

Oracle® Fusion Middleware

Administrator's Guide for Oracle Application Development
Framework

11g Release 2 (11.1.2.4.0)

E16179-05

March 2013

Documentation for Oracle Application Development
Framework (Oracle ADF) administrators that describes how
to deploy, monitor, and configure ADF applications.

Oracle Fusion Middleware Administrator's Guide for Oracle Application Development Framework 11g Release 2 (11.1.2.4.0)

3 Monitoring and Configuring ADF Applications

3.1	Introduction to ADF Application Monitoring and Configuration	3-1
3.2	Monitoring Performance Using Fusion Middleware Control.....	3-2
3.2.1	How to View Application Module Performance	3-2
3.2.2	How to view Application Module Pool Performance.....	3-3
3.2.3	How to View ADF Task Flow Performance	3-4
3.3	Configuring Application Properties Using Fusion Middleware Control.....	3-5
3.3.1	How to Modify ADF Business Components Parameters	3-5
3.3.2	How to Modify Connection Configurations.....	3-14
3.4	Configuring Application Properties Using the MBean Browser	3-21
3.4.1	How to Modify ADF Application Configuration Using MBean	3-21
3.4.2	How to Modify ADF Connections Using MBean	3-22
3.4.3	How to Modify ADF Business Components Configuration Using MBeans.....	3-24
3.4.4	How to Modify MDS Configuration Using MBean.....	3-24
3.4.5	How to Modify Active Data Service Configuration Using MBean	3-25
3.5	How to Edit Credentials Deployed with the Application	3-27
3.6	Diagnosing Problems using the Diagnostic Framework	3-27
3.7	Viewing Application Metric Information with DMS SPY	3-28
3.8	Configuring WebSphere Application Server.....	3-28
3.8.1	How to Configure WebSphere to Allow Reuse of Query Result Sets.....	3-28

4 WLST Command Reference for ADF Applications

4.1	Overview of Custom WLST Commands for Oracle ADF.....	4-1
4.2	ADF-Specific WLST Commands.....	4-1
4.2.1	adf_createFileUrlConnection	4-2
4.2.1.1	Description	4-2
4.2.1.2	Syntax	4-2
4.2.1.3	Example.....	4-2
4.2.2	adf_createHttpURLConnection	4-2
4.2.2.1	Description	4-2
4.2.2.2	Syntax	4-3
4.2.2.3	Example.....	4-3
4.2.3	adf_setURLConnectionAttributes	4-3
4.2.3.1	Description	4-3
4.2.3.2	Syntax	4-3
4.2.3.3	Example.....	4-3
4.2.4	adf_listUrlConnection	4-3
4.2.4.1	Description	4-3
4.2.4.2	Syntax	4-4
4.2.4.3	Example.....	4-4
4.2.5	getADFMArchiveConfig	4-4

4.2.5.1	Description	4-4
4.2.5.2	Syntax	4-4
4.2.5.3	Example.....	4-5
4.2.6	exportJarVersions	4-6
4.2.6.1	Description	4-6
4.2.6.2	Syntax	4-6
4.2.6.3	Example.....	4-6
4.2.7	exportApplicationJarVersions	4-6
4.2.7.1	Description	4-6
4.2.7.2	Syntax	4-6
4.2.7.3	Example.....	4-7
4.2.8	exportApplicationSelectedJarVersions	4-7
4.2.8.1	Description	4-7
4.2.8.2	Syntax	4-7
4.2.8.3	Example.....	4-7

C.5	Deploying an ADF Application to GlassFish	C-5

Preface

Welcome to *Administrator's Guide for Oracle Application Development Framework*.

Audience

This document is intended for system administrators who need to deploy, manage, monitor, and configure Oracle ADF applications using the Oracle Application Development Framework (Oracle ADF).

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at

<http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc>.

Access to Oracle Support

Oracle customers have access to electronic support through My Oracle Support. For information, visit

<http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info> or visit

<http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs> if you are hearing impaired.

Conventions

The following text conventions are used in this document:

Convention	Meaning
boldface	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.
<i>italic</i>	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
monospace	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

What's New in This Guide in Release 11.1.2.4.0

For Release 11.1.2.4.0, this guide has not been updated. The following table lists the sections that was changed for 11.1.2.3.0.

For changes made to Oracle JDeveloper and Oracle Application Development Framework (Oracle ADF) for this release, see the What's New page on the Oracle Technology Network at <http://www.oracle.com/technetwork/developer-tools/jdev/documentation/index.html>.

Sections	Change Description
Chapter 4, "WLST Command Reference for ADF Applications"	
Section 4.2.6, "exportJarVersions"	Added new command for exporting JARs versions information to a CSV file.
Section 4.2.7, "exportApplicationJarVersions"	Added new command for exporting runtime JARs versions information for an application to a CSV file.
Section 4.2.8, "exportApplicationSelectedJarVersions"	Added new command for exporting selected JARs versions information (using the <code>versions.xml</code> file) to a CSV file.
Appendix C, "Configuring GlassFish Server"	
Appendix C, "Configuring GlassFish Server"	Added new appendix with instructions to configure GlassFish Server to run ADF applications.

Part I

Understanding Oracle ADF

Part I contains the following chapters:

- [Chapter 1, "Introduction to Oracle ADF Administration"](#)

Introduction to Oracle ADF Administration

This chapter describes the administrative tasks you can perform and the tools you can use to deploy, manage, monitor, and configure applications developed for the Oracle Application Development Framework (Oracle ADF).

This chapter includes the following sections:

- [Section 1.1, "Introducing Oracle ADF"](#)
- [Section 1.2, "Oracle ADF Architecture"](#)
- [Section 1.3, "Administering Oracle ADF Applications"](#)

1.1 Introducing Oracle ADF

The Oracle Application Development Framework (Oracle ADF) builds on Java Platform, Enterprise Edition (Java EE) standards and open-source technologies to provide a complete framework for implementing service-oriented applications. You can use this framework to provide enterprise solutions across different platforms. You can build applications that search, display, create, modify, and validate data for web, web services, desktop, or mobile interfaces.

You use Oracle JDeveloper 11g with Oracle ADF to develop applications with an environment that supports the full development lifecycle of design, test, and deployment. For more information about ADF development, see *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

After you have developed and tested your ADF application in test environments, you can deploy your application to production environments using the tools described in this book. You can monitor the performance of applications as they are running. You can also manage and configure properties and attributes.

1.2 Oracle ADF Architecture

Oracle ADF supports the industry-standard model-view-controller architecture to achieve separation of business logic, navigation, and user interface. The MVC architecture provides:

- A model layer that represents the data values
- A view layer that contains the UI components
- A controller layer that handles input and navigation
- A business service layer that encapsulates business logic

The Fusion web application technology stack components are:

- ADF Model, for accessing declarative data binding metadata
- ADF Business Components, for building business services
- ADF Faces rich client, for AJAX-enabled UI components for web applications built with JavaServer Faces (JSF)
- ADF Controller, for input processing, navigation, and reusable task flows

1.2.1 ADF Business Components

ADF Business Components are application objects you can use to implement service-oriented Java EE applications. You implement ADF Business Components for clients to query, insert, update, and delete business data. You can apply business rules to the Business Components to enforce proper usage. The key components of ADF Business Components are the entity object, the view object, and the application module.

An *entity object* represents a row in a database table. It uses data manipulation language (DML) operations to modify data. Entity objects are used with others to reflect relationships in the database schema.

A *view object* represents a SQL query. You use the SQL Language to query the database to obtain the results. You can also link a view object with other entity objects to create master-detail hierarchies.

An *application module* is the transactional component that allows UI components to access data. It presents a data model and methods to perform certain tasks.

1.2.2 ADF Model

ADF Model implements a service abstraction called *data control*. Data control uses metadata interfaces to abstract business services. This metadata is used to describe data collections, properties, methods, and types. In JDeveloper, data controls appear in the Data Controls panel. When you drag and drop attributes, collections, and methods onto a page, JDeveloper automatically creates the bindings from the page to the associated services.

1.2.3 ADF Controller

ADF Controller provides a navigation and state management model that works with JSF. You can create navigational flows called task flows that encapsulate a specific task sequence.

1.2.4 ADF Faces Rich Client

ADF Faces provides over 100 rich components that can be used out of the box to create web applications. ADF Faces components provide built-in AJAX functionality to allow requests to be sent to the server without fully rendering the page. JSF provides server-side control to reduce the dependency on JavaScript. The components support skinning, internationalization, and accessibility options.

ADF Faces has a large set of components, including tables, trees, dialogs, accordions, and a variety of layout components. It also includes ADF Data Visualization components, which are Flash- and SVG-enabled, for displaying graphs, charts, and gauges.

1.3 Administering Oracle ADF Applications

You can perform a variety of administration tasks on ADF applications. You can deploy ADF applications using Enterprise Manager Fusion Middleware Control, WLST commands, the `ojdeploy` command, scripts, or the WebLogic Administration Console.

After the ADF application has been deployed, you can configure application properties using Enterprise Manager Fusion Middleware Control. You can also configure some properties using the MBean Browser to change values in the ADF MBeans. For example, you can use Enterprise Manager Fusion Middleware Control to change the URL connection or WebService connection endpoints or seed the production credentials.

When you run the application, you can monitor performance data on the application modules, application module pooling, and task flows.

Part II

Administering ADF Applications

Part II contains the following chapters:

- [Chapter 2, "Deploying ADF Applications"](#)
- [Chapter 3, "Monitoring and Configuring ADF Applications"](#)
- [Chapter 4, "WLST Command Reference for ADF Applications"](#)

Deploying ADF Applications

This chapter describes how to deploy Oracle ADF applications packaged as an EAR file to a target application server. It also describes how to use scripts and Ant to automate the deployment process. This chapter focuses on deploying ADF applications for production and later stage testing. For information about deploying ADF applications for development, see the *Oracle Fusion Middleware Developer's Guide for Oracle Application Development Framework*.

For deploying to third-party application servers, such as IBM WebSphere Application Server, see the *Oracle Fusion Middleware Third-Party Application Server Guide*.

This chapter includes the following sections:

- [Section 2.1, "Introduction to Deploying ADF Applications"](#)
- [Section 2.2, "Preparing the Standalone Application Server for Deployment"](#)
- [Section 2.3, "Deploying Using Oracle Enterprise Manager Fusion Middleware Control"](#)
- [Section 2.4, "Deploying Using Scripting Commands"](#)
- [Section 2.5, "Deploying Using Scripts and Ant"](#)
- [Section 2.6, "Deploying Using the Application Server Administration Tool"](#)

2.1 Introduction to Deploying ADF Applications

Deployment is the process of packaging application files and artifacts and transferring them to a target application server to be run. During application development using JDeveloper, developers can test the application using the Integrated WebLogic Server that is built into the JDeveloper installation, or they can use JDeveloper to directly deploy to a standalone application server.

After the application has been developed, administrators can deploy the application to production application servers. The tools that the administrators use for production-level deployment are:

- Oracle Enterprise Manager Fusion Middleware Control
- WebLogic Scripting Tool (WLST) commands or WebSphere Application Server (wsadmin) commands
- Command scripts and Ant scripts
- Oracle WebLogic Administration Console or WebSphere Administrative Console

This chapter describes the tools and methods that administrators use to deploy ADF applications. For information about deploying ADF applications for development and

testing purposes using JDeveloper, see the *Oracle Fusion Middleware Developer's Guide for Oracle Application Development Framework*.

If your application uses customization, you may need to set up the MDS repository in the application server. For more information about MDS, see the *Oracle Fusion Middleware Administrator's Guide*.

Note: Developers, Test, and QA personnel may also use these tools and the methods in this chapter to deploy ADF applications to staging application servers.

2.2 Preparing the Standalone Application Server for Deployment

To run ADF applications, you must install the standalone application server with the ADF runtime. You can include the ADF runtime during a new application server installation or you can install the ADF runtime into an existing application server installation.

[Figure 2-1](#) shows the flow diagram for preparing a standalone application server for deployment. Note the following definitions used in the diagram:

- OWSM: Oracle Web Services Manager
- JRF: Java Required Files
- RCU: Repository Creation Utility
- MDS: Metadata Store

Figure 2–1 Preparing the Application Server Flow Diagram

For WebLogic Server, the following points apply:

- After WebLogic Server has the ADF runtime installed, you can create a new WebLogic Server domain or you can extend an existing WebLogic Server domain for Oracle ADF.
- If the Managed Servers are on a different host than the Administration Server, you must perform additional configuration tasks for the Managed Servers to enable them to host ADF applications.
- An ADF application will use either a JDBC data source or a JDBC URL to access its data. You can configure WebLogic Server with the data source using the Oracle WebLogic Server Administration Console.
- For additional information about the tools available (such as OPatch) for patching your existing Oracle Fusion Middleware environment or upgrading your existing

IBM WebSphere Application Server environment, see the *Oracle Fusion Middleware Patching Guide*.

- For additional information about creating and loading the schemas that are necessary for many of the Oracle Fusion Middleware components, see the *Oracle Fusion Middleware Repository Creation Utility User's Guide*.
- For the latest information about Oracle Application Development Framework and Oracle JDeveloper, see the *Oracle JDeveloper Release Notes* on Oracle Technology Network.

For WebSphere Application Server, the following points apply:

- For general information about using IBM WebSphere Application Server with Oracle Fusion Middleware and installation and configuration procedures, see the *Oracle Fusion Middleware Third-Party Application Server Guide*.
- After WebSphere Application Server has the ADF runtime installed, you can create a new WebSphere cell or you can extend an existing WebSphere cell for ADF.
- For additional information about using the Oracle Fusion Middleware Configuration Wizard to configure WebSphere and the WebSphere cell environment, see the *Oracle Fusion Middleware Configuration Guide for WebSphere*.
- For additional information about the tools available (such as OPatch) for patching your existing Oracle Fusion Middleware environment or upgrading your existing WebSphere Application Server environment, see the *Oracle Fusion Middleware Patching Guide*.
- For additional information about creating and loading the schemas that are necessary for many of the Oracle Fusion Middleware components, see the *Oracle Fusion Middleware Repository Creation Utility User's Guide*.
- If the servers are on a different node than the Deployment Manager, you must perform additional configuration tasks for the servers to enable them to host ADF applications.
- An ADF application will use either a JDBC data source or a JDBC URL to access its data. You can configure WebSphere Application Server with the data source using the WebSphere Administrative Console.
- For the latest information about Oracle Application Development Framework and Oracle JDeveloper, see the *Oracle JDeveloper Release Notes* on Oracle Technology Network.

2.2.1 How to Install the ADF Runtime to the Application Server Installation

The application server requires the ADF runtime to run ADF applications.

Installing the ADF runtime is not required if you are using JDeveloper to run applications in Integrated WebLogic Server.

For WebLogic Server, you can install the ADF runtime using the following installers:

- Oracle Fusion Middleware 11g Application Developer Installer: Installs the ADF runtime and Oracle Enterprise Manager. You should use the Oracle Fusion Middleware 11g Application Developer Installer if you want to use Oracle Enterprise Manager to manage standalone ADF applications (without Oracle SOA Suite or Oracle WebCenter components). You must have already installed Oracle WebLogic Server before you can use this installer.

Note: The Oracle 11g Installer for JDeveloper can also be used to install the ADF runtime to the application server installation. However, it does not include all the components that are typically needed for production and full test environments. Therefore, this installer should not be used for anything other than for development purposes.

For WebSphere Application Server, you can install the ADF runtime using the following installer:

- Oracle Fusion Middleware 11g Application Developer Installer: Installs the ADF runtime and Oracle Enterprise Manager. You must have already installed WebSphere Application Server before you can use this installer. For more information, see the *Oracle Fusion Middleware Third-Party Application Server Guide*.

2.2.1.1 Installing the ADF Runtime into an Existing WebLogic Server Installation Using the Oracle Fusion Middleware Application Developer Installer

You can use the Oracle Fusion Middleware 11g Application Developer Installer to install the ADF runtime and Enterprise Manager.

Install Oracle WebLogic Server. You must also have obtained the Oracle Fusion Middleware 11g Application Developer Installer.

Use the instructions in the *Oracle Fusion Middleware Third-Party Application Server Guide* to obtain the software and start the installer.

In the installer you will perform several tasks including:

- Adding any software updates
- Selecting the WebLogic Server directory for installation
- Verifying installation information

After you have installed the ADF runtime, follow the instructions in [Section 2.2.2, "How to Create and Extend Oracle WebLogic Server Domains,"](#) to use the Oracle Fusion Middleware Configuration Wizard to create or extend the Oracle WebLogic Server domain.

2.2.1.2 Installing the ADF Runtime into an Existing WebSphere Application Server Installation Using the Oracle Fusion Middleware Application Developer Installer

You can use the Oracle Fusion Middleware 11g Application Developer Installer to install the ADF runtime and Enterprise Manager.

Before you begin, you must already have a WebSphere Application Server installation.

Use the instructions in the *Oracle Fusion Middleware Installation Planning Guide* to obtain the software and to start the installer.

In the installer you will perform several tasks including:

- Adding any software updates
- Selecting the WebSphere directory for installation
- Verifying installation information

After you have installed the ADF runtime, configure the cells and perform other tasks as described in the *Oracle Fusion Middleware Third-Party Application Server Guide* and the *Oracle Fusion Middleware Configuration Guide for WebSphere*.

2.2.2 How to Create and Extend Oracle WebLogic Server Domains

You need to create and configure the Oracle WebLogic Server domain to accept ADF applications. If you do not already have a domain, you need to create one. If you already have a domain, you must extend the domain before it can run ADF applications.

If you are using Managed Servers to run your applications, you may need to configure your Managed Server. For more information about configuring a Managed Server on Oracle WebLogic Server, see *Oracle Fusion Middleware Creating Domains Using the Configuration Wizard*.

If you are setting up Managed Servers for ADF where the Managed Servers are on the same host as the Administration Server, follow the instructions described in this section.

If you are setting up to deploy to Managed Servers that are on a different host than the Administration Server, perform the additional steps described in [Section 2.2.2.3, "Setting Up Remote WebLogic Managed Servers for Oracle ADF."](#)

2.2.2.1 Creating an Oracle WebLogic Server Domain for Oracle ADF

You must create an Oracle WebLogic Server domain if it does not already exist.

To create a new Oracle WebLogic Server domain:

1. Start the Oracle Fusion Middleware Configuration wizard as described in the "Configuring Application Developer" chapter of the *Oracle Fusion Installation Guide for Application Developer*.

Follow the directions as described in that guide but consider the following steps.

2. In the Welcome page, select **Create a New WebLogic Domain** and click **Next**.
3. In the Select Domain Source page, select **Generate a domain configured automatically to support the following products**.

The option **Basic WebLogic Server Domain (Required)** is already selected.

Select **Oracle JRF**. If you are using Oracle Web Services, select **Oracle WSM Policy Manager** and click **Next**.

2.2.2.2 Extending the Oracle WebLogic Server Domain for Oracle ADF

Before you begin:

You must already have an existing Oracle WebLogic Server domain with the ADF runtime installed.

To extend an Oracle WebLogic Server domain for ADF:

1. Start the Oracle Fusion Middleware Configuration wizard as described in the "Configuring Application Developer" chapter of the *Oracle Fusion Installation Guide for Application Developer*.

Follow the directions as described in that guide but consider the following steps.

2. In the Welcome page, select **Extend an existing WebLogic domain** and click **Next**.
3. In the Select a WebLogic Domain Directory page, select the location of the domain you want to configure for Oracle ADF, and click **Next**.
4. In the Select Extension Source page, select **Extend my domain automatically to support the following added products**.

The option **Basic WebLogic Server Domain (Required)** is already selected.

Select **Oracle JRF**. If you are using Oracle Web Services, select **Oracle WSM Policy Manager** and click **Next**.

This configures the rest of the runtime `.jar` files using the `manifest` file.

Note: Your application's EAR file must have a `weblogic-application.xml` file containing a reference to the `adf.oracle.domain` shared library.

You can now start Oracle WebLogic Server by running the command-line script `ORACLE_HOME\user_projects\domains\domain_name\bin\startWebLogic.cmd`, and you can stop the server using the `stopWebLogic.cmd` script in the same directory. For Linux platforms, use `\bin\startWebLogic.sh` and `stopWebLogic.sh` respectively.

Access the Oracle WebLogic Server Administration Console using the URL `http://localhost:7001/console`.

2.2.2.3 Setting Up Remote WebLogic Managed Servers for Oracle ADF

If the WebLogic Managed Servers are on a different host than the Administration Server, you need to perform additional steps.

You will need to set up Managed Servers for Oracle ADF on the host with the Administration Server, pack the JRF template, copy it to the remote host, and unpack the template.

To set up remote Managed Servers for Oracle ADF:

1. Use the Oracle Installer for JDeveloper to install Oracle WebLogic Server installations on both the local and remote hosts, if not already installed. If you are not installing JDeveloper Studio, you need to select the **Application Development Framework Runtime** option in the installer. The local host is the host with the Administration Server.

Or, if there are existing WebLogic Server installations, use the Oracle Installer for JDeveloper to install the ADF runtime into the WebLogic Server installations on both hosts by selecting the **Application Development Framework Runtime** option. For more information on installation, see [Section 2.2.1, "How to Install the ADF Runtime to the Application Server Installation."](#)

2. Run the Oracle Fusion Middleware Configuration Wizard to create a new Oracle WebLogic Server domain. In the wizard, select the **Oracle JRF** option, as described in [Section 2.2.2.1, "Creating an Oracle WebLogic Server Domain for Oracle ADF."](#)
3. On the local host, run the Oracle Fusion Middleware Configuration Wizard to create Managed Servers.
4. On the local host, start the Administration Server and the Managed Server.

For example,

```
cd ORACLE_HOME/user_projects/domain/base_domain/bin
./startWeblogic.sh
./startManagedWebLogic.sh ManagedServer_1 http://localhost:7001
```

- On the local host, pack the Managed Server configuration information into a JAR and then copy the JAR to the remote host. This JAR contains the JRF template information.

For example,

```
cd ORACLE_HOME/oracle_home/common/bin

./pack.sh -managed=true -domain=../../../../user_projects/domains/base_domain
        -template=../../../../base_domain_managed.jar -template_name=
        "Base Managed Server Domain"

cp ../../../../../../base_domain_managed.jar remote_machine_ORACLE_HOME/
```

- On the remote host, unpack the Managed Server configuration JAR.

For example,

```
cd ORACLE_HOME/oracle_common/common/bin
./unpack.sh -domain=../../../../user_projects/domains/base_domain
        -template=../../../../base_domain_managed.jar
```

If the Managed Server was created after the domain was, you must delete the entire domain configuration directory of the Managed Server before running `unpack`.

- On the remote host, start the Node Manager.

For example,

```
cd ORACLE_HOME/wlserver_10.3/server/bin
./startNodeManager.sh
```

- On the remote host, if the Managed Server was not created with the JRF template applied, run the `applyJRF WLST` command to extend the Managed Server with the JRF template.

Also, if the Managed Server was created after the domain was, you must delete the entire domain configuration directory of the Managed Server before running `applyJRF`.

- On the both hosts, start the Managed Servers.

For example,

```
cd ORACLE_HOME/user_projects/domains/base_domain/bin
./startManagedWebLogic.sh ManagedServer_2 http://<adminServerHost>:7001
```

2.2.3 How to Create a JDBC Data Source for Oracle WebLogic Server

Use the Oracle WebLogic Server Administration Console to set up a JDBC data source in the WebLogic Server instance for your applications.

To configure Oracle WebLogic Server for a JDBC data source:

- Start Oracle WebLogic Server (if not already started) by choosing **Oracle Fusion Middleware > User Projects > Domain > Start Admin Server for WebLogic Server Domain** from the Windows **Start** menu.

For Linux, log in as the root user and navigate to:

```
<ORACLE_HOME>/user_projects/domains/MYSOADomain/bin
```

Run the following command:

```
./startWebLogic.sh
```

Or, from the Application Server Navigator, right-click an Oracle WebLogic Server instance and choose **Launch Admin Console**.

2. Start the Oracle WebLogic Server Administration Console by choosing **Oracle Fusion Middleware > User Projects > Domain > Admin Server Console** from the Windows **Start** menu.
3. Log in to the Oracle WebLogic Server Administration Console.
4. In the WebLogic Server Administration Console page, select **JDBC > Data Sources**.
5. Click **New**.
6. In the JDBC Data Source Properties page:
 - In the **Name** field, enter the name of the JDBC data source.
 - In the **JNDI** field, enter the name of the connection in the form `jdbc/connection DS`.
 - For the **Database Type**, select **Oracle**.
 - For the **Database Driver**, select **Oracle Driver (thin)**, and click **Next**.
7. In the Transactions Options page, accept the default options and click **Next**.
8. In the Connection Properties page:
 - For **Database Name**, enter the Oracle SID. For example, `orcl`.
 - For **Host Name**, enter the machine name of the database.
 - Enter the port number used to access the database.
 - Enter the user name and password for the database and click **Next**.
9. In the Test Database Connection page, click **Test Configuration** to test the connection.
10. In the Select Targets page, select the server for which the JDBC data source is to be deployed.
11. Click **Finish**.

Once the data source has been created in Oracle WebLogic Server, it can be used by an application module.

2.2.4 How to Create a JDBC Data Source for IBM WebSphere Application Server

To configure a JDBC data source for WebSphere Application Server, see the *Oracle Fusion Middleware Third-Party Application Server Guide*.

2.3 Deploying Using Oracle Enterprise Manager Fusion Middleware Control

You can use Oracle Enterprise Manager Fusion Middleware Control to deploy the EAR file created in JDeveloper. Fusion Middleware Control is a Web browser-based, graphical user interface that you can use to monitor and administer a farm. For more information about deploying using Fusion Middleware Control, see the *Oracle Fusion Middleware Administrator's Guide*.

2.4 Deploying Using Scripting Commands

Applications or modules can be deployed from JDeveloper without starting the JDeveloper IDE. You can run WLST commands (for WebLogic) or wsadmin commands (for WebSphere Application Server) from the command line or sequence them in scripts to run as a batch.

Before deploying from the command line, there must be deployment profiles for the application (EAR) or project (JAR or WAR). JDeveloper creates these deployment profiles automatically for certain types of applications, but before using commands for deployment, it is important to verify that the deployment profile(s) exist. To verify that the profiles exist, choose the **Deployment** node from either the Application Properties or Project Properties dialogs in JDeveloper. For more information about deployment profiles, see the *Oracle Fusion Middleware Developer's Guide for Oracle Application Development Framework*.

JDeveloper can also be used to deploy an application's EAR, WAR, or JAR files. The same scripts that are used for deployment via a command line are also used to deploy via JDeveloper, but JDeveloper creates the syntax and provides a user interface for the deployment.

There are specific WLST commands (WebLogic) for working with ADF applications. For a list of these commands, see [Chapter 4, "WLST Command Reference for ADF Applications."](#)

For more information about using WLST scripts, see the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

There are specific wsadmin commands (WebSphere Application Server) for working with ADF applications. For a list of these commands, see [Appendix B, "wsadmin Command Reference for ADF Applications."](#)

2.5 Deploying Using Scripts and Ant

You can deploy the application using commands and scripts. You create a script to deploy the application using the `ojdeploy` command and use the `ojaudit` command to audit projects, workspaces, or source files of the application. You can also set up the script to run automatically, for instance, whenever a developer checks in new changes.

`ojdeploy` scripts and Ant scripts can be used together or separately:

1. Create an `ojdeploy` script to compile, package, and deploy the application.
2. Create an `ojdeploy` script to compile and package the application. Then use an Ant script (such as `WLDeploy`) to deploy the application.
3. Create an Ant script to compile, package, and deploy the application. The Ant does not need to use `ojdeploy`.

For more information about the `ojdeploy` and `ojaudit` commands, see the JDeveloper online help.

You can deploy to most application servers from JDeveloper, or use tools provided by the application server vendor. You may also use Ant to package and deploy applications. The `build.xml` file, which contains the deployment commands for Ant, may vary depending on the target application server.

For deployment to other application servers, see the application server's documentation. If your application server does not provide specific Ant tasks, you

may be able to use generic Ant tasks. For example, the generic `ear` task creates an EAR file for you.

For information about Ant, see <http://ant.apache.org>.

2.6 Deploying Using the Application Server Administration Tool

For WebLogic, you can use the Oracle WebLogic Server Administration Console to deploy the EAR file created in JDeveloper. For more information, see *Oracle Fusion Middleware Deploying Applications to Oracle WebLogic Server*.

For WebSphere Application Server, you can use the IBM WebSphere Administrative Console to deploy the EAR file created in JDeveloper. For more information, go to the WebSphere Application Server Information Center at:

<http://publib.boulder.ibm.com/infocenter/wasinfo/v7r0/index.jsp?topic=/com.ibm.websphere.home.doc/welcome.html>.

Monitoring and Configuring ADF Applications

This chapter describes how to monitor ADF application performance. It also describes how to configure an ADF application's properties after it has been deployed to Oracle WebLogic Server using Fusion Middleware Control. It also describes configuration tasks required for applications deployed to IBM WebSphere Application Server.

This chapter includes the following sections:

- Section 3.1, "Introduction to ADF Application Monitoring and Configuration"
- Section 3.2, "Monitoring Performance Using Fusion Middleware Control"
- Section 3.3, "Configuring Application Properties Using Fusion Middleware Control"
- Section 3.4, "Configuring Application Properties Using the MBean Browser"
- Section 3.5, "How to Edit Credentials Deployed with the Application"
- Section 3.6, "Diagnosing Problems using the Diagnostic Framework"
- Section 3.7, "Viewing Application Metric Information with DMS SPY"
- Section 3.8, "Configuring WebSphere Application Server"

3.1 Introduction to ADF Application Monitoring and Configuration

After you have deployed an ADF application to Oracle WebLogic Server, you can monitor the application performance and configure application properties on the server. You can use Enterprise Manager Fusion Middleware Control to perform these tasks.

Enterprise Manager Fusion Middleware Control offers a user interface for the performance tasks. Some configuration tasks can be performed either from a user interface or by configuring an MBean, as listed in [Table 3-1](#).

Table 3–1 Configuration Tasks Using Fusion Middleware Control

Configuration tasks	Fusion Middleware Control UI	Fusion Middleware Control MBean Browser
ADF Business Components	Section 3.3.1, "How to Modify ADF Business Components Parameters"	Section 3.4.3, "How to Modify ADF Business Components Configuration Using MBeans"
ADF connections	Section 3.3.2, "How to Modify Connection Configurations"	Section 3.4.2, "How to Modify ADF Connections Using MBean"
ADF application configuration		Section 3.4.1, "How to Modify ADF Application Configuration Using MBean"
Metadata Services (MDS)		Section 3.4.4, "How to Modify MDS Configuration Using MBean"
Active Data Service (ADS)		Section 3.4.5, "How to Modify Active Data Service Configuration Using MBean"

By default, the post-deployment changes made using MBeans are stored in MDS with a layer name of `adfshare` and a layer value of `adfshare`. You can provide a specific layer name by specifying the `adfAppUID` property in the application's `adf-config.xml`.

[Example 3–1](#) shows the `adf-properties-child` code in `adf-config.xml`.

Example 3–1 MDS Layers in the `adf-config.xml` File

```
<adf:adf-properties-child xmlns="http://xmlns.oracle.com/adf/config/properties">
  <adf-property name="adfAppUID" value="DeptApp.myApp" />
</adf:adf-properties-child>
```

If you are moving data between MDS repositories (for example, from a test to a production system), use the `MDS exportMetadata` and `importMetadata` commands as described in the chapter on managing the Oracle metadata repository in the *Oracle Fusion Middleware Administrator's Guide* and in the chapter on Metadata Services custom WLST commands in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

3.2 Monitoring Performance Using Fusion Middleware Control

You can monitor the performance of Oracle ADF applications using the Enterprise Manager Fusion Middleware Control.

You can:

- View application module performance
- View application module pool performance
- View task flow performance

3.2.1 How to View Application Module Performance

You can view performance information about application modules. Application module components can be used to support a unit of work which spans multiple browser pages.

Before you begin:

You must already have deployed an Oracle ADF application and have Enterprise Manager Fusion Middleware Control available to access the application.

To view ADF application module performance:

1. Log in to an Oracle Fusion Middleware farm using Fusion Middleware Control.
2. Click the **Farm** tab.
3. Expand the *Farm_domain* node.
4. Expand the **Application Deployments** node and click a J2EE application deployment, for example, *StoreFrontModule (AdminServer)*.

After you select an application, the Application Deployment page displays.

5. Click **Application Deployment** and select **ADF > ADF Performance** from the dropdown menu.

The ADF Performance page displays. It contains subtabs for viewing performance information about active application module pools and task flows.

3.2.2 How to view Application Module Pool Performance

An *application module pool* is a collection of instances of a single application module type which are shared by multiple application clients. One application module pool is created for each root application module used by an ADF web application (ADF Business Components, ADF Controller, or ADF Faces) in each Java virtual machine where a root application module of that type is used by the ADF Controller layer.

Before you begin:

You must already have deployed an Oracle ADF application and have Enterprise Manager Fusion Middleware Control available to access the application.

To view application module pooling performance:

1. Log in to an Oracle Fusion Middleware farm using Fusion Middleware Control.
2. Click the **Farm** tab.
3. Expand the *Farm_domain* node.
4. Expand the **Application Deployments** node and click a J2EE application deployment, for example, *StoreFrontModule (AdminServer)*.

After you select an application, the Application Deployment page displays.

5. Click **Application Deployment** and select **ADF > ADF Performance** from the dropdown menu.

The ADF Performance page displays. It contains subtabs for viewing performance information about active Application Module Pools and Task Flows.

6. Click the **Application Module Pools** tab.
7. In the **Module** column, select an application module to display its details in the Application Module Pools table.

No Data Available displays in the Module column if an application has never run.

8. Click a module to display additional informations about the module, for example, Lifetime, State Management, Pool Use, and Application Module Pools Page.

Use the Application Module Pools page to display active application module pools, a collection of application module instances of the same type. The Application Module Pools page:

- Displays size and performance information about pool connections
- Specifies settings that affect how application module pools behave
- Specifies credential information for the application module pools

Element	Description
Module	Displays the active application module pool name, for example, <code>model.BugTest5PM</code> . Click a module to display additional information about it, for example, Lifetime, State Management, Pool Use, Application Module Pools page.
Requests	Displays the number of requests that were made for the application during the selected time interval.
Average Creation Time (ms)	Displays the average time (in milliseconds) required to complete a request for the application module pool.
Maximum Creation Time (ms)	Displays the longest time (in milliseconds) required to complete any of the requests for the application module pool.
Free Instances	Displays the number of available instances of the application module pool.

3.2.3 How to View ADF Task Flow Performance

You can view performance information about task flows. Task flows provide a modular and transactional approach to navigation and application control. Task flows mostly contain pages that will be viewed, but they also can contain activities that call methods on managed beans, evaluate an EL expression, or call another task flow, all without invoking a particular page.

Before you begin:

You must already have deployed an Oracle ADF application and have Enterprise Manager Fusion Middleware Control available to access the application.

To view task flow performance:

1. Log in to an Oracle Fusion Middleware farm using Fusion Middleware Control.
2. Click the **Farm** tab.
3. Expand the *Farm_domain* node.
4. Expand the **Application Deployments** node and click a J2EE application deployment, for example, `StoreFrontModule (AdminServer)`.

After you select an application, the Application Deployment page displays.

5. Click **Application Deployment** and select **ADF > ADF Performance** from the dropdown menu.

The ADF Performance page displays. It contains subtabs for viewing performance information about active application module pools and task flows.

6. Click the **Task Flows** tab.

By default, Task Flow Performance charts on the tab display data for the preceding 15 minutes. To set a different interval, click the time at the top of the page or move the slider to another interval, for example, from 08:00 AM to 08:30 AM.

7. Click **TF Charts**.
 - **Request Processing Time** displays the average request processing time for all ADF task flows that execute during the selected interval.
 - **Active Task Flows** displays the number of active instances of each ADF task flow during the selected interval.

3.3 Configuring Application Properties Using Fusion Middleware Control

You can use Enterprise Manager Fusion Middleware Control to configure ADF application configuration parameters. These configuration parameters are stored in ADF MBeans. Fusion Middleware Control provides a user interface to configure the ADF Business Components and ADF Connections MBeans. You can also use the System MBean Browser to directly access the underlying MBeans and configure their values. For more information about accessing the underlying MBeans, see [Section 3.4, "Configuring Application Properties Using the MBean Browser."](#)

Fusion Middleware Control provides a user interface for you to:

- Configure ADF Business Component parameters
- Configure connection parameters

3.3.1 How to Modify ADF Business Components Parameters

You control the runtime behavior of an application module pool by setting appropriate configuration parameters. Fusion Middleware Control provides a UI to configure ADF Business Components, as described in this section. You can also configure the ADF Business Components MBeans directly using the generic MBean Browser, as described in [Section 3.4.3, "How to Modify ADF Business Components Configuration Using MBeans."](#)

Before you begin:

You must already have deployed an Oracle ADF application and have Enterprise Manager Fusion Middleware Control available to access the application.

To modify business components parameters:

1. Log in to an Oracle Fusion Middleware farm using Fusion Middleware Control.
2. Click the **Farm** tab.
3. Expand the *Farm_domain* node.
4. Expand the **Application Deployments** node and click a J2EE application deployment, for example, *StoreFrontModule (AdminServer)*.

After you select an application, the Application Deployment page displays.

5. Click **Application Deployment** and select **ADF > Configure ADF Business Components** from the dropdown menu.
6. Click an **Application Module**.
7. Click the **Pooling and Scalability**, **Core**, **Database**, or **Security** tabs to update configuration parameters.

If the application module uses data sources, you can configure the data sources by clicking **Edit Datasource** from the **Core** tab.

The ADF Business Components configurations page is arranged with the following sections or tabs:

- Application Modules section
- Pooling and Scalability tab - Application Pool Properties
- Pooling and Scalability tab - Connection Pool Properties
- Core tab
- Database Properties tab
- Security Properties tab

Application Modules Section

In the Application Modules section, select the application module you want to configure.

Element	Description
Application Modules	Displays the active application module name. Click the module name to display the applications in the module.

Pooling and Scalability Tab - Application Pool Properties

In the Pooling and Scalability tab, select the application pool properties you want to configure.

Element	Description
AmpoolDoampooling	Select to enable application module pooling by default. Whenever you deploy your application in a production environment the default setting of <code>jbo.ampool.doampooling</code> is <code>true</code> and is the way you will run your application. But, as long as you run your application in a test environment, setting the property to <code>false</code> can play an important role in your testing. When this property is <code>false</code> , there is effectively no application pool.
AmpoolWritecookietoclient	Select to write the <code>SessionCookie</code> value to the client browser.

Element	Description
AmpoolMaxavailablesize	<p>Enter the maximum number of available application modules that should be referenced by an application pool. This is the ideal maximum number of available application module instances in the pool when not under abnormal load.</p> <p>When the pool monitor wakes up to do resource cleanup, it will try to remove available application module instances to bring the total number of available instances down to this ideal maximum. Instances that have been not been used for a period longer than the idle instance timeout will always get cleaned up at this time, and then additional available instances will be removed, if necessary to bring the number of available instances down to this size.</p> <p>The default maximum available size is 25 instances. Configure this value to leave the maximum number of available instances desired after a resource cleanup. A lower value generally results in more application module instances being removed from the pool on a cleanup.</p>
AmpoolSessioncookiefactoryclass	<p>Enter a custom session cookie factory implementation. This class creates the session cookies that allow clients to retrieve application modules in stateful mode</p>
AmpoolMaxinactiveage	<p>Enter the maximum amount of time (in milliseconds) that an application module may remain inactive before it is removed from the pool.</p> <p>The default is 600000 milliseconds of idle time (which is 600 seconds, or ten minutes). A lower value results in more application module instances being marked as candidates for removal at the next resource cleanup. A higher value results in fewer application module instances being marked as candidates for removal at the next resource cleanup.</p>
AmpoolMinavailablesize	<p>Enter the minimum number of available application modules that should be referenced by an application pool. This is the minimum number of available application module instances that the pool monitor should leave in the pool during a resource cleanup operation.</p> <p>Set to 0 (zero) if you want the pool to shrink to contain no instances when all instances have been idle for longer than the idle timeout after a resource cleanup.</p> <p>The default is 5 instances.</p>
Doconnectionpooling	<p>Select if the application pool should release the application module connection upon checkin. This forces the application module pool to release the JDBC connection used each time the application module is released to the pool.</p>
Recyclethreshold	<p>Enter the maximum number of application module instances in the pool that attempt to preserve session affinity for the next request made by the session. This session used them last before releasing them to the pool in managed-state mode.</p>
AmpoolConnectionstrategyclass	<p>Enter a custom connection strategy implementation, for example <code>oracle.jbo.common.ampool.DefaultConnectionStrategy</code>. This is the class that implements the connection strategy.</p>

Element	Description
Maxpoolcookieage	<p>Enter the maximum browser cookie age for pooled application module sessions. This is the maximum age of the browser cookies used to help clients retrieve stateful application modules. If these cookies do not time out, the value is -1. It is recommended that the maximum cookie age be always set less than or equal to the session cookie age. It is set that way by default (both are -1). If you change the maximum cookie age, then you must also change the session cookie age to the same value.</p>
AmpoolInitpoolsize	<p>Enter an initial number of application module instances to be created in a pool. This is the number of application module instances to created when the pool is initialized.</p> <p>The default is 0 (zero) instances. A general guideline is to configure this value to 10% more than the anticipated number of concurrent application module instances required to service all users.</p> <p>Creating application module instances during initialization takes the CPU processing costs of creating application module instances during the initialization instead of on-demand when additional application module instances are required.</p>
AmpoolDynamicjdbccredentials	<p>Select if an application pool may support multiple JDBC users. This property enables additional pooling lifecycle events to allow developer-written code to change the database credentials (username/password) each time a new user session begins to use the application module.</p> <p>This feature is enabled by default (<code>true</code>); however this setting is a necessary but not sufficient condition to implement the feature. The complete implementation requires additional developer-written code.</p>
AmpoolIsuseexclusive	<p>Select if application module use is exclusive.</p>
AmpoolResetnontransactionalstate	<p>Select if the nontransactional application module state should be reset upon an unmanaged checkin. This forces the application module to reset any nontransactional state like view object runtime settings, JDBC prepared statements, bind variable values, and so on. when the application module is released to the pool in unmanaged, or "stateless" mode.</p> <p>This feature is enabled by default (<code>true</code>). Disabling this feature can improve performance; however, since it does not clear bind variable values, your application needs to ensure that it systemically sets bind variable values correctly. If your application does not do so, and this feature is disabled, then it is possible for one user to see data with another user's bind variable values.</p>
AmpoolMaxpoolsize	<p>Enter the maximum number of application module instances that the pool can allocate. The pool will never create more application module instances than this limit imposes.</p> <p>The default is 5000 instances. A general guideline is to configure this value to 20% more than the initial pool size to allow for some additional growth. If the value is set too low, then some users may see an error when they tries to access the application if no application module instances are available.</p>

Element	Description
AmpoolTimetolive	<p>Enter the connection pool time to live for connection instances. This is the number of milliseconds after which an application module instance in the pool is considered as a candidate for removal during the next resource cleanup, regardless of whether it would bring the number of instances in the pool below <code>minavailablesize</code>.</p> <p>The default is 3600000 milliseconds of total time to live (which is 3600 seconds, or one hour). The default value is sufficient for most applications.</p>
AmpoolMonitorsleepinterval	Enter the length of time (in milliseconds) between pool resource cleanups.
Dofailover	<p>Select if failover should occur upon checkin to the application module pool. This feature enables eager passivation of pending transaction state each time an application module is released to the pool in managed state mode. Web applications should set <code>enable failover</code> (<code>true</code>) to allow any other application module to activate the state at any time. This feature is disabled by default (<code>false</code>).</p> <p>Best Practice: When enabling application module state passivation, a failure can occur when Oracle WebLogic Server is configured to forcibly release connection back into the pool. A failure of this type produces a <code>SQLException</code> (Connection has already been closed) that is saved to the server log. The exception is not reported through the user interface. To ensure that state passivation occurs and users' changes are saved, set an appropriate value for the <code>weblogic-application.xml</code> deployment descriptor parameter <code>inactive-connection-timeout-seconds</code> on the <code><connection-check-params></code> pool-params element. Setting the deployment descriptor parameter to several minutes, in most cases, should avoid forcing the inactive connection timeout and the resulting passivation failure. Adjust the setting as needed for your environment.</p>
poolClassName	Enter the custom application pool implementation class.
Show Connection Pool Properties	Expand to display fields containing current advanced connection pool properties, or enter new values in the fields.
Hide Connection Pool Properties	Click to hide all Connection Pool Properties fields.

Pooling and Scalability Tab - Connection Pool Properties

In the Pooling and Scalability tab, select the connection pool properties you want to configure.

Element	Description
Initpoolsize	<p>Enter the initial size of a JDBC connection pool. This is the number of JDBC connection instances created when the pool is initialized.</p> <p>The default is an initial size of 0 instances.</p>

Element	Description
Maxpoolsize	<p>Enter the maximum size of a JDBC connection pool. This is the maximum number of JDBC connection instances that the pool can allocate. The pool will never create more JDBC connections than this allows.</p> <p>The default is 5000 instances.</p>
Poolmaxinactiveage	<p>Enter the maximum amount of time (in milliseconds) that a connection may remain inactive before it is removed from the pool. This is the number of milliseconds after which to consider an inactive application module instance in the pool as a candidate for removal during the next resource cleanup.</p> <p>The default is 600000 milliseconds of idle time (which is 600 seconds, or ten minutes). A lower value results in more application module instances being marked as candidates for removal at the next resource cleanup. A higher value results in fewer application module instances being marked as candidates for removal at the next resource cleanup.</p>
Poolmaxavailablesize	<p>Enter the maximum number of available connections that should be referenced by a connection pool. This is the ideal maximum number of JDBC connection instances in the pool when not under abnormal load.</p> <p>When the pool monitor wakes up to do resource cleanup, it will try to remove available JDBC connection instances to bring the total number of available instances down to this ideal maximum. Instances that have been not been used for a period longer than the idle instance timeout will always get cleaned up at this time, and then additional available instances will be removed, if necessary, to bring the number of available instances down to this size.</p> <p>The default is an ideal maximum of 25 instances (when not under load).</p>
Poolrequesttimeout	<p>Enter the time (in milliseconds) that a request should wait for a JDBC connection to be released to the connection pool.</p>
Poolminavailablesize	<p>Enter the minimum number of available connections that should be referenced by a connection pool. This is the minimum number of available JDBC connection instances that the pool monitor should leave in the pool during a resource cleanup operation.</p> <p>Set to zero (0) if you want the pool to shrink to contain no instances when instances have been idle for longer than the idle time-out.</p> <p>The default is to not let the minimum available size drop below 5 instances.</p>
Poolmonitorsleepinterval	<p>Enter the time (in milliseconds) that the connection pool monitor should sleep between pool checks. This is the length of time in milliseconds between pool resource cleanup.</p> <p>While the number of application module instances in the pool will never exceed the maximum pool size, available instances which are candidates for getting removed from the pool do not get "cleaned up" until the next time the application module pool monitor wakes up to do its job.</p>

Element	Description
ConnectionPoolManager	Enter the implementation of the connection pool manager which will be used.
Pooltimetolive	Enter the application pool time to live (in milliseconds) for application module instances.

Core Tab

Use the core tab to view or edit core properties for the application module.

Element	Description
DefaultLanguage	Enter the default business components session language, which is part of the locale.
Passivationstore	Enter the type of store, file, or database file that should be used for application module passivation. database is the default choice. While it may be a little slower than passivating to file, it is by far the most reliable choice. file may offer faster performance because access to the file is faster than access to the database.
Default Country	Enter the default business components session country, which is part of the Locale.
AssocConsistent	Select if entity row set associations have been kept consistent.
XmlValidation	Select to determine the validation mode for the XML parser. If selected, the XML parser uses strict XML validation.
DatabaseConfig	Database Configuration.
Name	Enter the name of the application module.
OracleSchema	Enter the name of the schema in which the business components runtime libraries are deployed.
Show Advanced Properties	Expand to display fields containing current advanced core properties, or enter new values in the fields.
PersMaxRowsPerNode	Enter the maximum size of a node for view row spillover.
PassivationTrackInsert	If selected when an application module is activated, it will be updated to include rows inserted into the database while it was passive.
ApplicationPath	For EJB deployment, enter the JNDI path to the business components.
ViewlinkConsistent	If selected, the view object row sets retrieved through view link accessors will include rows that have been added, even if these changes have not been posted to the database.
ConnectionMode	Deprecated property, formerly used for deployment to VisiBroker. VisiBroker deployment is no longer supported.
Maxpassivationstacksize	Enter the maximum size of the passivation stack (default is 10)

Element	Description
TxnHandleafterpostexc	Select to cause ADF Business Components to take a transaction snapshot before beginning a commit operation. If an exception is thrown after changes have been posted to the database, ADF Business Components will use this snapshot to roll back the in-memory state of your application module to the point before commit operation began.
SnapshotstoreUndo	Enter the target for undo snapshots {transient persistent}
Project	Enter the name of the project containing extended business components to be substituted for base ones, if Factory-Substitution-List is not empty.
Tmpdir	Enter the directory for temporary Oracle ADF Business Components files.
DeployPlatform	The deployment platform: select LOCAL, EJB_IAS (for an EJB deployed to Oracle Application Server), or WLS (for an EJB deployed to Oracle WebLogic Server).
PersMaxActiveNodes	Enter the maximum number of nodes that will be cached in memory for view row spillover.
Saveforlater	Select Save snapshots for the lifetime of the transaction.
ViewCriteriaAdapter	Enter a custom class that will be used by view objects to convert between view criteria and view object SQL.
Connectfailover	Select business components transparent JDBC connection failover
Hide Advanced Properties	Click to hide all Connection Pool Properties fields.

Database Properties Tab

If you are using a JDBC URL for your connection information so that the ADF database connection pool is used, then the configuration parameters listed here can be used to tune the behavior of the database connection pool.

Element	Description
MaxCursors	Enter the maximum number of cursors to be used by the session. This is the maximum number of cursors the business components may have open. The framework will clean up free JDBC statements as the number of cursors approaches this number.
Sql92DbTimeQuery	Enter the database system time SQL query string.
SQLBuilder	Enter the SQLBuilder implementation (Oracle, OLite, DB2, or SQL92 for other SQL92-compliant databases).
Sql92LockTrailer	Enter the SQL statement trailer clause for locking.
JdbcTrace	Select to trace all JDBC activity with lines flagged by + <code>PropertyConstants.JDBC_MARKER</code> +
oracleDefineColumnLength	Enter the column length for all JDBC CHAR or VARCHAR2 columns. Use <code>as_bytes</code> to make column precision specifications in bytes. Use <code>as_chars</code> to make column precision specifications in characters. This is important for larger character sets, such as Unicode.

Element	Description
Sql92JdbcDriverClass	Enter the name of the class implementing JDBC Driver, for example, <code>sun.jdbc.odbc.JdbcOdbcDriver</code> .
TypeMapEntries	Enter the type map implementation. This specifies a custom type map between Java types and SQL types.
ControlTableName	Enter the persistent collection control table name.
FetchMode	Enter the control fetch behavior of View Objects (+ <code>PropertyConstants.ENV_FETCH_AS_NEEDED</code> + " " + <code>PropertyConstants.ENV_FETCH_ALL</code> +). AS.NEEDED causes view objects to fetch rows only when they are requested. ALL causes them to fetch the entire results of their queries.
LockingMode	Enter the default locking mode for an application module. This prevents the application module pool from creating a pending transaction state on the database with row-level locks each time the application module is released to the pool. Fusion web applications should set the locking mode to optimistic to avoid creating the row-level locks.
JdbcBytesConversion	Indicate whether to use JDBC default bytes conversion or to perform such conversion in the framework.
Show Advanced Properties	Expand to display fields containing current advanced database properties, or enter new values in the fields.
TxnSeqInc	Select persistent transaction sequence increment.
UsePersColl	Select enable view row spillover to help manage large rowsets.
TxnSeqName	Enter persistent transaction sequence name.
Hide Advanced Properties	Click to hide all advanced property fields.

Security Properties Tab

Use the Security Properties tab to configure application module security information.

Element	Description
SecurityContext	Enter the JAAS context. This element specifies a particular JAAS implementation. The default is JAZN.
Show Advanced Properties	Expand to display fields containing current advanced security properties, or enter new values in the fields.
UserPrincipal	Enter the authenticated user principal name.
SecurityConfig	Enter the complete path and file name of JAZN configuration, for example, <code>k:\j2ee\home\config\jazn.xml</code> . If this property value is null or length 0, runtime will assume that <code>jazn.xml</code> is in the same path as <code>jazn.jar</code> and append <code>/config/jazn.xml</code> before it accesses login module or gets the JAZN context for getting permission manager.
javaNamingSecurityCredentials	For EJB deployment, enter the password for the application server connection.

Element	Description
AppModuleJndiName	For EJB deployment, enter the JNDI name used to look up the application module factory.
SecurityLoginmodule	Enter a custom login module for authentication, for example, <code>oracle.security.jazn.realm.RealmLoginModule</code> . The default is the JAZN login module.
ServerUseNullDbTransaction	Use 9.0.2 compatible <code>oracle.jbo.server.NullDbtransactionImpl</code> when not connected to the database.
SecurityEnforce	Enter one of the following values: None - No authentication. Test - Requires authentication. If using the tester or ADF Swing, a dialog will prompt for login. If authentication fails, the application module is still instantiated. Must - Like Test, but if authentication fails, the application module will not be instantiated. Instead, you will get an exception. Auth - Like Must, but in addition, if you have used the Entity Wizard Authorization editor to define entity or attribute permissions, the permissions will be checked. For example if the permission on <code>Dept.Deptno</code> was granted <code>update_while_new</code> to role <code>users</code> , then the <code>users</code> role can set the <code>Deptno</code> value only when the row is new. Otherwise, it is not editable. Note that even if there are permissions granted via the wizard, they will not be enforced unless <code>jbo.security.enforce</code> is set to <code>Auth</code> .
javaNamingSecurityPrincipal	For EJB deployment, enter the password for the application server connection.
Hide Advanced Properties	Click to hide all advanced property fields.

3.3.2 How to Modify Connection Configurations

A connection configuration contains information that a client application uses to identify the ADF application module's deployment scenario. You use Oracle Enterprise Manager Fusion Middleware Control to:

- Register and manage back-end services such as mail, discussion forums servers, and so on
- Register and manage external applications that users need access to while working with applications
- Register and manage any portlet producers that the application uses or that users may need access to

Fusion Middleware Control provides a UI to configure ADF connections, as described in this section. You can also configure the ADF connections MBean directly using the generic MBean Browser, as described in [Section 3.4.2, "How to Modify ADF Connections Using MBean."](#)

Before you begin:

You must already have deployed an Oracle ADF application and have Enterprise Manager Fusion Middleware Control available to access the application.

You must have MDS configured in your application before you can modify the ADF application and connection configurations. ADF connection attributes are persisted to MDS.

If you deployed an application to several nodes within a cluster, any ADF connection changes to a single node will be propagated to all the other nodes. MDS will store a single set of connection information for all versions of an application.

To modify connection configurations:

1. Log in to an Oracle Fusion Middleware farm using Fusion Middleware Control.
2. Click the **Farm** tab.
3. Expand the *Farm_domain* node.
4. Expand the **Application Deployments** node and click a J2EE application deployment, for example, `StoreFrontModule (AdminServer)`.

After you select an application, the Application Deployment page displays.

5. Click **Application Deployment** and select **ADF > Configure ADF Connections** from the dropdown menu.
6. In the **Connection Type** drop-down list, choose the type of connection you want to configure:
 - ADF BC Service
 - Discussions and Announcements
 - File System
 - Mail Server
 - Secure Enterprise Search
 - URL
 - Web Service

You cannot create an Essbase connection, however, you can edit an existing Essbase connection that was deployed with the application.

7. In the **Connection Name** field, enter a unique name for the connection configuration.
8. Click **Create Connection**.

The Connection Configuration page updates with a section where you can specify options for the connection type you chose.

The following connection types are supported:

- ADF Business Components Service connection
- Essbase connection
- Discussions and Announcements connection
- File system connection
- Mail server connection
- Secure enterprise search connection

- URL connection
- Web Service connection

ADF Business Components Service Connection

Use the ADF Business Components Service connection page to create a new ADF Business Components Service connection or to modify existing connection details.

Element	Description
serviceEndpointProvider	Enter the provider of the service endpoint. Valid types are <i>ADFBC</i> , <i>Fabric</i> , <i>SOAP</i> .
serviceConnectionName	Enter the service connection name.
jndiName	Enter the JNDI name of the EJB that implements the service interface. Applicable when the endpoint is <i>ADF BC</i> .
jndiFactoryInitial	Enter the class name of initial context factory for JNDI lookup. Applicable when the endpoint is <i>ADF BC</i> .
jndiProviderURL	Enter configuration information for the JNDI lookup. Applicable when endpoint is <i>ADF BC</i> .
jndiSecurityPrincipal	Enter the identity of the principal (e.g. user) for the JNDI lookup. Applicable when the endpoint is <i>ADF BC</i> .
jndiSecurityCredentials	Enter the principal's credentials for JNDI lookup. Applicable when the endpoint is <i>ADF BC</i> .
fabricAddress	Enter the service name of the SOA composite. Applicable when the endpoint is <i>Fabric</i> .
serviceInterfaceName	Enter the class name of the service endpoint interface.
serviceSchemaName	Enter the name of the service schema file.
serviceSchemaLocation	Enter the relative path of the service schema file.

Essbase Connection

You cannot create an Essbase connection; however, you can edit an existing Essbase connection that was deployed with the application.

Element	Description
Host	Enter the host that this connection represents.
Port	Displays the default port that this connection uses to connect to Essbase. Clear the Default option to enter a port other than the default.
Username	Enter the user name authorized to connect to Essbase during design time. This user name is replaced at runtime with the user name specified by the application.
Password	Enter the password of the user. An asterisk (*) is displayed for each character you enter in this field.

Discussions and Announcements Connection

Use the Discussion Forum Connection pages to connect to a new discussions server connection or to modify existing connection details. Forum Connections configuration includes configurations for name, connection details, and advanced.

Discussions and Announcements Connection - Name

Element	Description
Name	Enter a unique name for the connection.

Discussions and Announcements Connection - Connection Details

Element	Description
Server URL	Enter the URL of the discussion server hosting the discussion forums. For example: <code>http://discuss-server.com:8888/owc_discussions</code>
Administrator User Name	Enter the user name of the discussion server administrator. Administrative privileges are required for this connection so that operations can be performed on behalf of WebCenter users.
Connection Timeout (in Seconds)	.Enter the connection timeout in seconds. The default is -1.
Connection Secured	Indicate whether or not the discussion server connection is secure.

Discussions and Announcements Connection - Advanced Configuration

Element	Description
Cache Size (in MB)	Specify the amount of space reserved for the cache (in MB). The default is 0.
Cache Expiration Time (in Minutes)	Specify a suitable expiration period for the cache. This is the maximum length of time (in minutes) that cached content is valid. The default is 0.
Connection Timeout (in Seconds)	Specify a suitable timeout for the connection. This is the length of time (in seconds) that the WebCenter application waits for a response from the discussion server before issuing a connection timeout message. The default is 60 seconds.

File System Connection

Use the Add/New Content Repository Connection pages to connect to a new content repository or to modify existing connection details.

Note: All configuration changes are stored in the MDS repository.

File System Connection Details - File System

Element	Description
Root Path	Enter the full path to a folder on a local file system in which your content is placed. For example: C : /MyContent Caution: File system content <i>must not</i> be used in production or enterprise application deployments. This feature is provided for development purposes only.

Mail Server Connection

Use the Mail Server connection pages to configure LDAP and advanced mail server configurations

Element	Description
IMAP Host	Enter the host name of the machine where the IMAP service (Internet Message Access Protocol) is running.
IMAP Port	Enter the port on which the IMAP service listens.
IMAP Secured	Indicate whether a secured connection (SSL) is required for incoming mail over IMAP.
SMTP Host	Enter the host name of the machine on which the SMTP service (Simple Mail Transfer Protocol) is running.
SMTP Port	Enter the port on which the SMTP service listens.
SMTP Secured	Indicate whether a secured connection (SSL) is required for outgoing mail over SMTP.
Associated External Application	Associate the mail server with an external application. External application credential information is used to authenticate users against the IMAP server.

Mail Server Connection - LDAP Configuration

Element	Description
LDAP Domain	Enter the LDAP domain.
LDAP Host	Enter the host name of the LDAP (Lightweight Directory Access Protocol) server.
LDAP Port	Enter the port on which the LDAP service listens.
LDAP Secured	Indicate whether a secured connection (SSL) is required for the LDAP connection.
LDAP Administrator User Name	Enter the user name of the LDAP server administrator.
LDAP Administrator Password	Enter the password for the LDAP server administrator.
LDAP Base DN	Enter the base-distinguished name for the LDAP schema.
LDAP Default User	Enter the LDAP default user.

Mail Server Connection - Advanced Configuration

Element	Description
Connection Timeout (in Seconds)	Specify a suitable timeout for the connection. This is the length of time (in seconds) that the WebCenter application waits for a response from the mail server before issuing a connection timeout message. The default is 60 seconds.
Cache Expiration Time (in Minutes)	Specify a suitable expiration period for the cache. This is the maximum length of time (in minutes) that cached content is valid. The default value (-1) means that the cache never expires.

Secure Enterprise Search Connection

Use the Secure Enterprise Search Connection pages to connect the WebCenter application to a new Oracle Secure Enterprise Search server or to modify existing connection details.

Secure Enterprise Search Connection Provider configuration includes configurations for name, connection details, and advanced configurations.

Secure Enterprise Search Connection - Name

Element	Description
Connection Name	Enter a unique name for the connection.
Active Connection	Select to use this connection for search-related services in the WebCenter application. You can register multiple search connections through Oracle Enterprise Manager Fusion Middleware Control, but only one connection is active at a time.

Secure Enterprise Search Connection - Connection Details

Element	Description
SOAP URL	Enter the Web Service URL that Oracle Secure Enterprise Search exposes to enable search requests. Use the format: <code>http://<host>:<port>/search/query/OracleSearch</code> For example: <code>http://myHost:7777/search/query/OracleSearch</code>
Application User Name	Enter the name of a valid user. You can specify the name of any user in the identity store. The user must be present in both the Oracle Identity Management server configured for your WebCenter application and the Oracle Identity Management server configured for Oracle SES. The WebCenter application must authenticate itself as a trusted application to Oracle Secure Enterprise Search so that it may perform searches on behalf of WebCenter users.
Application Password	Enter the appropriate user password.

Secure Enterprise Search Connection - Advanced Configuration

Element	Description
Oracle Secure Enterprise Search Data Group	Enter the Secure Enterprise Search data group in which to search.
Execution Timeout	Enter the search execution timeout in milliseconds.
Executor Preparation Timeout	Enter the search executor preparation timeout in milliseconds.
Number of Saved Searches	Enter the number of saved searches displayed.
Simple Search Result Rows	Enter the number of results displayed from a simple search, for each service.
Search Result Rows	Enter the number of search results displayed for each service.
Global Search Result Rows	Enter the number of search results displayed (on the toolbar) for each service.

URL Connection

Use the URL Connection pages to configure URL connections.

Element	Description
URL	Enter the URL of the desired data stream, but omit any URL parameters.
Username	Enter the username require to enter the web site.
Password	Enter the password required to enter the web site.
AuthenticationRealm	Defines the Realm as in HTTP authentication. Defined by the server hosting the protected resources.
Proxy	Defines the proxy to be used for connecting to HTTP/HTTPS resources. Specifies the host/port and any authentication details needed to authenticate against the proxy itself.
ProxyUseDefault	Uses the default proxy at the system level instead of the connection level at both DT or RT, or wherever the connection instance is active. At design time, the default proxy will be the JDeveloper IDE proxy settings, at runtime, it will be the one configured for WLS.
ConnectionClassName	Indicates the type of challenge authentication. The two supported modes are Basic and Digest authentication (HTTP basic & digest).
ChallengeAuthenticationType	The class name of the connection that gets loaded into the reference to be used by the factory to construct the connection instance.

Web Service Connection

Use the Web Service Connection page to configure a connection using the WebService MDDS model based on the service WSDL to call and invoke the WebService.

Use the **Configure Web Service** dropdown list to configure the Web Service Client, including attaching and detaching policy. After you have finished the configuration in the web services page, you can use the breadcrumbs to navigate back to the ADF Connections page.

Element	Description
Model	Enter the WebService MDDS model elements generated based on the service WSDL.
WsdlUrl	Enter the WebService service WSDL URL.
DefaultServiceName	Enter the default service Name of the service WSDL.

3.4 Configuring Application Properties Using the MBean Browser

You can use the Enterprise Manager Fusion Middleware Control MBean Browser to access and modify the values in ADF MBeans deployed with the ADF application into Oracle WebLogic Server.

You can view and modify:

- ADFcConfiguration MBean
- ADF Connections MBean
- ADF Business Components BC4J MBeans
- MDS Configuration MBean
- Active Data Service (ADS) MBean

3.4.1 How to Modify ADF Application Configuration Using MBean

You can modify ADF application configurations MBeans using the MBean Browser.

Before you begin:

You must have MDS configured in your application before you can modify the ADF application and connection configurations. ADF application attributes are persisted to MDS.

If you deployed an application to several nodes within a cluster, any ADF application configuration changes to a single node via an MBean will be propagated to all the other nodes. MDS will store a single set of ADF application configuration information for all versions of an application.

To modify ADF application configuration using MBean Browser:

1. Log in to an Oracle Fusion Middleware farm using Fusion Middleware Control.
2. Click the **Farm** tab.
3. Expand the *Farm_domain* node.
4. Expand the **Application Deployments** node and click a J2EE application deployment, for example, *StoreFrontModule (AdminServer)*.

After you select an application, the Application Deployment page displays.

5. Click **Application Deployment** and select **ADF > Configure ADF (adf-config)** from the dropdown menu.

6. In the left pane of the System MBean Browser, expand the parent ADF MBean **ADFConfig** and then the **ADFConfig** folder to expose the child ADF MBeans. You may see the child ADF MBeans **ADFcConfiguration** and **MDSAppConfig**.
7. In the left pane, select the **ADFcConfiguration** MBean, and in the right pane, select the attribute you want to view or modify.

Figure 3–1 shows an ADF Configuration MBean in the Fusion Middleware Control MBean Browser.

Figure 3–1 ADF Configuration MBean

8. Change the attribute value and click **Apply**.
9. In the left pane, select the parent ADF MBean **ADFConfig**.
10. In the right pane, click the **Operations** tab and click **save**.

The new values you have edited are written to MDS after you click **save** from the parent MBean.

3.4.2 How to Modify ADF Connections Using MBean

You can modify ADF connection configurations MBean using the MBean Browser.

You can also modify ADF connections using the Fusion Middleware UI described in [Section 3.3.2, "How to Modify Connection Configurations."](#)

Before you begin:

You must have MDS configured in your application before you can modify the ADF application and connection configurations. ADF application attributes are persisted to MDS.

If you deployed an application to several nodes within a cluster, any ADF connection changes to a single node via an MBean will be propagated to all the other nodes. MDS will store a single set of ADF application configuration information for all versions of an application.

To modify ADF application configuration using MBean Browser:

1. Log in to an Oracle Fusion Middleware farm using Fusion Middleware Control.
2. Click the **Farm** tab.
3. Expand the *Farm_domain* node.
4. Expand the **Application Deployments** node and click a J2EE application deployment, for example, *StoreFrontModule (AdminServer)*.

After you select an application, the Application Deployment page displays.

5. Click **Application Deployment** and select **System MBean Browser** from the dropdown menu.
6. In the left pane of the System MBean Browser, navigate to the **ADFConnections** MBean. The MBean should be in **oracle.adf.share.connections > server name > application name**.
7. In the left pane, select the ADF Connections MBean, and in the right pane, select the attribute you want to view or modify.

Figure 3–2 shows an ADF Connections MBean displayed in the Fusion Middleware Control MBean Browser.

Figure 3–2 ADF Connections MBean

The screenshot shows the Fusion Middleware Control interface. The left pane displays the System MBean Browser tree, with the path **oracle.adf.share.connections > Server: ms1 > Application: BC_MultAM_Multip > ADFConnections** selected. The right pane shows the **Application Defined MBeans: ADFConnections:ADFConnection:** configuration page. The **Show MBean Information** tab is active, displaying a table of attributes.

Name	Description
1 ConfigMBean	If true, it indicates that this MBean is a ConfigMBean.
2 ConnectionChildMBeans	Get list of child MBeans
3 ConnectionTypes	Lists the connection types that are supported by this MBean.
4 eventProvider	If true, it indicates that this MBean is an event provider as defined by JSR-77.
5 eventTypes	All the event's types emitted by this MBean.
6 objectName	The MBean's unique JMX name
7 ReadOnly	If true, it indicates that this MBean is a read-only MBean.
8 RestartNeeded	Indicates whether a restart is needed.
9 stateManageable	If true, it indicates that this MBean provides state management capabilities as defined by JSR-77.
10 statisticsProvider	If true, it indicates that this MBean is a statistics provider as defined by JSR-77.
11 SystemMBean	If true, it indicates that this MBean is a System MBean.

8. Change the attribute value and click **Apply**.

9. In the right pane, click the **Operations** tab and click **save**.

The new values you have edited are written to MDS after you click **save**.

3.4.3 How to Modify ADF Business Components Configuration Using MBeans

You can modify ADF Business Components configurations MBeans using the MBean Browser. ADF Business Component configuration information are stored in MBeans that are specific for each application. Unlike ADF connections and ADF application configuration information which you can configure once for all versions of the same application, you will need to configure ADF Business Components for each version of the application.

You can also modify ADF Business Components configuration information using the Fusion Middleware UI described in [Section 3.3.1, "How to Modify ADF Business Components Parameters."](#)

Before you begin:

You must have MDS configured in your application before you can modify the ADF application and connection configurations. ADF application attributes are persisted to MDS.

If you deployed an application to several nodes within a cluster, any ADF Business Components changes to a single node via MBeans will be propagated to all the other nodes. MDS will store a single set of ADF application configuration information for all versions of an application.

To modify ADF application configuration using MBean Browser:

1. Log in to an Oracle Fusion Middleware farm using Fusion Middleware Control.
2. Click the **Farm** tab.
3. Expand the *Farm_domain* node.
4. Expand the **Application Deployments** node and click a J2EE application deployment, for example, *StoreFrontModule (AdminServer)*.

After you select an application, the Application Deployment page displays.

5. Click **Application Deployment** and select **System MBean Browser** from the dropdown menu.
6. In the left pane of the System MBean Browser, navigate to the BC4J MBeans. These MBeans should be in **oracle.bc4j.mbean.share > server name > application name**.
7. In the left pane, select the ADF Connections MBean, and in the right pane, select the attribute you want to view or modify.
8. Change the attribute value and click **Apply**.

3.4.4 How to Modify MDS Configuration Using MBean

You can use the MBean Browser to perform advanced configuration of MDS parameters. For more information about configuring MDS using MBeans, see the *Oracle Fusion Middleware Administrator's Guide*.

Before you begin:

You must already have deployed an Oracle ADF application and have Enterprise Manager Fusion Middleware Control available to access the application.

To modify MDS configuration using MBean Browser:

1. Log in to an Oracle Fusion Middleware farm using Fusion Middleware Control.
2. Click the **Farm** tab.
3. Expand the *Farm_domain* node.
4. Expand the **Application Deployments** node and click a J2EE application deployment, for example, *StoreFrontModule (AdminServer)*.

After you select an application, the Application Deployment page displays.

5. Click **Application Deployment** and select **MDS Configuration** from the dropdown menu.
6. Click **Configuration MBean Browser** or **Runtime MBean Browser**.
7. Select the MBean and the attribute you want to view or modify.

Figure 3–3 show an MDS MBean in the Fusion Middleware Control MBean Browser.

Figure 3–3 MDS MBean

The screenshot displays the Fusion Middleware Control interface. The top navigation bar shows 'StoreFrontModule(V2.0)' and 'Application Deployment'. The main content area is titled 'System MBean Browser' and shows a tree view of MBeans. The selected MBean is 'MDSAppConfig' under the path 'Application: StoreFrontModule > ADFConfig > ADFConfig > ADFAppConfig'. The right pane shows the 'Application Defined MBeans: ADFConfig:MDSAppConfig' with an 'Apply' button. Below this, there are two tabs: 'Attributes' and 'Notifications'. The 'Attributes' tab is active, displaying a table of attributes.

Name	Description
1 AppMetadataRepositoryInfo	Metadata repository partition where the application is deployed.
2 AutoPurgeTimeToLive	Automatically purge versions of metadata documents older than the given time interval specified in seconds.
3 ConfigMBean	If true, it indicates that this MBean is a Config MBean.
4 DeployTargetRepository	The repository where the application's metadata is deployed. All the event's types emitted by this MBean.
5 eventTypes	
6 ExternalChangeDetection	Enables the application to detect applicable metadata changes performed external to the application.
7 ExternalChangeDetectionInterval	The maximum time interval in seconds with which the application will detect external metadata changes. This parameter is only valid if ExternalChangeDetection is enabled.
8 MaximumCacheSize	The maximum metadata cache size limit in kilobytes.
9 ReadOnly	If true, it indicates that this MBean is a read only MBean.
10 ReadOnlyMode	Switches the application into read only mode so no metadata updates will be made.
11 RestartNeeded	Indicates whether a restart is needed.
12 RetryConnection	Enables the application to retry to connect to the metadata repository after connection failure.
13 SharedMetadataRepositoryInfo	Shared metadata repository partition(s) referenced by the application.
14 SystemMBean	If true, it indicates that this MBean is a System MBean.

8. Change the value and click **Apply**.

3.4.5 How to Modify Active Data Service Configuration Using MBean

You can use Active Data Service (ADS) framework to control the runtime behavior of an Oracle ADF application and qualifying ADF Faces components so that whenever data changes on the server, the ADF Model layer notifies the component and the component rerenders the changed data.

Before you begin:

You must already have deployed an Oracle ADF application and have Enterprise Manager Fusion Middleware Control available to access the application.

Note that the ADF Faces components of your application must be configured to use ADS. Additionally, if your application services do not support ADS, then your application must define a service proxy so that the components can display the data as it updates in the source. For details about ADS, see Chapter 45, "Using the Active Data Service" in the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

To modify ADF application configuration using MBean Browser:

1. Log in to an Oracle Fusion Middleware farm using Fusion Middleware Control.
2. Click the **Farm** tab.
3. Expand the *Farm_domain* node.
4. Expand the **Application Deployments** node and click a J2EE application deployment, for example, *application1 (AdminServer)*.

After you select an application, the Application Deployment page displays.

5. Click **Application Deployment** and select **ADF > Configure ADF (adf-config)** from the dropdown menu.
6. In the left pane of the System MBean Browser, expand the parent ADF MBean **ADFConfig** and then the **ADFConfig** folder to expose the child ADF MBeans.
You may see the child ADF MBeans **ActiveDataConfiguration** and **MDSAppConfig**.
7. In the left pane, select the **ActiveDataConfiguration** MBean, and in the right pane, select the attribute you want to view or modify.

Attribute	Description
Transport	The method by which data will be delivered to the client. Value values are: <ul style="list-style-type: none"> ▪ streaming (default) ▪ polling ▪ long-polling For more information, see the "What You May Need to Know About Transport Modes" section of the <i>Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework</i> .
LatencyThreshold	Latency threshold in milliseconds. Active data messages with network delays greater than this threshold will be treated as being "late".
KeepAliveInterval	Frequency in milliseconds for sending keep-alive messages when no events are generated.
PollingInterval	Frequency in milliseconds of the poll request; only used when clients are set to use polling
MaxReconnectAttemptTime	Maximum period of time in milliseconds a client will keep attempting to reconnect to server upon getting disconnected
ReconnectWaitTime	Time interval in milliseconds to wait between reconnect attempts.

Figure 3–4 shows an ActiveDataConfiguration MBean in the Fusion Middleware Control MBean Browser.

Figure 3–4 ADF Active Data Configuration MBean

The screenshot shows the Fusion Middleware Control interface. The top bar indicates the user is logged in as 'weblogic' on host 'adc2100931.us.oracle.' and the page was refreshed on Apr 13, 2011 2:03:50 PM PDT. The main area is titled 'System MBean Browser' and shows a tree view of MBeans. The selected MBean is 'ActiveDataConfiguration' under the path 'Application Defined MBeans > oracle.adf.share.config > Server: AdminServer > Application: application1 > ADFConfig > ADFConfig > ActiveDataConfiguration'. The right pane shows the 'Application Defined MBeans: ADFConfig:ActiveDataConfig...' configuration page with the 'Show MBean Information' tab selected. The 'Attributes' tab is active, displaying a table of attributes.

Name	Description
1 ConfigMBean	If true, it indicates that this MBean is a Config MBean.
2 eventTypes	All the event's types emitted by this MBean.
3 KeepAliveInterval	Frequency (in ms) for sending keep-alive messages when no events are generated
4 LatencyThreshold	Latency threshold (in ms): Active Data messages with network delays greater than this threshold will be treated as being 'late'
5 MaxReconnectAttemptTime	Maximum period of time (in ms) a client will keep attempting to reconnect to server upon getting disconnected
6 PollingInterval	Frequency (in ms) of the poll request; only used when clients are set to use polling
7 ReadOnly	If true, it indicates that this MBean is a read only MBean.
8 ReconnectWaitTime	Time interval (in ms) to wait between reconnect attempts
9 RestartNeeded	Indicates whether a restart is needed.
10 SystemMBean	If true, it indicates that this MBean is a System MBean.
11 Transport	Active Data transport mechanism; can be polling, long-polling or streaming.
12 UsePolling	This attribute has been deprecated. Flag to indicate whether clients should use polling

8. Change the attribute value and click **Apply**.
9. In the left pane, select the parent ADF MBean **ADFConfig**.
10. In the right pane, click the **Operations** tab and click **save**.

The new values you have edited are written to MDS after you click **save** from the parent MBean.

3.5 How to Edit Credentials Deployed with the Application

You can use Enterprise Manager Fusion Middleware Control to edit credentials that were deployed with an ADF application to the credential store. You can also create new credentials and delete existing credentials.

For ADF applications, the following considerations apply:

- The **Map** name is typically the `adfAppUID` property defined in the application's `adf-config.xml` file.
- The **Key** name is typically in the format `anonymous#connection`, where `connection` is the connection name.
- The **Credential Type** is **Generic** and it is modeled as a hash map of key-value pairs.

For more information, see the "Managing Credentials with Fusion Middleware Control" section of the *Oracle Fusion Middleware Application Security Guide*.

3.6 Diagnosing Problems using the Diagnostic Framework

Oracle Fusion Middleware provides a Diagnostic Framework to help you detect, diagnose, and resolve problems with your application

When a critical error occurs, the Diagnostic Framework immediately captures diagnostic data and associates the data and error with an incident number. Using this number, you can retrieve the data for analysis from the Automatic Diagnostic Repository (ADR).

Oracle ADF provides an ADFConfig dump which will execute when an INCIDENT_ERROR message is logged. You can also add code to invoke the dump in the application exception handlers. [Example 3–2](#) show a sample code you can add to your exception handler to invoke the ADFConfig dump.

Example 3–2 Sample Code for Invoking ADFConfig Diagnostic Dump in Exception Handler

```
IllegalArgumentException e = new IllegalArgumentException("test exception");
LoggerFactory.getFrameworkLogger().log(ODLLevel.INCIDENT_ERROR,
    "Test error message", e);
```

For more information about the Diagnostic Framework, see the chapter on diagnosing problems in the *Oracle Fusion Middleware Administrator's Guide*.

If you are using the Diagnostic Framework on an IBM WebSphere application server, you need to perform additional tasks. For more information, see the *Oracle Fusion Middleware Third-Party Application Server Guide*.

3.7 Viewing Application Metric Information with DMS SPY

You can use the DMS Spy servlet to view application metric information in a web browser.

For more information, see the "Monitoring Oracle Fusion Middleware" section in the *Oracle® Fusion Middleware Performance and Tuning Guide*

3.8 Configuring WebSphere Application Server

You use the WebSphere Application Server administrative console to configure WebSphere Application Server. For more information, go to the WebSphere Application Server Information Center at:
<http://publib.boulder.ibm.com/infocenter/wasinfo/v7r0/index.jsp?topic=/com.ibm.websphere.home.doc/welcome.html>.

3.8.1 How to Configure WebSphere to Allow Reuse of Query Result Sets

WebSphere Application Server closes shared database connections between application generated requests. You need to set two properties in WebSphere to allow reuse of result sets.

Use the WebSphere Application Server administrative console to set the `non-transactional datasource` and `DisableMultiThreadedServletConnectionMgmt` properties.

To set properties in WebSphere to reuse results sets:

1. Start WebSphere Application Server administrative console.
2. Navigate to **Data sources > DB2 Universal JDBC Driver XA DataSource > WebSphere Application Server data source properties** and set **Non-transactional data source** to **enabled**.
3. Save the configuration.

4. Navigate to **Application servers > server_name > Web Container > Custom Properties** and **set DisableMultiThreadedServletConnectionMgmt to true.**
5. Save the configuration.
6. Restart WebSphere Application Server.

Setting these two properties will enable your deployed application to reuse result sets across requests.

WLST Command Reference for ADF Applications

This chapter describes the WLST commands you can use to deploy, manage, and configure Oracle ADF applications to Oracle WebLogic Server.

For wsadmin commands reference for the IBM WebSphere Application Server, see [Appendix B, "wsadmin Command Reference for ADF Applications."](#)

This chapter includes the following sections:

- [Section 4.1, "Overview of Custom WLST Commands for Oracle ADF"](#)
- [Section 4.2, "ADF-Specific WLST Commands"](#)

4.1 Overview of Custom WLST Commands for Oracle ADF

Use the ADF-based URL Connections WLST commands to navigate the hierarchy of configuration or runtime beans and control the prompt display. Use the `getADFMArchiveConfig` commands to manage the `ADFMArchiveConfig` object.

To use the custom WLST commands for Oracle ADF, you must invoke the WLST script from the Oracle Common home. For more information about other WLST commands, such as custom Metadata Services (MDS) commands, see the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

4.2 ADF-Specific WLST Commands

Use the commands in [Table 4-1](#) for ADF applications.

Table 4-1 Browse Commands for WLST Configuration

Use this command...	To...	Use with WLST...
<code>adf_createFileURLConnection</code>	Create a new ADF file connection.	Online or Offline
<code>adf_createHttpURLConnection</code>	Create a new ADF URL connection.	Online or Offline
<code>adf_setURLConnectionAttributes</code>	Set or edit the attributes of a newly created or existing ADF connection.	Online or Offline
<code>adf_listURLConnection</code>	List a new URL connection.	Online or Offline

Table 4–1 (Cont.) Browse Commands for WLST Configuration

Use this command...	To...	Use with WLST...
<code>getADFMArchiveConfig</code>	Returns a handle to the <code>ADFMArchiveConfig</code> object for the specified archive.	Online or Offline
<code>exportJarVersions</code>	Export CSV format of JARs versions from current <code>ORACLE_HOME</code> at a specified location.	Offline
<code>exportApplicationJarVersions</code>	Export CSV format of JARs versions of a specified application at a specified location.	Online
<code>exportApplicationSelectedJarVersions</code>	Export CSV format of JARs versions from current <code>ORACLE_HOME</code> at a specified location in coordination with the <code>Versions.xml</code> file.	Online

4.2.1 `adf_createFileURLConnection`

Use with WLST: Online or Offline.

4.2.1.1 Description

Use this command to creates a new connection based on the `oracle.adf.model.connection.url.FileURLConnection` connection class.

4.2.1.2 Syntax

```
adf_createFileURLConnection(appName, name, URL)
```

Argument	Definition
<code>appName</code>	Application name for which the connection will be created.
<code>name</code>	The name of the new connection.
<code>URL</code>	The URL associated with this connection.

4.2.1.3 Example

```
adf_createFileURLConnection('myapp', 'tempDir', '/scratch/tmp')
```

4.2.2 `adf_createHttpURLConnection`

Use with WLST: Online or Offline.

4.2.2.1 Description

Use this command to create a new connection based on the `oracle.adf.model.connection.url.HttpURLConnection` connection type class.

4.2.2.2 Syntax

```
adf_createURLConnection (appName, name, [URL], [authenticationType], [realm],
[user], [password])
```

Argument	Definition
<i>appName</i>	Application name for which the connection will be created.
<i>name</i>	The name of the new connection.
<i>url</i>	(Optional) The URL associated with this connection.
<i>authenticationType</i>	(Optional) The default is basic.
<i>realm</i>	(Optional) If this connection deals with authentication, then this should be set. The default is basic.
<i>user</i>	(Optional)
<i>password</i>	(Optional)

4.2.2.3 Example

```
adf_createURLConnection('myapp', 'cnn', 'http://www.cnn.com')
```

4.2.3 adf_setURLConnectionAttributes

Use with WLST: Online or Offline.

4.2.3.1 Description

Use this command to set or edit the attributes of a newly created or existing ADF connection.

4.2.3.2 Syntax

```
adf_setURLConnectionAttributes(appname, connectionname, attributes)
```

Argument	Definition
<i>appname</i>	Application name.
<i>connectionname</i>	The name of the connection.
<i>attributes</i>	The array containing attributes to set in key/value pairs.

4.2.3.3 Example

```
adf_setURLConnectionAttributes
('myapp', 'cnn', 'ChallengeAuthenticationType:digest',
'AuthenticationRealm:XMLRealm')
```

4.2.4 adf_listUrlConnection

Use with WLST: Online or Offline.

4.2.4.1 Description

Use this command to list the connections of the application.

4.2.4.2 Syntax

```
adf_listURLConnection (appname)
```

Argument	Definition
appname	Application name.

4.2.4.3 Example

```
adf_listURLConnection ('myapp')
```

4.2.5 getADFMArchiveConfig

Use with WLST: Online or Offline.

4.2.5.1 Description

Returns a handle to the `ADFMArchiveConfig` object for the specified archive. The returned `ADFMArchiveConfig` object's methods can be used to change application configuration in an archive.

The `ADFMArchiveConfig` object provides the following methods:

- `setDatabaseJboSQLBuilder ([value])` - Sets the Database `jbo.SQLBuilder` attribute.
- `getDatabaseJboSQLBuilder ()` - Returns the current value of the `jbo.SQLBuilder` attribute.
- `setDatabaseJboSQLBuilderClass ([value])` - Sets the Database `jbo.SQLBuilderClass` attribute. Value is the full name of the custom builder class.
- `getDatabaseJboSQLBuilderClass ()` - Returns the current value of the `jbo.SQLBuilderClass` attribute.
- `setDefaultRowLimit ([value])` - Sets the defaults `rowLimit` attribute. Value is a long specifying the row limit (Default -1).
- `getDefaultRowLimit ()` - Returns the current value of the `rowLimit` attribute.
- `save ([toLocation])` - If you specify the `toLocation`, then the changes will be stored in the target archive file and the original file will remain unchanged. Otherwise, the changes will be saved in the original file itself.

4.2.5.2 Syntax

```
archiveConfigObject = ADFMAdmin.getADFMArchiveConfig(fromLocation)
```

Argument	Definition
<i>fromLocation</i>	The name of the ear file, including its complete path.

The syntax for `setDatabaseJboSQLBuilder ([value])` is:

```
archiveConfigObject.setDatabaseJboSQLBuilder ([value])
```

Argument	Definition
<i>value</i>	The value of the <code>jbo.SQLBuilder</code> attribute. Valid values are: 'Oracle' (Default), 'OLite', 'DB2', 'SQL92', 'SQLServer', or 'Custom'. If 'Custom' is specified, then the <code>jbo.SQLBuilderClass</code> attribute should also be set.

The syntax for `getDatabaseJboSQLBuilder()` is:

```
archiveConfigObject.getDatabaseJboSQLBuilder()
```

The syntax for `setDatabaseJboSQLBuilderClass([value])` is:

```
archiveConfigObject.setDatabaseJboSQLBuilderClass([value])
```

Argument	Definition
<i>value</i>	The value of the <code>jbo.SQLBuilderClass</code> attribute.

The syntax for `getDatabaseJboSQLBuilderClass()` is:

```
archiveConfigObject.getDatabaseJboSQLBuilderClass()
```

The syntax for `setDefaultRowLimit([value])` is:

```
archiveConfigObject.setDefaultRowLimit([value])
```

Argument	Definition
<i>value</i>	The value of the <code>rowLimit</code> attribute.

The syntax for `getDefaultRowLimit()` is:

```
archiveConfigObject.getDefaultRowLimit([value])
```

The syntax for `save([toLocation])` is:

```
archiveConfigObject.save([toLocation])
```

Argument	Definition
<i>toLocation</i>	The file name along with the absolute path to store the changes.

4.2.5.3 Example

In the following example, the `jbo.SQLBuilder` attribute is set to 'DB2'.

```
wls:/offline> archive =
    ADFMAdmin.getADFMArchiveConfig(fromLocation='/tmp/testArchive.ear')
wls:/offline> archive.setDatabaseJboSQLBuilder(value='DB2')
wls:/offline> archive.save()
```

In the following example, the `jbo.SQLBuilder` attribute is removed so that application default is used.

```
wls:/offline> archive =
    ADFMAdmin.getADFMArchiveConfig(fromLocation='/tmp/testArchive.ear')
wls:/offline> archive.setDatabaseJboSQLBuilder()
wls:/offline> archive.save(toLocation='/tmp/targetArchive.ear')
```

In the following example, the `jbo.SQLBuilder` attribute is set to 'Custom', and the `jbo.SQLBuilderClass` attribute is set to the class 'com.example.CustomBuilder'.

```
wls:/offline> archive =
    ADFMAdmin.getADFMArchiveConfig(fromLocation='/tmp/testArchive.ear')
wls:/offline> archive.setDatabaseJboSQLBuilder('Custom')
wls:/offline> archive.setDatabaseJboSQLBuilderClass('com.example.CustomBuilder')
wls:/offline> archive.save(toLocation='/tmp/targetArchive.ear')
```

In the following example, the `rowLimit` attribute is set to 100.

```
wls:/offline> archive = getADFMArchiveConfig(fromLocation='/tmp/testArchive.ear')
wls:/offline> archive.setDefaultRowLimit(100)
wls:/offline> archive.save(toLocation='/tmp/targetArchive.ear')
```

4.2.6 exportJarVersions

Use with WLST: Offline.

4.2.6.1 Description

Use to export CSV format of JARs versions from current `ORACLE_HOME` at a specified location. Exported JARs versions information can be opened in Oracle OpenOffice or MicroSoft Excel.

4.2.6.2 Syntax

```
exportJarVersions(path)
```

Argument	Definition
path	Location to extract JARs versions.

4.2.6.3 Example

This example shows how JARs versions are exported to `/tmp/export-MyApp-Versions.csv`. R/W privileges for the CSV file need to be verified.

```
wls:/offline>exportJarVersions('/tmp/export-MyApp-Versions.csv')
```

4.2.7 exportApplicationJarVersions

Use with WLST: Online.

4.2.7.1 Description

Used to export CSV format of runtime JARs versions of a specified application at a specified location.

4.2.7.2 Syntax

```
exportApplicationJarVersions(applicationName, path)
```

Argument	Definition
applicationName	Application name to export JARs versions
path	Location to export JARs versions.

4.2.7.3 Example

This example shows how MyApp runtime JARs versions are exported to `/tmp/export-MyApp-Versions.csv`. R/W privileges for the CSV file need to be verified.

```
wls:/DefaultDomain/serverConfig>exportApplicationJarVersions('MyApp',
'/tmp/export-MyApp-Versions.csv')
```

4.2.8 exportApplicationSelectedJarVersions

Use with WLST: Online.

4.2.8.1 Description

Used to export CSV format of JARs versions of selected JARs at a specified location.

4.2.8.2 Syntax

```
exportApplicationSelectedJarVersions(applicationName, path, jarsLocation)
```

Argument	Definition
applicationName	Application name to export JARs versions.
path	Location to extract JARs versions.
jarsLocation	Optional list of selected JARs. If not specified, default JARs runtime version list from <code>%WLSDOMAIN%/config/fmwconfig/Versions.xml</code> will be exported. If the <code>selectedJars</code> property in <code>Versions.xml</code> is empty, version information of <code>adfm.jar</code> , <code>adf-richclient-impl-11.jar</code> , <code>adf-controller.jar</code> , <code>adf-pageflow-impl.jar</code> , <code>adf-share-support.jar</code> and <code>mdsrt.jar</code> will be exported.

4.2.8.3 Example

This example shows how JARs versions are exported to `/tmp/export-MyApp-Versions.csv` using the `selectedJars` property of the `Versions.xml` file. In this case, since the `jarsLocation` parameter is not specified, the libraries listed in the `selectedJars` property of the `Versions.xml` file will be exported. R/W privileges for the CSV file need to be verified.

```
wls:/offline>exportApplicationSelectedJarVersions('MyApp',
'/tmp/export-MyApp-Versions.csv')
```

```
Versions.xml
<Diagnostics xmlns="xmlns.oracle.com/adf/diagnostics">
  <Versions xmlns="xmlns.oracle.com/adf/diagnostics/versions"
    exportVersionsOnApplicationStartup="true"
    selectedJars="$ORACLE_HOME$/modules/oracle.adf.model_11.1.1/adfm.jar;
$ORACLE_HOME$/modules/oracle.adf.view_11.1.1/adf-richclient-impl-11.jar;
$ORACLE_HOME$/modules/oracle.adf.controller_11.1.1/adf-controller.jar;
$ORACLE_HOME$/modules/oracle.adf.pageflow_11.1.1/adf-pageflow-impl.jar;
$ORACLE_HOME$/modules/oracle.adf.share_11.1.1/adf-share-support.jar;
$ORACLE_HOME$/modules/oracle.mds_11.1.1/mdsrt.jar" />
</Diagnostics>
```

This example shows how JARs versions are exported to `/tmp/export-MyApp-Versions.csv` using the `jarsLocation` parameter. In this case, the libraries passed explicitly in the `jarsLocation` parameter will be exported. R/W privileges for the CSV file need to be verified.

```
wls:/offline>exportApplicationSelectedJarVersions('MyApp',  
'/tmp/export-MyApp-Versions.csv',  
'$ORACLE_HOME$/modules/oracle.adf.model_11.1.1/adfm.jar;$ORACLE_  
HOME$/modules/oracle.adf.view_11.1.1/adf-richclient-impl-11.jar')
```

Part III

Appendices

Part III contains the following chapters:

- [Appendix A, "ADF Runtime Libraries"](#)
- [Appendix B, "wsadmin Command Reference for ADF Applications"](#)
- [Appendix C, "Configuring GlassFish Server"](#)

ADF Runtime Libraries

This appendix provides a reference of the contents of ADF runtime libraries that are deployed into Oracle WebLogic Server to support ADF applications.

The following ADF runtime libraries are described:

- [Section A.1, "Using JDeveloper to Find the ADF Runtime Library"](#)
- [Section A.2, "adf.oracle.domain.webapp.war Library"](#)
- [Section A.3, "adf.oracle.domain.ear Library"](#)
- [Section A.4, "System Classpath"](#)
- [Section A.5, "adf.desktopintegration.war Library"](#)

A.1 Using JDeveloper to Find the ADF Runtime Library

In addition to the listings in this appendix, you can also use JDeveloper to find a JAR's corresponding ADF runtime library.

To find the ADF runtime library for a JAR:

1. In JDeveloper, select **Tools > Manage Libraries**.
2. In the Manage Libraries dialog Libraries tab, click the **Search** icon and select **Jar name** from the dropdown list.
3. In the search field, enter the name of the JAR and click the search icon.

A.2 adf.oracle.domain.webapp.war Library

[Table A-1](#) lists the JAR files that are packaged into the `adf.oracle.domain.webapp.war` file and their corresponding ADF runtime library.

Table A-1 *adf.oracle.domain.webapp.war Library*

JAR	ADF Library
oracle.adf.controller_11.1.1/adf-controller-api.jar	ADF Controller Runtime
oracle.adf.controller_11.1.1/adf-controller-rt-common.jar	ADF Controller Runtime

wsadmin Command Reference for ADF Applications

This chapter describes the wsadmin commands you can use to deploy, manage, and configure Oracle ADF applications. wsadmin commands are intended to be used with the IBM WebSphere Application Server.

This chapter includes the following sections:

- [Section B.1, "Overview of Custom wsadmin Commands for Oracle ADF"](#)
- [Section B.2, "ADF-Specific WebSphere Commands"](#)

B.1 Overview of Custom wsadmin Commands for Oracle ADF

Use the ADF-based URL Connections wsadmin commands to navigate the hierarchy of configuration or runtime beans and control the prompt display. Use the `getADFMArchiveConfig` commands to manage the `ADFMArchiveConfig` object.

Each command must be qualified by the module name. For example, if the module is `URLConnection.py`, then the command can be invoked like this:

`URLConnection.createURLConnection`. An example for the module `ADFAdmin.py` would be `ADFAdmin.getADFArchiveConfig`.

B.2 ADF-Specific WebSphere Commands

Use the commands in [Table B-1](#) to manage ADF applications.

Table B-1 Browse Commands for wsadmin Configuration

Use this command...	To...	Use with wsadmin...
<code>createURLConnection</code>	Create a new ADF file connection.	Online or Offline
<code>createURLConnection</code>	Create a new ADF URL connection.	Online or Offline
<code>setURLConnectionAttributes</code>	Set or edit the attributes of a newly created or existing ADF connection.	Online or Offline
<code>listURLConnection</code>	List a new URL connection.	Online or Offline
<code>getADFMArchiveConfig</code>	Returns a handle to the <code>ADFMArchiveConfig</code> object for the specified archive.	Online or Offline

B.2.1 createFileURLConnection

Use with wsadmin: Online or Offline.

B.2.1.1 Description

Use this command to creates a new connection based on the `oracle.adf.model.connection.url.FileURLConnection` connection class.

B.2.1.2 Syntax

```
URLConnection.createFileURLConnection(appName, name, URL)
```

Argument	Definition
<code>appName</code>	Application name for which the connection will be created.
<code>name</code>	The name of the new connection.
<code>URL</code>	The URL associated with this connection.

B.2.1.3 Example

```
URLConnection.createFileURLConnection('myapp', 'tempDir', '/scratch/tmp')
```

B.2.2 createHttpURLConnection

Use with wsadmin: Online or Offline.

B.2.2.1 Description

Use this command to create a new connection based on the `oracle.adf.model.connection.url.HttpURLConnection` connection type class.

B.2.2.2 Syntax

```
URLConnection.createHttpURLConnection (appName, name, [URL], [authenticationType], [realm], [user], [password])
```

Argument	Definition
<code>appName</code>	Application name for which the connection will be created.
<code>name</code>	The name of the new connection.
<code>url</code>	(Optional) The URL associated with this connection.
<code>authenticationType</code>	(Optional) The default is basic.
<code>realm</code>	(Optional) If this connection deals with authentication, then this should be set. The default is basic.
<code>user</code>	(Optional)
<code>password</code>	(Optional)

B.2.2.3 Example

```
URLConnection.createHttpURLConnection('myapp', 'cnn', 'http://www.cnn.com')
```

B.2.3 setURLConnectionAttributes

Use with wsadmin: Online or Offline.

B.2.3.1 Description

Use this command to set or edit the attributes of a newly created or existing ADF connection.

B.2.3.2 Syntax

```
URLConnection.setURLConnectionAttributes(appname, connectionname, attributes)
```

Argument	Definition
appname	Application name.
connectionname	The name of the connection.
<i>attributes</i>	The array containing attributes to set in key/value pairs.

B.2.3.3 Example

```
URLConnection.setURLConnectionAttributes
('myapp', 'cnn', 'ChallengeAuthenticationType:digest',
'AuthenticationRealm:XMLRealm')
```

B.2.4 listURLConnection

Use with wsadmin: Online or Offline.

B.2.4.1 Description

Use this command to list the connections of the application.

B.2.4.2 Syntax

```
URLConnection.listURLConnection(appname)
```

Argument	Definition
appname	Application name.

B.2.4.3 Example

```
URLConnection.listURLConnection ('myapp')
```

B.2.5 getADFMArchiveConfig

Use with wsadmin: Online or Offline.

B.2.5.1 Description

Returns a handle to the `ADFMArchiveConfig` object for the specified archive. The returned `ADFMArchiveConfig` object's methods can be used to change application configuration in an archive.

The `ADFMArchiveConfig` object provides the following methods:

- `setDatabaseJboSQLBuilder([value])` - Sets the Database `jbo.SQLBuilder` attribute.
- `getDatabaseJboSQLBuilder()` - Returns the current value of the `jbo.SQLBuilder` attribute.

- `setDatabaseJboSQLBuilderClass ([value])` - Sets the Database `jbo.SQLBuilderClass` attribute.
- `getDatabaseJboSQLBuilderClass ()` - Returns the current value of the `jbo.SQLBuilderClass` attribute.
- `setDefaultRowLimit ([value])` - Sets the defaults `rowLimit` attribute. Value is a long specifying the row limit (Default -1).
- `getDefaultRowLimit ()` - Returns the current value of the `rowLimit` attribute.
- `save ([toLocation])` - If you specify the `toLocation`, then the changes will be stored in the target archive file and the original file will remain unchanged. Otherwise, the changes will be saved in the original file itself.

B.2.5.2 Syntax

```
archiveConfigObject = ADFMAdmin.getADFMArchiveConfig(fromLocation)
```

Argument	Definition
<i>fromLocation</i>	The name of the ear file, including its complete path.

The syntax for `setDatabaseJboSQLBuilder ([value])` is:

```
archiveConfigObject.setDatabaseJboSQLBuilder([value])
```

Argument	Definition
<i>value</i>	The value of the <code>jbo.SQLBuilder</code> attribute. Valid values are: 'Oracle' (Default), 'OLite', 'DB2', 'SQL92', 'SQLServer', or 'Custom'. If 'Custom' is specified, then the <code>jbo.SQLBuilderClass</code> attribute should also be set.

The syntax for `getDatabaseJboSQLBuilder ()` is:

```
archiveConfigObject.getDatabaseJboSQLBuilder()
```

The syntax for `setDatabaseJboSQLBuilderClass ([value])` is:

```
archiveConfigObject.setDatabaseJboSQLBuilderClass([value])
```

Argument	Definition
<i>value</i>	The value of the <code>jbo.SQLBuilderClass</code> attribute.

The syntax for `getDatabaseJboSQLBuilderClass ()` is:

```
archiveConfigObject.getDatabaseJboSQLBuilderClass()
```

The syntax for `save ([toLocation])` is:

```
archiveConfigObject.save([toLocation])
```

Argument	Definition
<i>toLocation</i>	The file name along with the absolute path to store the changes.

B.2.5.3 Example

In the following example, if the `adf-config.xml` file in the archive does not have the application and shared metadata repositories defined, then you should provide the complete connection information.

```
# Open something.ear and return an object which can be used
# manipulate it
archive = ADFMAdmin.getADFMArchiveConfig('/path/to/something.ear')

# Return current JBO SQL Builder value
archive.getDatabaseJboSQLBuilder()

# Change JBO SQL Builder value to Oracle
archive.setDatabaseJboSQLBuilder('Oracle')

# Save the changes back to the original file
archive.save()

archive = ADFMAdmin.getADFMArchiveConfig('/path/to/something.ear')
archive.getDatabaseJboSQLBuilder()
```

In the following example, the `jbo.SQLBuilder` attribute is set to 'DB2'.

```
wsadmin> archive =
    ADFMAdmin.getADFMArchiveConfig(fromLocation='/tmp/testArchive.ear')
wsadmin> archive.setDatabaseJboSQLBuilder(value='DB2')
wsadmin> archive.save()
```

In the following example, the `jbo.SQLBuilder` attribute is removed so that application default is used.

```
wsadmin> archive =
    ADFMAdmin.getADFMArchiveConfig(fromLocation='/tmp/testArchive.ear')
wsadmin> archive.setDatabaseJboSQLBuilder()
wsadmin> archive.save(toLocation='/tmp/targetArchive.ear')
```

In the following example, the `jbo.SQLBuilder` attribute is set to 'Custom', and the `jbo.SQLBuilderClass` attribute is set to the class 'com.example.CustomBuilder'.

```
wsadmin> archive =
    ADFMAdmin.getADFMArchiveConfig(fromLocation='/tmp/testArchive.ear')
wsadmin> archive.setDatabaseJboSQLBuilder('Custom')
wsadmin> archive.setDatabaseJboSQLBuilderClass('com.example.CustomBuilder')
wsadmin> archive.save(toLocation='/tmp/targetArchive.ear')
```

In the following example, the `rowLimit` attribute is set to 100.

```
wsadmin:/offline> archive =
getADFMArchiveConfig(fromLocation='/tmp/testArchive.ear')
wsadmin:/offline> archive.setDefaultRowLimit(100)
wsadmin:/offline> archive.save(toLocation='/tmp/targetArchive.ear')
```

Configuring GlassFish Server

This appendix describes how to configure GlassFish Server for Oracle ADF Essentials. It describes how to obtain the Oracle ADF Runtime and how to install these files into the GlassFish Server.

This appendix contains the following sections:

- [Section C.1, "About Configuring GlassFish"](#)
- [Section C.2, "Obtaining GlassFish Server and Oracle ADF Runtime"](#)
- [Section C.3, "Configuring GlassFish with ADF Runtime Libraries"](#)
- [Section C.4, "Additional Configuration Tasks"](#)
- [Section C.5, "Deploying an ADF Application to GlassFish"](#)

C.1 About Configuring GlassFish

GlassFish Server is an application server that can be configured to run Oracle ADF applications. If you do not have a GlassFish Server installation, you can download GlassFish Server from the GlassFish website. Before you can run ADF applications in a GlassFish Server, you need to configure GlassFish with the Oracle ADF Runtime libraries.

For a list of the supported Oracle ADF features for GlassFish, go to the OTN site at <http://www.oracle.com/technetwork/developer-tools/adf/overview/adfessentials-1719844.html>

For instructions on obtaining and installing GlassFish, see <http://glassfish.java.net/downloads/3.1.2-final.html>

For information about developing ADF applications for GlassFish, see the "Deploying ADF Applications to GlassFish" appendix in the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

C.2 Obtaining GlassFish Server and Oracle ADF Runtime

Oracle ADF Essentials supports the Open Source and commercial versions of GlassFish Server. With either version, you will need the Full Platform distribution. The Web Profile distribution is not supported. After you have installed the GlassFish Server, you need to obtain the ADF Essentials `adf-essentials.zip` file from OTN and follow the instructions in this appendix to install the ADF Runtime libraries.

For information on how to start and stop the server and other application server tasks, see GlassFish documentation at the GlassFish website.

C.2.1 How to Obtain GlassFish Server

You can download the open source version of the GlassFish Server from the GlassFish website:

<http://glassfish.java.net/downloads/3.1.2-final.html>

Follow the instructions and documentation at the site to install and configure a GlassFish Server.

C.2.2 How to Obtain Oracle ADF Runtime

In order for a GlassFish Server to run Oracle ADF applications, you must install the ADF Runtime library files into the GlassFish installation directory.

You can download the Oracle ADF Essentials `adf-essentials.zip` file from the Oracle Technology Network at

<http://www.oracle.com/go/?&Src=7578263&Act=4&pcode=WWMK12022244MPP044>.

After you have downloaded the `adf-essentials.zip` file, you can extract the files to a temporary directory which you can use to copy the required files into the GlassFish installation directories.

C.3 Configuring GlassFish with ADF Runtime Libraries

The ADF Runtime libraries consists of the following:

- ADF Share libraries
- ADF Model libraries
- ADF Controller libraries
- ADF View libraries

The ADF Share libraries must be manually installed into the GlassFish installation. You use your operating system command or tools to copy the files. For instructions, see [Section C.3.1, "How to Install ADF Share Libraries Manually."](#)

The ADF Model, ADF Controller, and ADF View libraries are loaded into GlassFish with the deployed application and will be included automatically by JDeveloper.

The steps for installing the ADF Runtime libraries are:

1. Configure ADF Share libraries.
 - Copy the ADF Share libraries from `adf-essentials.zip` into the GlassFish installation.
2. Deploy the application as an EAR file.

C.3.1 How to Install ADF Share Libraries Manually

Before you begin:

It may be helpful to have an understanding of the options that are available to you when you are mapping ADF Share for GlassFish. For more information, see [Section C.3, "Configuring GlassFish with ADF Runtime Libraries."](#)

You will need to complete these tasks:

- Install the GlassFish Server

- Obtain the `adf-essentials.zip` file and unzip it to a temporary directory

To install the ADF Share Runtime libraries:

1. Copy or move the ADF Share library files from the temporary directory to the `<glassfish>/domains/domain1/lib` folder:

The ADF Share files should be in the temporary directory where you had unzip the `adf-essentials.zip` file as described in [Section C.2.2, "How to Obtain Oracle ADF Runtime."](#) Typically, this directory is `<temp>/oracle_common/modules`.

```
oracle.adf.share.ca_11.1.1/adf-share-base.jar
oracle.adf.share.ca_11.1.1/adf-share-ca.jar
oracle.adf.share_11.1.1/commons-el.jar
oracle.adf.share_11.1.1/adf-share-support.jar
oracle.adf.share_11.1.1/adfsharebean.jar
oracle.adf.share_11.1.1/jsp-el-api.jar
oracle.adf.share_11.1.1/adflogginghandler.jar
oracle.adf.share_11.1.1/oracle-el.jar
oracle.mds_11.1.1/mdsrt.jar
oracle.bali.share_11.1.1/share.jar
oracle.xml_11.1.1/xml.jar
oracle.javatools_11.1.1/resourcebundle.jar
oracle.javatools_11.1.1/javamodel-rt.jar
oracle.javatools_11.1.1/javatools-nodeps.jar
oracle.adf.security_11.1.1/adf-share-security.jar
oracle.adf.security_11.1.1/adf-controller-security.jar
oracle.xdk_11.1.0/xmlparserv2_sans_jaxp_services.jar
oracle.xdb_11.1.0.jar
oracle.jrf_11.1.1/jrf-api.jar
oracle.jdbc_11.1.1/ojdbc6dms.jar
oracle.dms_11.1.1/dms.jar
oracle.odl_11.1.1/ojdl.jar
oracle.odl_11.1.1/ojdl2.jar
oracle.jmx_11.1.1/jmxframework.jar
oracle.jmx_11.1.1/jmxspi.jar
oracle.classloader_11.1.1.jar
oracle.logging-utils_11.1.1.jar
oracle.web-common_11.1.1.jar
oracle.webservices_11.1.1/oc4j-ws-support.jar
org.apache.bcel_5.1.jar
oracle.nlsrtl_11.2.0/orai18n-mapping.jar
```

2. Verify all the libraries have been copied.

C.4 Additional Configuration Tasks

After you have installed the ADF Runtime into the GlassFish Server, you need to perform additional configuration tasks on GlassFish.

The configuration tasks are:

- [Section C.4.1, "GlassFish Administration Console"](#)
- [Section C.4.2, "How to Create a Datasource for GlassFish"](#)
- [Section C.4.3, "How to Configure the JVM Cache"](#)

C.4.1 GlassFish Administration Console

You can use the GlassFish Administration Console to configure the GlassFish Server including managing applications, JDBC pools, and other resources.

The GlassFish Administration Console is at:

`http://<machine_name>:4848/`

C.4.2 How to Create a Datasource for GlassFish

Before you begin:

It may be helpful to have an understanding of the options that are available to you when you are creating a datasource for GlassFish. For more information, see [Section C.2, "Obtaining GlassFish Server and Oracle ADF Runtime."](#)

You can use the GlassFish Administration Console or `asadmin` commands to create the datasource. For more information, see GlassFish documentation.

To create a datasource for GlassFish using `asadmin` command:

1. Open a command line window.
2. Invoke the `asadmin` command to create a datasource for GlassFish.

For instance, the following command creates a datasource for an application:

```
asadmin> create-jdbc-connection-pool --datasourceclassname
oracle.jdbc.pool.SampleDataSource
--restype javax.sql.XADataSource
--property user=xyz
:password=xyz:url=jdbc:oracle:thin:@machine.com:1521:machine
--target=server SampleDSPool

asadmin> ping-connection-pool SampleDSPool

asadmin> create-jdbc-resource --connectionpoolid SampleDSPool jdbc/OracleDS
```

C.4.3 How to Configure the JVM Cache

You need to configure the JVM settings to `simple` and increase the memory size from 192 Mb to 512 Mb.

Before you begin:

It may be helpful to have an understanding of the options that are available to you when you are configuring JVM for GlassFish. For more information, see [Section C.4, "Additional Configuration Tasks."](#)

To configure JVM Cache for MDS:

1. Start the GlassFish Administration Console.
2. Choose **Configurations > server-config > JVM Settings**.
3. Select **JVM Options** and specify `-Doracle.mds.cache=simple` and `XX:MaxPermSize=512m`.
4. Click **Save**.

5. Or, open the `<glassfish>/domains/domain1/config/domain.xml` file and edit the following entries:

```
<jvm-options>-XX:MaxPermSize=512m</jvm-options>  
<jvm-options>-Doracle.mds.cache=simple</jvm-options>
```

C.5 Deploying an ADF Application to GlassFish

After you have referenced the libraries in the application, you can proceed to deploy the application to GlassFish Server. For more information, see the "Deploying ADF Applications to GlassFish" appendix in the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.
