1. Preface

1.1 Introduction

This manual is designed to help acquaint you with the interface between Oracle FLEXCUBE and the ANSER system.

This manual provides you extensive explanations about the various maintenances required for the smooth exchange of data between Oracle FLEXCUBE and the applicable systems through the interface. It also gives you an insight into the processes involved in the actual exchange of data.

1.2 Audience

This manual is intended for the following User/User Roles.

Role	Function
Back office clerk	Input functions for contracts
Back office managers/officers	Authorization functions
Product Managers	Product definition and authorization
End of day operators	Processing during end of day/ beginning of day
Financial Controller / Product Managers	Generation of reports

1.3 Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc>.

1.4 Organization

This manual is organized as follows:

Chapter 1	<i>About this Manual</i> gives information on the intended audience. It also lists the various chapters covered in this User Manual.
Chapter 2	<i>ANSER Interface</i> explains the process of registering Oracle FLEXCUBE customers with ANSER system for initiating transactions and inquiries through ANSER system.
Chapter 3	<i>Function ID Glossary</i> has alphabetical listing of Function/Screen ID's used in the module with page references for quick navigation.

1.5 Abbreviations

Abbreviation	Description
System	Unless and otherwise specified, it shall always refer to Oracle FLEX-CUBE system
EOD	End Of Day
CMS	Card Management System
DD	Direct Debit

1.6 Glossary of Icons

This User Manual may refer to all or some of the following icons.

Icons	Function
	Exit
	Add row
	Delete row
	Option List

1.7 Related Documents

- IF Firm Banking
- IF Direct Debit User Manual

2. ANSER Interface

2.1 Introduction

Oracle FLEXCUBE provides a facility to register Oracle FLEXCUBE customers with ANSER system for initiating transactions and inquiries through ANSER system.

ANSER system is a data transfer system, provided by NTT Data Corporation since 1981, which links banks with corporate customers. Corporate customers using Firm Banking services are usually linked to their banks using the ANSER system.

ANSER system acts as an intermediate channel between corporate customer and Bank. Corporate customer can perform operation/transactions using ANSER system. This transaction/operation request gets routed through ANSER system to the designated bank (where the corporate customer holds the account). Designated bank processes the request and provide response back to the corporate customer's terminal using ANSER system.

Following are the maintenances performed at ANSER network

- ANSER Registration: The corporate customer has to register with the Firm Banking system to access their accounts using ANSER system. The accounts can be of different banks. Access will be based on the PID of the customer with each bank. On registration the customer will be eligible to do transactions and inquires for the accounts under the PID from the ANSER or FB system.
- Zengin Beneficiary Registration: The corporate customer should register the beneficiaries for inter-bank funds transfer at the ANSER system. The verification of the beneficiary is done at the ANSER system.

Following financial transactions are supported from ANSER system are:

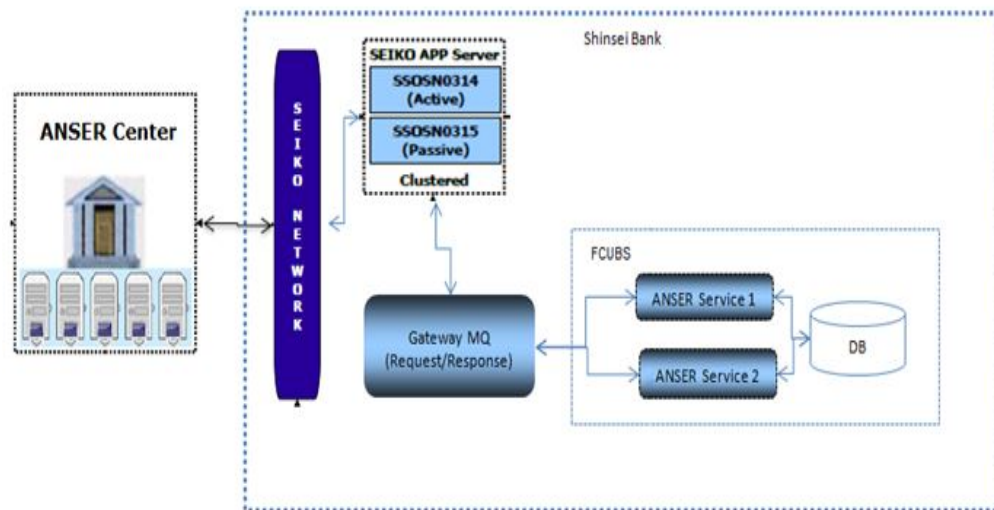

- Funds transfer Request
- Reservation transaction (future dated funds transfer)
- Reservation transactions reversal
- Notice deposit account opening
- Notice deposit full/partial redemption

Following are the Inquiries supported from ANSER system are:

- Fund Transfer Credit Inquiry
- Account Activity Inquiry
- Balance Inquiry
- Fund Transfer Debit Inquiry

2.2 Process Flow

The following diagram depicts the working of the ANSER Interface:

2.3 Registering ANSER File Upload

Following table describes the upload file format. The upload file is a flat file with fixed length of 40 bytes per record, each record is split as per below table:

Item	Name of Item	Attribute	Length	Description
1	PID of the customer	Character	10	PID of the customer who wants to register for ANSER system
2	Account Type	Character	2	Account type of the customer account
3	Account Number	Character	15	Oracle FLEXCUBE customer account number (Account Number includes branch code)
4	Blank space	Character	13	Blank space in file

The system performs the following validation during file upload:

- The system reads each record and identifies individual customers. The customer numbers are identified based on the PID from the incoming file.
- The system performs account number validation of the incoming file.
- The system validates the account number against the PID of the customer in incoming file. If the account number is valid, the system uploads the incoming file record, else the record is not uploaded.
- If any of the value in the incoming file is null or if the file is empty with no records (zero byte file), in such cases, the system will not upload any record.
- All the existing records from the table are deleted before uploading new registration file.

Following table describes the Oracle FLEXCUBE mapping details:

Item	Upload File Fields	Oracle FLEXCUBE Column
1	PID of the customer	PID of the customer
2	Account Type	Account Type
3	Account Number	Account Number

During file upload, the system uploads the registration file records in upload table along with valid customer and customer accounts.

2.4 Configuring Shumoku Codes

Oracle FLEXCUBE allows you to configure a list of Shumoku codes and associate each customer account class with a Shumoku code. You can maintain default account for a customer with a Shumoku code combination.

You should process ANSER transaction requests with the default account maintained for the PID and Shumoku code. During interface processing, the system considers the default account number maintained in the 'Default Account Maintenance' screen (STDDACMT), for the given PID and the Shumoku code for the registration. The system ignores the account number provided as input in the registration and derives the default account number maintained in the 'Default Account Maintenance' screen.

Note

If the default account number is not maintained for the PID and Shumoku code, the registration will be a failure.

2.5 Unit Number Generation and Processing

Oracle FLEXCUBE provides a facility to generate a Unit Number of the Term Deposit. The Unit Number generated will be in a sequence for a Customer PID and Shumoku code combination. You need to map the Shumoku code in the Account Class maintenance.

The system fetches the maximum Unit Number for the Customer PID and Shumoku code combination and increments it. If the Unit Number for the Customer PID and Shumoku code reaches 9999, then the system fetches the minimum Unit Number of a closed Term deposit account for the same combination, which is not in use for any other active Term deposit for reuse. The system then assigns it to the new Term Deposit account which is created.

If the unit number for the Customer PID and Shumoku code combination reaches 9999 and no unit number from the Closed Term Deposit accounts are available for re-use, the subsequent TD creation will be failed with a valid error message 'Unit number for the Customer and the Shumoku code reached the maximum'.

Note

- ANSER TD creation does not have Unit Number in request and Unit Number will be in response in the place of the Deposit Number.

- For ANSER TD Redemption transaction, the system uses the above derivation logic to derive the TD account number using the Customer PID, Shumoku code and Unit number.

2.6 Specifying Interface Definition Details

You can define the format details and properties associated with ANSER interface file in the 'Interface Definition' (GIDINTDF) screen.

Specify the following details:

Interface Code

Specify a unique interface code 'ANSERREG' to identify the interface as incoming. The file name of the interface is ANANTRG.DAT.

For more information on 'Interface Definition', refer to the section 'Specifying Interface Definition Details' in the chapter 'Generic Interface' in Gateway Interface User Manual.

2.7 Invoking GI Process

You can trigger file uploads manually for ANSER interface through 'Interface Trigger' (GIDIFPRS) screen.

Specify the following details:

Interface Code

Specify a unique interface code 'ANSERREG' to identify the interface as incoming. The file name of the interface is ANANTRG.DAT.

For more information on 'Interface Definition', refer to the section 'Specifying Interface Definition Details' in the chapter 'Generic Interface' in Gateway Interface User Manual.

2.8 Processing ANSER Service

The system uses the Existing Request and Response Messaging Queues to pick the inquiry type transaction request and financial type transaction request to send the response back to the queues.

Inquiry Messages

Following table describes the Inquiry messages, which are processed for ANSER system:

Request Message	Response Message	Description
M009	M010	Fund transfer credit inquiry
M011	M012	Account activity inquiry
M013	M014	Balance Inquiry
M023	M024	Fund transfer Debit inquiry

Transfer/Remittance Messages

Following table describes the Financial messages, which are processed for ANSER system:

Request Message	Response Message	Description
M015	M016	FT registered beneficiary (Pre-confirmation)
M017	M018	FT un-registered beneficiary (Pre-confirmation)
M019	M020	FT confirmation for above two types of messages
M021	M022	FT reserve transaction (Future date transaction)
M025	M026	FT cancellation (Pre-confirmation)
M027	M028	FT cancellation (confirmation)

Following are the MDBs based services handled in FCUBS:

- **ANSER service 1:** This MDB reads and picks the inquiry type of transaction in Request Message queue of Gateway server and provides response results in response message queue of Gateway server.
- **ANSER service 2:** This MDB reads and picks the financial type of transaction in Request Message queue of Gateway server and provides response results in response message queue of Gateway server.

2.9 Maintaining ANSER Parameters

You can maintain the parameters for ANSER Interface in the 'ANSER System Parameters Maintenance' screen. You can invoke this screen by typing 'STDANPRM' in the field at the top right corner of the Application tool bar and clicking the adjoining arrow button.

Specify the following details:

Parameter Name

Specify the name of the parameter. Alternatively, you can select the parameter name from the option list. The list displays all the valid parameter name maintained in the system.

Parameter Description

Specify the description of the parameter.

Parameter Value

Specify the value of the parameter.

You can define the values of all the attributes which can be parametrized. Parametrization would be done for the below mentioned attributes. Following table describes the parameter details:

Parameter Name	Parameter Description
ANSER_MAKERID	ANSER Maker ID
ANSER_CHECKERID	ANSER Checker ID
ANSER_SOURCE_CODE	ANSER Source Code. The value will be other then Oracle FLEXCUBE.
PM_SOURCE	Payment Source
PM_CHG_EXTCOMP	Payment Charge External Component
TD_ANSER_ACC_CLASS	Account Class

Parameter Name	Parameter Description
TD_ANSER_CHANNEL_ID	Channel ID
TD_ANSER_LOCATION	Location
TD_ANSER_MEDIA	Media

2.10 Processing ANSER Financial Transaction Request

After receiving the Financial Transaction online message from ANSER service 2, the system will first decode the message and store the data into ANSER transaction data source. The system checks whether the ANSER account is eligible for ANSER transaction or not based on the ANSER registration. If not registered, the system will not process the transaction and response back with error.

If the PID is registered for ANSER transaction, the system will send the transaction for processing based on the Message Type, Operation Code and Service Code.

Message Type	Operation Code	Service Code	Beneficiary Registered	Transaction Code	Transaction
M015	G008	71/74/75	Yes	T009	Current Dated PM Transaction/ Notice Deposit Opening/ Notice Deposit Redemption
M015	G009	76/77/78	Yes	T009	Future Dated PM Transaction/ Notice Deposit Opening/ Notice Deposit Redemption
M017	G010	86	No	T010	Future Dated PM Transaction
M019	G008	71/74/75	Yes	T011	Authorization of Current Dated PM Transaction/ Notice Deposit Opening/ Notice Deposit Redemption
M019	G009	76/77/78	Yes	T012	Authorization of Future Dated PM Transaction/ Notice Deposit Opening/ Notice Deposit Redemption

Message Type	Operation Code	Service Code	Beneficiary Registered	Transaction Code	Transaction
M021	G010	86	No	T012	Authorization of Future Dated PM Transaction
M025	G012	79	NA	T014	Recall of PM Transaction
M027	G012	79	NA	T015	Authorization of Recall of PM Transaction

Oracle FLEXCUBE will receive the beneficiary details for ANSER service, which is registered in ANSER Gateway. If the beneficiary details are not set in the request message, the system recalls the transaction.

Note

- While processing ANSER transaction, the source code should be parametrized and mapped against the parameter name ANSER_SOURCE_CODE.
 - Maker ID and the Checker ID of the transaction should be parametrized and mapped against the parameter NAME ANSER_MAKERID and ANSER_CHECKERID respectively.
 - Maker ID and Checker ID created for ANSER should not have auto authorization parameter unchecked.
 - In the Upload Source Preference Maintenance, the post upload status must be unauthorized for ANSER source code.
-

Once the transaction is processed, the system builds the response and sends it to the response queue.

2.11 Processing Payment Reserve Transaction (future date transaction)

You can send funds transfer request to Oracle FLEXCUBE Payments for creating outgoing payment with transfer type 'Customer Transfer'.

The source code of the outgoing payment is parametrized. You can maintain payment source in the 'Source Maintenance' (PMDSORCE) screen.

Specify the following details:

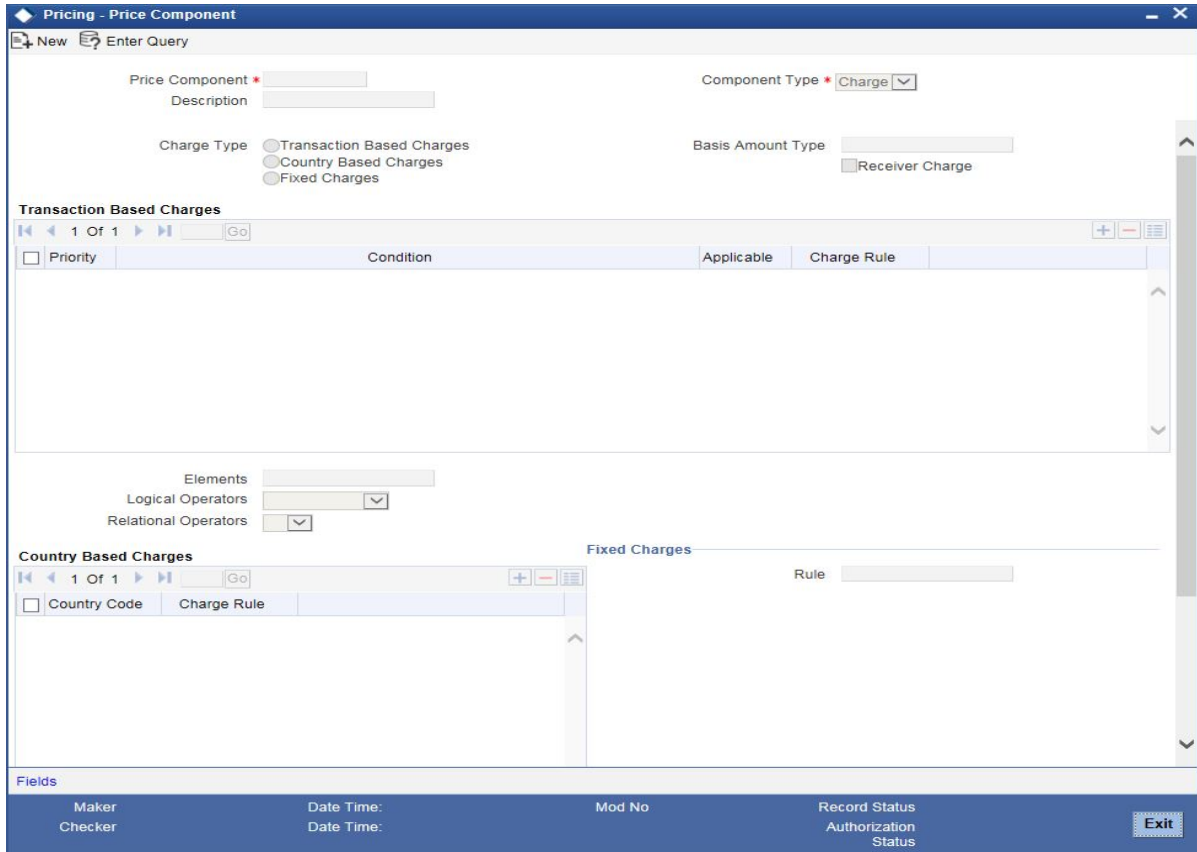

Source Code

Specify the source code for sending funds transfer request from ANSER.

This source code will be mapped against param name PM_SOURCE in ANSER Parameters Maintenance (STDANPRM).

For more information on 'Payment Source', refer to the section 'Maintaining Payment Source' in the chapter 'Maintenance Required for Processing FLEXCUBE Payments' in FLEXCUBE Payments User Manual.

You can maintain price component for an external component code.

Specify the following details:

Price Component

Specify the price component for an external component code.

This external component is parametrized and mapped against parameter name PM_CHG_EXTCOMP in ANSER Parameters Maintenance (STDANPRM).

Following table describes the input parameter for creating payment transaction:

FT transaction /FT reserve transaction

Payment Transaction Fields	ANSER Message fields
Source Code	Parametrized
Transfer Type	C-Customer Transfer
Product Type	Outgoing payment
Mode of Payment	A-Account
Branch Code	ANSER contract/branch code
Book Date	System Application Date

Payment Transaction Fields	ANSER Message fields
Customer No	To be derived from ANSER contract/account No..The customer no would be fetched from customer account maintenance
Instruction Date	Transfer date
Transfer Currency	JPY
Transfer Amount	Transferred amount
End to End ID	Process ID
Transaction ID	ANSER transaction No.
Contract Reference No	Generated by the system
Alternate Reference Number	Account System transaction No.
Message Reference	None

Debtor Details

Payment Transaction Fields	ANSER Message fields
Account ID Number	ANSER contract/account No. + Branch Code = PID. Using PID and ANSER contract/ deposit category code we can fetch the default account number from ANSER registration maintenance
Account Currency	JPY
Account Branch	ANSER contract/branch code
Account Type	Need to be derived from Account ID Number

Creditor Details

Payment Transaction Fields	ANSER Message fields
Account ID Number	Transfer destination/account No. + Branch Code
Account Currency	JPY
Account Branch	Transfer destination/branch code
Account Type	Need to be derived from Deposit Category

After creating PM outgoing transactions, the system sends the payment message to WBNK

2.12 Processing Notice Deposit Opening Request

The Notice Deposit Opening request is sent to Term Deposit module to create TD Customer Account. The transaction will be in unauthorized status. Following process followed while processing Notice Deposit Opening Request:

- The Account Class for creation of the TD is parametrized. In 'Account Class Maintenance', you can create an account class before processing Notice Deposit Opening request from ANSER. The account class should be mapped against parameter name TD_ANSER_ACC_CLASS in 'ANSER Parameters Maintenance' (STDANPRM).
- The Channel ID for creation of the TD is parametrized. In 'Channel ID Maintenance', a Channel ID is created before processing any Notice Deposit Opening request from ANSER. The new Channel ID should mapped against parameter name TD_ANSER_CHANNEL_ID in ANSER Parameters Maintenance (STDANPRM).
- Location and Media is parametrized. The Location and Media should be mapped against parameter name TD_ANSER_LOCATION and TD_ANSER_MEDIA 'respectively in 'ANSER Parameters Maintenance' (STDANPRM).
- The Payout Off Set Account should be Oracle FLEXCUBE customer account.

Following table describes the input parameter for creating TD Customer Account:

TD Opening Fields	ANSER Message Fields
Customer No	To be derived from ANSER contract/account No.
Account Class	Parametrized
Channel ID	Parametrized
Deposit Currency	JPY
Deposit amount	Transfer amount
Close on maturity	Checked
Pay In Option	Account
Pay In Off Set Account	ANSER contract/account No. + Branch Code = PID. Using PID and ANSER contract/deposit category code, you can fetch the default account number from ANSER registration maintenance
Pay Out Option	Account
Pay Out Off Set Account	Transfer Destination: Account No. + Branch Code

If the number of call deposits is more than one, the system creates multiple notice deposit and sends multiple responses for single request. The transfer amount of each deposit is equal to the Total Transfer Amount divided by Number of Call Deposits.

The system generates the Deposit Number and sends back to ANSER. Based on the Notice deposit number, the deposit is redeemed.

2.13 Processing Notice Deposit Redemption

The Notice Deposit Redemption request is sent to Term Deposit module to create TD Redemption transaction. The transaction will be in unauthorized status. Partial Redemption is allowed for ANSER system. For the last redemption of a deposit transfer, the amount should be equal to the balance deposit amount or balance deposit amount + interest.

Following table describes the input parameter for creating TD Redemption:

TD Redemption Fields	ANSER Message Fields
Account Number	Deposit No
Redemption Mode	Partial
Redemption Amount	Transfer amount
Pay Out Option	Account
Pay Out Off Set Account	Transfer Destination: Account No. + Branch Code

2.14 Processing Payment Recall Transaction

The Recall Transaction request is sent to Oracle FLEXCUBE payments to create recall request. The transaction will be in unauthorized status.

Following table describes the input parameter for Payment Recall Request:

FT Recall Request	
Recall Request Fields	Mapping Field
Source Code	The source code for recall request. This will be the source code of the original transaction
Contract Reference Number	Will be derived from Acceptance No
Branch Code	ANSER contract/branch code

Note

- Recall Reason Code is not be available in the ANSER request.
- Recall is possible only if the status of the original transaction is active or liquidated
- If 'Recall Allowed' option is Yes before dispatch, the recall request date should be less than the recall by date. The Recall By date is computed by adding the recall

days, based on the calendar basis, to the activation date. In this option, the recall by date will be least of messaging date and the computed recall by date.

2.15 Processing Payment Transaction Confirmation

For un-authorized payment, transaction request message is sent to confirm the transaction. Confirmation is provided based on the execution type. If the execution type value is 1 or 2, the un-authorized payment transaction is authorized. If the execution type value is 9, the un-authorized PM transaction will be undo.

2.16 Processing Notice Deposit Opening Confirmation / Redemption Confirmation

For un-authorized Notice Deposit Opening/Redemption, request message is sent to confirm the transaction. The confirmation is provided based on the execution type. If the execution type value is 1, the un-authorized Notice Deposit Opening/Redemption is authorized. If the execution type value is 9 then the un-authorized Notice Deposit Opening/Redemption transaction will be undo.

2.17 Processing Payment Recall Request Confirmation

For un-authorized payment, Recall Request message is sent to confirm the transaction. The confirmation is provided based on the execution type. If the execution type value is 1 then the un-authorized payment transaction is authorized. If the execution type value is 9, the un-authorized PM transaction will be undo

2.18 Processing ANSER Inquiry

The ANSER system will send the request to Oracle FLEXCUBE with all the mandatory fields required for processing the request. Oracle FLEXCUBE derives or fetches the account number from the ANSER request and checks if it is registered for performing ANSER Inquiries.

If not registered, Oracle FLEXCUBE will not process the Inquiry request and sends a response an with error message. If registered, Oracle FLEXCUBE will process the inquiry request and respond with transaction details initiated from ANSER system or supported with ANSER system.

After processing the inquiry, the system builds the response and sends it to the response queue. If there are more than 10 transactions fetched for the inquiry request, the system sends multiple responses for single inquiry request with each response carrying maximum 10 transactions.

ANSER system sends requests for following inquiries:

2.18.1 Processing Funds Transfer Credit Inquiry

In Fund Transfer Credit Inquiry only the credit entries are queried for the account and response is sent back to the ANSER system. Below is the request message sent for processing based on message type, operation code, and service code.

Message Type	Operation Code	Service Code	Transaction Code	Inquiry
M009	G003	21	T006	Fund Transfer Credit Inquiry without date input: Indicates no dates input will be passed as part of request for processing and all the credit entries for the account initiated from ANSER system or supported by ANSER system need to be responded back.

Message Type	Operation Code	Service Code	Transaction Code	Inquiry
M009	G006	21	T006	Fund Transfer Credit Inquiry without date input: Indicates no dates input will be passed as part of request for processing and all the credit entries for the account initiated from ANSER system or supported by ANSER system need to be responded back.
		31	T006	Fund Transfer Credit Re-Inquiry (Today): Indicates only Current system working day's credit entries for the account initiated from ANSER system or supported by ANSER system need to be responded back.
		41	T006	Fund Transfer Credit Re-Inquiry (Yesterday): Indicates only previous working day credit entries for the account initiated from ANSER system or supported by ANSER system need to be responded back.
		51	T006	Fund Transfer Credit Re-Inquiry (Two days before): Indicates only two days before working day's credit entries for the account initiated from ANSER system or supported by ANSER system need to be responded back. Result will not include previous and current working days credit entries.

Following are the request parameters required for processing:

Item	ANSER Request Field	Oracle FLEXCUBE Column	Comment
1	ANSER Contract / Branch Code	Alternate Customer Number	Combination of ANSER branch and account number from request will be the PID of the account number registered for processing ANSER transaction. Account number need to be fetched from the ANSER registration data source for the PID.
2	ANSER Contract / Account No		

After processing the transaction, the response is build and send back to ANSER system.

For any request, the transaction limit is 999, which is sent as response to the ANSER system. If the transaction fetched is more than 999, the system sends an error message to ANSER system.

If the value for acquisition request number (transaction sequence number) field is passed in the inquiry request, the system adds the transaction details for that sequence number to the response and replies back to ANSER system.

2.18.2 Processing Account Activity Inquiry

Account activity inquiry for account contains all the transaction activities related to the account, which is processed and responded to the ANSER system.

Following are the request message sent for processing based on message type, operation code and service code:

Message Type	Operation Code	Service Code	Transaction Code	Inquiry
M011	G004	24	T007	Account Activity Without Date input: Indicates no dates input will be passed as part of request for processing and all the credit and debit entries for the account initiated from ANSER system or supported by ANSER system need to be responded back.

Message Type	Operation Code	Service Code	Transaction Code	Inquiry
M011	G007	24	T007	Account Activity Without Date input: Indicates no dates input will be passed as part of request for processing and all the credit and debit entries for the account initiated from ANSER system or supported by ANSER system need to be responded back.
		27	T007	Account Activity With Date input: Indicates dates will be passed as part of request for processing account activity inquiry.
		37	T007	Account Activity Re-Inquiry With Date input: Indicates dates will be passed as part of request for processing account activity inquiry.

Following are the request parameters required for processing:

Item	ANSER Request Field	Oracle FLEXCUBE Column	Comment
1	ANSER Contract / Branch Code	Oracle FLEXCUBE Customer Account Number	Combination of ANSER branch and account number from request will be the PID of the account number registered for processing ANSER transaction. Account number need to be fetched from the ANSER registration data source for the PID.
2	ANSER Contract / Account No		

After processing the transaction, the system will build the response and sends it back to ANSER system.

For any request, the transaction limit is 999, which is sent as response to the ANSER system. If the transaction fetched is more than 999, the system sends an error message to ANSER system.

If the value for acquisition request number (transaction sequence number) field is passed in the inquiry request, the system adds the transaction details for that sequence number to the response and replies back to ANSER system.

During re-inquiry with inquiry type as 2, the system sends only the incremental transactions performed through ANSER system.

For re-inquiry, the last contact reference need not be fetched based on the previous sent inquiry response and any transactions after the last contact reference need not to be responded back. If no inquiry response is sent before, in such cases all the transactions should be responded back to ANSER system.

2.18.3 Processing Balance Inquiry

While processing balance inquiry, the system queries only the available balance for the account and sends the response to the ANSER system. Following are the request message sent for processing based on message type, operation code and service code:

Message Type	Operation Code	Service Code	Transaction Code	Inquiry
M013	G005	11	T008	Balance Inquiry (Today): Indicates that only current system working day's balance need to be responded back for the account.
		12	T008	Balance Inquiry (Yesterday): Indicates that only previous working day's balance need to be responded back for the account.

Following are the request parameters required for processing:

Item	ANSER Request Field	Oracle FLEXCUBE Column	Comment
1	ANSER Contract / Branch Code	Alternate Customer Number	Combination of ANSER branch and account number from request will be the PID of the account number registered for processing ANSER transaction. Account number need to be fetched from the ANSER registration data source for the PID.
2	ANSER Contract / Account No		

After processing the transaction, the system build the response and sends it back to the ANSER system.

2.18.4 Processing Fund Transfer Debit Inquiry

In Fund Transfer Debit Inquiry, the system queries only the debit entries for an account and sends the response to the ANSER system. Following are the request messages send for processing based on message type, operation code and service code:

Message Type	Operation Code	Service Code	Transaction Code	Inquiry
M023	G011	73	T013	Debit Transfer Inquiry: Indicates all the debit entries for the account initiated from ANSER system or supported by ANSER system need to be responded back

Following are the request parameters required for processing:

Item	ANSER Request Field	Oracle FLEXCUBE Column	Comment
1	ANSER Contract / Branch Code	Alternate Customer Number	Combination of ANSER branch and account number from request will be the PID of the account number registered for processing ANSER transaction. Account number need to be fetched from the ANSER registration data source for the PID.
2	ANSER Contract / Account No		

After processing the transaction, the system builds the response and sends it back to the ANSER system.

For any request, the transaction limit is 999, which is sent as response to the ANSER system. If the transaction fetched is more than 999, the system sends an error message to ANSER system.

If the value for acquisition request number (transaction sequence number) field is passed in the inquiry request, the system adds the transaction details for that sequence number to the response and replies back to ANSER system.

2.19 Processing Batch

You can process batch for future dated payment transaction file hand-off. You need to maintain the interface details in the Interface Definition screen (GIDIFTDF) for outgoing payment transaction file.

The screenshot shows the 'Interface Definition' window with the following sections and fields:

- Justification:** Date, Number, Text, Frequency Type (Daily), Day, Month, Date, Last Run Date, Next Run Date.
- Padding Character:** Date, Number, Text, Pre Message AUDF, Post Message AUDF.
- Incoming:** Function, Processed File Mask, Default Action (New), On Override (Reject), Outgoing Interface, Incoming File Mask, Log Output.
- Schedule Details:** Schedule checkbox, Start Time (Hour: 0, Min: 0), End Time (Hour: 23, Min: 59).
- Parallel Process:** Parallel Process Required checkbox, Parallel Process dropdown, No Of Records, No Of Parallel Process.
- Other Fields:** Branch Code, External System, Format Type (Fixed), File Path, Filemask, CRC Algorithm, CRC File Mask, CRC File Path, SKIP, Suppress Record Reference, Commit/Fetch Frequency, Date Format (YYYYMMDD), No Of Executions/Day (1), Duplication File Check Required For Current Date, Interface Code, Delimiting Character, Confirmation File Required, When To Run (Mandatory), Triggering (Manual), Confirmation File Mask, Confirmation File Path.

At the bottom, the 'Component Details' table is shown with the following structure:

Maker	Checker	Date Time:	Date Time:	Mod No	Record Status	Authorization Status
-------	---------	------------	------------	--------	---------------	----------------------

An 'Exit' button is located in the bottom right corner of the table area.

Specify the following details:

Interface Code

Specify a unique interface code 'ANSERHOF' for outgoing payment transaction file.

File Mask

Specify the file mask as '/A/N/S/E/R/_/F/U/T/U/R/E/_/T/X/N/.C/S/V'.

All the future dated transactions should be written to a file and placed in pre defined file path maintained in file path of the Interface Definition screen (GIDIFTDF).

You can manually trigger the generation of the outgoing file using Interface Trigger screen (GIDIFPRS). You can also scheduled the automatic generation of the outgoing file by selecting 'when to run' parameter in the Interface Definition screen (GIDIFTDF).

GI should query future dated payment transactions, which is initiated from ANSER and generate ANSER_FUTURE_TXN.CSV file.

For more information on 'Interface Definition', refer to the section 'Specifying Interface Definition Details' in the chapter 'Generic Interface' in Gateway Interface User Manual.

Header and details in the file must be in fixed format separated by commas, the file format is as follows:

File format

File Type	Fields Seperated by commas
Header	ANSER_TXN_NO,ACCT_SYSTEM_TXN_NO,COD_MEMBER_NO,COD_SND_ACCT,COD_SND_EX-T_ACCT,COD_SND_ACCT_TYP,NAM_SND_BANK_BRN,DAT_TXN_STR,DAT_POST_STL,DAT_TXN,VALUE_DATE,NAM_RCV_BANK_BRN,COD_RCV_EXT_ACCT,COD_RCV_ACCT_TYP,AMT_TXN_LCY,AMT_TXN_FEE_LCY,MESSAGE1,MESSAGE2,COD_STATUS,COD_TXN_TYPE
Detail	Details values must be written to file in fixed format separated by commas by referring the header columns

Note

If records are not fetched for the future dated transaction, then system generates the ANSER_FUTURE_TXN.CSV file only with the header details.
