attributes:

Title	<b>My Page</b>
Theme	<b>No Theme</b>
Definition Label	<b>page_2</b>

## Step 4. Test the URLs

1. With a portal file open in WebLogic Workshop, make sure the Look & Feel value in the Property Editor is set to a Look & Feel that uses the default skeleton.
2. Select **Portal > Open Current Portal**. Your portal appears in a browser window. Navigate among the books and pages to see the simplified URLs.

You can also create a streaming portal desktop using your portal file as a template in the WebLogic Administration Portal. After you create the desktop, view it and navigate among the books and pages to see the simplified URLs.

For instructions, see [Create a Desktop](#) in the WebLogic Administration Portal help system.
