

Oracle® Fusion Middleware

Installation Planning Guide

11g Release 1 (11.1.1.8.0)

B32474-18

March 2014

Documentation for installers and system administrators that describes how to plan and prepare your system for installing and configuring an Oracle Fusion Middleware product.

Primary Author: Kevin Hwang

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, the following notice is applicable:

U.S. GOVERNMENT RIGHTS Programs, software, databases, and related documentation and technical data delivered to U.S. Government customers are "commercial computer software" or "commercial technical data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, duplication, disclosure, modification, and adaptation shall be subject to the restrictions and license terms set forth in the applicable Government contract, and, to the extent applicable by the terms of the Government contract, the additional rights set forth in FAR 52.227-19, Commercial Computer Software License (December 2007). Oracle America, Inc., 500 Oracle Parkway, Redwood City, CA 94065.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Xeon are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Opteron, the AMD logo, and the AMD Opteron logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information on content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services.

Preface

The *Oracle Fusion Middleware Installation Planning Guide* covers common Oracle Fusion Middleware concepts that affect installation, installation procedures, and troubleshooting.

Intended Audience

This guide is intended for users who are installing Oracle Fusion Middleware products for the first time and are comfortable running some system administration operations, such as creating users and groups, adding users to groups, and installing operating system patches on the computer where the products are going to be installed. Users on UNIX systems who are installing Oracle Fusion Middleware need root access to run some scripts.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc>.

Access to Oracle Support

Oracle customers have access to electronic support through My Oracle Support. For information, visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info> or visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs> if you are hearing impaired.

Related Documents

For additional information, see the following manuals:

- *Oracle Fusion Middleware Concepts*. This book introduces the common terms and concepts in an Oracle Fusion Middleware environment.
- *Oracle Fusion Middleware Administrator's Guide*. This book contains information for managing your Oracle Fusion Middleware environment after installation and configuration is complete.
- *Oracle Fusion Middleware High Availability Guide*. This book contains information for installing Oracle Fusion Middleware in high availability environments.

Conventions

The following text conventions are used in this document:

Convention	Meaning
boldface	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.
<i>italic</i>	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
monospace	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

Understanding Your Installation Starting Point

This chapter provides roadmaps and flowcharts to help you install the latest version of Oracle Fusion Middleware.

The procedures you will need to follow in order to install the latest Oracle Fusion Middleware software vary depending on the product you are installing, and whether or not you have a previous version of that product installed on your system.

Find the starting point below that best describes your current environment and go to that section for more information:

- Section 1.1, "Important Information About Product Name Changes"
- Section 1.2, "Starting as a New Oracle Fusion Middleware User"
- Section 1.3, "Starting with Oracle Application Server 10g"
- Section 1.4, "Starting with Oracle Fusion Middleware 11g (11.1.1.1.0)"
- Section 1.5, "Starting with Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) or Later"

1.1 Important Information About Product Name Changes

Some Oracle Fusion Middleware products have new names as of 11g Release 1 (11.1.1.6.0). Table 1–1 illustrates these changes. Please note that the new product names are used throughout the remainder of this document.

Table 1–1 Oracle Fusion Middleware Product Name Changes

Previous Name	Name in 11g Release 1 (11.1.1.6.0)
Oracle WebCenter	Oracle WebCenter Portal
Oracle Enterprise Content Management Suite	Oracle WebCenter Content

1.2 Starting as a New Oracle Fusion Middleware User

If you are a new Oracle Fusion Middleware user, there are two methods for installing the latest software, depending on the product:

- If you are installing any Oracle Fusion Middleware product except for Oracle Portal, Forms, Reports and Discoverer, go to Section 1.2.1, "Using the Product Installer".

- If you are installing Oracle Portal, Forms, Reports and Discoverer, go to Section 1.2.2, "Using the Patch Set Installer".

1.2.1 Using the Product Installer

Installing the latest Oracle Fusion Middleware product using the product installer involves the following:

- Creating the Database Schemas
- Installing an Application Server
- Installing Your Oracle Fusion Middleware Products
- Configuring Your Products and Creating the WebLogic Domains

Figure 1–1 illustrates the overall installation and configuration flow.

Figure 1–1 Installing Oracle Fusion Middleware Using the Product Installer

1.2.1.1 Creating the Database Schemas

See Section 3.1.8, "Install and Configure a Database and Schemas".

If you are using an IBM DB2 database, make sure you also read Section 3.1.9, "Create Operating System Users for IBM DB2 Databases".

1.2.1.2 Installing an Application Server

See Section 3.1.7, "Install an Application Server".

1.2.1.3 Installing Your Oracle Fusion Middleware Products

Table 3–1 lists each Oracle Fusion Middleware product along with its corresponding installation guide. Follow the instructions in the installation guide to install your products.

1.2.1.4 Configuring Your Products and Creating the WebLogic Domains

After your products are installed, you must configure them for use. To do so, run the Fusion Middleware Configuration Wizard to create your WebLogic Domain, Administration Server, and various Managed Servers.

Information about creating domains and Managed Servers with the Configuration Wizard can be found in *Oracle Fusion Middleware Creating Domains Using the Configuration Wizard*. For Oracle WebCenter Content, this information can also be found in *Oracle WebCenter Content Installation Guide*.

If you are installing multiple products, be sure to read the *Oracle Fusion Middleware Interoperability and Compatibility Guide* as described in Section 3.1.5, "Review Interoperability and Compatibility".

1.2.2 Using the Patch Set Installer

If you are installing Oracle Portal, Forms, Reports and Discoverer for the first time, you cannot install the latest release directly, as the patch set installer for this product is designed only to patch an existing installation. Therefore, you must install the latest full versions of the product, which is available in 11g Release 1 (11.1.1.2.0). Then you must patch your installation to update your software to the latest version. This process involves the following:

- Creating the Database Schemas
- Installing Oracle WebLogic Server
- Installing Oracle Portal, Forms, Reports and Discoverer Release 11g (11.1.1.2.0)
- Updating Oracle Portal, Forms, Reports and Discoverer to the Latest Version
- Configuring Your Products and Creating Your WebLogic Domains

Note: A new release of Oracle Forms and Reports, 11g Release 2 (11.1.2.x), is also available. See Section 1.2.2.6, "Installing Oracle Forms and Reports 11g Release 2 (11.1.2)" for more information.

Figure 1–2 illustrates the overall installation and configuration flow.

Figure 1–2 *Installing The Latest Oracle Portal, Forms, Reports and Discoverer Using the Patch Set Installer*

1.2.2.1 Creating the Database Schemas

See Section 3.1.8, "Install and Configure a Database and Schemas".

1.2.2.2 Installing Oracle WebLogic Server

See Section 3.1.7, "Install an Application Server".

1.2.2.3 Installing Oracle Portal, Forms, Reports and Discoverer Release 11g (11.1.1.2.0)

After the schemas and Oracle WebLogic Server are installed, you are ready to install Oracle Portal, Forms, Reports and Discoverer.

Note: You must install but do not configure the 11g Release 1 (11.1.1.2.0) version of your product. You should only configure your products after you have run the Patch Set Installer and updated your software to the latest version.

When you run the installer, you should select the **Install Software - Do Not Configure** installation type on the Select Installation Type screen.

If you happen to configure your products before you upgrade your software to the latest version, you must follow the instructions in Section 1.5, "Starting with Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) or Later" in order to properly upgrade and configure your software.

Follow the instructions in *Oracle Fusion Middleware Installation Guide for Oracle Portal, Forms, Reports and Discoverer* to install Oracle Portal, Forms, Reports and Discoverer.

1.2.2.4 Updating Oracle Portal, Forms, Reports and Discoverer to the Latest Version

Run the Patch Set Installer to update your software to the latest version. For instructions, see "Applying the Latest Oracle Fusion Middleware Patch Set" in *Oracle Fusion Middleware Patching Guide*.

Note: If you are a new Oracle Fusion Middleware user, you should only read the following sections in this chapter:

- "Summary of the Patch Set Installation Process"
- "Perform General Pre-Patching Tasks"
- "Download and Start the Product Installer or Patch Set Installer"
- "Patch Set Installer Instructions"

After completing these sections, you should skip to Section 1.2.2.5, "Configuring Your Products and Creating Your WebLogic Domains".

1.2.2.5 Configuring Your Products and Creating Your WebLogic Domains

After Oracle Portal, Forms, Reports and Discoverer is installed, you must configure the components for use. To do so, run the OUI-based configuration tool from `bin` directory inside your product's Oracle home directory to create a WebLogic Domain, Oracle instances and Managed Servers.

Please note that this configuration tool is not the same as the Configuration Wizard that is available with Oracle Application Developer, Oracle WebCenter Portal, Oracle SOA Suite and Business Process Management Suite, or Oracle Service Bus. Instructions for running the configuration tool for system components can be found in *Oracle Fusion Middleware Installation Guide for Oracle Portal, Forms, Reports and Discoverer*.

1.2.2.6 Installing Oracle Forms and Reports 11g Release 2 (11.1.2)

In addition to the current release, Oracle Forms and Reports is also available in 11g Release 2 (11.1.2.x). This version of Oracle Forms and Reports allows for greater flexibility in configuration options and also supports Oracle Access Manager 11g for

increased security features. If interested, visit the Oracle Forms and Reports Download, Installation, and Configuration ReadMe for 11g Release 2 (11.1.2.0.0).

1.3 Starting with Oracle Application Server 10g

For information on upgrading from Oracle Application Server 10g to an Oracle Fusion Middleware 11g Release, refer to the *Oracle Fusion Middleware Upgrade Planning Guide*, as well as the other upgrade guides in the Oracle Fusion Middleware 11g documentation library:

- *Oracle Fusion Middleware Upgrade Guide for Java EE*
- *Oracle Fusion Middleware Upgrade Guide for Oracle Portal, Forms, Reports, and Discoverer*
- *Oracle Fusion Middleware Upgrade Guide for Oracle Identity Management*
- *Oracle Fusion Middleware Upgrade Guide for Oracle SOA Suite, WebCenter Portal, and ADF*

1.4 Starting with Oracle Fusion Middleware 11g (11.1.1.1.0)

If your existing Oracle Fusion Middleware software is 11g Release 1 (11.1.1.1.0), you must first migrate your existing software and configuration data to 11g Release 1 (11.1.1.2.0), and then update the software to the latest version.

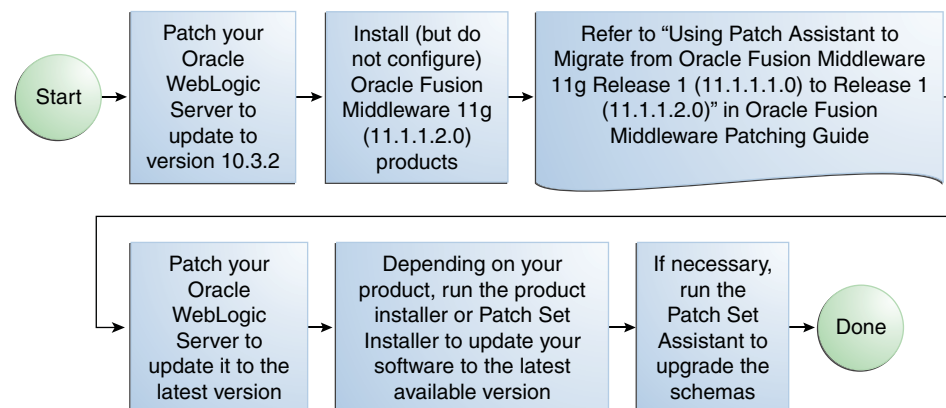

Updating to 11g Release 1 (11.1.1.2.0) involves the following:

- Updating Oracle WebLogic Server to Version 10.3.2
- Installing Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) Products
- Migrating Your 11g Release 1 (11.1.1.1.0) Configuration Data to 11g Release 1 (11.1.1.2.0)

After this is complete, you should follow the instructions in Section 1.5, "Starting with Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) or Later" to complete updating your software to the latest version.

Figure 1–3 illustrates the overall installation and configuration flow.

Figure 1–3 Install Flow for Existing 11g (11.1.1.1.0) Users

1.4.1 Updating Oracle WebLogic Server to Version 10.3.2

You must first update the version of Oracle WebLogic Server on your system to 10.3.2. In order to update your WebLogic Server, you must have a My Oracle Support account.

To update your existing Oracle WebLogic Server version 10.3.0 or 10.3.1 to version 10.3.2, use the upgrade installers. For more information, see "Downloading an Upgrade Installer From My Oracle Support" in *Oracle Fusion Middleware Installation Guide for Oracle WebLogic Server*.

Note: This link will take you to a document in the Release 11.1.1.3.0 documentation library. The instructions, however, are applicable for updating your Oracle WebLogic Server to 10.3.2, which is the version supported in Release 11.1.1.2.0.

If you have Oracle WebLogic Server version 10.2.x or earlier, then you must refer to the upgrade instructions in *Oracle Fusion Middleware Upgrade Guide for Oracle WebLogic Server*.

1.4.2 Installing Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) Products

When installing the 11g Release 1 (11.1.1.2.0) version of your products, make sure that you do not configure your products. The following products offer installers which are separate from the configuration tool, meaning you should install the software only, and do not run the configuration tool:

- Oracle SOA Suite and Oracle Business Process Management Suite
- Oracle WebCenter Portal
- Oracle Application Developer
- Oracle Service Bus
- Oracle WebCenter Content

The following products offer two installation types: **Install and Configure** and **Install Software - Do Not Configure**:

- Oracle Identity Management
- Oracle Web Tier
- Oracle Portal, Forms, Reports and Discoverer
- Oracle Data Integrator
- Oracle Business Intelligence

For these products, make sure you select the **Install Software - Do Not Configure** installation type.

Find the installation guide for your particular product in the Release 11.1.1.2.0 Documentation Library. Follow the instructions in the installation guide to install Release 11.1.1.2.0 of your product.

1.4.3 Migrating Your 11g Release 1 (11.1.1.1.0) Configuration Data to 11g Release 1 (11.1.1.2.0)

After you have upgraded your software, you must run the Patch Assistant tool to migrate your data to the updated version. For instructions, refer to "Using Patch Assistant to Migrate from Oracle Fusion Middleware 11g Release 1 (11.1.1.1.0) to Release 1 (11.1.1.2.0)" in *Oracle Fusion Middleware Patching Guide*.

1.4.4 Updating to the Most Recent Product Version

Now that your software is updated to Release 1 (11.1.1.2.0), follow the instructions in Section 1.5, "Starting with Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) or Later" to update your software to the latest version.

1.5 Starting with Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) or Later

Below are the tasks required to install the latest product version of Oracle Fusion Middleware if your existing software version is 11g Release 1 (11.1.1.2.0) or later:

- Updating WebLogic Server
- Updating Your Existing Software
- Updating Your Database Schemas

Figure 1–4 illustrates the overall installation and configuration flow:

Figure 1–4 Install Flow for Users of Existing 11g Release 1 (11.1.1.2.0) or Later

1.5.1 Updating WebLogic Server

You must first update the version of Oracle WebLogic Server on your system to 10.3.6. In order to update your WebLogic Server, you must have a My Oracle Support account.

If you have Oracle WebLogic Server version 10.3.0, 10.3.1, 10.3.2, 10.3.3, 10.3.4, or 10.3.5, use the upgrade installers to upgrade your WebLogic Server to 10.3.6. For more information, see "Downloading an Upgrade Installer From My Oracle Support" in *Oracle Fusion Middleware Installation Guide for Oracle WebLogic Server*.

If you have Oracle WebLogic Server version 10.2.x or earlier, then you must refer to the upgrade instructions in *Oracle Fusion Middleware Upgrade Guide for Oracle WebLogic Server*.

1.5.2 Updating Your Existing Software

If you are updating Oracle Portal, Forms, Reports and Discoverer, download and use the Patch Set Installer to update your existing software to the latest version. For all other Oracle Fusion Middleware products, download and use the latest product installer to update your existing software to the latest version. The same installer can

be used to install a new version or update existing software that is version 11g Release 1 (11.1.1.2.0) or later.

Refer to "Applying the Latest Oracle Fusion Middleware Patch Set" in *Oracle Fusion Middleware Patching Guide* for patching instructions for all Fusion Middleware products.

Oracle WebCenter Portal and Oracle Identity and Access Management have special patching instructions. For more information, see "Patching Oracle WebCenter Portal" and "Patching Oracle Identity and Access Management 11.1.1.3.0 to 11.1.1.6.0" in *Oracle Fusion Middleware Patching Guide*.

1.5.3 Updating Your Database Schemas

Run the Patch Set Assistant to upgrade the existing schemas in your database to the latest version. To see which schemas need to be upgraded, refer to "Which Schemas Need to be Updated with Patch Set Assistant?" in *Oracle Fusion Middleware Patching Guide*.

For instructions on how to run the Patch Set Assistant, refer to "Updating Your Schemas with Patch Set Assistant" in *Oracle Fusion Middleware Patching Guide*.

Understanding Oracle Fusion Middleware Concepts and Directory Structure

This chapter describes important directory locations you should be familiar with before beginning your Oracle Fusion Middleware installation.

This chapter contains the following content:

- Section 2.1, "Oracle Fusion Middleware Concepts"
- Section 2.2, "Oracle Fusion Middleware Installation Directory Structure"
- Section 2.3, "Oracle Fusion Middleware Domain Directory Structure"
- Section 2.4, "Considerations for Multiple Products and Multiple Domains"

2.1 Oracle Fusion Middleware Concepts

For more information about important Oracle Fusion Middleware concepts for all users, refer to *Oracle Fusion Middleware Concepts*.

2.2 Oracle Fusion Middleware Installation Directory Structure

This section describes the various directories that are created when you install Oracle Fusion Middleware products:

- Section 2.2.1, "Middleware Home and WebLogic Server Home Directories"
- Section 2.2.2, "Oracle Home and Oracle Common Home Directories"

2.2.1 Middleware Home and WebLogic Server Home Directories

All Oracle Fusion Middleware products (except for Oracle Web Tier and Oracle Identity Management with Oracle Internet Directory only) require the presence of an application server on your system. All Oracle Fusion Middleware products support Oracle WebLogic Server as the application server. Beginning with 11g Release 1 (11.1.1.4.0), some products also support IBM WebSphere as the application server. For the latest information in application server support, refer to the *System Requirements and Supported Platforms for Oracle Fusion Middleware 11gR1* document on the Oracle Fusion Middleware Supported System Configurations page.

The top-level directory for all Oracle Fusion Middleware products is called the Middleware home; this directory serves as a container for the Oracle WebLogic Server home, Oracle Common home, and one or more product Oracle homes. The Middleware home directory is created when Oracle WebLogic Server is installed as the application server. The WebLogic Server home directory is inside the Middleware

home and is created when Oracle WebLogic Server is installed. Figure 2–1 shows the directory structure after a typical Oracle WebLogic Server installation:

Figure 2–1 Directory Structure after an Oracle WebLogic Server Installation

Some of the notable directories in the Middleware home when created by the Oracle WebLogic Server installation are the WebLogic Server home (`wlserver_10.3`), the directory for the JDK which you can use for product installations (`jdkversion`), and the Oracle Coherence directory, which is used by Oracle Service Bus for its business service result caching functionality (`coherence_3.7`).

If you choose to use IBM WebSphere as your application server, then you must still manually create a Middleware home directory where your Oracle Fusion Middleware products will be installed, as shown in Figure 2–2. The Middleware home and WebSphere home do not have any relation to each other and can be located anywhere on your system.

Figure 2–2 Directory Structure after an IBM WebSphere Installation and Middleware Home

If you are installing Oracle Web Tier or Oracle Identity Management with only Oracle Internet Directory where an application server is not required, you must still manually create a Middleware home directory on your system.

2.2.2 Oracle Home and Oracle Common Home Directories

Each Oracle Fusion Middleware product must be installed in its own Oracle home location. When a product is installed, two Oracle home directories are created: the product Oracle home and the Oracle Common home.

The product's software binaries will be installed into the product Oracle home; no runtime process can write to this directory.

The Oracle Common home contains the binary and library files required for the Oracle Enterprise Manager Fusion Middleware Control and Java Required Files (JRF). There can be only one Oracle Common home within each Middleware home.

Both the product Oracle home (in the example shown in Figure 2–3, the SOA Oracle home) and Oracle Common home directories must reside inside an existing Middleware home directory:

Figure 2-3 Directory Structure with Oracle Home Directories

2.2.2.1 Creating the Product Oracle Home

The product Oracle home directory can be created in the following ways:

- Before running the installation, you can create your Oracle home directory on your system. Remember that the Oracle home must reside inside the Middleware home directory, and it must also be an empty directory. Then, when you run the installer and are asked to provide the location of your Oracle home, you can specify the directory you have created.
- While running the installer, you can specify the name of a new directory. This directory will automatically be created for you by the installer and will be located inside the Middleware home directory.

2.2.2.2 Creating the Oracle Common Home

The Oracle Common home directory is created in the following ways:

- Installing Oracle Application Developer. For more information, see the *Oracle Fusion Middleware Installation Guide for Application Developer*.
- Installing any Oracle Fusion Middleware product. The directory `oracle_common` is automatically created inside the Middleware home directory.

2.3 Oracle Fusion Middleware Domain Directory Structure

This section describes the directory structure for the configuration phase of your Oracle Fusion Middleware product installation:

- Section 2.3.1, "WebLogic Server Domain"
- Section 2.3.2, "Multiple Instances of the Same Product in a Single Domain"
- Section 2.3.3, "Multiple Products with Multiple WebLogic Server Domains"
- Section 2.3.4, "Extending an Existing Domain"
- Section 2.3.5, "Oracle Instance and WebLogic Server Domain"

2.3.1 WebLogic Server Domain

After a product is installed, it can be configured into a WebLogic Server domain. See *Oracle Fusion Middleware Concepts* for more information about WebLogic Server domains.

During configuration, on the "Specify Domain Name and Location" screen, you will be asked for the location where you want to store data for your domains and applications. Specifically, you will be asked for:

- Domain name
- Domain location

- Application location

The domain location and domain name together are referred to as the domain home. For example, on a UNIX operating system, if you specified `/home/Oracle/Middleware/domains` as your domain location and `soa_domain` as your domain name, the domain home would be `/home/Oracle/Middleware/domains/soa_domain`.

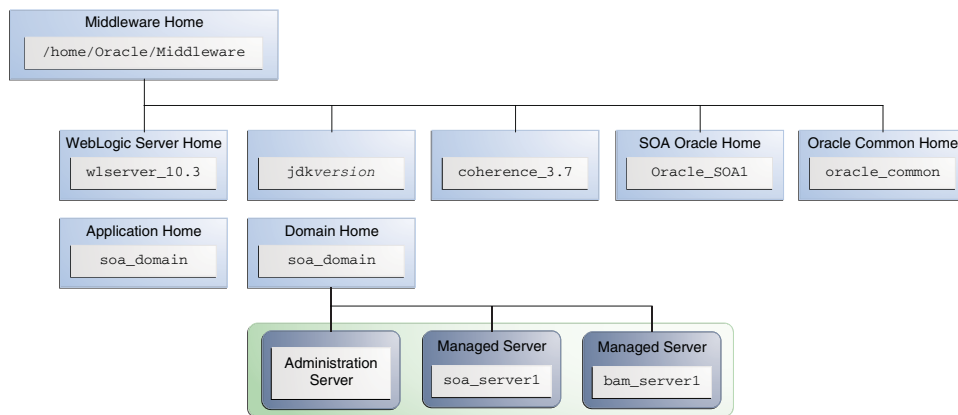

The application location and domain name together are referred to as the application home. For example, on a Windows operating system, if you specified `C:\Oracle\Middleware\applications` as your application location, then the application home would be `C:\Oracle\Middleware\applications\soa_domain`.

Note that a directory with the specified domain name is created in both the specified domain location and application location.

The domain home and application home can be created anywhere on your system. When you run the Configuration Wizard, the default location for the domain home is `user_projects/domains` under the Middleware home. The default location for the application home is `user_projects/applications`, also under the Middleware home. It is recommended that you create your domain home and application home outside of both the Middleware home and Oracle home directories, so that in the event you need to patch either the Middleware home or Oracle home, your domain and application information would remain untouched.

For more information about domain configuration, see the Installation Guide for your product. For recommendations about configuring a domain in an enterprise production environment, see the Enterprise Deployment Guide for your product.

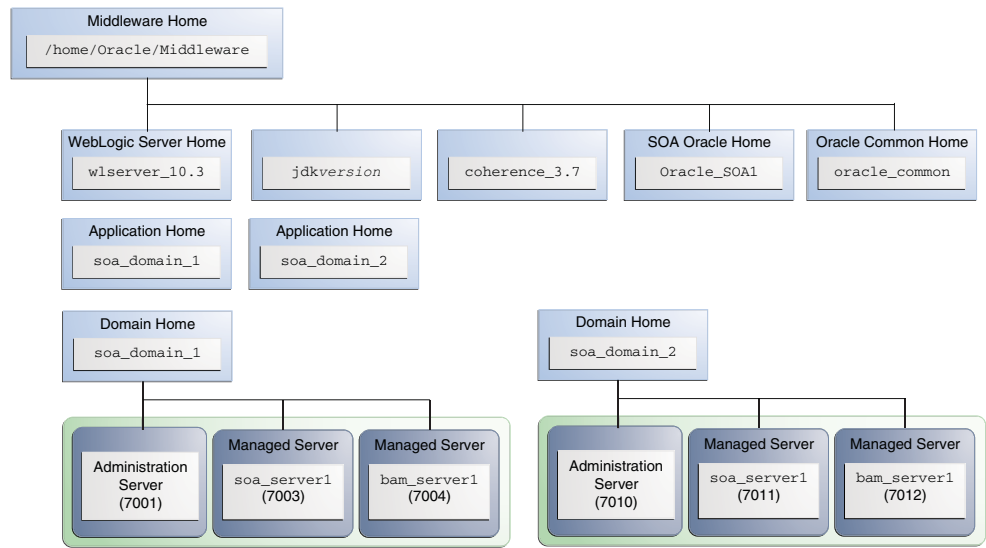

Figure 2-4 Directory Structure after a WebLogic Server Domain is Created

2.3.2 Multiple Instances of the Same Product in a Single Domain

It is possible to install multiple instances of the same product in a single domain, as illustrated in Figure 2-5:

Figure 2–5 Directory Structure with Multiple Instances of a Single Product

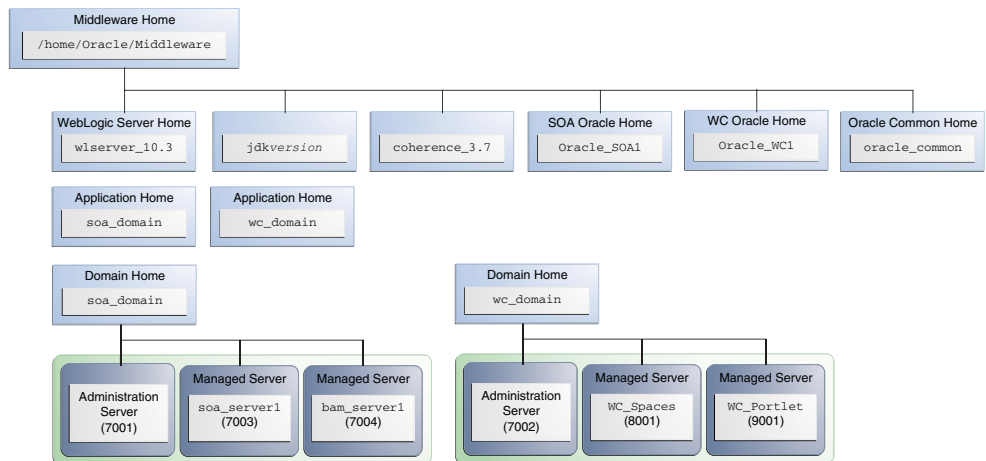

Note that each instance of Oracle SOA has its own domain (soa_domain_1 and soa_domain_2).

There are some important things to consider when creating multiple products and multiple domains, such as name uniqueness and port numbers; see Section 2.4, "Considerations for Multiple Products and Multiple Domains" for more information.

2.3.3 Multiple Products with Multiple WebLogic Server Domains

If you install multiple products and choose to create a separate domain for each product, then your directory structure would look something like the one shown in Figure 2–6:

Figure 2–6 Directory Structure with Multiple Oracle Fusion Middleware Products

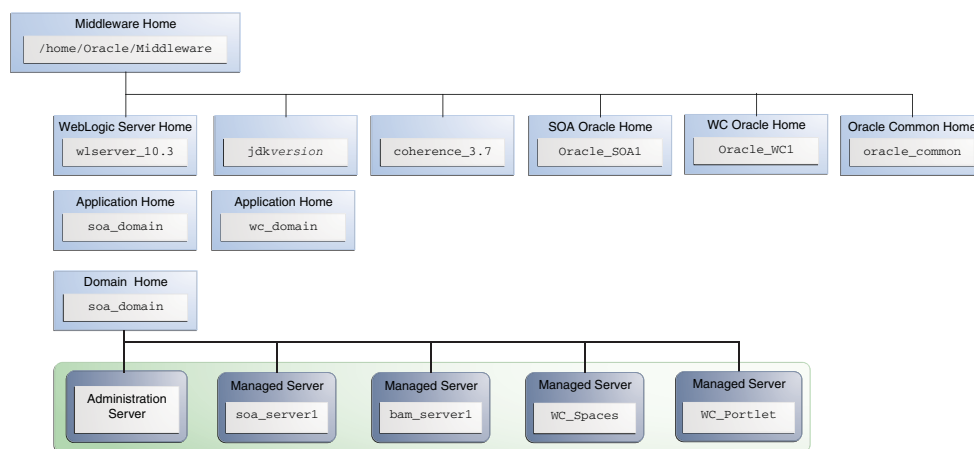

Notice that each product has its own Oracle home directory. To differentiate among all the product Oracle home directories, the install guides typically refer to each Oracle home by product name; for example, the Oracle home for Oracle SOA Suite is referred to as the SOA Oracle home, while the Oracle home for Oracle WebCenter Suite is referred to as the WebCenter Oracle home.

There are some important things to consider when creating multiple products and multiple domains, such as name uniqueness and port numbers; see Section 2.4, "Considerations for Multiple Products and Multiple Domains" for more information.

2.3.4 Extending an Existing Domain

During installation and configuration, you may choose to extend an existing domain rather than creating a new domain. Extending a domain means that you add products and functionality to an existing domain. If, for example, you first install Oracle SOA Suite to create a new domain, then install Oracle WebCenter while choosing to extend the existing Oracle SOA Suite domain, then your topology would look like the one shown in Figure 2-7:

Figure 2-7 Directory Structure with Multiple Oracle Fusion Middleware Products in a Single Domain

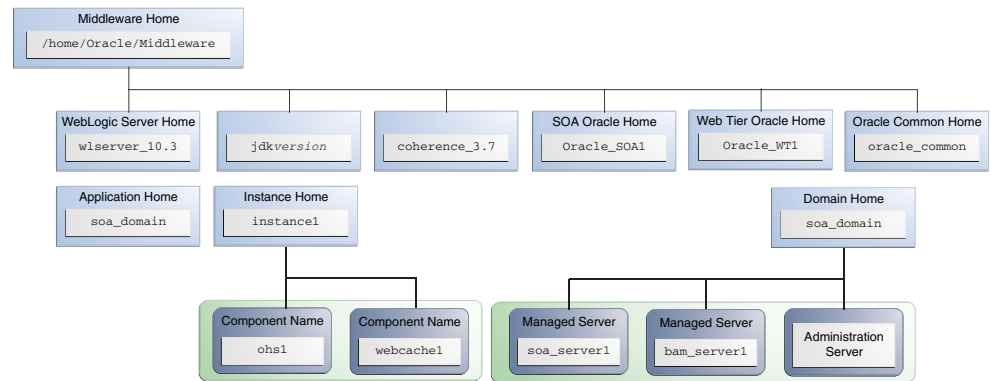

In essence, you are adding the products and functionality of Oracle WebCenter Suite to the existing Oracle SOA Suite domain.

Not all Oracle Fusion Middleware products can be configured or used in conjunction with other Oracle Fusion Middleware products. If you intend to configure multiple products in your domain, make sure you have read "Domain Extension Interoperability" in *Oracle Fusion Middleware Interoperability and Compatibility Guide*.

2.3.5 Oracle Instance and WebLogic Server Domain

Figure 2-8 shows the directory structure when two products are installed, but one product (Oracle SOA Suite) is configured in a WebLogic Server domain (because it consists of Java components) while the other product (Oracle WebTier) is configured in an Oracle Instance (because it consists of system components):

Figure 2–8 Directory Structure with an Oracle Instance and a WebLogic Server Domain

For more information about Java components and system components, refer to "Understanding Key Oracle Fusion Middleware Concepts" in *Oracle Fusion Middleware Administrator's Guide*.

2.4 Considerations for Multiple Products and Multiple Domains

This section contains important things to consider if you are installing and configuring Oracle Fusion Middleware in an environment containing multiple products or multiple domains:

- Section 2.4.1, "Determining Unique Server and Domain Names"
- Section 2.4.2, "Checking Port Numbers Across Multiple Oracle Homes"
- Section 2.4.3, "Finding Additional Information for Multiple Products and Multiple Domains"

2.4.1 Determining Unique Server and Domain Names

If you choose to create multiple domains on a single machine, make sure that each domain has a unique name. When you are running the Configuration Wizard to create and configure your domains, be sure to specify a unique domain name on the "Specify Domain Name and Location" screen. For example, in Figure 2–6, the WebCenter domain might have the name `wc_domain`, while the SOA domain could be called `soa_domain`. Refer to the product installation guides for more information.

2.4.2 Checking Port Numbers Across Multiple Oracle Homes

When you are configuring multiple domains or multiple Oracle home directories, you must also make sure that the Administration Server and Managed Servers in each domain and Oracle home all use unique port numbers. There is no provision for checking port numbers across multiple domains, so you will have to keep track of this manually.

One way to do so is to use the `staticports.ini` file, which contains a record of all the ports that are in use on your system to help avoid conflicts. Some of the product installers allow you to select **Specify Ports using Configuration file** on the Configure Ports screen during installation.

For more information, see "Managing Ports" in *Oracle Fusion Middleware Administrator's Guide*.

2.4.2.1 Customizing the Administration Server Port Number

To customize the Administration Server port number, select **Administration Server** on the "Select Optional Configuration" screen in the Configuration Wizard. This will cause the Configure the Administration Server screen to appear, on which you can specify the Administration Server port number.

2.4.2.2 Customizing the Manager Server Port Numbers

To customize the Managed Server port numbers, select **Managed Servers, Clusters and Machines** on the "Select Optional Configuration" screen in the Configuration Wizard. This will cause the Configure Manager Servers screen to appear, on which you can specify the port numbers for your managed servers.

2.4.3 Finding Additional Information for Multiple Products and Multiple Domains

For more information about multiple products and multiple domains, refer to the documentation listed in Table 3–2, "Oracle Fusion Middleware High Availability and Enterprise Deployment Guides".

Common Installation Planning Tasks

This chapter describes common tasks that should be performed prior to beginning any Oracle Fusion Middleware installation.

The following topics are covered:

- Section 3.1, "Before You Begin"
- Section 3.2, "Installing Oracle Configuration Manager"
- Section 3.3, "Understanding Installation and Configuration Privileges and Users"
- Section 3.4, "Recovering From a Partial or Interrupted Installation or Configuration"
- Section 3.5, "Creating and Starting Managed Servers on a Remote Machine"

3.1 Before You Begin

This section contains important information that you should read before you begin to install or upgrade your system:

- Section 3.1.1, "Read and Understand Oracle Fusion Middleware Concepts"
- Section 3.1.2, "Plan Your Architecture and Review the Appropriate Documentation"
- Section 3.1.3, "Review System Requirements and Specifications"
- Section 3.1.4, "Review Certification Information"
- Section 3.1.5, "Review Interoperability and Compatibility"
- Section 3.1.6, "Obtain the Oracle Fusion Middleware Software"
- Section 3.1.7, "Install an Application Server"
- Section 3.1.8, "Install and Configure a Database and Schemas"
- Section 3.1.9, "Create Operating System Users for IBM DB2 Databases"

3.1.1 Read and Understand Oracle Fusion Middleware Concepts

If you are new to Oracle Fusion Middleware, you should read *Oracle Fusion Middleware Concepts* before proceeding with an installation or upgrade. Chapter 2, "Understanding Oracle Fusion Middleware Concepts and Directory Structure", contains important information about the directory structure of Oracle Fusion Middleware installations that you should be familiar with before you install any product.

3.1.2 Plan Your Architecture and Review the Appropriate Documentation

Depending on the environment you want to create with your Oracle Fusion Middleware document, the documentation you access will vary.

If you are planning to install in a simple, single-instance topology on a single host, you should refer to the product documentation listed in Table 3–1:

Table 3–1 Oracle Fusion Middleware Products and Corresponding Install Guides

Product	Install Guide
Oracle Identity Management	<i>Oracle Fusion Middleware Installation Guide for Oracle Identity Management</i>
Oracle Web Tier	<i>Oracle Fusion Middleware Installation Guide for Oracle Web Tier</i>
Oracle SOA Suite	<i>Oracle Fusion Middleware Installation Guide for Oracle SOA Suite and Oracle Business Process Management Suite</i>
Oracle WebCenter Portal	<i>Oracle Fusion Middleware Installation Guide for Oracle WebCenter Portal</i>
Oracle Application Developer	<i>Oracle Fusion Middleware Installation Guide for Application Developer</i>
Oracle WebCenter Content	<i>Oracle WebCenter Content Installation Guide</i>
Oracle Service Bus	<i>Oracle Fusion Middleware Installation Guide for Oracle Service Bus Installation Guide</i>
Oracle Business Intelligence	<i>Oracle Fusion Middleware Installation Guide for Oracle Business Intelligence</i>
Oracle Data Integrator	<i>Oracle Fusion Middleware Installation Guide for Oracle Data Integrator</i>

If you are planning to create a more complex, enterprise deployment or high-availability environment, you should refer to the product documentation listed in Table 3–2:

Table 3–2 Oracle Fusion Middleware High Availability and Enterprise Deployment Guides

Product	Install Guide
All	<i>Oracle Fusion Middleware High Availability Guide</i>
Oracle SOA Suite	<i>Oracle Fusion Middleware Enterprise Deployment Guide for Oracle SOA Suite</i>
Oracle WebCenter Portal	<i>Oracle Fusion Middleware Enterprise Deployment Guide for Oracle WebCenter Portal</i>
Oracle WebCenter Content	<i>Oracle Fusion Middleware Enterprise Deployment Guide for Oracle Enterprise Content Management Suite</i>
Oracle Business Intelligence	<i>Oracle Fusion Middleware Enterprise Deployment Guide for Oracle Business Intelligence</i>

These documents are all located in the Oracle Fusion Middleware documentation library for your particular release. See the "Documentation Libraries for 11g Releases" page on Oracle Technology Network for details.

3.1.3 Review System Requirements and Specifications

Before performing any upgrade or installation you should read the Oracle Fusion Middleware System Requirements and Specifications document to ensure that your environment meets the minimum installation requirements for the products you are installing.

This document contains information related to hardware and software requirements, minimum disk space and memory requirements, database schema requirements, and required system libraries, packages, or patches.

If you are installing on a DHCP server, non-networked computer, or multihomed computer, there are additional configuration steps that are required. These steps are also available in the system requirements document in the "Oracle Fusion Middleware System Configuration Requirements" section.

If you are installing on a Windows operating system and want to install and configure Java Access Bridge for Section 508 Accessibility, read the "Installing and Configuring Java Access Bridge" section in this document.

If you are installing on a UNIX operating system, Oracle recommends that you configure your system to enable Unicode support. For more information, read the "Enabling Unicode Support" section in this document.

3.1.4 Review Certification Information

Before performing any upgrade or installation you should read the *System Requirements and Supported Platforms for Oracle Fusion Middleware 11gR1* document. This document contains certification information related to supported 32-bit and 64-bit operating systems, databases, web servers, LDAP servers, adapters, IPv6, JDKs, and third-party products. It is located on the Oracle Fusion Middleware Supported System Configurations page.

3.1.5 Review Interoperability and Compatibility

Before performing any upgrade or installation you should read *Oracle Fusion Middleware Interoperability and Compatibility Guide*. This document contains important information regarding the ability of Oracle Fusion Middleware products to function with previous versions of other Oracle Fusion Middleware, Oracle, or third-party products. This information is applicable to both new Oracle Fusion Middleware users and existing users who are upgrading their existing environment.

3.1.6 Obtain the Oracle Fusion Middleware Software

Depending on your specific needs, there are multiple places where you can obtain Oracle Fusion Middleware software. For details, refer to the Oracle Fusion Middleware Download, Installation, and Configuration ReadMe Files page, where you can find the ReadMe file for your specific release.

3.1.7 Install an Application Server

All Oracle Fusion Middleware products (except for Oracle Web Tier and Oracle Identity Management with Oracle Internet Directory only) require an application server on your system. For Oracle Application Developer or Oracle SOA Suite and Business Process Management Suite you can choose to install Oracle WebLogic Server or IBM WebSphere as the application server. Refer to the *System Requirements and Supported Platforms for Oracle Fusion Middleware 11gR1* document to determine the certified versions of these application servers for installation on your system. This

document is located on the "Oracle Fusion Middleware Supported System Configurations" page.

All Oracle Fusion Middleware products must be installed in the Oracle Middleware home directory, which can be created by installing Oracle WebLogic Server as the application server on your system. If you choose to use IBM WebSphere as your application server, you must manually create a Middleware home directory in which you can install your Oracle Fusion Middleware products.

For more information about the installation directory structure, see Section 2.2, "Oracle Fusion Middleware Installation Directory Structure".

For instructions on how to install Oracle WebLogic Server, see "Running the Installation Program in Graphical Mode" in *Oracle Fusion Middleware Installation Guide for Oracle WebLogic Server*.

For instructions on how to install IBM WebSphere, see *Oracle Fusion Middleware Third-Party Application Server Guide*.

3.1.8 Install and Configure a Database and Schemas

Installation of most Oracle Fusion Middleware products requires the availability of a database (only Oracle Web Tier and Oracle Forms and Reports without Oracle Identity Management protection do not require a database). This database must be up and running, and does not have to be on the same system where you are installing the components. The database must also be compatible with Repository Creation Utility (RCU), which is used to create the schemas necessary for your Oracle Fusion Middleware components.

Note: It is recommended that all metadata repositories reside on a database at the same site as the products to minimize network latency issues.

For information about which databases are certified for use with Oracle Fusion Middleware and RCU, and important database configuration information, see "RCU System and Database Requirements" in *Oracle Fusion Middleware Repository Creation Utility User's Guide*.

After your database is installed and configured, run the latest version of RCU to create your schemas. For instructions, see "Creating Schemas" in *Oracle Fusion Middleware Repository Creation Utility User's Guide*.

For more information about managing metadata repositories, refer to "Managing the Oracle Metadata Repository" in the Oracle Fusion Middleware System Requirements and Specifications document.

3.1.9 Create Operating System Users for IBM DB2 Databases

If you are not using an IBM DB2 database, you can skip this section.

IBM DB2 databases authenticates its database users using equivalent operating system users. Therefore, prior to running RCU, one operating system user must be created on the database host for each schema. The operating system user name must match the schema owner name and must contain only lowercase letters; no all-uppercase or mixed-case names are allowed. For example, if you plan to create a schema named DEV_MDS using RCU, then the operating system user must be named `dev_mds` (all lowercase letters).

You can create the operating system user with the following command (this example creates the operating system user `dev_mds` and assigns the password `welcome1`):

```
/usr/sbin/useradd dev_mds -p welcome1 -d /scratch/dev_mds
```

Refer to your system documentation for more information.

3.2 Installing Oracle Configuration Manager

During installation, you will be asked whether or not you want to configure your system to automatically check for security (**Specify Security Updates** screen) and software (**Install Software Updates** screen) updates. Electing to do so installs Oracle Configuration Manager on your system.

Oracle Configuration Manager continuously tracks key Oracle and system details, providing essential data to help you manage and service your configurations. Collected data is sent via HTTPS to Oracle Support, which maintains a secure view of each configuration. My Oracle Support then provides system health checks, patch advice, and other valuable information about your Oracle products. Configuration manager does NOT collect application data, such as user passwords.

For more information, log into or create a My Oracle Support account at <https://support.oracle.com/>, then click on the **Collector** tab.

3.3 Understanding Installation and Configuration Privileges and Users

This section contains the following:

- Section 3.3.1, "Installation and Configuration Privileges"
- Section 3.3.2, "Installing as a Non-Default User on UNIX Operating Systems"

3.3.1 Installation and Configuration Privileges

The user who installs a Fusion Middleware product owns and has read, write, and execute privileges on the binary files installed in the Oracle home. Other users in the operating system group have only read and execute privileges (no write privileges). This means they cannot write to the files, but they can use the installed binaries in the Oracle home to configure a domain or set of Fusion Middleware products.

During configuration, the files generated by the configuration process are owned by the user who ran the Configuration Wizard. The user who ran the Configuration Wizard has read, write, and execute privilege on those files. Other users in the operating system group can read and execute the files, but they do not have write privileges.

To ensure the proper permissions and privileges for all files, the same owner must perform both tasks - install the Oracle Fusion Middleware product and configure the WebLogic Server domain using the Configuration Wizard.

3.3.2 Installing as a Non-Default User on UNIX Operating Systems

On UNIX operating systems, the installation of Fusion Middleware products is owned and controlled as a known user (for example, "oracle"). The file permissions associated with this installation are configured to ensure the highest level of security possible, which by default are 700 (meaning all files are owned and accessible by the owner only).

Changing the default permissions settings will reduce the security of the installation and possibly your system. Therefore, making such a change is not recommended. If access to particular files or executables is required by other users, the UNIX `sudo` command (or other similar command) should be considered in lieu of changing file permissions.

Refer to your UNIX operating system Administrator's Guide or contact your operating system vendor if you need further assistance.

3.4 Recovering From a Partial or Interrupted Installation or Configuration

The installation of an Oracle Fusion Middleware 11g product consists of two phases:

1. Installation Phase

During this phase, the installer lays down the binaries in an Oracle home directory. The Oracle home directory must be located inside the Middleware home directory (see Section 2.2.1, "Middleware Home and WebLogic Server Home Directories") and no runtime processes can write to this directory.

2. Configuration Phase

During this phase, the configuration of instances for system components and/or the configuration of a WebLogic Server domain for Java components occurs (see "Understanding Key Oracle Fusion Middleware Concepts" in *Oracle Fusion Middleware Administrator's Guide* for more information about Java components and system components).

The Oracle Instance home (for Oracle instances) and WebLogic Server domains (for the Managed Servers that host the Java components) contain no binaries; they hold files such as configuration files, log files, and temporary files that can be updated.

The installers for Oracle SOA Suite and Oracle Business Process Management Suite, Oracle WebCenter Portal, Oracle WebCenter Content, Oracle Application Developer, and Oracle Service Bus create only Java components in a WebLogic Server domain. For these products, the installation and configuration phases are completely separate - you must run the Configuration Wizard separately after the software installation to configure your Java components.

The installer for Oracle Identity Management and Oracle Portal, Forms, Reports and Discoverer will create both system components and Java components in a WebLogic Server domain. The installer for Oracle Web Tier will create only system components, and you will have the option of associating these components with an existing WebLogic Server domain. For these products, the installer gives you the option to "Install and Configure"; if you choose this option, the installer runs and performs both the installation and configuration phase. If you do not choose to "Install and Configure" then you can install the binaries first and then run the configuration tool separately to configure your components.

The actions required to recover from a partial installation or configuration are described in the following sections:

- Section 3.4.1, "Recovering From an Installation Phase Failure or Interruption"
- Section 3.4.2, "Recovering From a Configuration Phase Failure or Interruption"

Additional information can be found in the Troubleshooting appendix in each product installation guide.

3.4.1 Recovering From an Installation Phase Failure or Interruption

If the product installation is interrupted during the installation phase, the recommended approach is to deinstall the product and remove the Oracle home, then start the installation again.

For product-specific deinstallation information, refer to the deinstallation chapter in your product installation guide.

3.4.2 Recovering From a Configuration Phase Failure or Interruption

If the installation phase is completed successfully but the configuration phase is interrupted and cannot be restarted, the recommended approach is to:

1. Address and fix the cause of the failure or interruption.
2. Retry the configuration by selecting the **Retry** button in the graphical user interface.
3. If the configuration is still not able to continue, you should exit the installer (for system components) or Configuration Wizard (for Java components) session, remove the failed instance or domain, then restart your configuration tool.

The following must be manually removed (note that your environment may or may not contain all of these directories; it depends on when, exactly, your configuration phase failure or interruption occurred):

- Instance home directory
- Domain home directory
- Application home directory
- Remove the domain entry from the *MW_HOME/domain_registry.xml* file.
- Remove the domain entry from the *WL_HOME/common/nodemanager/nodemanager.domains* file.
- On Microsoft Windows operating systems, check to see whether the failed configuration has created a Windows service labelled "Oracle Process Manager (*instance_name*)" for OPMN. If one exists, manually remove it with the following command:

```
sc delete "service_name"
```

3.5 Creating and Starting Managed Servers on a Remote Machine

To create and start a Managed Server in a WebLogic domain on a remote machine, complete the following steps:

- Use the `pack` command located in the *WebLogic_Home/common/bin* (on UNIX operating systems) or *WebLogic_Home\common\bin* (on Microsoft Windows operating systems) directory to create a Managed Server template that contains a subset of the files in a domain that are required to create a Managed Server domain directory hierarchy on a remote machine.

The `-managed={true|false}` parameter of the `pack` command specifies whether the template is to be used to create Managed Servers on remote machines.

- Use the `unpack` command located in the *WebLogic_Home/common/bin* (on UNIX operating systems) or *WebLogic_Home\common\bin* (on Windows operating systems) directory to create the Managed Server domain directory on the remote machine.

For more information, see the "Creating and Starting a Managed Server on a Remote Machine" in *Oracle Fusion Middleware Creating Templates and Domains Using the Pack and Unpack Commands*.

Silent Oracle Fusion Middleware Installation and Deinstallation

This chapter describes how to install and deinstall your Oracle Fusion Middleware environment from the command line in silent mode.

This chapter contains the following content:

- Section 4.1, "Understanding Silent Installation"
- Section 4.2, "Understanding Response Files"
- Section 4.3, "Performing Pre-Silent Installation Tasks"
- Section 4.4, "Creating Database Schema in Silent Mode"
- Section 4.5, "Creating the Middleware Home Directory in Silent Mode"
- Section 4.6, "Installing Your Oracle Fusion Middleware Product in Silent Mode"
- Section 4.7, "Creating a WebLogic Domain in Silent Mode"
- Section 4.8, "Configuring Your Oracle Fusion Middleware Product in Silent Mode"
- Section 4.9, "Deinstalling Your Oracle Fusion Middleware Product in Silent Mode"

4.1 Understanding Silent Installation

Silent installation eliminates the need to monitor your product installation because no graphical output is displayed and no input by the user is required.

Silent installation of your Oracle Fusion Middleware product is accomplished by using the `-silent` flag on the command line when you start the installer. In most cases, you will need to supply the location and name of a file containing certain variable and parameter values (for example, installation location). These are the values that would be asked for during a typical installation using the graphical user interface.

For Oracle Fusion Middleware products, this file is typically called a response file. For more information, see Section 4.2, "Understanding Response Files".

Note: For UNIX users, if this is a first time installation of any Oracle product, you must create the `oraInst.loc` file before starting. Please refer to Section 4.3.1, "UNIX Users: Creating the `oraInst.loc` File" for more information.

Following installation of your product, you need to run the `root.sh` script as the `root` user. The `root.sh` script detects settings of environment variables and enables you to enter the full path of the local `bin` directory.

Note: For Windows users, if this is a first time installation of any Oracle product, you must create the registry keys before starting. Registry key creation is described in Section 4.3.2, "Windows Users: Creating the Registry Key"

4.2 Understanding Response Files

Before doing a silent installation, you must provide information specific to your installation in a response file (for example, the installation directory). The installer will fail if you attempt an installation using a response file that is not configured correctly. Response files are text files that you can create or edit in a text editor.

4.2.1 Creating a Response File

Oracle recommends creating a response file in the following manner:

1. Run your product's graphical installer, as described in your product installation guide.
2. On the Installation Summary screen, click **Save** to save your installation parameters to a response file.

You will be prompted for a name and location where you want to create this response file. After it is created, you can use it exactly as-is to replicate the installation on other systems, or modify it as needed.

4.2.2 Sample Response Files

Pre-existing sample response files are provided in the `Disk1/stage/Response` (on UNIX operating systems) or `Disk1\stage\Response` (on Windows operating systems) directory in the location where you unzipped your downloaded archive files for installation.

Refer to your product installation guide for more detailed descriptions of the sample installation and deinstallation response files that are provided for each product.

4.2.3 Securing Your Response Files for Silent Installation

Your response files contain certain passwords required by the installer. To minimize security issues regarding these passwords in the response file, follow these guidelines:

- Set the permissions on the response files so that they are readable only by the operating system user who will be performing the silent installation.
- If possible, remove the response files from the system after the silent installation is completed.

4.3 Performing Pre-Silent Installation Tasks

This section covers the pre-installation tasks that may be required before you are able to perform a silent installation.

The following topics are covered:

- Section 4.3.1, "UNIX Users: Creating the `oraInst.loc` File"
- Section 4.3.2, "Windows Users: Creating the Registry Key"

4.3.1 UNIX Users: Creating the `oraInst.loc` File

The Oracle inventory directory is used by the installer to keep track of all Oracle products installed on the computer. The inventory directory is stored in a file called `oraInst.loc`. If this file does not already exist on your system, you must create it before starting a silent installation. This file is used by the installer.

1. Log in as the `root` user.

```
prompt> su
```

2. Using a text editor such as `vi` or `emacs`, create the `oraInst.loc` file in the directory of your choice. The contents of the file consist of the following two lines:

```
inventory_loc=oui_inventory_directory
inst_group=oui_install_group
```

Replace `oui_inventory_directory` with the full path to the directory where you want the installer to create the inventory directory. Then, replace `oui_install_group` with the name of the group whose members have write permissions to this directory.

3. Exit from the `root` user.

```
# exit
```

4.3.2 Windows Users: Creating the Registry Key

If you have not installed Oracle SOA Suite on your computer, then you need to create the following Registry key and value:

```
HKEY_LOCAL_MACHINE / SOFTWARE / Oracle / inst_loc = [inventory_directory]
```

Replace `Inventory_Directory` with the full path to your installer files. For example:

```
C:\Program Files\Oracle\Inventory
```

4.4 Creating Database Schema in Silent Mode

If your Oracle Fusion Middleware product requires database schemas, you must first create the schemas in your database before installing and configuring your product.

For instructions on how to create the schemas in silent mode, refer to "Running Repository Creation Utility (RCU) from the Command Line" in *Oracle Fusion Middleware Repository Creation Utility User's Guide*.

4.5 Creating the Middleware Home Directory in Silent Mode

Installation of all Oracle Fusion Middleware products requires the presence of an Oracle Middleware home directory, which can be created by installing Oracle WebLogic Server.

To install the latest Oracle WebLogic Server in silent mode, see "Product Distribution" in *Oracle Fusion Middleware Installation Guide for Oracle WebLogic Server* to obtain the latest software, and "Running the Installation Program in Silent Mode" in *Oracle Fusion Middleware Installation Guide for Oracle WebLogic Server* for silent installation instructions.

4.6 Installing Your Oracle Fusion Middleware Product in Silent Mode

To install your Oracle Fusion Middleware product in silent mode, use the `-silent` mode from the command line. The full syntax for running the installer from the command line on UNIX operating systems is shown below:

```
runInstaller [-mode] [-options] [(<CommandLinevariable=Value>)*]
```

On Windows operating systems:

```
setup.exe [-mode] [-options] [(<CommandLinevariable=Value>)*]
```

Table 4–1 lists the valid command line parameters for silent installation.

Table 4–1 Installer Command Line Parameters

Parameter	Description
Installation Modes - Only One Mode Can be Specified	
-i	Launches the installer in GUI mode. This is the default mode and is used if no mode is specified on the command line.
-install	
-silent	Install in silent mode. The installer must be passed either a response file or command line variable value pairs.
-d	Launches the installer in GUI mode for deinstallation.
-deinstall	NOTE: this option is only available when you start the deinstaller from the <code>ORACLE_HOME/oui/bin</code> (on UNIX operating systems) or <code>ORACLE_HOME\oui\bin</code> (on Windows operating systems) directory.
-p	Launches the installer in GUI mode but only checks the prerequisites. No software is installed.
-prerequisite	
-v	Launches the installer in GUI mode and performs all prerequisite and validation checking, but does not install any software.
-validate	
-sv	Performs all prerequisite and validation checking in silent mode. You must pass the installer either a response file or a series of command line variable value pairs.
-silentvalidate	
Installation Options	
-help	Displays the usage parameters for the <code>runInstaller</code> or <code>setup.exe</code> command.
--help	
--usage	NOTE: the <code>--usage</code> option is only valid for the <code>runInstaller</code> command on UNIX operating systems.
-invPtrLoc <i>file</i>	Pointer to the inventory location file. Replace <i>file</i> with the full path and name of the <code>oraInst.loc</code> file.

Table 4–1 (Cont.) Installer Command Line Parameters

Parameter	Description
-response <i>file</i>	Pointer to the response file. Replace <i>file</i> with the full path and name of the response file.
-responseFile <i>file</i>	See Section 4.2, "Understanding Response Files" for information about creating the response files.
-jreLoc <i>location</i>	Pointer to the location where Java Runtime Environment (JRE) is installed. Replace <i>location</i> with the full path to the <code>jre</code> directory where your JRE is installed.
-logLevel <i>level</i>	Specify the level of logging performed by the installer; all messages with a lower priority than the specified <i>level</i> will be recorded. Valid levels are: <ul style="list-style-type: none"> ▪ severe ▪ warning ▪ info ▪ config ▪ fine ▪ finer ▪ finest
-debug	Obtain debug information from the installer.
-force	Allow the silent installation to proceed in a non-empty directory.
-printdiskusage	Log debugging information pertaining to disk usage.
-printmemory	Log debugging information pertaining to memory usage.
-printtime	Log debugging information pertaining to time usage. This command causes the <code>timeTakenTimestamp.log</code> file to be created.
-waitforcompletion	Windows only - the installer will wait for completion instead of spawning the Java engine and exiting. NOTE: this option only works if the command is invoked from a script; for example, if a <code>.bat</code> file contains the <code>setup.exe</code> file with the <code>-waitforcompletion</code> option. This option will not work if invoked directly from the command line prompt.
-noconsole	Messages will not be displayed to the console window.
-ignoreSysPrereqs	Ignore the results of the system prerequisite checks and continue with the installation.
-executeSysPrereqs	Execute the system prerequisite checks only, then exit.
-paramFile <i>file</i>	Specify the full path to the <code>oraparam.ini</code> file. This file is the initialization file for the installer. The default location of this file is <code>Disk1/install/platform</code> (on UNIX operation systems) or <code>Disk1\install\platform</code> (on Windows operation systems).
-novalidation	Disables all validation checking performed by the installer.
-nodefaultinput	For the GUI install, several screens have information or default values pre-populated. Specifying this option disables this behavior so that no information or values are pre-populated.

Command Line Variables

Table 4–1 (Cont.) Installer Command Line Parameters

Parameter	Description
Installer Variables	<p>Installer variables are specified using <code>varName=value</code>. For example, on a UNIX operating system:</p> <pre>ORACLE_HOME=/home/Oracle/Middleware/as_1</pre> <p>On a Windows operating system:</p> <pre>ORACLE_HOME=C:\products\Oracle\Middleware\as_1</pre>
Session Variables	Session variables are specified using <code>session:varName=value</code> .
Component Variables	Component variables are specified using <code>session:compInternalName:[Version:]varName=value</code> .

4.6.1 Sample Silent Install Commands

If this is the first time you are installing on your system (meaning there is no pre-existing Oracle Inventory location), use the following command to perform a silent installation on UNIX systems:

```
./runInstaller -silent -response file -invPtrLoc file
```

On Windows systems:

```
setup.exe -silent -response file -invPtrLoc file
```

Below is a full example of this command for UNIX systems:

```
./runInstaller -silent -response /home/Oracle/response/devSOA.rsp -invPtrLoc /home/jdoe/oraInst.loc
```

On Windows operating systems:

```
setup.exe -silent -response C:\home\Oracle\response\devSOA.rsp -invPtrLoc c:\home\Oracle\oraInst.loc
```

If you have already installed an Oracle product on your system and do not need to specify an inventory location, then you can use a command similar to the following on UNIX systems:

```
./runInstaller -silent -response file
```

On Windows systems:

```
setup.exe -silent -response file
```

Below is a full example of this command on a UNIX system:

```
./runInstaller -silent -response /home/Oracle/response/devSOA.rsp
```

On Windows operating systems:

```
setup.exe -silent -response c:\home\Oracle\response\devSOA.rsp
```

4.6.2 Sample Silent Install Output

Below is a sample output from a silent Oracle SOA Suite installation using the `sampleResponse_wls.rsp` template:

```
$ ./runInstaller -jreLoc /home/Oracle/Middleware/jdk160_version/ -silent -response /home/Oracle/response/sampleResponse_wls.rsp
Platform is Linux X86 32 bit
```

Starting Oracle Universal Installer...

The installation of Oracle SOA Suite 11g completed successfully.

4.7 Creating a WebLogic Domain in Silent Mode

The Oracle Web Tier installer does not provide a mechanism for creating an Oracle WebLogic Server domain.

If you are performing a silent installation of Oracle Web Tier without a WebLogic Server domain already configured on your system, and you want to associate your components with a WebLogic Server domain, or you have a need to be able to create a WebLogic Domain in silent mode, you can use the procedure described in this section to create and enable a WebLogic Server domain using WebLogic Server Scripting Tool (WLST) scripts:

- Task 1: Install the Latest Oracle WebLogic Server in Silent Mode
- Task 2: Create the WebLogic Server Domain Using WLST
- Task 3: Enable the WebLogic Server Domain with JRF and EM
- Task 4: Start the Administration Server in the WebLogic Server Domain
- Task 5: Verify the Domain is Up and Running

4.7.1 Task 1: Install the Latest Oracle WebLogic Server in Silent Mode

See Section 4.5, "Creating the Middleware Home Directory in Silent Mode".

4.7.2 Task 2: Create the WebLogic Server Domain Using WLST

Create a WLST script containing the following WLST commands to create the WebLogic Server domain:

```
#!/usr/bin/python
import os, sys
readTemplate('WebLogic_Server_Home/common/templates/domains/wls.jar')
cd('/Security/base_domain/User/admin_name')
cmo.setPassword('examplepassword')
cd('/Server/AdminServer')
cmo.setName('admin_server_name')
cmo.setListenPort(admin_server_port)
cmo.setListenAddress('admin_server_address')
writeDomain('DOMAIN_HOME')
closeTemplate()
exit()
```

For example, you could create a file called `create_domain_7001.py` that contained the following:

```
#!/usr/bin/python
import os, sys
readTemplate('/oracle/Middleware/wlserver_10.3/common/templates/domains/wls.jar')
cd('/Security/base_domain/User/weblogic')
cmo.setPassword('ExamplePassword1')
cd('/Server/AdminServer')
cmo.setName('AdminServer')
cmo.setListenPort(7001)
cmo.setListenAddress('examplehost.exampledomain.com')
writeDomain('/oracle/Domains/ExampleSilentWTDomain')
closeTemplate()
exit()
```

To run the script:

1. Set the environment

```
cd WebLogic_Server_Home/common/bin
./commEnv.sh
```

2. Run the script using WLST. For example:

```
wlst path_to_script/create_domain_7001.py
```

4.7.3 Task 3: Enable the WebLogic Server Domain with JRF and EM

Create a second script containing the following WLST commands to enable the WebLogic Server domain with JRF and EM:

```
#!/usr/bin/python
import os, sys
readDomain('DOMAIN_HOME')
addTemplate('MW_HOME/oracle_common/common/templates/applications/jrf_template_11.1.1.jar')
addTemplate('MW_HOME/oracle_common/common/templates/applications/oracle.em_11_1_1_0_0_template.jar')
updateDomain()
closeDomain()
exit()
```

For example, you could create a file called `enable_domain_7001.py` that contained the following:

```
#!/usr/bin/python
import os, sys
readDomain('/oracle/Domains/ExampleSilentWTDomain')
addTemplate('/oracle/Middleware/oracle_common/common/templates/applications/jrf_template_11.1.1.jar')
addTemplate('/oracle/Middleware/oracle_common/common/templates/applications/oracle.em_11_1_1_0_0_template.jar')
updateDomain()
closeDomain()
exit()
```

After the script is created, run it using WLST. For example:

```
wlst path_to_script/enable_domain_7001.py
```

To see which domain templates are required for your Fusion Middleware product or component, refer to "Fusion Middleware Product Templates" in *Oracle Fusion Middleware Domain Template Reference*.

4.7.4 Task 4: Start the Administration Server in the WebLogic Server Domain

After the domain is created, start the Administration Server. Run the `startWebLogic.sh` (on UNIX operating systems) or `startWebLogic.cmd` (on Windows operating systems) script in the directory where you created your new domain.

For example, on UNIX operating systems:

```
cd /oracle/Domains/ExampleSilentWTDomain
./startWebLogic.sh
```

On Windows operating systems:

```
cd C:\Oracle\Domains\ExampleSilentWTDomain
```

```
startWebLogic.cmd
```

4.7.5 Task 5: Verify the Domain is Up and Running

Login to Fusion Middleware Control using the following URL:

```
http://administration_server_host:administration_server_port/em
```

Login to the Administration Server Console using the following URL:

```
http://administration_server_host:administration_server_port/console
```

4.8 Configuring Your Oracle Fusion Middleware Product in Silent Mode

The way in which you can configure your Oracle Fusion Middleware product from the command line varies depending on the type of product.

4.8.1 System Components

If your product contains system components (for example, Oracle Web Tier, Oracle Portal, Forms, Reports and Discoverer, or Oracle Identity Management), you can use the same commands as described in Section 4.6, "Installing Your Oracle Fusion Middleware Product in Silent Mode".

These products use the same engine for both installation and configuration, so the contents of the response file determine whether you are only installing the software, only configuring existing software, or installing and configuring at the same time.

As mentioned in Section 4.2, "Understanding Response Files", the recommended way to create these response files is to run the graphical installer once and save the configuration to a response file. Each product also comes with sample response files that you can use. Refer to the product installation guides for more information.

Below are some example silent configuration commands, assuming you have previously performed a software-only installation (did not run the configuration tool).

On UNIX operating systems:

```
./config.sh -silent -response response_file
```

For example:

```
./config.sh -silent -response /home/Oracle/response/devSOA.rsp
```

On Windows operating systems:

```
config.bat -silent -response response_file
```

For example:

```
config.bat -silent -response C:\home\Oracle\response\devSOA.rsp
```

4.8.2 Java Components

If your product contains Java components (for example, Oracle SOA Suite, or Oracle WebCenter), the installer and the Configuration Wizard are essentially different products and therefore you cannot configure your products silently using the same silent installation commands.

Instead, silent configuration for Java components must be done using WebLogic Scripting Tool (WLST) commands.

For more information, refer to:

- *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*
- *Oracle Fusion Middleware Oracle WebLogic Scripting Tool*

4.9 Deinstalling Your Oracle Fusion Middleware Product in Silent Mode

To deinstall the Oracle Fusion Middleware product software on your system (both system and java components), use the `-d` or `-deinstall` parameter from the command line. You must start the deinstaller from the `ORACLE_HOME/oui/bin` (on UNIX operating systems) or `ORACLE_HOME\oui\bin` (on Windows operating systems) directory; this is the only directory where the `-d` or `-deinstall` parameters are accepted.

On UNIX operating systems:

```
./runInstaller -silent -deinstall -response file
```

On Windows operating systems:

```
setup.exe -silent -deinstall -response file
```

4.9.1 Command Line Parameters for Silent Deinstallation

Table 4–2 lists the valid command line parameters for silent deinstallation.

Table 4–2 Deinstaller Command Line Parameters

Parameter	Description
Installation Modes - Only One Mode Can be Specified	
<code>-d</code>	Launches the installer in GUI mode for deinstallation.
<code>-deinstall</code>	
Installation Options	
<code>-help</code>	Displays the usage parameters for the <code>runInstaller</code> (on UNIX operating systems) or <code>setup.exe</code> (on Windows operating systems) command.
<code>--help</code>	
<code>--usage</code>	
<code>-invPtrLoc file</code>	Pointer to the inventory location file. Replace <i>file</i> with the full path and name of the <code>oraInst.loc</code> file.
<code>-response file</code>	Pointer to the response file. Replace <i>file</i> with the full path and name of the response file.
<code>-responseFile file</code>	
<code>-jreLoc location</code>	Pointer to the location where Java Runtime Environment (JRE) is installed. Replace <i>location</i> with the full path to the <code>jre</code> directory where your JRE is installed.

Table 4–2 (Cont.) Deinstaller Command Line Parameters

Parameter	Description
-logLevel <i>level</i>	Specify the level of logging performed by the installer; all messages with a lower priority than the specified <i>level</i> will be recorded. Valid levels are: <ul style="list-style-type: none"> ▪ severe ▪ warning ▪ info ▪ config ▪ fine ▪ finer ▪ finest
-debug	Obtain debug information from the installer.
-force	Allow the silent installation to proceed in a non-empty directory.
-printdiskusage	Log debugging information pertaining to disk usage.
-printmemory	Log debugging information pertaining to memory usage.
-printtime	Log debugging information pertaining to time usage. This command causes the <code>timeTakenTimestamp.log</code> file to be created.
-waitforcompletion	Windows only - the installer will wait for completion instead of spawning the Java engine and exiting.
-noconsole	Messages will not be displayed to the console window.
-ignoreSysPrereqs	Ignore the results of the system prerequisite checks and continue with the installation.
-executeSysPrereqs	Execute the system prerequisite checks only, then exit.
-paramFile <i>file</i>	Specify the full path to the <code>oraparam.ini</code> file. This file is the initialization file for the installer. The default location of this file is <code>Disk1/install/platform</code> (on UNIX operation systems) or <code>Disk1\install\platform</code> (on Windows operation systems).
-novalidation	Disables all validation checking performed by the installer.
-nodefaultinput	For the GUI install, several screens have information or default values pre-populated. Specifying this option disables this behavior so that no information or values are pre-populated.
Command Line Variables	
Installer Variables	Installer variables are specified using <code>varName=value</code> . For example, on a UNIX operating system: <pre>ORACLE_HOME=/home/Oracle/Middleware/as_1</pre> On a Windows operating system: <pre>ORACLE_HOME=C:\products\Oracle\Middleware\as_1</pre>
Session Variables	Session variables are specified using <code>session:varName=value</code> .
Component Variables	Component variables are specified using <code>session:compInternalName:[Version:]varName=value</code> .

4.9.2 Sample Silent Deinstall Output

Below is a sample output from a silent deinstall using the `deinstall_oh.rsp` template:

```
$ ./runInstaller -silent -deinstall -jreLoc /home/Oracle/Middleware/jdk160_
version/ -response /home/Oracle/Response/deinstall_oh.rsp
Starting Oracle Universal Installer...

Checking swap space: must be greater than 500 MB.   Actual 4047 MB   Passed
