Using This Documentation

Oracle's ONET feature groups uplink and downlink ports on its switch. ONET provides internal and external isolated network connectivity for blade servers by bridging downlink ports with uplink ports connected to an external switched network. By restricting traffic within the uplink/downlink port combination, ONET ensures that traffic is not propagated to other ports that should not have access to this data. By linking the uplink port to the downlink port, ONET effectively turns that connection into a bridge for the blade server connected to the downlink port. This document describes the use of ONET on a switch.

For detailed information about the commands and options described in this document, refer to the *Sun Ethernet Fabric Operating System CLI Base Reference Manual*.

Acronyms and Abbreviations

Acronym or Abbreviation	Explanation
CLI	Command-line interface
GARP	Generic Attribute Registration Protocol
GMRP	GARP Multicast Registration Protocol
GVRP	GARP VLAN Registration Protocol
IP	Internet Protocol
LAN	Local area network
MAC	Media access control
RSTP	Rapid Spanning Tree Protocol
STP	Spanning Tree Protocol

Acronym or Abbreviation	Explanation
VLAN	Virtual local area network
WAN	Wide area network

CLI Command Modes

The following table lists the configuration mode used in this document with the access and exit methods.

Command Mode	Access Method	Prompt	Exit Method
Privileged EXEC	This is the default mode and only way to access the ONET CLI commands.	ONET#	Use the <code>exit</code> command to return to the Oracle ILOM prompt.

Feedback

Provide feedback on this documentation at:

<http://www.oracle.com/goto/docfeedback>

Support and Accessibility

Oracle customers have access to electronic support through My Oracle Support. For information visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info> or visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs> if you are hearing impaired.

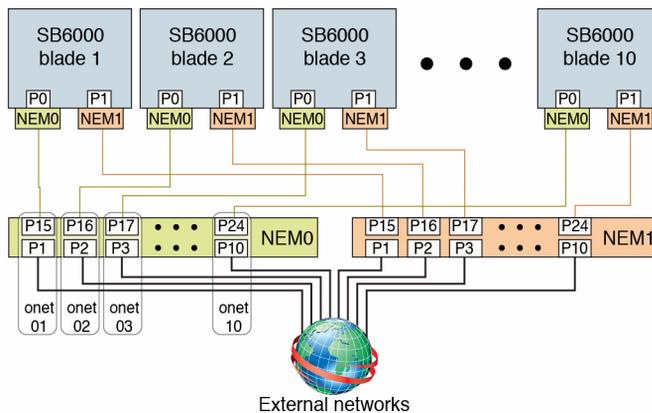

ONET Configuration

These sections describe the ONET configuration and default settings.

- “ONET Example Topology” on page 5
- “Default Settings” on page 6

ONET Example Topology

The ONET configuration is predefined and cannot be changed during switch operation. The downlink ports connected to the blade servers are configured to be connected to individual uplink ports. The following figure illustrates the ONET port assignments.

The ONETs are named onet01 to onet10, where onet01 is configured with port 1 as the uplink port and port 15 as the downlink port connected to the blade server. Onet02 is a pairing of port 2 as the uplink port, port 16 as the downlink port, and so on, until onet10 pairs port 10 with port 24.

Default Settings

Feature	Default Setting
VLAN module status	Enable
Default VLAN ID (configured in the switch)	1
MAC address table aging time	300 seconds
Acceptable frame types	All (accepts untagged frames or priority-tagged frames or tagged frames received on the port)
STP	Disabled
GMRP	Disabled
GVRP	Disabled

ONET and Oracle ILOM

You must start ONET from Oracle ILOM. You can also access ONET CLI commands through Oracle ILOM.

- “Start ONET From Oracle ILOM” on page 7
- “Start the ONET CLI” on page 8
- “Stopping SEFOS Before Starting ONET” on page 8

▼ Start ONET From Oracle ILOM

- **Log in to Oracle ILOM and start ONET from the Oracle ILOM prompt.**

```
Oracle(R) Integrated Lights Out Manager (Fabric Component Edition)
Version 3.0.5.2
Copyright (c) 2011, Oracle and/or its affiliates. All rights
reserved.
Warning: password is set to factory default.

-> start /NEM/onet
Are you sure you want to start /NEM/onet (y/n)? y

start: Please wait while onet comes up, this can take anywhere from
30 seconds to 2 minutes depending on the configuration
.....
start: ONET Enabled successfully.
```

▼ Start the ONET CLI

- Access the ONET CLI.

```
-> start /NEM/onet_cli/  
Are you sure you want to start /NEM/onet_cli (y/n)? y  
  
start: Connecting to Fabric Switch CLI  
SUNSP-UN0064 ONET#
```

Stopping SEFOS Before Starting ONET

ONET works in tandem with SEFOS so that the one-to-one uplink to downlink port combination is achieved. SEFOS uses a different set of configuration files when used with ONET. ONET cannot run in conjunction with stand-alone SEFOS, and SEFOS must be stopped before ONET can be started. When ONET is started while SEFOS is running, Oracle ILOM displays the following message:

```
-> start /NEM/onet  
Are you sure you want to start /NEM/onet (y/n)? y  
  
start: ONET start failed because SEFOS is running
```

- “Stop SEFOS” on page 8
- “Start ONET” on page 9
- “Stop ONET” on page 9

▼ Stop SEFOS

- Stop SEFOS before starting ONET.

```
-> stop /NEM/sefos  
stop: Unsaved SEFOS configuration will be lost  
Are you sure you want to stop /NEM/sefos (y/n)? y  
  
stop: SEFOS stopped successfully.
```

▼ Start ONET

- Type.

```
-> start /NEM/onet  
Are you sure you want to start /NEM/onet (y/n)? y  
  
start: Please wait while onet comes up, this can take anywhere from  
30 seconds to 2 minutes depending on the configuration  
.....  
start: ONET Enabled successfully.
```

If you reset the switch while ONET is running, ONET will be running once it is restarted.

▼ Stop ONET

- Stop ONET from Oracle ILOM.

```
-> stop /NEM/onet  
Are you sure you want to stop /NEM/onet (y/n)? y  
  
stop: ONET Disabled successfully.
```

Configuring an ONET

This section provides information on how to create, modify, and delete ONETs.

- [“Configure an ONET” on page 11](#)
- [“Common Configuration Errors” on page 13](#)

▼ Configure an ONET

This procedure enables you to create an ONET with multiple downlink ports and a single uplink port, with an option to assign them as member ports (tagged) to multiple VLANs. The `modify` command can be used to modify the downlink and uplink ports, name and VLAN assigned to a given ONET.

A given uplink or downlink port cannot be part of more than one ONET. In the default scenario, all 10 downlinks port are part of an ONET. The only way to create a new ONET is to delete an existing ONET.

1. Delete an ONET.

```
ONET# configure
ONET#-configure# no onet onet01
ONET#-configure# no onet onet02
ONET#-configure# end
```

2. Create an ONET.

```
ONET#-configure# onet onet-new uport extreme-ethernet 2 dport
extreme-ethernet 15,16
ONET#-configure# exit
ONET# show onets
Name: onet-new
  Onet VLAN:          4084
  Downlink port(s):  16 15
  VLAN(s):
```

```

Uplink port:          02
Name: onet10
  Onet VLAN:          4075
  Downlink port(s):   24
  VLAN(s):
  Uplink port:        10
Name: onet09
  Onet VLAN:          4076
  Downlink port(s):   23
  VLAN(s):
  Uplink port:        09

```

3. Modify an ONET.

You can add a list of VLANs to the ONET and modify `onet-new` to have VLAN 2000 and uplink port as Ex 0/1.

```

ONET# configure
ONET#-configure# set onet onet01 uport extreme-ethernet 1 dport
extreme-ethernet 15,16 vlan id 2000
ONET#-configure# exit
ONET# show onets
Name: onet-new
  Onet VLAN:          4084
  Downlink port(s):   16 15
  VLAN(s):            2000
  Uplink port:        01
Name: onet10
  Onet VLAN:          4075
  Downlink port(s):   24
  VLAN(s):
  Uplink port:        10
Name: onet09
  Onet VLAN:          4076
  Downlink port(s):   23
  VLAN(s):
  Uplink port:        09

```

4. Delete an ONET.

```

ONET# configure
ONET#-configure# no onet onet-new
ONET#-configure# exit
ONET# show onets

Name: onet10
  Onet VLAN:          4075
  Downlink port(s):   24

```

```
VLAN(s):
  Uplink port:          10
Name: onet09
  Onet VLAN:           4076
  Downlink port(s):    23
VLAN(s):
  Uplink port:          09
```

Common Configuration Errors

This section shows examples of common errors made in configuring ONETs.

- **Creating an existing ONET.**

```
ONET# configure
ONET#-configure#onet onet01 uport extreme-ethernet 1 dport
extreme-ethernet 21
ONet onet01 already in use
ONET#-configure# end
```

- **Creating an ONET with downlink/uplink ports in another ONET.**

```
ONET# configure
ONET#-configure#onet onet03 uport extreme-ethernet 2 dport
extreme-ethernet 21
ONet uport 2 already in use
ONET#-configure# onet onet03 uport 5 extreme-ethernet dport
extreme-ethernet 15
ONet dport 15 already in use
ONET#-configure# end
```

- **Modifying an ONET Vlan without specifying uplink and downlink port.**

```
ONET# configure
ONET#-configure#set onet onet10 uport extreme-ethernet 7 vlan id
1000
Need both uport and dport parameters to assign VLAN
ONET#-configure# end
```

ONET CLI Commands

You can use these CLI commands with ONET. With the exception of the `show onet` and `show onets` commands, these commands are equivalents.

- “help Command” on page 15
- “show onet Command” on page 16
- “show onets Command” on page 17
- “show interfaces description Command” on page 18
- “show vlan Command” on page 21
- “show lldp Command” on page 23
- “show mac-address-table Command” on page 23
- “speed port Command” on page 24
- “exit Command” on page 25
- “write startup-config Command” on page 25
- “no onet Command” on page 26
- “onet Command” on page 26
- “set onet Command” on page 26

help Command

This command provides a description of the available CLI commands.

Syntax

`help command`

```
ONET# help help  
help: Displays help for a particular command
```

show onet Command

This command shows the detail of an individual ONET. This command includes the uplink and downlink ports assigned to the specified ONET and the internal ONET VLAN information. The tunneled VLAN information is empty initially, but is displayed when ONET manipulation commands are supported.

Syntax

```
show onet onet-id [counters]
```

```
ONET# show onet onet01
Name: onet01
  Onet VLAN:          4075
  Downlink port(s):  15
  VLAN(s):
  Uplink port:       01
ONET# show onets onet01 counters
Name: onet10
  Onet VLAN:          4075
  Downlink port(s):  15
  VLAN(s):
  Uplink port:       01
```

Port	InOctet	InUcast	InDiscard	InErrs	InHCOctet
Ex0/1	0	0	0	0	0

Port	OutOctet	OutUcast	OutDiscard	OutErrs	OutHCOctet
Ex0/1	0	0	0	0	0

Port	InOctet	InUcast	InDiscard	InErrs	InHCOctet
Ex0/15	0	0	0	0	0

Port	OutOctet	OutUcast	OutDiscard	OutErrs	OutHCOctet
Ex0/15	0	0	0	0	0

show onets Command

This command displays the information for all available ONETs. The output shown in this example is for the example topology shown in [“ONET Example Topology” on page 5](#)”.

Syntax

```
show onets
```

```
ONET# show onets
Name: onet10
  Onet VLAN:          4084
  Downlink port(s):  24
  VLAN(s):
  Uplink port:       10
Name: onet09
  Onet VLAN:          4083
  Downlink port(s):  23
  VLAN(s):
  Uplink port:       09
Name: onet08
  Onet VLAN:          4082
  Downlink port(s):  22
  VLAN(s):
  Uplink port:       08
Name: onet07
  Onet VLAN:          4081
  Downlink port(s):  21
  VLAN(s):
  Uplink port:       07
Name: onet06
  Onet VLAN:          4080
  Downlink port(s):  20
  VLAN(s):
  Uplink port:       06
Name: onet05
  Onet VLAN:          4079
  Downlink port(s):  19
  VLAN(s):
  Uplink port:       05
Name: onet04
  Onet VLAN:          4078
```

```
Downlink port(s): 18
VLAN(s):
Uplink port: 04
Name: onet03
Onet VLAN: 4077
Downlink port(s): 17
VLAN(s):
Uplink port: 03
Name: onet02
Onet VLAN: 4076
Downlink port(s): 16
VLAN(s):
Uplink port: 02
Name: onet01
Onet VLAN: 4075
Downlink port(s): 15
VLAN(s):
Uplink port: 01
```

show interfaces description Command

This command displays the status and configuration information for the ports within the switch.

Syntax

```
show interfaces description
```

```
ONET# show interfaces

Ex0/1 up, line protocol is down (not connect)
Bridge Port Type: Customer Bridge Port

Hardware Address is 00:14:4f:6c:63:4f

show vlan Command

This command displays the VLAN membership of the ports within the switch. This command should display the ONET VLANs and the uplink-downlink port members of each VLAN.

In this example, ports 11-14 are unused at this time and are assigned to the default VLAN.

Syntax

show vlan

```
ONET# show vlan

Vlan database

show lldp Command

This command displays the configuration information for LLDP.

Syntax

```
show lldp
```

```
ONET# show lldp  
  
LLDP is disabled  
Transmit Interval      : 30  
Holdtime Multiplier   : 4  
Reinitialization Delay : 2  
Tx Delay               : 2  
Notification Interval : 5  
Chassis Id SubType    : Mac Address  
Chassis Id             : 00:14:4f:6c:63:4f
```

show mac-address-table Command

This command displays the MAC address table learned and published by the switch.

Syntax

```
show mac-address-table
```

```
ONET# show mac-address-table
```

Vlan	Mac Address	Type	Ports
----	-----	----	-----
Total Mac Addresses displayed: 0			

speed port Command

This command sets the link speed for the SFP ports 1 and 2 only. Error messages are displayed when invalid values for the ports or the speeds are used. The link speed is retained even if the switch is reset.

Syntax

```
speed port interface-type interface { 1000 | 10000 }
```

```
ONET# speed port extreme-ethernet 0/3 1000

Port speed can only be changed for ports 1 and 2!
Unknown argument value

ONET# speed port extreme-ethernet 0/2 10001

Port speed can only be set to either 1000 or 10000!
Unknown argument value
```

The default link speed for the SFP ports is 10Gbps. The following output appears for port 1 before the port speed is changed:

```
ONET# show interfaces

Ex0/1 up, line protocol is down (not connect)
Bridge Port Type: Customer Bridge Port

Hardware Address is 00:21:28:c4:53:01
MTU 9216 bytes, Full duplex, 10 Gbps, No-Negotiation
HOL Block Prevention enabled.
Input flow-control is off,output flow-control is off
.....
ONET# speed port extreme-ethernet 0/1 1000
```

The following output appears after the speed is changed:

```
ONET# show interfaces

Ex0/1 up, line protocol is down (not connect)
Bridge Port Type: Customer Bridge Port

Hardware Address is 00:21:28:c4:53:01
MTU 9216 bytes, Full duplex, 1 Gbps, No-Negotiation
HOL Block Prevention enabled.
Input flow-control is off,output flow-control is off
```

exit Command

Use this command to exit ONET.

Syntax

exit

```
ONET# exit

Connection closed by foreign host.
```

write startup-config Command

This command saves the existing configuration and restores it after rebooting.

Syntax

write startup-config

```
ONET# write startup-config
ONET#
```

no onet Command

This command deletes an existing ONET.

Syntax

```
no onet onet-id
```

```
ONET# configure  
ONET#-configure# no onet onet01  
ONET#-configure# end
```

onet Command

This command creates a new ONET. This command enables you to specify the *onet-id* (name), uplink and downlink ports, and the VLAN.

Syntax

```
onet onet-id uport interface-type 1,2-3,4..14 dport interface-type 15,16-17,18...24  
[vlan id 1-4094]
```

```
ONET# configure  
ONET#-configure# onet onet-new uport extreme-ethernet 2 dport  
extreme-ethernet 15,16  
ONET#-configure# end
```

set onet Command

This command modifies an existing ONET. This command enables you to modify the uplink and downlink ports, ONET name, and the VLAN.

Syntax

```
set onet name [uport interface-type 1,2-3,4..14] [dport interface-type  
15,16-17,18...24] [name new-name] [vlan id 1,2,3-4]
```

```
ONET# configure  
ONET#-configure# set onet onet01 uport extreme-ethernet 1 dport  
extreme-ethernet 15,16 vlan id 2000  
ONET#-configure# end
```
