# Preface

Welcome to the JD Edwards EnterpriseOne documentation.

## Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc>.

## Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info> or visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs> if you are hearing impaired.

## Related Information

For additional information about JD Edwards EnterpriseOne applications, features, content, and training, visit the JD Edwards EnterpriseOne pages on the JD Edwards Resource Library located at:

<http://learnjde.com>

## Conventions

The following text conventions are used in this document:

Convention	Meaning
<b>Bold</b>	Boldface type indicates graphical user interface elements associated with an action or terms defined in text or the glossary.
<i>Italics</i>	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
<b>Monospace</b>	Monospace type indicates commands within a paragraph, URLs, code examples, text that appears on a screen, or text that you enter.
<b>&gt; Oracle by Example</b>	Indicates a link to an Oracle by Example (OBE). OBEs provide hands-on, step-by-step instructions, including screen captures that guide you through a process using your own environment. Access to OBEs requires a valid Oracle account.

# 1 Introduction to JD Edwards EnterpriseOne Product Packaging

## JD Edwards EnterpriseOne Product Packaging Overview

Oracle's JD Edwards EnterpriseOne Product Packaging describes the different methods used to package JD Edwards EnterpriseOne objects and data so that they can easily be moved from one machine to another. You can use the Object Packaging Tools or Software Mastering Tools to package and move the objects and data.

The Object Packaging Tools provide a streamlined alternative to using the full set of Software Mastering Tools. There are two methods for using the Object Packaging Tools. The first method uses Object Management Workbench (OMW) to provide a simple way to transfer a single newly-developed or customized object from one machine to another in order to test it or to continue development. The second method uses Configuration Assistant to easily develop and package configurations and reuse the intellectual property that you have developed.

The full set of Software Mastering Tools gives you the ability to create your own software mastering processes. In this capacity, the tools oversee the entire mastering process from defining a software master to mastering a CD. The tools start with the definition process, where you provide as much initial information as possible. After you enter the critical information, the tools provide batch processes to validate the software mastering information before mastering, to master the software, and to validate the final software master image. This process gives you the ability to determine which objects should be shared between locations and create a custom installation that can be burned onto a CD. Then the CD can be used to deploy this custom installation anywhere within the enterprise.

## JD Edwards EnterpriseOne Product Packaging Implementation

JD Edwards EnterpriseOne standardizes and automates software installation, making many steps transparent to users. Technical setup is preconfigured to meet the requirements of many JD Edwards EnterpriseOne customers. In addition, JD Edwards EnterpriseOne products are preintegrated and share a common database, which reduces the implementation process, minimizes ongoing administration, and provides customers with the flexibility to add new applications, modules, and tools as needed.

# 2 Understanding Product Packaging

## Software Change Management

Prompted by the move to distributed client and server environments, software change management has assumed increasing importance. Customers want software that maximizes their return on investment. Development cycles are shrinking, and companies need to maintain a competitive advantage and speed up time to market. In addition, development environments today are more complex than ever. Organizations may have hundreds or even thousands of developers distributed around the world. It has never been more challenging to manage maximum developer productivity while ensuring high-quality and rapid deployment cycles.

Change management includes the following areas:

### **Version Control**

This encompasses the check-in and checkout or revision management of code, models, and so forth.

### **Build Management**

This represents the re-creation of an application for various revisions.

### **Promotion Management**

This is the control of logical and physical movement of code between development, testing, and production.

### **Release Management**

This is the notification and electronic distribution of software.

### **Problem Tracking**

This is the reporting, tracking, and resolution of application problems.

### **Configuration Management**

This encompasses the management of both physical level software components (source code) and logical level components (specification components, design diagrams, and so forth).

### **Project Management**

This includes project planning and scheduling, task assignment, and tracking.

### **Distributed Code Management**

This encompasses managing and synchronizing code from multiple geographic locations.

## Distributed Development

Distributed development refers to the ability to perform development using one installation of JD Edwards EnterpriseOne and deploying that development to another installation.

For example, a developer in Paris could create new objects using the Paris installation of JD Edwards EnterpriseOne. An administrator in Paris could then use the JD Edwards EnterpriseOne Product Packaging Tools to create a CD that includes those new objects. This CD could be shipped to London where an administrator updates the London installation of JD Edwards EnterpriseOne (assuming that both installations are at the same release level). The JD Edwards EnterpriseOne Product Packaging Tools described in this guide provide this functionality.

This ability should not be confused with remote development, which is the creation of JD Edwards EnterpriseOne objects by a developer who is completely disconnected from any installation. With remote development, the developer can connect to a JD Edwards EnterpriseOne installation later and merge those objects.

JD Edwards EnterpriseOne Product Packaging helps manage the complex development environment by enabling you to synchronize development teams across remote locations or multiple platforms.

JD Edwards EnterpriseOne Product Packaging can assist in overcoming some of the challenges of distributed development such as:

### **Multiple Physical Locations**

Increasingly, development organizations are located across multiple physical locations, from adjacent buildings to across continents.

### **Multiple Platforms**

Not only may your developers be in different physical locations, they may also be developing on and for multiple platforms.

### **Outsourcing and Contractors**

In addition, the use of outsourcing and subcontractors has exploded in the software industry. A challenge for many organizations involves tracking the software source code that third-party software vendors provide. The software may be being built not only on Oracle software, but also on vendor software.

### **Localizations**

Finally, things become even more complex when you need to make local changes to the supplied software. All of these factors create an urgent need for management of software across multiple geographically dispersed locations.

## Object Packaging

Object packaging provides a very simple way to move any JD Edwards EnterpriseOne object from one machine to another through the creation of a zip file that contains compressed files and directories. The zip file, called a PAR file, can consist of JD Edwards EnterpriseOne objects from either local specifications or from central objects. Depending on the purpose of the PAR file, it may also contain:

- JD Edwards EnterpriseOne objects in an XML metadata specification file format.
- Data dictionary items, user-defined codes, and new tables in XML file format.
- Deployment components and a schedule of tasks to be performed, as well as documentation on these components and tasks.
- Oracle Business Accelerator (OBA) files such as the Business Accelerator Schedule file, help files, and business process documentation.
- Data PAR files that contain base configuration data for OBA.

Use object packaging within Object Management Workbench to create PAR files from local specifications. Use object packaging within Configuration Assistant to create PAR files from central objects. Once a PAR file is created, it can be easily transported from one machine to another (for example, through email or a USB flash drive).

## Software Mastering Tools

Oracle's JD Edwards EnterpriseOne Software Mastering Tools are used to perform these basic processes for JD Edwards EnterpriseOne Product Packaging:

- Package definition.
- Batch process to validate the definition.
- Batch process to master the software.
- Batch process to validate the master image.

The tools used for mastering are:

### **Software Mastering Director (P9640)**

Oracle's JD Edwards EnterpriseOne Software Mastering Director automates many routine, repetitive, and time-consuming mastering tasks, reducing manual processes and increasing control. In addition, verification and master reports inform you about each step of the process.

The JD Edwards EnterpriseOne Software Mastering Director application:

- Provides the ability to build a mastered version of objects or modules.
- Uses a series of batch processes (UBEs) and manual tasks that build all of the components of a master.
- Creates a final product that is an image master in a tree format, which administrators can burn onto a CD.
- Provides verification and master status reports.

### **Change Table Configuration Director (P9642)**

Oracle's JD Edwards EnterpriseOne Change Table Configuration Director enables you to share code across all or some of the locations. JD Edwards EnterpriseOne keeps an inventory of code and data changes in files known as change tables. The JD Edwards EnterpriseOne Change Table Configuration Director provides a JD Edwards EnterpriseOne administrator with the ability to define how a module's change tables are to be built. You can even use the Director to define a source set of changes and move them to multiple target development locations.

The JD Edwards EnterpriseOne Change Table Configuration Director:

- Defines which change tables are to be included.
- Specifies multiple target and source release combinations.
- Runs change tables from a central master batch process (UBE).

### **Data Cleanup Procedure Application (P9646)**

Use Oracle's JD Edwards EnterpriseOne Data Cleanup application to create procedures and templates to clean up the software master data. The data cleanup application can delete obsolete data, standardize existing data, and provide integrity, summary, and error reports about the data. You can clean up these items:

- Data Dictionary tables and specifications.
- Autopilot tables.
- User-defined codes and types.
- Menu tables.
- Object Librarian tables.
- Central Objects tables.

# 3 Working with Object Packaging

## Using Object Packaging in Object Management Workbench

JD Edwards EnterpriseOne Object Management Workbench (OMW) is the primary component of the change management system for EnterpriseOne development. A change management system is vital to a productive development environment because it helps organize a myriad of development activities and helps prevent problems, such as when a developer intermixes components from different releases or when multiple developers simultaneously change an object. JD Edwards EnterpriseOne OMW automates many of these change management activities.

OMW provides a way for developers to save and restore an entire OMW project or individual JD Edwards EnterpriseOne objects from their local specifications. This provides a simple way to backup development work or move objects between machines. For example, a developer may need to pass their JD Edwards EnterpriseOne objects to a quality engineer for testing.

See [JD Edwards EnterpriseOne Tools Object Management Workbench Guide](#) .

### Saving an Object to a PAR File

Object packaging within OMW is the mechanism by which you can save and restore your OMW project or JD Edwards EnterpriseOne objects from and to local specifications. This is done by using a PAR file. A PAR file is similar to a zip file in that it contains compressed files and directories. Developers can use OMW to create PAR files for individual objects in order to easily transfer the object to another machine for testing or further development. JD Edwards EnterpriseOne objects are stored in XML format within the PAR files.

To save an object to a PAR file, access JD Edwards EnterpriseOne OMW.

1. In JD Edwards EnterpriseOne OMW, select the object or project that you want to save.
2. Click the Save button in the center column.

The jdeomw dialog box appears. OMW provides two methods with which to save an object. The first method is to save the object to a zip file. If you save the object to a zip file, OMW saves the object or project as a local copy in a PAR file format, which is compatible with Zip, Jar, and JD Edwards Change Assistant technologies. The second method is to save the object to a shared database location.

3. Click Yes to save the object to a zip file.
4. On the Select Folder form, search for and select the folder to which you want to save the object, and then click Open.

OMW creates a PAR file for your object at the specified location. You can copy the PAR file to email or portable storage and easily move it to another machine.

### Restoring an Object from a PAR File

To restore an object from a PAR file, access JD Edwards EnterpriseOne OMW.

1. In JD Edwards EnterpriseOne OMW, select the object or project that you want to restore.

2. Click the Restore button in the center column.
3. On the Overwrite/Delete Specs Confirmation window, click Yes.

The jdeomw dialog box appears and provides options for you to choose from where you want to restore the object. You can choose to restore the object from a zip file, or to restore the object from the Save location specified by the OMW administrator.

4. Click Yes to restore the object from a zip file.

**Note:** If you have saved at the object level, you will restore at the object level. If you have saved at the project level, you will restore at the project level. To restore individual objects from the project, you can use WinZip to open the PAR file and extract the individual objects.

5. On the Select Folder form, search for and select the PAR file from which you want to restore the object or project, and then click Open.

OMW restores the object or project. For objects that are new, all appropriate information is created. All actions are logged by the system.

**Note:** You can use OMW Allowed Actions to limit access to the save/restore functionality if necessary.

## Using Object Packaging in Web OMW

Web OMW is specific to User Defined Objects. You can see all projects and all objects from either version of OMW. However, the development client version can only operate on non-UDO objects, and Web OMW can only operate on UDOs. An OMW project can contain only all UDOs or all non-UDO. The only exception is the user's default project. It can contain a combination of both types.

Web OMW provides a way to save and restore an entire OMW project or individual JD Edwards EnterpriseOne UDOs into a zip file. This provides a simple way to move objects between path codes or machines.

See [JD Edwards EnterpriseOne Tools Object Management Workbench Guide](#) .

## Exporting a User Defined Object to a Zip File

Object packaging within web OMW is virtually the same as within OMW, except that it uses zip files to package the UDOs instead of PAR files.

To export a UDO to a zip file, access web OMW.

1. In web OMW, find the UDO or project that you want to export.
2. If the UDO or project is available to export, you will see an icon in the Export column of the grid for that row. Click the Export icon.
3. On the Select Folder form, search for and select the folder to which you want to save the UDO, and then click Save.

Web OMW creates a zip file for your UDO at the specified location. You can copy the zip file to email or portable storage and easily move it to another machine.

4. Close the File Download form.

**Note:** You can also export UDOs or projects containing UDOs via zip file using the Work with Repository History (P98700H) application. When you use the Export row exit from this application, the zip file is created from the UDO's most recent F98700H history record and is downloaded to your local client.

## Importing a User Defined Object from a Zip File

To import a UDO from a zip file, access web OMW.

1. In web OMW, select the UDO or project that you want to import.
2. If the UDO or project is available to import, you will see an icon in the Import column of the grid for that row. Click the Import icon.
3. On the File Upload form, click browse.
4. On the File Upload form, find and then select the zip file that you want to import, and then click Open.
5. Click Load to import the zip file.

**Note:** If you have saved at the object level, you will restore at the object level. If you have saved at the project level, you will restore at the project level. To restore individual objects from the project, you can use WinZip to open the file and extract the individual objects.

6. OMW restores the object or project. For objects that are new, all appropriate information is created. All actions are logged by the system.

**Note:** You can use OMW Allowed Actions to limit access to the import/export functionality if necessary.

7. At this point the imported objects are at a status of 07, Pending Promote. You must use the Approve/Share option from P98220U or P98220W in order to make the reports available to users.

The Approve/Share action extracts the data and artifacts from the zip repository and loads the runtime tables and target locations.

## Using Object Packaging in Configuration Assistant

This section provides an overview of JD Edwards EnterpriseOne Configuration Assistant and discusses how to include JD Edwards EnterpriseOne objects in a configuration.

## Understanding JD Edwards EnterpriseOne Configuration Assistant

The Configuration Assistant is a standalone Java-based tool provided by Oracle that allows you to extract a subset of JD Edwards EnterpriseOne configuration information into a portable archive. This data can then be loaded into any other JD Edwards EnterpriseOne environment using Change Assistant.

The Configuration Assistant provides another simple method to package JD Edwards EnterpriseOne objects as well as data and other configuration items. The Configuration Assistant is used with Oracle Business Accelerators (OBA) to assist you with the setup and configuration of business data, program versions, task views, user-defined codes (UDCs), and JD Edwards EnterpriseOne objects. Using Configuration Assistant, you can specify the configuration elements that you want to package, including objects, tables, versions, UDCs, security records, and task views. You can also specify

the loading instructions for each configuration element into the target environment, which include whether to replace tables, replace records, or append records.

**Note:**

- Online help within the Configuration Assistant application.
- *JD Edwards EnterpriseOne Tools Configuration Assistant User's Guide* .
- *"Using Change Assistant" in the JD Edwards EnterpriseOne Tools Software Updates Guide*

## Including JD Edwards EnterpriseOne Objects in a Configuration

To include JD Edwards EnterpriseOne objects in a configuration:

1. Within Change Assistant, select Tools, Configuration Assistant.
2. In Configuration Assistant, select an existing configuration or add a new configuration.
3. Use the Search tab to find OMW projects and objects.

When running UDO-enabled environments, you can search for UDOs using a user defined objects search category. UDOs are included just like all of the other object types. They display within projects the same way that other objects do. They consist of the following object types: E1PAGE, QUERY, WATCHLIST, CAFE1, FORMAT, and ONEVIEW.

4. Select the projects and objects that you want to include in the configuration.
5. Select other items, such as tables and UDCs, that you want to include in the configuration.
6. Click the Extract Configuration Data button.

The Extract Status window appears and displays the status of the extraction as it occurs.

7. Click the Report button or look at the status bar to see if the extraction was successful.

A PAR file containing the selected objects is created and placed in your configuration directory.

**Note:** The configuration directory is defined within the Preferences for Configuration Assistant.

8. Use Change Assistant to restore the PAR file.

**Note:**

- Online help within the Configuration Assistant application.
- *JD Edwards EnterpriseOne Tools Configuration Assistant User's Guide* .

# 4 Working with Software Masters

## Understanding Software Master Creation

This section discusses the software master creation process.

Use this checklist to ensure that you complete all of the processes that are necessary for creating a software master:

- Verify that at least 1 GB of space is available for the TEMP directory of the workstation from which you use JD Edwards EnterpriseOne Product Packaging Tools.  
This memory requirement is the most memory that you might need for a software master. The actual size of the master depends on the size of the package that you create.
- Complete the tasks in this section.
- Define a software master using Oracle's JD Edwards EnterpriseOne CD Configuration Director.
- Provide information about the type of master that you want to create, such as its name, release number, and so on.
- Select the package that you want built into the master.
- Configure change tables using Oracle's JD Edwards EnterpriseOne Change Table Director.
- Provide the target release number for the change tables.
- Provide source environment information about the change tables.
- Select the change tables and their versions.
- Validate the software master definition.
- Create the final software master, which automatically validates the master.
- Use the software master to update JD Edwards EnterpriseOne.

## Preparing for Software Master Creation

This section discusses how to:

- Set up the system TEMP directory.
- Set up the UBEs.
- Create pristine control tables.
- Create a data dictionary in the pristine data source.
- Create change tables.
- Verify the creation of change tables.

## Setting Up the System TEMP Directory

This task creates a temporary directory that will be used to store the Oracle-supported local database for mastering the JD Edwards EnterpriseOne Product Packaging CD.

To set up the System TEMP directory:

1. From the Windows desktop, select Start, Settings, Control Panel.
2. On Windows Control Panel, double-click the System button.
3. On System Properties, click the Advanced tab.
4. Double-click Environment Variables.
5. Set the TEMP and TMP variables for both the User and System settings so that they all access the same directory (for example, c:\TEMP).

**Note:** Ensure that the windows temporary directory on the workstation has at least 1 GB free disk space available (the more space the better). If the temp directory has less than 1 GB of free space, you can create a temp directory on another disk drive with adequate space and set the system environment variables TEMP and TMP to point to the new temp folder. Reboot the system for the change to take effect.

This directory will store the software master that you create in the following tasks.

6. In the temporary directory that you specified in the previous step, create an empty subdirectory called \master.

**Note:** The name of this subdirectory is case-sensitive and should be all lowercase.

## Setting Up the UBEs

JD Edwards EnterpriseOne is initially configured to accommodate internal Oracle naming conventions that are not relevant to customer installations. Therefore, customers must change the configuration of data source names and paths in the UBEs so that they correspond to the naming conventions that are described in this document.

**Note:** Unless you check out the versions before making the following changes, these changes will be available only on this workstation until another package is installed.

To set up the UBEs:

1. On the Mastering Workstation, enter **BV** in the FastPath field to open up Batch Version.
2. Search for the R9640E UBE, select the XJDE0002 version, and change the Component File Specifications parameter to \*.\*.
3. For each of the UBEs listed, search for the UBE, select the specified version, and change the following processing option for the "Data Source Name" to **OneWorld - Product Packaging**.

UBE	Version
R9670	XJDE0001
R9670	XJDE0002
R9670	XJDE0003
R96700	XJDE0001

UBE	Version
R9600400C	XJDE0001

4. Create a JD Edwards EnterpriseOne Object Configuration Manager (OCM) mapping to run R9640B locally.

## Creating Pristine Control Tables

For control table changes to be included on an update CD, the JD Edwards EnterpriseOne Product Packaging Tool requires a pristine copy of the control tables. If the installation includes the PS900 pristine environment, these tables already exist in the JD Edwards EnterpriseOne instance and you can bypass the following task. If the installation does not include the pristine environment, you can create a set of pristine control tables by copying the Control Table tables from Control Tables Local to a new data source: Control Tables - PS900. You perform this process only once.

To create pristine control tables:

1. On the Deployment Server, sign in to JD Edwards EnterpriseOne in the DEP900 environment.
2. From menu GH9011, select Batch Versions.
3. Type **R98403** in the Batch Application field and click Find.
4. On Work With Batch Versions - Available Versions, select version XJDE0501 (Control Tables For Pristine Database), and select Processing Options from the Row menu.
5. Select the Environment tab and change these processing options:
  - o Target Environment (option 1)  
Leave this field blank.
  - o Target data source (option 2)  
Enter **Control Tables - PS900**.
  - o Data Load (option 3)  
Enter **2** to copy data to the table.
  - o Source data source (option 4)  
Enter **Control Tables Local**.
6. Run the version locally.  
  
The report copies the F9000, F9001, F9002, F0004, F0004D, F0005, F0005D, F9005, F9005D, F9006, F9006D, F91100, F91100D, F91400, F91410, F91420, F91430, F91500, F91510, and F951000 tables from the Control Tables Local data source to Control Tables - PS900.
7. Verify the results of the report and the creation of the tables.
8. Quit the Batch Versions application.
9. From menu GH9011, select Object Configuration Manager.
10. On Machine Search and Select, select the machine with the System - 900 data source.
11. For the PS900 environment, add Object Configuration Manager mappings for tables F9000, F9001, F9002, F0004, F0004D, F0005, F0005D, F9005, F9005D, F9006, F9006D, F91100, F91100D, F91400, F91410, F91420, F91430, F91500, F91510, and F951000, and assign these new tables to the Control Tables - PS900 data source.
12. Activate the new mappings.
13. Quit Object Configuration Manager.

## Creating a Data Dictionary in the Pristine Data Source

You must create a data dictionary in the pristine data source.

To create a data dictionary in the pristine data source:

1. From the deployment server, sign in to the JDEPLAN environment.  
Use **JDE** as the user name and **JDE** as the password.
2. From the System Administration Tools menu (GH9011), select Batch Versions.
3. On Work With Batch Versions - Available Versions, type **R98403** into the Batch Application field and click Find.
4. Select version XJDE0509 and click Copy.
5. On Version Copy, enter a new version name and a new version title, and then click OK.
6. On Work With Batch Versions - Available Versions, select the version that you just created and select Processing Options from the Row menu.
7. Complete these processing options as indicated:
  - o Target data source (option 2)  
**DATA DICTIONARY - PS900**
  - o Source environment (option 5)  
**Data Dictionary Local**Use these processing options to set up the batch process to copy the data dictionary tables from the JDEPLAN environment to the new pristine data dictionary.
8. Set the version that you just created to run in the proof mode first.
9. Run this report locally, not on the enterprise server.
10. Verify the results of this report.
11. When satisfied with the proof mode results, run the version that you just created in final mode.
12. Run OCM from the Fast Path field and select the enterprise server.
13. For the PS900 environment, add OCM mappings for F9200, F9202, F9203, F9207, F9210, F9211, and F9212 that point these tables to Data Dictionary - PS900.
14. Activate the new OCM mappings.

## Creating Change Tables

JD Edwards EnterpriseOne Product Packaging requires that a set of tables, called change tables, exist and be mapped to the Control Tables - <environment> data source. A change table is a table that contains the items that have changed between releases or updates. Normally, these tables are generated during the installation process, when you run the environment workbench. If, however, the environment is populated with demo data, these tables will not be generated even though the environment workbench reports that they were created successfully.

Complete this task and the next if you need to create change tables in the mastering environment.

To create change tables:

1. On the deployment server, sign in to the JDEPLAN environment.
2. From menu GH9011, select Batch Versions.
3. Type **R98403** in the Batch Application field and click Find.
4. Select version XJDE0507 (Change Table) and click Copy.

5. On Version Copy, complete these fields as directed:

- o New Version
- o Version Title

Type a name for the new version.

CREATECT

6. Click OK.

7. On Batch Version Design, click the Processing Options button on the General tab.

8. Edit these processing options for CREATECT as directed:

- o Target Environment (option 1)

Type the name of the mastering environment.

- o Target Data Source (option 2)

Leave this field blank.

- o Data Load (option 3)

1: Load Production to create the table without data.

- o Source data source (option 4)

**Control Tables Local**

9. Click OK.

10. On Batch Version Design, click Run.

11. On Version Prompting, select Data Selection and click Submit.

12. On Data Selection, verify that these tables are listed in the right operand for BC OBNM, and add those that are missing:

- o F960004
- o F960005
- o F967611
- o F969000
- o F969001
- o F969002
- o F969005
- o F969006
- o F9691100
- o F9691400
- o F9691410
- o F9691420
- o F9691430
- o F9691500
- o F9691510
- o F9695100

- F9698710
- F9698712
- F9755
- F9757
- F9759
- F9760
- F98800DN
- F98800N
- F98800TN
- F98810DN
- F98810N
- F98811N
- F98830N
- F98840N
- F98845N

**13.** Run the version.

The program creates the change tables in Control Tables - CRP or whichever environment Control Table data source you specified.

## Verifying the Creation of Change Tables

For each of the change tables, verify that an OCM mapping exists and points to the appropriate data source for the mastering environment.

To verify the creation of change tables:

1. From menu GH9011, select Object Configuration Manager.
2. On Machine Search and Select, select the machine with the System - 900 data source.
3. For the mastering environment, verify that each of these change tables is mapped to the correct data source and that each mapping is activated:

Change Table	Data Source
F960004, F960005, F969000, F969001, F969002, F969005, F969006, F9695100, F98800DN, F98800N, F98800TN, F98810DN, F98811N, F98810N, F98830N, F98840N, F98845N	Control Tables - <environment>
F9698710, F9698712	Central Objects - <environment>

Change Table	Data Source
F967611, F9691100, F9691400, F9691410, F9691420, F9691430, F9691500, F9691510,	System - 900
F9755, F9757, F9759, F9760	Data Dictionary - 900

4. Quit OCM.
5. Run Oracle's JD Edwards EnterpriseOne Universal Table Browser (UTB) to verify that the tables were created in the correct location.

## Creating a Software Master

This section provides an overview of software master definitions, lists a prerequisite, and discusses how to:

- Define a software master.
- Configure change tables.
- Set the package build application to the mastering mode.
- Validate a software master definition.
- Create a final software master.
- Confirm the software master.
- Move the software master to a CD ROM.
- Update JD Edwards EnterpriseOne with the software master.

## Understanding Software Master Definitions

A software master definition provides the structure for the finished software master. It establishes what template and packages to use, what build steps to follow, and the directory structure of the final master. The software master definition is only the structure or outline of the master. After you set up the software master definition, you validate it and then create the actual software master.

### Custom Data Inclusions in the Software Definition

The JD Edwards EnterpriseOne Product Packaging application enables you to include custom data on the software master. Read the following tips for including custom tables and custom media objects on the software image.

### Custom Table Inclusions

If the customer creates a new, customized table that is to be delivered with pristine data, the mastering process should automatically handle this procedure if these conditions are met:

- The table is included in the update package.
- The table is in the environment of the update package.
- The table is not included in the target environment.

- The table and index change table exist.

## Custom Media Object Inclusions

To include custom media objects in the product package, add these build steps to the ASU template:

1. Add a build step to copy table records from the F00165 to the XML database.
2. Add a build step to copy the media object files from the deployment server to the image path directory.

## Change Table Configuration

This example illustrates why change table configurations are needed:

Create change table configurations to indicate to the JD Edwards EnterpriseOne Product Packaging Tools the change tables that you want included with the software master. When you install the finished software master, the installation process will update the control tables of the enterprise with the change tables that you indicate.

Assume that the home office in Denver, USA, makes software changes and wants to update an enterprise that is not networked to the Denver enterprise. The other enterprise, which has its own set of JD Edwards EnterpriseOne software and control tables, is in Paris, France. The Denver enterprise creates a software master that includes the package containing the software changes, as well as the change tables that contain data dictionary and user-defined codes changes, which, for this example, are the only control table changes since the Paris enterprise was last updated. The Denver enterprise writes the software master to a CD and ships it to Paris. When the Paris enterprise installs the software master, the change tables update the Paris control tables, making the tables concurrent with the Denver control tables.

## Final Master Creation

This task explains how to create the final software master image from a definition that you previously created. You can master a single definition or master all definitions of a specific JD Edwards EnterpriseOne release.

The report that accomplishes this task is Oracle's JD Edwards EnterpriseOne Master CD (R9640B) report. This report controls the execution of all of the build steps and the UBEs that are associated with the build steps. This report also changes the status of each build step from **30 - Validated** to a new status of **60 - Built** or **50 - Failed**.

With an average workstation, network, and ERP environment, the mastering process should take about one hour. However, the software includes many variables that can affect the time that is necessary to build a product package CD. These variables are:

- Status and level of debugging.
- Number of objects in the update package.
- Size of the objects in the update package.
- Overall size of the parent package.
- Number of change tables to define.
- Network speed.
- Type of database.
- Build machine speed.
- Build machine memory.
- Number of other processes running on the enterprise server, deployment server, and build machine.

## Prerequisite

Ensure that at least 1 GB of space is available for the TEMP directory of the workstation from which you use the JD Edwards EnterpriseOne Product Packaging Tools. This memory requirement is the most memory that you might need for a software master. The actual size of the master depends upon the size of the package that you create.

### Note:

- *Working with Software Master Templates.*

## Defining a Software Master

To define a software master:

1. Sign in to a JD Edwards EnterpriseOne workstation using the development environment where the modifications exist, such as DV900.
2. From Product Packaging (GH962), select Product Packages (P9640).
3. On Work With Software Mastering, click Add.
4. On CD Configuration Director, click Next.
5. On CD Information, complete these fields:
  - o Name  
Enter a unique name for the software master definition that you are adding, such as **E900UPDATE**. This name must exactly match the name of the package to be included, and it must be in all uppercase letters.
  - o Release  
Enter the release for the software master definition, such as **E900**. This is the release that is currently installed on the client workstation that you are using.
  - o Type  
Specify the type of CD that you want to master. In this case, it is an ASU CD (option **09**) which is the default. If you select an option other than **09**, the software displays an error message when you press **Next**. This field indicates which software template to use when you further define the master. Templates include the build steps and directory structure that is necessary to create a software master.
  - o Build Phase  
Enter the development phase that the software master definition represents, such as **alpha**, **beta**, or **general availability**.
  - o Description  
(Optional) Enter a description of the software master definition.
  - o Image Path  
Enter the directory path where you want the software master definition to reside on the JD Edwards EnterpriseOne Product Packaging build machine (for example, **d:\E900\PP**). The directory that you indicate will be the root directory for the software master that you create. It will contain the contents of the master. After you create the image, the CD can be burned through the CD burner software.

6. Click Next.

If you chose a template that appears on the list of values when you click the Search button for the Type field, but the template is not on the enterprise, the CD Template Does Not Exist form appears. You have probably entered the incorrect release number. Click OK to continue adding the software master definition, or click Cancel to stop adding the definition.

If the template that you chose using the Type field was set up to include packages, the CD Packages form appears.

7. Select the update package that includes the objects for the update disk.

You can either select an existing update package or create a new one. To ensure that the update package is defined correctly, note that:

- o You can use only update packages for this process.
- o The package name must be the same name as the product package that was previously defined, and it must be in all uppercase letters.
- o The package should be created from its very beginning.
- o The update package must always include specifications, build specifications, build business functions, and compression.

If the package is not compressed, then product packaging will not work correctly because JD Edwards EnterpriseOne Product Packaging looks only for cab files to copy to the image.

8. If the package is undefined, the Select Package Build form automatically appears; otherwise, click Select Package.

You can also add packages by clicking New Package Build or Package Assembly.

9. On Select Package Build, if you need to assemble or define a package or both, select one of these from the Form menu:

- o Pkg Assembly
- o Pkg Build

**Note:** Make sure that you compress any packages that you build.

See *Setting the Package Build Application to the Mastering Mode*.

10. On the Select Package Build form, find and select a package, and then click Select.

11. On CD Packages, select the package marker that appears.

For an ASU CD, only one package is required. For other types of software masters, more than one package might be required.

12. Click Next.

If the template that you chose was set up to include change table configurations, after you click Next, the JD Edwards EnterpriseOne Change Table Director form appears.

13. Continue to the next task, which explains how to configure the change tables.

## Configuring Change Tables

To configure change tables:

1. On the JD Edwards EnterpriseOne Change Table Director, which appears automatically during the mastering process if required by the template, click Next.  
Alternatively, from Product Packaging (GH962), select Change Table Configurations (P9642) and then click Add.
2. On the JD Edwards EnterpriseOne Change Table Director, click Next.
3. On the Target Release Selection form, complete the Target Release field.

Change the target release to a custom user-defined code (UDC) name that you are mastering. This name needs to be unique, such as E900TAX for the 1099 tax update. Select the release name using the visual assist button.

**Note:** The software will not function correctly if these tables have the same value for the source and target release. To add the custom UDC, press the visual assist and then click Revisions. This action displays the Work with User Defined Codes form. Work with User Defined Codes, click Add. Scroll to the bottom of the grid and add the new value in the last line of the grid. After you have created the UDC, select the new UDC on the Work with User Defined Codes form, and click Select. This action will populate the Target Release field with the new value.

4. Click Next.
5. On Source Environment Selection, complete these fields:
  - o Source Environment  
Enter the name of the environment that includes the control tables that are used as the baseline for the changes. The source is typically the pristine environment (**PS900**). The software builds the change table records by comparing the target environment to this baseline.
  - o Source Release  
Verify that the source release matches the release and the cumulative update level, such as **E900**, of the source environment that you want. The software automatically populates this field based upon the source environment.
6. Click Next.  
The Batch Application Selection form appears. This form lists the available change tables along with the batch application and version that will create the change table.
7. To select the default change tables that you want with the software master, double-click the gray button to the left of the change table row.  
A check mark appears on the button.  
Select any or all of these change tables where you made additions, deletions, or changes. The batch process compares the source and target tables in each selected category and creates a change table that contains all changes.
  - o Data Dictionary
  - o User Defined Codes  
This batch application should always be chosen because changes always occur to the UDC that defines the release.

- o Workflow.
- o Favorites.
- o Templates and Smart Fields.
- o Tips of the Day.
- o Table and Index Changes.
- o Solution Explorer.
- o Service Constants. (8.97 only)

You can double-click a check mark to remove it.

8. To select a different version or to select multiple versions, select a change table row, and then select Version Selection from the Row menu.
9. On Version Selection, select one or more versions and click Select or double-click the gray button to the left of a version.

A check mark appears to the left of the versions that you chose.

10. After choosing the versions that you want, click Close.

The Batch Application Selection form reappears.

A check mark appears to the left of the change table row that you chose. The change tables that you want to be built for the software master must have check marks next to them or the software will ignore them. If you chose more than one version, the word *<MULTIPLE>* appears under the Version column for that change table.

11. Either select another change table row and select Version Selection from the Row menu, or click Next.

If you click Next, the Additional Change Table Definitions form appears.

12. On Additional Change Table Definitions, perform one of these actions:

- o To define additional change table configurations for a new source and target release combination, select Continue and click OK.

The program displays the Target Release Selection form. Return to the beginning of this task and repeat the steps for a different source and target combination.

- o Select Quit and click OK.

This action stops the change table configuration director and displays the final revisions screen for mastering the defined CD.

If you select Quit, the CD Revisions form appears. Use this form to revise the software master definition.

13. On CD Revisions, click OK.

the software master definition is saved, and the CD Revisions form closes.

14. Continue to the next task, which explains how to validate the definition that you just created.

## Setting the Package Build Application to the Mastering Mode

To compress an update package, you must set the package build application to the mastering mode.

To set Oracle's JD Edwards EnterpriseOne Package Build Application to the mastering mode:

1. On the Deployment server, log on to the DEP900 environment.

2. From the Package and Deployment Tools menu (GH9083), right-click Package Build, and select Prompt For Values.
3. On Processing Options, type **1** in option 2 to set up the mastering mode.
4. Click OK.
5. Quit the package build application.

## Validating a Software Master Definition

This task explains how to run Oracle's JD Edwards EnterpriseOne Pre-Mastering CD Validation report (R9640A) to validate the software master definition that you set up and what to review in the report to help with the validation. The report runs in final mode. The report lists whether the build step is validated. The report will change the status of build steps that do *not* have errors.

To validate a software master definition:

1. From the Product Packaging menu (GH962), select Product Packages (P9640).
2. On Work With Software Mastering, click Find.

The existing software master definitions appear.

3. Select the master that you want to validate, and then select Validate from the Row menu.
4. On Report Output Destination, select to view the report on screen and click OK.

The report runs. All steps without errors whose statuses were In Definition (10) or Defined (20) are promoted to the status of Validated (30); they will work properly during the software mastering process. Otherwise, the build step will have either a warning or an error message. Error messages will stop the creation of a software master. You must fix any build steps that contain error messages. The message specifies the error.

Warning messages will not stop the creation of a software master. If a build step has a warning message, you should verify that the build step is as you want it before proceeding.

**Note:** The report will always include a warning stating that the build step is different from the template. This warning is always true because the process uses a custom package build.

5. Continue to the next task, which explains how to create the final software master.

## Creating a Final Software Master

To create a final software master:

1. From Product Packaging (GH962), select Product Packages (P9640).
2. On Work With Software Mastering, perform one of these actions:
  - o To create a software master from one specific definition, click Find, select the definition that you want to create, and then select Master CD from the Row menu.
  - o To create software masters for all definitions of a specific release, select Master Release from the Row menu.

A form appears in which you enter the release number of the definitions that you want to master.

Either choice runs a batch process (R9640B) that creates the software master based upon the definition that you chose. Run the report locally and select the option to display the results on screen. Depending

on the build steps that are necessary to complete, the report launches several other reports, each corresponding to a particular build step.

The software mastering process stops when it encounters a manual build step.

3. To complete the manual build step, select that build step, and select Execute Step from the View menu.

The status of that step is advanced to **60 (Built)**. Click Master CD or Master Release to continue the software master process. The progress of the build can be monitored from the CD Revisions screen.

4. From the View menu, select Refresh.

As each step is processed and completed, the icons change color and style. The last build step automatically validates the software master and generates a final report (R9840B) This report includes a comprehensive status of the product package build.

5. Review this report for errors.

If the validation report does not indicate any errors, you have successfully created a software master. This report validates that the number of directories match between the software master definition and the final software master. It also provides details about the file counts and the total size of the master in megabytes.

This process automatically creates a self-extracting executable file and a CAB file and places them in the \$TEMP/final directory using the name of the software master followed by the .exe and .cab extensions. Use the executable (.exe) file to update JD Edwards EnterpriseOne. Both files include the full software master with all of its directories. If you have a size restriction, such as when downloading from the internet, you can use the CAB file (which is always smaller than the executable file), but you will need to use a third-party application to uncompress the CAB file.

## Confirming the Software Master

After you create the software master image, you should visually check the directory structure and XML database to verify that the image is complete.

To confirm the software master:

1. In Windows Explorer, open the image path directory.
2. Verify that the package directory includes these objects:
  - o Install manager files.
  - o Planner directory.
  - o A data cab in the planner directory.
  - o A directory that is named the same as the package.
  - o Cab files in the package directory.
3. Verify that the \$TEMP\final directory includes these two files:
  - o packagename.cab
  - o packagename.exe
4. Open the XML database in the \$TEMP\master directory, and verify that this database is populated with tables.

**Note:** If the package includes new custom tables, verify that they are in the XML database and that they and their associated index change tables have records.

## Moving the Software Master to a CD ROM

After the software master process has been completed and confirmed, the image can be burned onto a CD.

To move the software master to a CD ROM:

Using a CD burner and CD burner software, copy the packagename.cab or packagename.exe file from the \$TEMP/final directory on to the CD ROM.

## Updating JD Edwards EnterpriseOne with the Software Master

This task explains how to update JD Edwards EnterpriseOne using the software master that you created. To perform this update, access the Work with Updates (P96470) application from the System Installation Tools (GH961) menu. This process includes setting merge flags, running the self-extracting executable (package\_name.exe), running software updates, and executing the installation workbench.

To update JD Edwards EnterpriseOne using a software master:

1. Run the package\_name.exe executable file from the CD.

This process installs the package into the Planner\Package directory on the deployment server, and extracts the package\_name.mdf and package\_name.ldf files into the Planner\Data directory. The process also creates the software master image in the PLANNER directory.

**Note:** You can also use the CAB file to create the software master image on the deployment server, but you need to use a third-party application to uncompress the file.

2. If InstallManager.exe exists on the CD, start the installation by double-clicking it.

If this file is not on the CD, double-click the package\_name.exe file to self-extract and uncompress the CAB file. After it is uncompressed, Install Manager will automatically launch.

3. On Installation Setup Screen, click Next.
4. On Installation Setup Type, verify that the machine has the necessary disk space and that the install path is correct, and then click Finish.

When the installation is complete, the Install Manager displays the "Installation Complete" window.

5. Click OK.
6. On the Deployment Server, sign in to the Planner environment (JDEPLAN).
7. Type **GH9612** in the Fast Path field.
8. Select Application Software Updates (P96470).
9. On Work with Software Updates, click Find.
10. Select the product package to install, and click Next.

11. On Software Update Environment Selection, select the path code on which to install the package, and click Next.

If you select unattended mode, the Installation Workbench will automatically perform all the workbench tasks to complete the installation. If you do not select unattended mode, the Installation Workbench tasks must be done manually.

If you select backup, the process will create a PAR file (PRJ\_packagename\_pathcode\_60\_99.par) in the Planner \Package\Package\_Name\PathCode.bak directory. All objects that are affected by the update will be backed up in the PAR file.

The Installation Workbench should stop after the Table Conversion workbench process is complete.

12. Review the PDFs and the log files that were created by the table conversions, and then continue with Installation Workbench.

When Installation Workbench is complete, the system returns to the Work with Software Updates screen, and the selected software update should have the Completed Normally install status.

13. Click Close to quit Work with Software Updates.
14. Review all PDFs that were generated on the deployment server by the software update process, and verify that each of report is free of errors.

If a report has errors or does not appear to have run, review the jde.log file to determine the source of the problem. This table provides descriptions of the Software Update reports.

Report	Version	Description
R98405 - Application	XJDE0001	Table Conversion/Merge Driver for Application Tables: Master UBE for creating and regenerating application tables. This report should have only one record—Table and Index Creation (F984072). The status of the record should be, "Completed Normally."
R98407	XJDE0001	Table and Index Creation: Launched by R98405 UBE, which creates or regenerates all tables that are specified in the table change table. Page one of the report includes source, target, and environment information. Page two includes the overall status of the table creation in green or red text. Subsequent pages list the status of each table and index to be created or regenerated.
R98405 - Control	XJDE0001	Table Conversion/Merge Driver for Control Tables: The master UBE that specifies the control table merge UBEs to launch. It should list the Data Dictionary UBE (R989200P), and the User Defined Codes UBE (R9600042). The status on all should be, "Completed Normally."

Report	Version	Description
R989200P	XJDE0001	Data Dictionary Merge: Launched by R98405. This UBE merges all data dictionary changes that are specified in the data dictionary change tables into the existing data dictionary. Page one of the report has source, target, and environment information. Subsequent pages list the status of each data dictionary addition or change. At the end of the individual listings, the overall status of the data dictionary merge is listed in green or red text. The final page has detailed summary information.
R9600042	XJDE0001	User Defined Code Merge: Launched by R98405. This UBE merges all user-defined code changes that are specified in the UDC change tables into the existing UDC tables. Page one of the report lists source, target, and environment information. Subsequent pages list the status of each UDC addition or change. The final page has detailed summary information.
R9690002	XJDE0001	JD Edwards EnterpriseOne Solution Explorer Merge: Launched by R98405. This UBE merges all JD Edwards EnterpriseOne Solution Explorer changes that are specified in the SE change tables into the existing SE tables. Page one of the report lists source, target, and environment information. Subsequent pages list each addition, change, or deletion in the change tables. The final page has detailed summary information.
R96911002	XJDE0001	Favorites Merge: Launched by R98405. This UBE merges all Favorites changes that are specified in the Favorites change tables into the existing Favorites tables. Page one of the report lists the source, target, and environment information. Subsequent pages list the status of each Favorites addition or change. The final page has detailed summary information.
R96914002	XJDE0001	Report Director Templates Merge: Launched by R98405. This UBE merges all changes that are specified in the Report Director Templates change tables into the existing Report Director

Report	Version	Description
		Templates tables. Page one of the report lists the source, target, and environment information. Subsequent pages list the status of each addition or change. The final page has detailed summary information.
R96915002	XJDE0001	Tips Merge: Launched by R98405. This UBE merges all Tips changes that are specified in the Tips change tables into the existing Tips tables. Page one of the report lists the source, target, and environment information. Subsequent pages list the status of each addition or change. The final page has detailed summary information.
R96951002	XJDE0001	Service Constant Merge: Launched by R98405. This UBE merges all service constant data that is specified in the change table into the existing Service Constant table. Page one of the report lists source, target, and environment information. Subsequent pages list the status of each service constant addition. This merge is only used for release 8.97.
R98405 - Spec	XJDE0001	Table Conversion/Merge Driver for specification tables: Master UBE for specification table merge. This report should have only one record—Specification Merge (F98710). The status of this record should be, "Completed Normally."
R98700	ZJDE0002	Specification Merge: Launched by R98405. This UBE adds, replaces, and merges all specified object specifications into the selected Central Objects path code. This report is the standard specification merge report. Page one of the report lists the source, target, and environment information. Page two summarizes information about the merge status. The remaining pages include the individual object action and status.

15. On the Deployment Server, sign in to the DEP900 environment.
16. Find the package in Oracle's JD Edwards EnterpriseOne Package Assembly (P9601), and build and deploy the update package to a client workstation.

## Deleting a Software Master

This section lists the form that is used to delete software masters. All records that are associated with the definition, such as the change table configurations and repair director records, will be deleted when you delete the software master.

### Form Used to Delete Software Masters

Form Name	FormID	Navigation	Usage
Work With Software Mastering	W9640B	Product Packaging (GH962), Product Packages	Delete a software master.

## Working with a Software Master Definition

This section provides overviews of software master revisions and software master validation and discusses how to:

- Revise a software master definition.
- Load a subdirectory from an enterprise network directory.
- Copy a software master definition.
- Proof a software master definition.

## Understanding Software Master Revisions

After you have completed the definition of a software master, you can revise any of the information, including the build steps and directory structure. You also can copy the definition information to a new software master definition, delete the definition, and proof and validate it.

You can revise a software master definition that you have created. This revision enables you to modify the information that you entered into the JD Edwards EnterpriseOne CD Configuration Director, as well as the build steps and directory structure that is included with the template that you chose.

The system uses icons to indicate the status of a software master. The icons have these meanings:

Icon	Meaning
Gray Partial Cog	The status code is 10: In Definition.
Gray Full Cog	The status code is 20: Defined.

Icon	Meaning
Gray Cog with Green Check Mark	The status code is 30: Validated.
Yellow-to-Gray Cyclic Arrows	The status code is 40: Processing.
Red Octagon	The status code is 50: Failed.
Gold Cog	The status code is 60: Built.

## Understanding Software Master Validation

You run a report to validate the software master definition that you created. The report runs in final mode, and it changes the status of the build steps that do not have errors. All steps without errors whose status was In Definition or Defined are promoted to the status of Validated. The report lists each build step that will run when you create the master. The report lists whether the build step is validated. If it is validated, the build step will work properly when you are creating the software master. Otherwise, the build step will have either a warning or error message.

Warning messages will not stop the creation of a software master. The message specifies what the warning is. If a build step has a warning message, you should verify that the build step is as you want it before proceeding.

Error messages will stop the creation of a software master. You must fix any build steps that contain error messages. The message specifies the error.

## Forms Used to Revise Software Masters

Form Name	FormID	Navigation	Usage
Work With Software Mastering	W9640B	Product Packaging (GH962), Product Packages	Select a software master to revise, proof, validate, or delete.
CD Revisions	W9640G	From Work With Software Mastering, select a software master to revise.	Verify and revise specifications for a software master. Run one or more steps.
Copy CD Configuration	W9640C	From Work with Software Mastering, select a software master and click Copy.	Create a new master based on an existing one.

## Revising a Software Master Definition

Access the Work With Software Mastering form.

### CD Information

Select the CD Information tab.

#### Status

Displays the status of a build step or directory structure within the mastering process. For example, the build step or directory structure could be at a status of defined, validated, or built. Use the visual-assist button to view a complete list of values for this field.

#### Comment

Displays short informational comments that are provided by the system about each step of the mastering process. You can enter comments into this field, but the system will overwrite any text that is currently in the field during the next mastering process.

#### Image Path

Overfills the directory path where you want the software master to reside on the enterprise. The directory that you indicate will be the root directory for the creation of the final software master.

### Build Steps

Select the Build Steps tab.

#### Sequence

Displays the order in which the system processes build steps, usually in increments of 10 (for example, **10**, **20**, **30**, and so on).

Verify the order in which you want the step performed during the creation of the software master definition. You can use the same sequence number for multiple build steps.

#### Type

Displays the type of CD being mastered. Verify which component type you want the build step to perform. For example, you can define steps to create file structures, build a package, or create INF files.

#### Status

Verifies the current status of the build step, which can indicate whether to run the particular step during the mastering process. For example, if you need to perform a manual step during the mastering process, you can manually complete the step, change the step's status to **60** (Built) by choosing the step, and then, from the View menu, select Execute Step.

#### Target Folder

Displays the name of the target folder, such as **planner** or **updatepkg**. The system populates this field based upon the template that was used to define the software master. Change the name of the target folder only if you added the folder yourself.

#### Executable

Displays the software that might populate this field based upon the build step's definition in the software master template. To change this field, click the Executable button and use the Select a Windows Executable form to select an executable for this build step.

#### Value/Parameter

Verifies the value or parameter. To change this information, click the Value/Parameter button, and then enter a value or parameter that is appropriate to the step you chose. This field is dynamic. The button name is either Value or Parameter, based upon the step that you select. The form that appears when you click the button also depends upon which step you select. For example, the Package Build step calls the Select Package Build form, from which you can select a package; and the Build Change Tables step calls the Work With Change Table Definitions form, from which you can modify the change table configuration.

## Directory Structure

Select the Directory Structure tab.

### Source Path

Displays the directory on the enterprise that you want to use to populate the highlighted target folder. You can use an absolute (full) directory path name, or you can use a relative path name with a token. The system copies the data that is contained in the source path, depending upon how you filter those files (see the File Filter field description for this information), into the highlighted target folder of the software master.

Verifies the directory path of the source that will populate the component. This is the source path name of the data that you want to retrieve for the master and that you placed into the target folder. You can specify this path using either a relative or absolute path. See *Troubleshooting Product Packaging* for information about relative and absolute paths.

### File Filter

Displays the filter, which you can designate, for the files that are contained in the source path. For example, you can use \*.\* to retrieve all files in the source path, or \*.exe to retrieve only executable programs.

Verify the file filter. The default is \*.\*. The file filter enables you to filter any data files that you retrieve from the source directory. For example, you can use \*.\* to retrieve all files in the source directory.

### Full Path

Displays the names and functions. This field is dynamic and its name and function depend upon the build step that is highlighted. The possible names and functions are:

**Value:** The value that is needed to complete the highlighted build step. For example, if the build step is a batch process, the value field contains the name of the batch process and its version, such as **R95012\XJDE0001**.

**Parameter:** The parameters that are needed for the highlighted build steps that process an executable program.

The full (absolute) target path name of the highlighted directory, such as **Root/planner/updatepkg**.

## Task List

This table provides information for building the task list:

Task	Action
To run one or more steps:	<p>Select the build step that you want to run, and from the View menu, either select Execute Step to run just that step or select Run From Step to run that step plus any steps that follow it.</p> <p>This option runs the step and updates its status to 60 (Built). You might use this option for manual build steps. Manual steps are those that you need to perform yourself, such as an additional mastering step that is not part of the JD Edwards EnterpriseOne Product Packaging Tools. After you complete the manual step, use the Execute Step option to update the step to a status of 60 so that you can proceed to the next step in the process.</p>
To renumber the build steps:	From the Form menu, select Renumber.

Task	Action
	The software renumbers the build steps, updating the Sequence field. The renumbering begins with 10 and increments each step by 10. The software keeps the build steps in the same sequence that you or the software master template established.
To add a subdirectory:	<p>Click a directory for which you want to add a subdirectory and click Add. You can select any directory, including the Root directory.</p> <p>The software creates a new directory that is labeled Undefined and places it at the bottom of the structure.</p>

## Loading a Subdirectory from an Enterprise Network Directory

Access the CD Revisions form.

1. Select the Directory Structure tab.
2. Select the directory that will be the root of the subdirectory that you want to load, which must already exist on the enterprise, and click Load.

This feature copies any enterprise directory structure into the software master definition.

3. On the Load Folders From Directory form, click Windows Folder.
4. On the Select Directory form, find and select a directory that you want to load into the software master, and then click OK.
5. On the Load Folders From Directory form, select one of these options:

- o Re-create subfolders

This option deletes the existing subdirectories and replaces them with the subdirectories that you want to load into the software master.

- o Append to existing

This option appends to the existing subdirectories the subdirectories that you want to load into the software master.

6. If necessary, select the Setup Source Directories check box.

During software master creation, by having this option enabled, the system automatically creates the structure of the source directories and copies all files within the source directories to the software master.

If you do not select Setup Source Directories, the software will create the source directory structure within the software master and the directories will be empty.

7. Click OK.

## Copying a Software Master Definition

Access the Copy CD Configuration form.

You can copy a software master definition that you already created, which enables you to copy the information that you entered into the CD Configuration Director, the build steps, and the directory structure.

**Type**

The type of CD that is being mastered. Verify which component type you want the build step to perform. For example, you can define steps to create file structures, build a package, or create INF files.

In most cases, you will not need to change the default value. If you need to, however, you can change the type of the software master when making a copy. For example, you can change the type from a Setup CD to an ASU CD. This change does not change build steps or the directory structure. When you validate the software master, you will receive warning messages that the master does not match the default settings of the ASU CD template. This is because the master is actually based on the Setup CD template. You will not be prevented from creating the software master.

## Proofing a Software Master Definition

Access the Work With Software Mastering form.

You can proof software master definitions. To do so, you create a report, which details each build step in the definition and lists the sequence of steps and processes that each step will run when creating the actual master.

Proofing a software master definition does not change any part of the status of a software master.

To proof a software master definition, perform one of these actions:

- To proof one software master definition, select the definition that you want to create, and then select Proof CD from the View menu.
- To proof all software master definitions for a specific release, select Proof Release from the View menu.

On the form that appears, enter the release number of the definitions that you want to proof.

## Working with Software Master Templates

This section provides overviews of software master templates, the all build step processes, the ASU CD template, and the custom CD, and lists the forms used to work with software master templates.

## Understanding Software Master Templates

The JD Edwards EnterpriseOne Product Packaging Tool uses software master templates. These templates provide default information when you are creating a new software master. For example, to distribute objects to a disconnected enterprise, you would build a master based on the ASU (Application Software Update) CD template. Oracle's JD Edwards EnterpriseOne Mastering Director would use the ASU CD template to determine which director steps, build steps, and directory structure to use when creating the software master. You can configure the default information that is provided by the templates.

You use build steps to build a template. Build steps are the processes that are used to create a software master. You also can add, revise, copy, and delete software master templates. After you add a template, you can use the JD Edwards EnterpriseOne Mastering Director to create a software master definition using that template.

The processes for revising, copying, proofing, and deleting software master templates are identical to those for the software masters themselves.

## Understanding the All Build Step Processes

A template can offer all of the following software mastering build step processes. Not all of these processes appear on every template.

### Undefined

Type = 00

Performed Automatically = Not applicable

This build step is the default process when you are adding a new build step to a software master or template. After you add this build step, you need to define it for the master or template.

### Create CD File Structure

Type = 01

Performed Automatically = Yes

This build step creates the physical directory structure at the image-path location that you specified when creating the software master definition.

### Package Build

Type = 02

Performed Automatically = Yes

This build step builds the assigned package based upon the package assembly and build definitions.

### Manual Build Step

Type = 03

Performed Automatically = No (See the specific template definition for complete information about the performance of this build step.)

This build step enables the administrator to instruct the user how to perform a process that has not yet been automated. You should verify the mastering steps and options of this step before beginning the master.

**Note:** The software mastering batch process stops when it encounters this build step. After you complete this build step, change its status to Succeeded (status code 60), and restart the software mastering batch process.

### Pre-Build Package

Type = 04

Performed Automatically = Yes

For Oracle internal use only.

## Pre-Build Pristine

Type = 05

Performed Automatically = Yes

For Oracle internal use only.

## Build Cross-Reference

Type = 06

Performed Automatically = Yes

For Oracle internal use only.

## Build Data Dictionary

Type = 07

Performed Automatically = Yes

For Oracle internal use only.

## Build In-House Package Database

Type = 08

Performed Automatically = Yes

For Oracle internal use only.

## Build Planner Database

Type = 09

Performed Automatically = Yes

For Oracle internal use only.

## Build Pristine Database

Type = 10

Performed Automatically = Partial (See the specific template definition for complete information about the performance of this build step.)

This build step creates the pristine data tables in the final pristine database that corresponds to the given set of modules.

## Build Store & Forward Database

Type = 11

Performed Automatically = Yes

For Oracle internal use only.

## Build Standalone Database

Type = 12

Performed Automatically = Yes

For Oracle internal use only.

## Build Change Tables

Type = 13

Performed Automatically = Yes

This build step builds the change tables based on the change table configuration that was set up as part of the software master definition.

## Master Central Objects

Type = 14

Performed Automatically = No

For Oracle internal use only.

## Compress

Type = 15

Performed Automatically = Partial (See the specific template definition for complete information about the performance of this build step.)

This build step compresses the final pristine JDE Masters database into the data.cab file in the final image path.

## Create INF

Type = 16

Performed Automatically = Yes

Do *not* modify this file manually. This build step updates the deployment.inf file that the installation applications use during the update installation.

## Copy CD Directory Files

Type = 17

Performed Automatically = Yes

This build step copies the built package to the target image path. This step also copies any additional files that are defined in the software master directory structure to the target image path.

**Note:** If you have already built the package and do not want the mastering process to build the package again, set the status of the Package Build step to 60. When you create the software master, the process bypasses the package build and, when it runs this Copy CD Directory Files step, copies the package.

## Virus Check

Type = 18

Performed Automatically = Partial

For Oracle internal use only.

## Windows Executable

Type = 19

Performed Automatically = Partial (See the specific template definition for complete information about the performance of this build step.)

This build step enables you to specify a Microsoft Windows executable or batch file as part of the mastering process.

## Data Cleanup

Type = 20

Performed Automatically = No

For Oracle internal use only.

## Build Package Database

Type = 21

Performed Automatically = Yes

For Oracle internal use only.

## Batch Process

Type = 22

Performed Automatically = Yes

This build step enables you to define a batch process to run as part of the software master definition.

# Understanding the ASU CD Template

The ASU CD is the main template that is used with the JD Edwards EnterpriseOne Product Packaging Tools. This template is the basis for delivering objects to distributed enterprises. The Product Packaging ASU Template data is delivered in the ASUTMPL900 configuration package on the Update Center. Use Change Assistant to download and deploy this package. This table shows the build steps and their sequence for an ASU CD:

Sequence Number	Build Step (Type)
10	Check Mastering Items (03 - Manual Build Step)
20	Cleanup Temporary Files (22 - Batch Process)

Sequence Number	Build Step (Type)
30	Create CD File Structure (01 - Create the CD File Structure)
40	Build (02 - Package Build)
60	Build Change Tables (13 - Build Change Tables)
70	Create/Load ASU Change Tables (22 - Batch Process)
80	Create/Load ASU Control Tables (22 - Batch Process)
90	Create/Load ASU Misc Tables (22 - Batch Process)
100	Create/Load New and Regen Tables (22 - Batch Process)
110	Create/Load ASU OL & VL Tables (22 - Batch Process)
120	ASU v/s Package Validation (22 - Batch Process)
130	Compress/Copy Database (15 - Compress)
140	Copy Package and Feature INFs (22 - Batch Process)
180	Copy CD Directory Files
190	Create INF
200	Create self-extracting executable
210	Validate the mastered CD

This table provides additional information pertaining to a particular build step within the ASU CD template:

Sequence Number	Build Step (Type) with Additional Information
10	<p>Check Mastering Items (03 - Manual Build Step)</p> <p>Verify the mastering steps and options of the step before beginning the master. This build step must be executed manually before the Master CD.</p>
20	Cleanup Temporary Files (22 - Batch Process)

Sequence Number	Build Step (Type) with Additional Information
	<p>Launches the R967002 batch process using version XJDE0001. This process deletes the files and folders from the directory that you specify (for example, \$TEMP\data).</p>
30	<p>Create CD File Structure (01 - Create CD Structure)</p> <p>Creates the CD file structure on the Image path.</p>
40	<p>Build (02 - Package Build)</p> <p>Builds the defined update package. This build step can be set to Built status if the package has run through the Package Build application.</p>
60	<p>Build Change Tables (13 - Build Change Tables)</p> <p>Builds the change tables based on the configuration that was set up during the director phase.</p>
70	<p>Create/Load ASU Change Tables (22 - Batch Process)</p> <p>Launches the R9670 batch process using version XJDE0003. This process creates change tables in the XML database, populating the tables from the Change Table data source.</p>
80	<p>Create/Load ASU Control Tables (22 - Batch Process)</p> <p>Launches the R9670 batch process using version XJDE0001. This process creates control tables in the XML database, and populates the tables from the Control Table data source.</p>
90	<p>Create/Load ASU Misc Tables (22 - Batch Process)</p> <p>Launches the R9670 batch process using version XJDE0002. This process creates miscellaneous tables in the XML database, and populates the tables based on the selections that you made for the objects in the ASU package, the change tables, and the software master definition.</p>
100	<p>Create/Load New &amp; Regen Tables (22 - Batch Process)</p> <p>Launches the R96700 batch process using version XJDE0001. This process creates tables in the XML database that are marked as new or regenerate in the table change table or the table conversion scheduler.</p>
110	<p>Create/Load ASU OL &amp; VL tables (22 - Batch Process)</p> <p>Launches the R9600400C batch process using version XJDE0001. This process copies to the XML database the Object Librarian, Versions List, and package assembly information for the master. Verify that the data source, which you can set in the processing options for this version, is set correctly.</p>
120	<p>ASU v/s Package Validation (22 - Batch Process)</p> <p>Launches the R9671 batch process using version XJDE0001. This process cross- validates information, ensuring that objects, tables, and specifications in the ASU package definition match with the object change table, table change table, index change table, and table conversion scheduler in the software master.</p>
130	<p>Compress/Copy Database (22 - Batch Process)</p>

Sequence Number	Build Step (Type) with Additional Information
	Launches R9640E using version XJDE0003. This process compresses the ASU database XML files and copies them from the \$TEMP/data directory to the final software master image path as Data.cab.
140	Copy Package and Feature INFs (22 - Batch Process)  Launches the R9600400E batch process using version XJDE0001. This process copies deployment features INFs, the package INFs, and the feature INFs from the deployment server to the \$TEMP directories.
180	Copy CD Directory Files (17 - Copy CD Directory Files)  Copies additional specified items into the image path. For example, all install programs are copied to the root of the image path.
190	Create INF (16 - Create INF)  Creates the deployment INF file into the image path directory.
200	Create self-extracting exe (22 - Batch Process)  Launches the R9640J batch process using version XJDE0001. This process takes the entire software master image and creates a CAB file and a self-extracting executable file in the \$TEMP/final directory. You can use either of these files to deliver the software master. Uncompress the CAB file or run the executable file on the deployment server, and then refer to the Application Software Update Guide to update JD Edwards EnterpriseOne with the software master.
210	Validate the Mastered CD (22 - Batch Process)  Launches R9640D version XJDE0001, which performs post-mastering validation on the master that has been created. Refer to the report output for details.

## Working with Custom CD Templates

The Custom CD is for general use; this CD type has no template. A JD Edwards EnterpriseOne administrator uses this CD type primarily to create backups of source code, documents, and so forth, while still using the JD Edwards EnterpriseOne Product Packaging Tools. This CD type enables you to enter a directory structure that contains all of the files that you want loaded on to a custom CD image. After the process is completed, the administrator can move that image to a CD burner to create the actual CD.

## Forms Used to Work with Software Master Templates

Form Name	FormID	Navigation	Usage
Work With CD Templates	W9640B	Advanced Operations menu (GH9622), Mastering Templates	Select a template to revise, proof, validate, or delete.

Form Name	FormID	Navigation	Usage
Template Director	W9640D	On the Work With CD Templates form, click Add.	Add a new template
CD Revisions	W9640G	On the Work With CD Templates form, select a template.	Revise a template.
Copy CD Configuration	W9640C	From Work with Software Mastering, select a template and click Copy.	Create a new template based on an existing one.

**Note:**

- *Revising a Software Master Definition.*
- *Loading a Subdirectory from an Enterprise Network Directory.*
- *Copying a Software Master Definition.*
- *Proofing a Software Master Definition.*

# 5 Working with Change Table Configurations

## Understanding Change Table Revisions

If you need to revise or add change tables, you can build and submit change table configurations to a software master after you have created the software master. Disregard this task if you have not yet created the software master. If the template that you select for the software master requires change tables, the software master will build the change tables that you specify during the setup of the software master definition.

## Working with Change Table Configurations

You copy change table configurations from one master definition to another master definition. This process copies all change table configurations associated with the master from which you are copying.

## Forms Used to Work with Change Tables

Form Name	FormID	Navigation	Usage
Work With Change Table Definitions	W9642Z	In Solution Explorer, navigate to System Administration Tools, Package and Deployment Tools, Product Packaging, Change Table Configurations (P9642).	Used to revise or delete change tables.
Copy Change Table Definitions	W9642A	In the Work With Change Table Definitions form, select a CD, then select one of its change table definitions and click Copy.	Used to create a new table definition based on an existing one.

## Setting Up Change Table Definitions

Access the Work With Change Table Definitions form and complete the following fields.

### Source Release

The system release number under which the source pristine tables were built.

### Target Release

The system release number for which you are building the software master.

**Source Environment**

The name of the source environment where the pristine control tables reside.

**Change Table Type**

A user defined name or remark.

**Batch Application**

The number that identifies the batch or interactive program (batch or interactive object).

**Version**

A user-defined set of specifications that control how applications and reports run. You use versions to group and save a set of user-defined processing option values and data selection and sequencing options. Interactive versions are associated with applications (usually as a menu selection). Batch versions are associated with batch jobs or reports. To run a batch process, you must choose a version.

**Configuration Status**

A user defined name or remark.

## Working with Change Table Director

If the template that you select for the software master requires change tables, the software master will build the change tables that you specify during the setup of the software master definition.

### Forms Used to Work With Change Table Director

Form Name	FormID	Navigation	Usage
Work With Change Table Definitions	W9642Z	In Solution Explorer, navigate to System Administration Tools, Package and Deployment Tools, Product Packaging, Change Table Configurations (P9642).	Used to revise or delete change tables.
Change Table Director	W9642E	In the Work With Change Table Definitions form, click Add.	Guides you through the steps necessary in setting up a configuration for running the Change Table batch applications across multiple releases.
Target Release Selection	W9642F	Complete the fields and click Next.	Used to identify the name of the CD and then change the Target release necessary.

Form Name	FormID	Navigation	Usage
Source Environment Selection	W9642G	Complete the fields and click Next.	Used to select the name of the environment where the pristine control tables exit.
Batch Application Selection	W9642AA	Select the batch applications and click Next.	Used to select the Change Table Types that you wish to have updated.
Additional Change Table Definitions	W9642L	Select Quit to close the JD Edwards EnterpriseOne Change Table Director or select Continue to display the Target Release Selection form.	Used to either add additional change table definitions or to exit the JD Edwards EnterpriseOne Change Table Director.

## Adding a Change Table Definition

The software builds the change tables that you select and includes them with the software master.

### Change Table Director

Oracle's JD Edwards EnterpriseOne Change Table Director guides you through the steps necessary in setting up a configuration for running the Change Table batch applications across multiple releases.

Access the JD Edwards EnterpriseOne Change Table Director form.

### Target Release Selection

Each Change Table configuration must be associated with a previously defined CD. Identify the name of the CD and then change the Target release necessary. In most cases, the target release will be the same as the defined release of the CD.

Access the Target Release Selection form.

Change Table Configurations - [Target Release Selection]

File Edit Preferences Form Window Help

Can... Next Dis... Abo Links Previo... OLE ... Internet

Each Change Table configuration must be associated with a previously defined CD. Identify the name of the CD and then change the Target release if necessary. In most cases, the target release will be the same as the defined release of the CD.

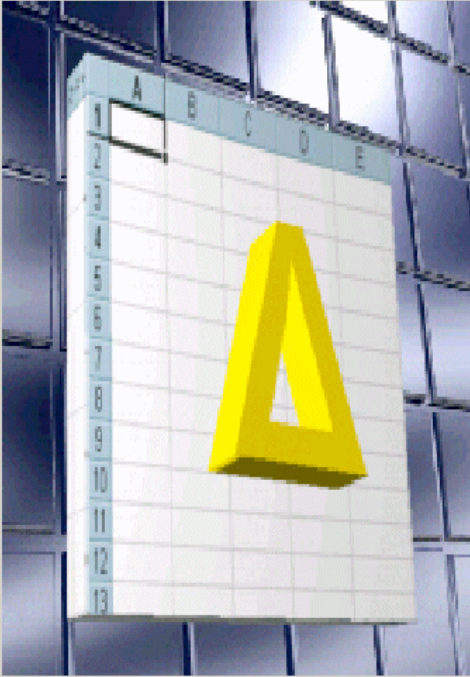

CD Name

Description

Release  A7.1 Base

Target Release  E812 Release 8.12

The Target Release cannot be the same as the Source Release. Use the director to add or select a unique release value.

**CD Name**

The unique name given to the software master.

**Description**

A short description of the software master

**Release**

The release number defined in the software master.

**Target Release**

The system release number for which you are building the release master.

## Source Environment Selection

The Source Environment Selection is used to select the name of the environment where the pristine control tables exist. This information is used along with the current environment to build the Change Table records.

Access the Source Environment Selection form.

Change Table Configurations - [Source Environment Selection]

File Edit Preferences Form Window Help

Can... Prev... Next Dis... Links Previo... OLE ... Internet

Choose the name of the environment where the pristine control tables exist. This information is used along with the current environment to build the Change Table records.

To see object mapping information for your selected environment, you may choose to take the Object Configuration Manager menu exit.

Source Environment

Description

Source Release

**Source Environment**

The name of the source environment where the pristine control tables reside.

**Description**

A user defined name or remark.

**Source Release**

The release number defined in the release master.

## Batch Application Selection

Each type of Change Table is associated with a particular Batch Application. Select the Change Table Types that you wish to have updated. To change the version, simply highlight the row and choose the Version Selection form the Row menu.

Access the Batch Application Selection form.

**Change Table Configurations - [Batch Application Selection]**

File Edit Preferences Form Row Window Help

Find Can... New... Prev... Next Dis... Abo Links Previo... OLE ... Internet

Each type of Change Table is associated with a particular Batch Application. Select the Change Table Types that you wish to have updated. To change the version, simply highlight the row and choose Version Selection from the Row menu.

To create another Change Table definition or to exit the Change Table Director, press Next.

Change Table Type	Batch Application	Version
Data Dictionary	R989200T	XJDE0001
User Defined Codes	R9600041	XJDE0001
Workflow	R988002	XJDE0001
Favorites	R96911001	XJDE0001
Templates and Smart Fields	R96914001	XJDE0001
Tips of the Day	R96915001	XJDE0001
Table and Index Changes	R9698710	XJDE0001
Solution Explorer	R9690001	XJDE0001
Service Constant	R96951001	XJDE0001

Row:1

### **Change Table Type**

A user defined name or remark.

### **Batch Application**

Additional text that further describes or clarifies a field in the system.

### **Version**

A user-defined set of specifications that control how applications and reports run. You use versions to group and save a set of user-defined processing option values and data selection and sequencing options. Interactive versions are associated with applications (usually as a menu selection. Batch versions are associated with batch jobs or reports. To run a batch process, you must choose a version.

## **Additional Change Table Definitions**

The Additional Change Table Definitions form is used to either add additional change table definitions or to exit the Change Table Director.

Access the Additional Change Table Definitions form and select either Continue or Quit.

### **Continue**

Select Continue to display the Target Release Selection form where you can then repeat all of the steps for a different source and target combination.

### **Quit**

Select Quit to close the JD Edwards EnterpriseOne Change Table Director.

# 6 Working with the Data Cleanup Procedure Application

## Understanding the Data Cleanup Procedure Application

JD Edwards EnterpriseOne Product Packaging Tool includes an application that enables you to add, revise, copy, and delete a set of data cleanup steps. You define how you want these steps to clean up the software master data.

## Working with the Data Cleanup Procedure Application

You can revise the information and steps within a data cleanup procedure that you have already created. If you revise a data cleanup procedure, those revisions are reflected wherever that procedure is used, such as when the revised procedure is nested within another procedure.

### Forms Used to Work with Data Cleanup Procedures

Form Name	FormID	Navigation	Usage
Work with Procedure	W9646A	In Solution Explorer, navigate to System Administration Tools, Package and Deployment Tools, Product Packaging, Data Cleanup Procedure Templates.	Used to execute or delete a data cleanup procedure.

## Using the Data Cleanup Procedure Application

Although this JD Edwards EnterpriseOne Product Packaging Tool function is primarily used to create data cleanup procedures, you can use it to create any type of procedure to run a batch process or Microsoft Windows executable.

Access the Work With Procedure form which contains the following information.

#### Release

The system release to which the data cleanup applies.

#### Name

The unique name given to a data-cleanup procedure.

#### Description

A short description of the data-cleanup procedure.

**Status**

The status of the data-cleanup procedure. Indicates where the data-cleanup procedure resides in the process between defining and executing. For example, the procedure could be at a status of defined, validated, or built. Before executing the data cleanup procedure (whether from the software master or from the data-cleanup procedure application), verify that the status of the procedure, and all of its build steps that you want to run with it, are validated.

**Type**

The type of procedure being run.

**Comment**

A short informational comment that you provide about the data-cleanup procedure.

**User ID**

The code that identifies a user profile.

## Adding a Data Cleanup Procedure

This function is used it to create various data cleanup procedures to run a batch process.

### Forms Used to Add a Data Cleanup Procedure

Form Name	FormID	Navigation	Usage
Work With Procedure	W9646A	In Solution Explorer, navigate to System Administration Tools, Package and Deployment Tools, Product Packaging, Data Cleanup Procedure Application (P9646).	Used it to create various procedures to run a batch process.
Procedure Definition Director	W9646B	In the Work With Procedure form, click Add.	Enables you to add procedure information and the steps that are necessary to clean up data.
Procedure Revision Information	W9646D	On the Work with Procedure form, select a procedure.	Revise or execute a data cleanup procedure.

## Adding Data Cleanup Procedures

This enables you to add procedure information and the steps that are necessary to clean up data.

## Procedure Definition Director

Oracle's JD Edwards EnterpriseOne Procedure Definition Director will take you through the steps necessary to define a procedure.

Access the Procedure Definition Director form.

## Add Procedure

The Add Procedure form is used to enter information about the new procedure.

Access the Add Procedure form and enter the following information.

### **Name**

The unique name given to a data-cleanup procedure.

### **Description**

A short description of the data cleanup procedure.

### **Comment**

A short informational comment that you provide about the data cleanup procedure.

### **Status**

The status of the data cleanup procedure. Indicates where the data-cleanup procedure resides in the process between defining and executing. Before executing the data-cleanup procedure (whether from the software master or from the data-cleanup procedure application), verify that the status of the procedure, and all of its build steps that you want to run with it, are validated (30). Values are:

**10** In Definition

**20** Defined

**30** Validated

**40** Processing

**50** Failed

**60** Built

**70** Obsolete

**80** Mastered

**90** Repaired

### **Procedure Release**

The system release number to which the data cleanup procedure applies.

### **Template Name**

The unique name given to a data cleanup procedure template.

## Procedure Revision Information

These options execute the entire procedure. If the procedure is executed successfully, the software updates the procedure and the build step statuses to 60 (Built).

Access the Procedure Revision form.

**Name**

The unique name given to a data-cleanup procedure.

**Description**

A short description of the data cleanup procedure.

**Status**

The status of the data cleanup procedure. Indicates where the data-cleanup procedure resides in the process between defining and executing. Before executing the data-cleanup procedure (whether from the software master or from the data-cleanup procedure application), verify that the status of the procedure, and all of its build steps that you want to run with it, are validated (30). Values are:

**10** In Definition

**20** Defined

**30** Validated

**40** Processing

**50** Failed

**60** Built

**70** Obsolete

**80** Mastered

**90** Repaired

**Comment**

A short informational comment that you provide about the data cleanup procedure.

**Release**

The CD release number to which the data-cleanup applies.

## Procedure Revision Steps

This option executes the data cleanup procedure step. If the step is executed successfully, the software updates the step status to 60 (Built). If you execute a data-cleanup procedure step, all of its subordinate steps are also executed, including any sub-procedures.

Access the Procedure Revision form.

The screenshot displays the 'Data Cleanup Procedure Application - [Procedure Revision]' window. The interface includes a menu bar (File, Edit, Preferences, Form, View, Window, Help) and a toolbar with buttons for OK, Cancel, Add, Delete, Rename, Refresh, Disconnect, and Abort. Below the toolbar are tabs for 'Information' and 'Steps'. The main area is divided into a left pane labeled 'Procedure' and a right pane for data entry. The 'Procedure' pane shows a tree view with icons. The right pane contains the following fields:

Status	<input type="text" value="30"/>	<input type="text" value="Validated"/>
Type	<input type="text" value="01"/>	Generic UBE
Sequence	<input type="text" value="10"/>	
Description	<input type="text" value="Step 1"/>	
Comment	<input type="text" value="Step 1"/>	
Object Name	<input type="text"/>	
Version	<input type="text"/>	

## Copying a Data Cleanup Procedure

The JD Edwards EnterpriseOne Product Packaging Tool function is primarily used to create data cleanup procedures.

### Forms Used to Copy a Data Cleanup Procedure

Form Name	FormID	Navigation	Usage
Work With Procedure	W9646A	In Solution Explorer, navigate to System Administration Tools, Package and Deployment Tools, Product Packaging, Data Cleanup Procedure Application (P9646).	Used it to create various procedures to run a batch process.
Copy Procedure	W9646L	In the Work with Procedure form, select a procedure and click Copy.	Used to create a new data cleanup procedure based on an existing one.

## Copying a Data Cleanup Procedure

Access the Procedure Definition Director form.

### Copy From Procedure

The unique name given to a data cleanup procedure.

### Copy To Procedure

The unique name given to a data cleanup procedure.

## Executing a Data Cleanup Procedure and Build Step

You can execute a data cleanup procedure and build step from the data cleanup application.

Although this task explains how to execute procedures from the data cleanup application, you can also use the software master build steps to define a step that executes the data cleanup.

## Forms Used to Execute a Data Cleanup Procedure and Build Step

Form Name	FormID	Navigation	Usage
Work With Procedure	W9646A	In Solution Explorer, navigate to System Administration Tools, Package and Deployment Tools, Product Packaging, Data Cleanup Procedure Application (P9646).	Use to create various procedures to run a batch process.
Procedure Revision	W9646D	In the Work with Procedure form, select a procedure.	Used to revise or execute a data cleanup procedure.

## Executing a Data Cleanup Procedure and Build Step

Access the Procedure Revision form.

### Name

The system release number to which the data cleanup applies.

### Description

The unique name given to the data cleanup procedure.

### Status

The status of the data cleanup procedure. Indicates where the data-cleanup procedure resides in the process between defining and executing. Before executing the data-cleanup procedure (whether from the software master or from the data-cleanup procedure application), verify that the status of the procedure, and all of its build steps that you want to run with it, are validated (30). Values are:

**10** In Definition

**20** Defined

**30** Validated

**40** Processing

**50** Failed

**60** Built

**70** Obsolete

**80** Mastered

**90** Repaired

### Comment

A short informational comment that you provide about the data cleanup procedure.

**Release**

The CD release number to which the data-cleanup applies.

# 7 Working with Advanced Operations

## Working with CD Templates

This section provides an overview of CD templates and discusses how to:

- Work with CD Templates.
- Add a New Template

### Understanding CD Templates

A JD Edwards EnterpriseOne administrator uses this CD template primarily to create backups of source code, documents, and so forth, while still using JD Edwards EnterpriseOne Product Packaging Tools.

### Forms Used with Mastering Templates

Form Name	FormID	Navigation	Usage
Work With CD Templates	W9640B	In Solution Explorer, navigate to System Administration Tools, Package and Deployment Tools, Product Packaging, Advanced Operations, Mastering Templates (P9640).	Used to select a template to revise, proof, validate, or delete.
CD Revisions	W9640G	In the Work With CD Templates form, select a template.	Used to revise a template.
Template Director	W9640D	In the Work With CD Templates form, click Add.	Used to add a new template
Template Information	W9640H	Complete the fields and click Next.	Used to provide the release level, CD type and a short description. The template name will be generated automatically.
CD Revisions	W9640G	Complete the fields and click Next.	Lets you set up your CD information, build steps, directory structure, and director steps.

Form Name	FormID	Navigation	Usage
Copy CD Configuration	W9640C	In the Work With Software Mastering, select a template and click Copy.	Used to create a new template based on an existing one.

## Setting Up CD Templates

The CD template enables you to enter a directory structure that contains all of the files that you want loaded on to a custom CD image. After the process is completed, the administrator can move that image to a CD burner to create the actual CD.

Access the Work With CD Templates form.

### Release

The system release number of the software master. use the Search button to review a complete list of values for this field.

### Build Phase

This is the phase of development that your software master represents, such as an alpha, a beta, or a general availability phase. You can add or change the phases, since this is a user defined code. Use the visual-assist button to view a complete list of values for this field.

### Build Phase Description

A user defined name or remark.

### CD Type

Type of CD being mastered.

### Type Description

A user defined name or remark.

### CD Name

The unique name given to a software master.

### Description

A short description of the software master.

### Comment

A short informational comment provided by the system about each step of the mastering process. You can enter your own comments into this field, but the system will overwrite any text currently in the field during the next mastering process.

### Definitions Date

The date the CD was defined.

### One Off CD

Future use.

## Adding a New CD Template

Access the Template Director form.

### Template Director

Oracle's JD Edwards EnterpriseOne Template Director is used to guide you through the steps necessary to define a CD.

### Template Information

The Template Information form is used to provide the release level, CD type and a short description. The template name will be generated automatically.

Access the Template Information form.

**Product Packages - [Template Information]**

File Edit Preferences Form Window Help

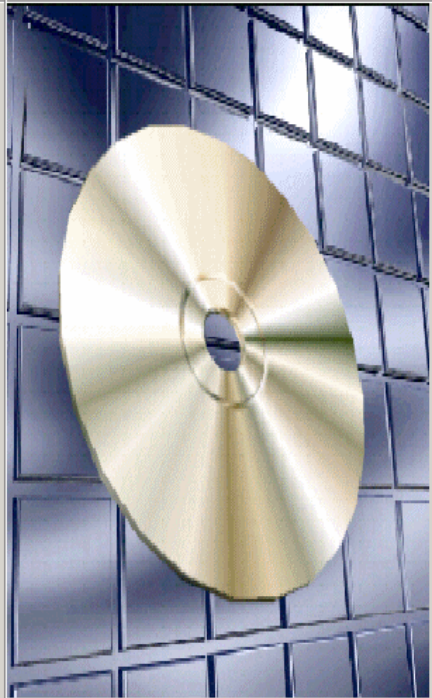

Can... Prev Next Dis... Abo Links Prev OLE ... Internet

Enter information about your new CD.

Provide the release level, CD type and a description. The template name will be generated automatically.

Name	<input type="text" value="E812-09"/>
Release	<input type="text" value="E812"/>  Release 8.12
Type	<input type="text" value="09"/> Application Software Update
Build Phase	<input type="text" value="03"/> General Availability
Description	<input type="text" value="Template for E812-Application Software Update"/>

Create this path on workstation if it does not exist.

**Release**

The system release number of the software master. Use the Search button to review a complete list of values for this field.

**Type**

The type of procedure being run.

**Build Phase**

This is the phase of development that your software master represents, such as an alpha, a beta, or a general availability phase. You can add or change the phases, since this is a user defined code. Use the visual-assist button to view a complete list of values for this field.

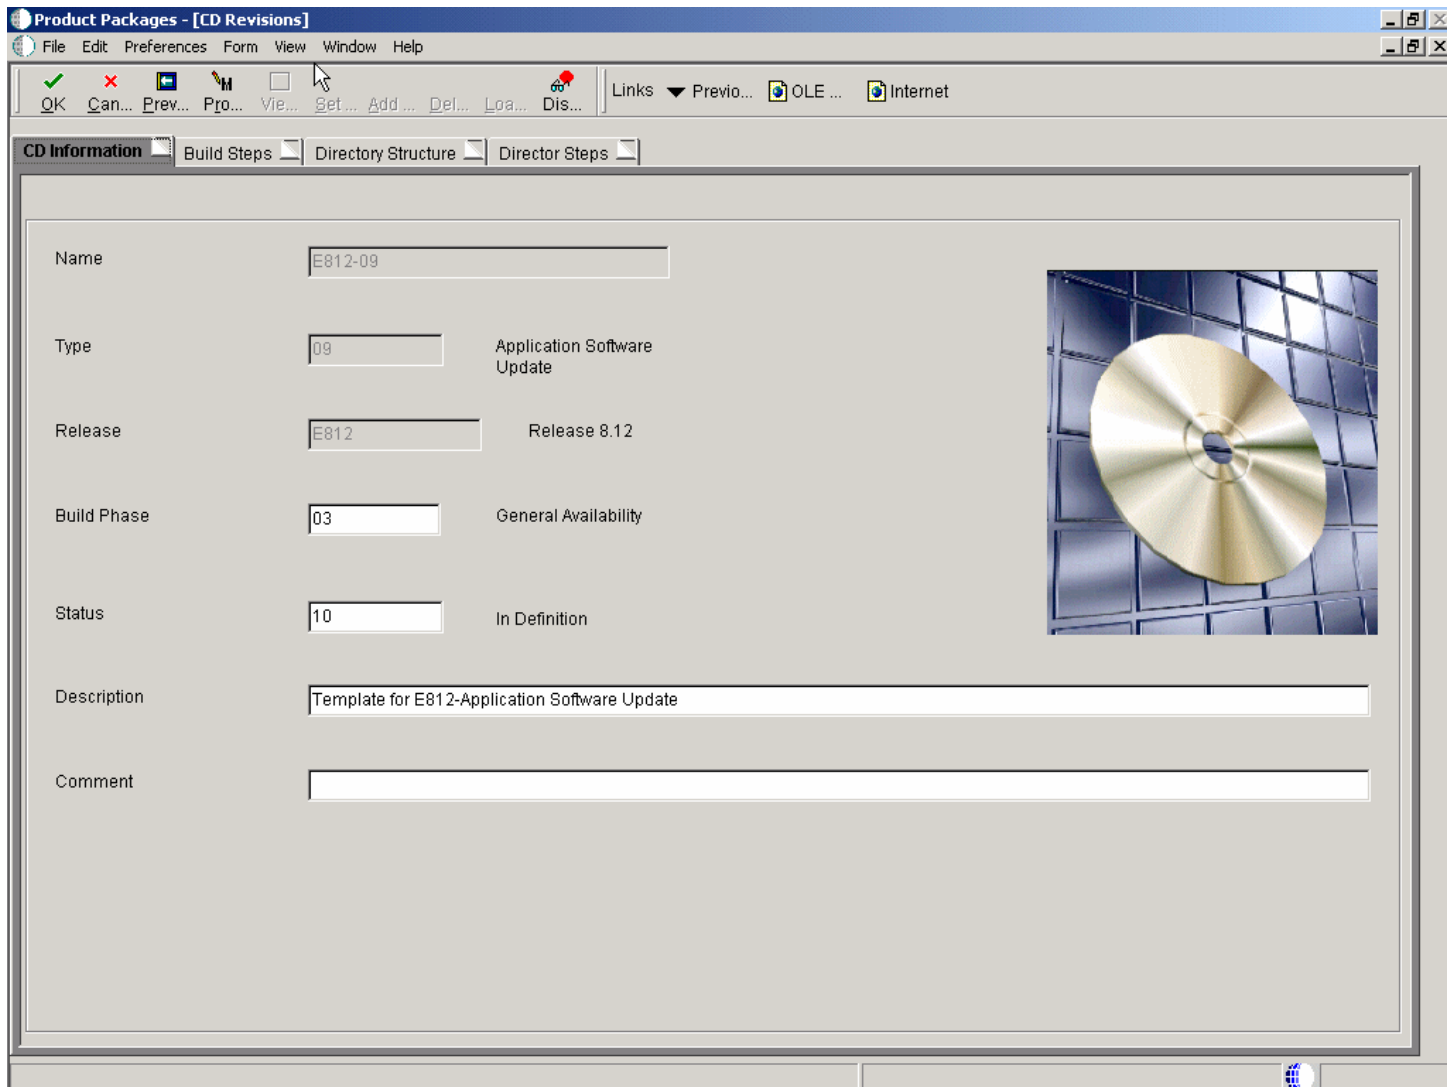

**Description**

A user defined name or remark.

## CD Revisions

The CD Revisions form lets you set up your CD information, build steps, directory structure, and director steps.

Access the CD Revisions form.

1. Enter your CD Information.

- **Status**

Displays the status of a build step or directory structure within the mastering process. For example, the build step or directory structure could be at a status of defined, validated, or built. Use the visual-assist button to view a complete list of values for this field.

- **Comment**

Displays short informational comments that are provided by the system about each step of the mastering process. You can enter comments into this field, but the system will overwrite any text that is currently in the field during the next mastering process.

- **Image Path**

Overfills the directory path where you want the software master to reside on the enterprise. The directory that you indicate will be the root directory for the creation of the final software master.

## 2. Define your Build Steps.

- **Sequence**

Displays the order in which the system processes build steps, usually in increments of 10 (for example, **10**, **20**, **30**, and so on).

Verify the order in which you want the step performed during the creation of the software master definition. You can use the same sequence number for multiple build steps.

- **Type**

Displays the type of CD being mastered. Verify which component type you want the build step to perform. For example, you can define steps to create file structures, build a package, or create INF files.

- **Status**

Verifies the current status of the build step, which can indicate whether to run the particular step during the mastering process. For example, if you need to perform a manual step during the mastering process, you can manually complete the step, change the step's status to **60** (Built) by choosing the step, and then, from the View menu, select Execute Step.

- **Target Folder**

Displays the name of the target folder, such as **planner** or **updatepkg**. The system populates this field based upon the template that was used to define the software master. Change the name of the target folder only if you added the folder yourself.

- **Executable**

Displays the software that might populate this field based upon the build step's definition in the software master template. To change this field, click the **Executable** button and use the Select a Windows Executable form to select an executable for this build step.

- **Value/Parameter**

Verifies the value or parameter. To change this information, click the **Value/Parameter** button, and then enter a value or parameter that is appropriate to the step you chose. This field is dynamic. The button name is either Value or Parameter, based upon the step that you select. The form that appears when you click the button also depends upon which step you select. For example, the Package Build step calls the Select Package Build form, from which you can select a package; and the Build Change Tables step calls the Work With Change Table Definitions form, from which you can modify the change table configuration.

### 3. Set up your Directory Structure.

- o **Source Path**

Displays the directory on the enterprise that you want to use to populate the highlighted target folder. You can use an absolute (full) directory path name, or you can use a relative path name with a token. The system copies the data that is contained in the source path, depending upon how you filter those files (see the **File Filter** field description for this information), into the highlighted target folder of the software master.

Verifies the directory path of the source that will populate the component. This is the source path name of the data that you want to retrieve for the master and that you placed into the target folder. You can specify this path using either a relative or absolute path. See *Troubleshooting Product Packaging* for information about relative and absolute paths.

- o **File Filter**

Displays the filter, which you can designate, for the files that are contained in the source path. For example, you can use \*.\* to retrieve all files in the source path, or \*.exe to retrieve only executable programs.

Verify the file filter. The default is \*.\*. The file filter enables you to filter any data files that you retrieve from the source directory. For example, you can use \*.\* to retrieve all files in the source directory.

- o **Full Path**

Displays the names and functions. This field is dynamic and its name and function depend upon the build step that is highlighted. The possible names and functions are:

**Value:**The value that is needed to complete the highlighted build step. For example, if the build step is a batch process, the value field contains the name of the batch process and its version, such as **R95012\XJDE0001**.

**Parameter:**The parameters that are needed for the highlighted build steps that process an executable program.

The full (absolute) target path name of the highlighted directory, such as **Root/planner/updatepkg**.

### 4. Define your Director Steps.

- o Package/Change Table Form

Indicates the package form and change table form used.

- o Software Update Form

Future use.

## Copying CD Configuration

You can copy a software master definition that you have already created. This copies the information that you entered into the JD Edwards EnterpriseOne CD Configuration Director, the build steps, and the directory structure.

Access the Copy CD Configuration form.

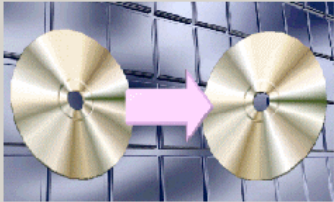

**Product Packages - [Copy CD Configuration]**

File Edit Preferences Window Help

OK Cancel Dis... Auto Links Displ... OLE ... Internet

**Copy From**

Name

**Copy To**

Name  (Name automatically generated from Release and Type)

Description

Status  In Definition

Release  A7.1 Base

Type  Application Software Update

### Copy From

The Copy From fields:

Name is the unique name given to a software master.

### Copy To

The Copy To fields:

Name is the unique name given to a software master and is automatically generated from release and type.

Description is a short description of the software master.

Status displays the status of a build step or directory structure within the mastering process.

Release is the system release number of the software master.

Type is the type of CD being mastered.

## Converting Relative and Absolute Paths

This section provides an overview of relative and absolute paths and discusses how to:

- Use relative path tokens
- Convert relative and absolute paths.

## Understanding Path Tokens

You use relative path tokens within a field. The software enables you to convert relative path tokens and absolute path names for those fields that accept them within the JD Edwards EnterpriseOne Product Packaging Tools. If any fields use a token, you can convert the token into an absolute path or you can convert the absolute path into a token. For example, you can convert any instance of \$DEP into Z:\DepServer or you can convert Z:\DepServer into \$DEP.

An absolute path name begins with the root directory and details the entire path, such as Z:\DepServer\CD Templates\Partial Update. A relative path name begins with a token, such as \$DEP. The token represents at least the root directory and possible contiguous directory paths. For example, \$DEP might represent Z:\DepServer. This relative path might appear within an applicable field as \$DEP\CD Templates\Partial Update.

You do not need to define the tokens. The JD Edwards EnterpriseOne Product Packaging Tool automatically resolves the token values based on the installation and other information that is available to it.

These are the relative path tokens that you can use:

### \$DEP

Represents the root directory where JD Edwards EnterpriseOne is installed on the deployment server.

### \$IMAGE

Represents the image path of the software master.

### \$CLIENT

Represents the root directory where JD Edwards EnterpriseOne is installed on the workstation that you are currently using.

### \$TEMP

Represents the Microsoft Windows temporary directory of the workstation that you are currently using.

## Forms Used to Work With Relative and Absolute Paths

Form Name	FormID	Navigation	Usage
Work With Software Mastering	W9640B	In Solution Explorer, navigate to System Administration Tools, Package and Deployment Tools, Product Packaging, Product Packages (P9640).  In the Work With Software Mastering form, select Convert Paths from the Row menu.	Used to delete a data cleanup template.
Report Output Destination	W98UBEA	In the Report Output Destination form, click OK.	Used to select the report destination and output stream access.

## Using Relative Path Tokens

To use relative path tokens:

From a field that allows relative paths, enter a token followed by the remainder of the path that is needed for that field.

For example:

\$DEP\CD Templates\Partial Update

## Converting Relative and Absolute Paths

The software converts the absolute and relative paths for any fields within the JD Edwards EnterpriseOne Product Packaging Tools to which this applies.

Access the Work With Software Mastering form.

1. Select the master for which you want to convert relative and absolute paths, and then select Convert Paths from the Row menu.

2. In Report Output Destination, select the option to send the report to a printer or to the screen, and then click OK.

The software converts the absolute and relative paths for any fields within the JD Edwards EnterpriseOne Product Packaging Tools to which this applies.

## Working with Data Cleanup Procedure Templates

This section discusses how to:

- Work with Data Cleanup Procedure Templates
- Add a Data Cleanup procedure
- Copy a Data Cleanup procedure

### Forms Used with Data Cleanup Procedure Templates

Form Name	FormID	Navigation	Usage
Work with Procedure	W9646A	In Solution Explorer, navigate to System Administration Tools, Package and Deployment Tools, Product Packaging, Advanced Operations, Data Cleanup Procedure Templates (P9646).	Used to execute or delete a data cleanup procedure.
Procedure Definition Director	W9646B	In the Work with Procedure form, click Add.	Takes you through the steps to add a data cleanup procedure.
Add Procedure	W9646C	In the Add Procedure form, enter the information and click Next.	Used to enter information about a data cleanup procedure.
Procedure Revision	W9646D	In the Work with Procedure form, select a procedure.	Used to revise or execute a data cleanup procedure.
Copy Procedure	W9646L	In the Work with Procedure form, select a procedure and click Copy.	Used to create a new data cleanup procedure based on an existing one.

## Setting Up Data Cleanup Procedure Templates

Although this JD Edwards EnterpriseOne Product Packaging Tool function is primarily used to create data cleanup procedures, you can use it to create any type of procedure to run a batch process or Microsoft Windows executable.

Access the Work With Procedure form.

### **Release**

The system release number to which the data cleanup applies.

### **Name**

The unique name given to a data-cleanup procedure.

### **Description**

A short description of the data-cleanup procedure.

### **Status**

The status of the data cleanup procedure. Indicates where the data cleanup procedure resides in the process between defining and executing. For example, the procedure could be at a status of defined, validated, or built. Before executing the data-cleanup procedure (whether from the software master or from the data cleanup procedure application), verify that the status of the procedure, and all of its build steps that you want to run with it, are at validated (30). Values are:

**10** In Definition

**20** Defined

**30** Validated

**40** Processing

**50** Failed

**60** Built

**70** Obsolete

**80** Mastered

**90** Repaired

### **Type**

The type of procedure being run.

### **Comment**

A short informational comments provided by the system about each step of the mastering process. You can enter our own comments in this field, but the system will over write any text in the field during the mastering process.

### **User ID**

The code that identifies the user profile.

## Adding a Data Cleanup Procedure

This function enables you to add procedure information and the steps that are necessary to clean up data.

## Procedure Definition Director

The JD Edwards EnterpriseOne Procedure Definition Director guides you through the steps necessary to define a procedure.

Access the Procedure Definition Director form.

## Add Procedure

The Add Procedure is used to enter information about the new procedure. You will need to enter the unique name and other information related to the procedure.

Access the Add Procedure form.

### **Name**

The unique name given to a data cleanup procedure.

### **Description**

A short description of the data cleanup procedure.

### **Comment**

A short information comment that you provide about the data cleanup procedure.

### **Status**

The status of the data cleanup procedure. Indicates where the data-cleanup procedure resides in the process between defining and executing. For example, the procedure could be at a status of defined, validated, or built. Before executing the data cleanup procedure (whether from the software master or from the data cleanup procedure application), verify that the status of the procedure, and all of its steps that you want to run with it, are at validated (30). Values are:

**10** In Definition

**20** Defined

**30** Validated

**40** Processing

**50** Failed

**60** Built

**70** Obsolete

**80** Mastered

**90** Repaired

### **Procedure Release**

The system release number to which the data cleanup applies.

## Procedure Revision

The Procedure Revision is used to revise or execute a data cleanup procedure.

Access the Procedure Revision form.

### **Name**

The unique name given to a data cleanup procedure.

### **Description**

A short description of the data cleanup procedure.

### **Status**

The status of the data cleanup procedure. Indicates where the data-cleanup procedure resides in the process between defining and executing. For example, the procedure could be at a status of defined, validated, or built. Before executing the data-cleanup procedure (whether from the software master or from the data cleanup procedure application), verify that the status of the procedure, and all of its steps that you want to run with it, are at validated (30). Values are:

**10** In Definition

**20** Defined

**30** Validated

**40** Processing

**50** Failed

**60** Built

**70** Obsolete

**80** Mastered

**90** Repaired

### **Comment**

A short information comment that you provide about the data cleanup procedure.

### **Release**

The system release number to which the data cleanup applies.

## Copying a Data Cleanup Procedure

The Copy Procedure is used to copy one procedure to another.

Access the Copy Procedure form.

### **Copy From Procedure**

The unique name given to the data cleanup procedure.

### **Copy To Procedure**

The unique name given to the data cleanup procedure.

## Viewing a Table Change Table

The change table is table that contains all the source table data changes and system metadata necessary to maintain the change table. This function allows you to view the Table Change table.

## Forms Used to Work with Table Change Table

Form Name	FormID	Navigation	Usage
Work With Table Change Table	W9698710A	In Solution Explorer, navigate to System Administration Tools, Package and Deployment Tools, Product Packaging, Advanced Operations, View Table Change table (P9698712).	Used to view the Table Change table.

## Viewing the Table Change Table

Access the Work With Table Change Table form.

### Table Name

The name that identifies a system object. JD Edwards EnterpriseOne architecture is object-based. Discrete software objects are the building blocks for all applications and developers can reuse the objects in multiple applications. The Object Librarian tracks each object.

### From Release

The release number as defined in the Software versions Repository file.

### To Release

The release number as defined in the Release Master.

### Table Change Type

Describes the type of action taken on a table or index during the upgrade or update process.

### EnterpriseOne Only (Y/N)

This field is used to describe the table associated with a scheduled conversion program. It is used to determine if the table is used by the system software only or if it is shared by JD Edwards EnterpriseOne software.

### User ID

The code that identifies a user profile.

### Program ID

The number that identifies the batch or interactive program (batch or interactive object).

The program ID is a variable length value. It is assigned according to a structured syntax in the form TSSXXX where:

**T** - The first character of the number is alphabetic and identifies the type.

**SS** - The second and third characters of the number are numeric and identify the system code.

**XXX** - The remaining characters of the number are numeric and identify a unique program or report.

### Date Updated

The date that specifies the last update to the file record.

**Work Stn ID**

The code that identifies the work station ID that executed a particular job.

**Time Updated**

The time that specifies when the program executed the last update to this record.

## Viewing the Index Change Tables

This function allows you to view the index change tables.

### Forms Used to Work with Index Change Table

Form Name	FormID	Navigation	Usage
Work With Index Change Table	W9698712A	In Solution Explorer, navigate to System Administration Tools, Package and Deployment Tools, Product Packaging, Advanced Operations, View Index Change Table (P9698712).	Used to view the Index Change Tables.

## Viewing the Index Change Tables

Access the Work With Index Change Table form.

**Table Name**

The name that identifies a system object. JD Edwards EnterpriseOne architecture is object-based. Discrete software objects are the building blocks for all applications and developers can reuse the objects in multiple applications. The Object Librarian tracks each object.

**Index Identifier**

The numeric ID used for the table's index.

**From Release**

The release number as defined in the Software Versions Repository file.

**To Release**

The release number as defined in the Release Master.

**Index Change Type**

Describes the type of action taken on a table or index during the upgrade or update process.

**EnterpriseOne Only (Y/N)**

This field is used to describe the table associated with a scheduled conversion program. It is used to determine if the table is used by the system software only or if it is shared by JD Edwards EnterpriseOne software.

**User ID**

The code that identifies a user profile.

**Program ID**

The number that identifies the batch or interactive program (batch or interactive object).

The program ID is a variable length value. It is assigned according to a structured syntax in the form TSSXXX where:

**T** - The first character of the number is alphabetic and identifies the type.

**SS** - The second and third characters of the number are numeric and identify the system code.

**XXX** - The remaining characters of the number are numeric and identify a unique program or report.

**Date Updated**

The date that specifies the last update to the file record.

**Work Stn ID**

The code that identifies the work station ID that executed a particular job.

**Time Updated**

The time that specifies when the program executed the last update to this record.

## Viewing the Control Change Tables

Control Change Tables are generated during the installation process when you run the environment workbench. This function allows you to view the Control Change tables.

## Forms Used with Software Update Control Tables

Form Name	FormID	Navigation	Usage
Software Update Control Tables	W96470I	In Solution Explorer, navigate to System Administration Tools, Package and Deployment Tools, Product Packaging, Advanced Operations, View Control Change Tables (P96470).	Used to add change or delete a software update control tables.

## Viewing the Software Update Control Tables

A software update control table is a table that contains the items that have changed between releases or updates.

Access the Software Update Control Tables form.

**From Release**

The current release level of your JD Edwards software before you upgrade it.

**To Release**

The release number as defined in the release master.

# 8 Working with Translation Updates

## Understanding Translation Updates

When an Oracle's JD Edwards EnterpriseOne software update is taken by a customer that uses a language not supported by JD Edwards EnterpriseOne, that customer's translated database requires updating. In addition, when a new translation is made for a customer that uses an unsupported language, the new translation must be deployed to the customer's database. JD Edwards EnterpriseOne Product Packaging Tool provides a way for business partners who support customers that use languages not offered by JD Edwards EnterpriseOne to create language updates, wrap the language updates into a database, and then create an update package to deliver the translation updates to customers. You use the Solution Explorer to perform the tasks for translation updates.

The JD Edwards EnterpriseOne Product Packaging Tool is a scripting engine that provides templates. Each template is a script that is used to build an update package. The update packages are deployed to the customers' systems. After you make a language update and check it into a JD Edwards EnterpriseOne OMW project as an object, you run the Language Update Template UBE (R95160) to create a copy of the template on your JD Edwards EnterpriseOne system. After you create the template, you use the Language OMW Groupings Program (P9649) to collect the translation update objects from OMW and wrap them into a database. You use the Work With CD Configurations Program (P9640) to create a package build, which is an executable file that can be deployed to customers' databases.

**Note:** The Translation Update Template is not intended to be used to build an entire language CD for updates.

## Creating Translation Update Templates

This section provides an overview of the Translation Update Template and discusses how to create the Translation Update Template.

### Understanding Translation Update Templates

Language templates are available with the JD Edwards EnterpriseOne Product Packaging Tool. You create the Translation Update Template by running Oracle's JD Edwards EnterpriseOne Insert Language Update Template (R95160) UBE. This UBE has processing options that enable you to specify the release and data source for the template. When the UBE successfully runs, you receive a report indicating header, details, build steps, and control record were successfully inserted.

### Prerequisites

The JD Edwards EnterpriseOne OMW project contains objects for which you have already made translations.

## Setting Processing Options for the Translation Update Template (R95160)

Processing options enable you to specify the release and data source for the template.

### Template Options

Use these processing options to specify the release for which the template is to be used and to specify where the template should be inserted. Use the processing option for **Release** to specify the JD Edwards EnterpriseOne release for which the template is to be used. You must provide a value for this processing option. If you leave the processing option for **Release** blank, the template will not be created. Use the processing option for **Data Source** to specify the destination for the Translation Update Template. If you leave this processing option blank, the system uses the OCM setting to determine where to insert the template.

#### Release

Specify the release for the Language Update Template. The release value must be the same as the release of the project that you are using, and this value is required for the batch application to run. Use the visual assist to locate the release.

#### Data Source

Specify the data source where the Language Update Template should be inserted. If you leave this field blank, the system determines the destination of the template from OCM. Use the visual assist to specify a data source.

## Collecting Translation Updates

This section lists the forms to collect translation updates and discusses how to build a database of the translation updates.

### Forms Used to Collect Translation Updates

Form Name	FormID	Navigation	Usage
Work with Language Groups	W9649A	In the Fast Path field of Solution Explorer, type P9649.	Locate and copy the language that is to be mastered for the new project.
Language Group Information	W9649B	Select Copy on the Work with Language Groups form.	Enter information to create the database.
Work with OMW Project Detail	W9649F	Click Next on the Language Group Information form.	Select the OMW Project where the language updates have been checked in as objects.

Form Name	FormID	Navigation	Usage
OMW Project Search & Select	W9649G	Click Browse on the Work with OMW Project Detail form.	Search for and Select the OMW Project that includes the objects for the language updates.
Work With OMW Project Detail	W9649F	Click Close on the OMW Project Search & Select form.	Select the OMW Project that includes the objects for the language updates.
Select Languages	W9649C	Click Next on the Work with OMW Project Detail form.	Select the language and data source for which you want to build a database.
Language Information	W9649D	Click Copy on the Select Languages form.	Enter language and data source mapping data source information.
Work with Language Groups	W9649A	Click Finish on the Select Languages form or click OK on the Language Information form.	Build a database that contains the translation updates.

## Creating a Translation Updates Database

After you enter Oracle's JD Edwards EnterpriseOne Language OMW\_Groupings (P9649) program, each of these forms automatically appears as a result of selecting an option on the current form. The forms appear in the order provided in the Process Introduction Table.

### Work With Language Groups

The Work with Language Groups is used to select the language that is to be mastered for the project. This form appears the first time that the record is created; it does not appear if you are inspecting the record on an update. If you need to change the language or mapping information, you can access this form by clicking Add or Copy on the Select Languages form

Access the Work with Language Groups form.

#### Language Group

The language group name.

#### Description

A user defined name or remark.

#### Database File Path

An enterprise directory path that you specify, which will be the root directory containing the contents of your software master.

### **OMW Project Type**

An identifier for an enterprise project. An enterprise project is composed of a group of enterprise objects that have been modified or created by a developer to complete a task. All work with objects within enterprise must occur within the context of a project.

### **Language**

The language name identifier.

## Language Group Information

The Language Group Information form is used to enter the name and description for the language group and the directory path where the language database(s) will be stored. Use the \*ALL option to select if whole language is to be mastered or Project if the OMW project names are associated with this language group.

Access the Language Group Information form.

### **Language Group**

The language group name.

### **Description**

A user defined name or remark.

### **Data File Path**

An Enterprise directory path that you specify which will be the root directory containing the contents of your software master.

### **All**

Select All if whole language is to be mastered.

### **Project**

Select Project if the OMW project names are to be associated with this language.

## Work with OMW Project Detail

The Work with OMW Project Detail form is used to select the individual projects to be used in the language group.

Access the Work with OMW Project Detail form.

### **OMW Project Name**

An identifier for an Enterprise project. An Enterprise project is composed of a group of Enterprise objects that have been modified or created by a developer to complete a task. All work with objects within Enterprise must occur within the context of a project.

### **Description**

A user defined name or remark.

## OMW Project Search & Select

The OMW Project Search & Select form is used to display a list of projects to select from when you click on the browse button on the Work with OMW Project Detail form.

P9649 - [OMW Project Search & Select]

### **OMW Project Name**

An identifier for a JD Edwards EnterpriseOne project. A JD Edwards EnterpriseOne project is composed of a group of JD Edwards EnterpriseOne objects that have been modified or created by a developer to complete a task. All work with objects within JD Edwards EnterpriseOne must occur within the context of a project.

### **Description**

A user defined name or remark.

### **Project Status**

A value that indicates the status of a project. Values are:

**01** Complete

**11** New Project Pending Review

**21** Programming

**25** Rework - Same Issue

**26** QA Test/Review

**28** QA Test/Review Complete

**38** In Production

**40** Production Development

**41** Production to Prototype

**42** Transfer Prototype to Development

**45** Pristine Get

**91** Cancelled-Entered in Error

This project status should be the starting point in the status activity rules that are defined in the Object Management Configuration Application (P98230).

### **Project Type**

An identifier for a JD Edwards EnterpriseOne project. A JD Edwards EnterpriseOne project is composed of a group of JD Edwards EnterpriseOne objects that have been modified or created by a developer to complete a task. All work with objects within JD Edwards EnterpriseOne must occur within the context of a project.

### **Project Severity**

The criticality of the project.

### **Product Code Reporting**

A user defined code (98/SY) that specifies the system number for reporting and jargon purposes.

### **Date Entered**

The date the project was entered.

### **Date Started**

The date the project was started.

### **Planned Completion**

The date the project is planned for completion

### **Completion Date**

The actual date the project was completed.

**Order Number**

A number that identifies the original document. This document can be a voucher, a sales order, an invoice, unapplied cash, a journal entry, and so on.

**Category Code 1**

Future use.

**Category Code 2**

Future use.

**Category Code 3**

Future use.

**Category Code 4**

Future use.

**Category Code 5**

Future use.

**Category Code 6**

Future use.

**Category Code 7**

Future use.

**Category Code 8**

Future use.

**Category Code 9**

Future use.

**Category Code 10**

Future use.

**Program ID**

The number that identifies the batch or interactive program (batch or interactive object).

The program ID is a variable length value. It is assigned according to a structured syntax in the form TSSXXX where:

**T** - The first character of the number is alphabetic and identifies the type.

**SS** - The second and third characters of the number are numeric and identify the system code.

**XXX** - The remaining characters of the number are numeric and identify a unique program or report.

**Machine Key**

The Location or Machine Key indicates the name of the machine on the network (server or workstation).

**User ID**

The code that identifies the user profile.

**Date Updated**

The date that specifies the last date to the file record.

**Time Updated**

The time that specifies when the program executed the last update to this record.

**Time Zone**

Choose the time zone for which you want to view the date and time.

**Rule Name**

Unique name identifying a daylight savings rule. Use daylight savings rules to adjust time for a geographic and political locale.

**Source Release Number**

The transfer rule only applies to objects in the project for this release (objects are always tied to a release within a project). The From and To Release fields should always be equal.

**Target Release Number**

The transfer rule only applies to the objects in the project that are for this release. (Objects are always tied to release within a project). The From and To release fields should always be equal.

## Select Languages

The Select Languages form is used to select the language and data source where the language records for the specified language resides.

Access the Select Language form.

**L**

A user defined code (01/LP) that specifies the language to use on forms and printed reports. before you specify a language, a code for that language must exist at either the system level or in your user preference.

**Language**

A user defined code (01/LP) that specifies the language to use on forms and printed reports. before you specify a language, a code for that language must exist at either the system level or in your user preference.

**Data Source**

The name that identifies the data source.

**Media Objects Data Source**

A user defined name or remark.

## Creating an Update Package

This section lists the forms to create an update package and discusses how to create an update package.

## Understanding Package Updates

After you enter the Work With CD Configuration (P9640) program, each of these forms automatically appears as a result of selecting an option on the current form. The forms appear in the order listed in the Process Instruction Table. The Build Steps tab on the CD Revisions form enables you to select the new database that you created in the previous task, and then create an update package that is sent to your workstation.

## Prerequisites

Before you complete the task in this section:

- Verify that the Language Update Template is available.
- Verify that the database for the translation updates is available.

## Forms Used to Create an Update Package

Form Name	FormID	Navigation	Usage
Work With Software Mastering	W9640B	In Solution Explorer, navigation to System Administration Tools, Package and Deployment Tools, Product Packaging, Product Packages (P9640).	Add a new update package.
CD Configuration Director	W9640D	Click Add on the Work With Software Mastering form.	Create a CD beginning page.
CD Information	W9640H	Click Next on the CD Configuration Director form.	Create the update package build.
CD Revisions	W9640G	Click Next on the CD Information form.	Enter location information for a valid CD and the OMW project.
Work with Language Groups	W9649A	Click the Value button from the Build Steps tab on the CD Revisions form.	Select the language package that you created in the Collecting Translation Updates task.

## Creating an Update Package

After the build is finished, verify that the executable file was created and is on your workstation in the location that you specified.

## Work With Software Mastering

Access the Work With Software Mastering form.

### Release

The system release number of the software master.

### Build Phase

This is the phase of development that your software master represents, such as an alpha, a beta, or a general availability phase. You can add or changes the phases since this is a user defined code. Values are:

**01** Alpha

**02** Beta

**03** General Availability

### Build Phase Description

A user defined name or remark.

### CD Type

The type of CD being mastered.

### Type Description

A user defined name or remark.

### CD Name

A unique name given to a software master.

### Description

A short description of the software master.

### Status

The status of the software master within the mastering process. Values are:

**10** In Definition

**20** Defined

**30** Validated

**40** Processing

**50** Failed

**60** Built

**70** Obsolete

**80** Mastered

**90** Repaired

### Status Description

A user defined name or remark.

### Comment

A user defined name or remark.

### Definitions Date

The date the CD was defined.

**CD Master Date**

The date the CD was mastered.

**One Off CD**

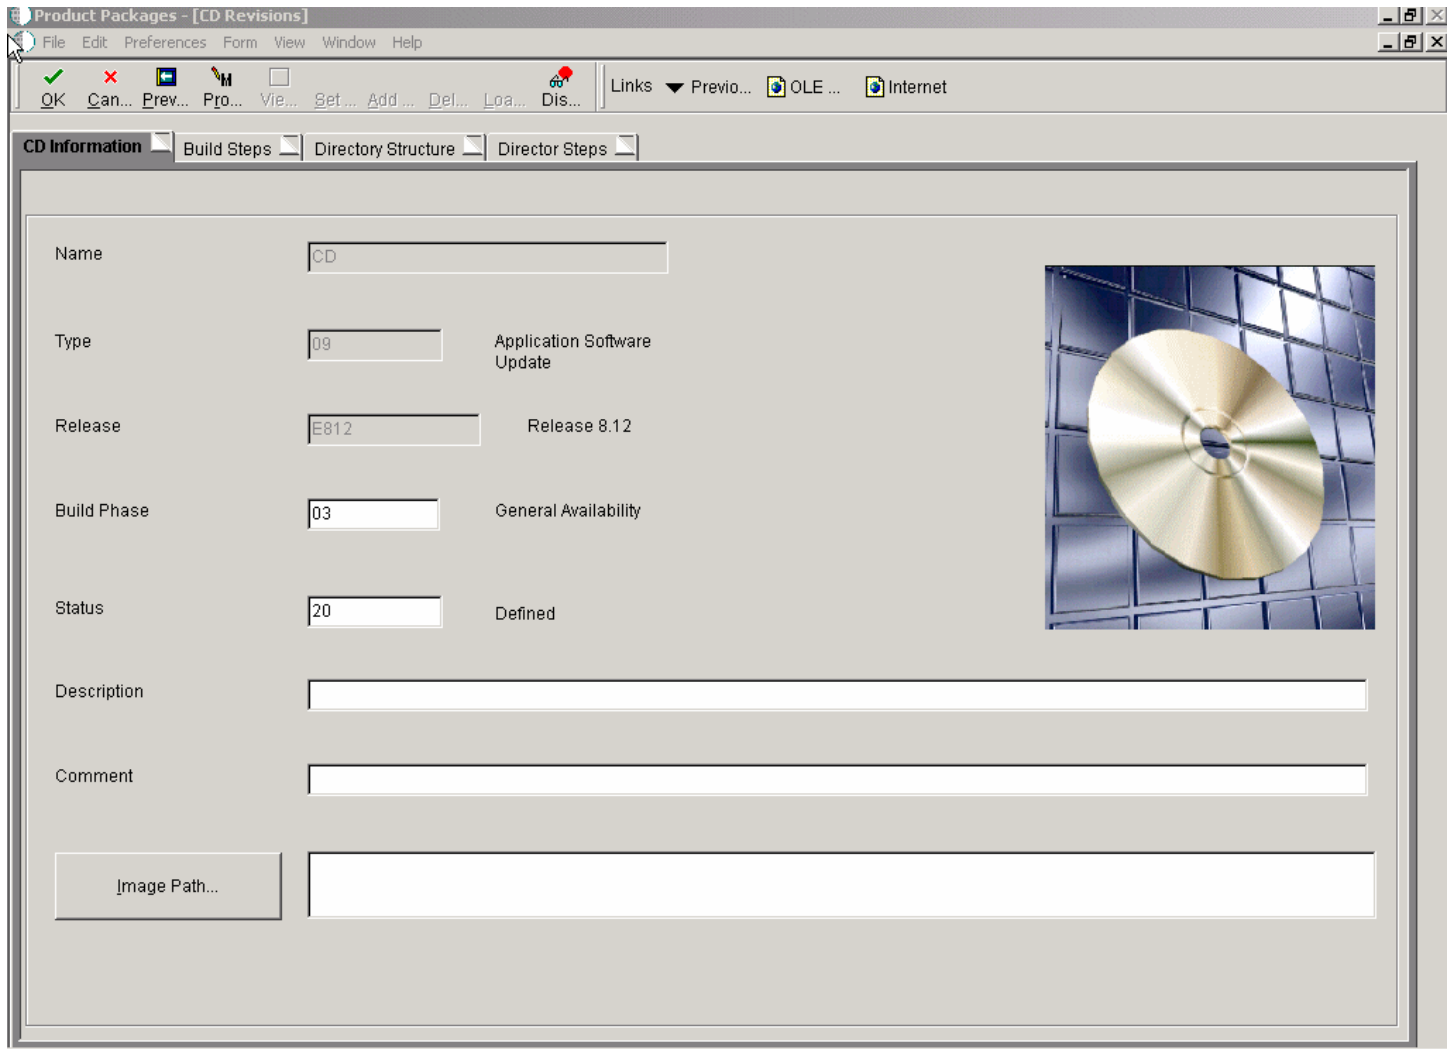

Future use.

## CD Configuration Director

The JD Edwards EnterpriseOne CD Configuration Director guides you through the steps necessary to define a CD.

## CD Revisions

The CD Information tab lets you set up your CD information, build steps, directory structure, and director steps.

1. Enter your CD Information.

- o **Status**

Displays the status of a build step or directory structure within the mastering process. For example, the build step or directory structure could be at a status of defined, validated, or built. Use the visual-assist button to view a complete list of values for this field.

- o **Comment**

Displays short informational comments that are provided by the system about each step of the mastering process. You can enter comments into this field, but the system will overwrite any text that is currently in the field during the next mastering process.

- o **Image Path**

Overfills the directory path where you want the software master to reside on the enterprise. The directory that you indicate will be the root directory for the creation of the final software master.

2. Define your Build Steps.

- o **Sequence**

Displays the order in which the system processes build steps, usually in increments of 10 (for example, **10**, **20**, **30**, and so on).

Verify the order in which you want the step performed during the creation of the software master definition. You can use the same sequence number for multiple build steps.

- o **Type**

Displays the type of CD being mastered. Verify which component type you want the build step to perform. For example, you can define steps to create file structures, build a package, or create INF files.

- o **Status**

Verifies the current status of the build step, which can indicate whether to run the particular step during the mastering process. For example, if you need to perform a manual step during the mastering process, you can manually complete the step, change the step's status to **60** (Built) by choosing the step, and then, from the View menu, select Execute Step.

- o **Target Folder**

Displays the name of the target folder, such as **planner** or **updatepkg**. The system populates this field based upon the template that was used to define the software master. Change the name of the target folder only if you added the folder yourself.

- o **Executable**

Displays the software that might populate this field based upon the build step's definition in the software master template. To change this field, click the **Executable** button and use the Select a Windows Executable form to select an executable for this build step.

- o **Value/Parameter**

Verifies the value or parameter. To change this information, click the **Value/Parameter** button, and then enter a value or parameter that is appropriate to the step you chose. This field is dynamic. The button name is either Value or Parameter, based upon the step that you select. The form that appears when you click the button also depends upon which step you select. For example, the Package Build step calls the Select Package Build form, from which you can select a package; and the Build Change Tables step calls the Work With Change Table Definitions form, from which you can modify the change table configuration.

### 3. Set up your Directory Structure.

- o **Source Path**

Displays the directory on the enterprise that you want to use to populate the highlighted target folder. You can use an absolute (full) directory path name, or you can use a relative path name with a token. The system copies the data that is contained in the source path, depending upon how you filter those files (see the **File Filter** field description for this information), into the highlighted target folder of the software master.

Verifies the directory path of the source that will populate the component. This is the source path name of the data that you want to retrieve for the master and that you placed into the target folder. You can specify this path using either a relative or absolute path. See *Troubleshooting Product Packaging* for information about relative and absolute paths.

- o **File Filter**

Displays the filter, which you can designate, for the files that are contained in the source path. For example, you can use \*.\* to retrieve all files in the source path, or \*.exe to retrieve only executable programs.

Verify the file filter. The default is \*.\*. The file filter enables you to filter any data files that you retrieve from the source directory. For example, you can use \*.\* to retrieve all files in the source directory.

- o **Full Path**

Displays the names and functions. This field is dynamic and its name and function depend upon the build step that is highlighted. The possible names and functions are:

**Value:** The value that is needed to complete the highlighted build step. For example, if the build step is a batch process, the value field contains the name of the batch process and its version, such as **R95012\XJDE0001**.

**Parameter:** The parameters that are needed for the highlighted build steps that process an executable program.

The full (absolute) target path name of the highlighted directory, such as **Root/planner/updatepkg**.

### 4. Define your Director Steps.

- o Package/Change Table Form

Indicates the package form and change table form used.

- o Software Update Form

Future use.

# 9 Appendix A - Troubleshooting Product Packaging

## Failure During the Check Mastering Items Step

When mastering the CD, the process fails during the Check Mastering Items step.

### Solution

This step is a manual build; it must be performed manually. Highlight the step and select Execute Step from the View exit menu. After the step is executed, click Master CD and then proceed.

## Failure to Build the Feature INF File

JD Edwards EnterpriseOne Product Packaging mastering process fails at the build step Copy Package and Feature INFs - report R9600400E. Because features are a part of the Package Build process, update packages do not build feature INF files.

### Solution

If features are included in the chosen update package, be sure that the Feature INF files were created previously.

## Failure to Copy Change Tables

No change tables (for instance, F960004 and F960005) exist in the XML database, and the jde.log file lists several errors indicating that it cannot find these tables in the Control tables. This problem indicates that the change tables do not exist in the mastering environment.

### Solution

Verify that the tables exist and are set up correctly in the mastering environment.

## Failure to Copy Custom Tables

Custom tables were not copied to the XML database, even though these tables were included in the update package and exist in the environment that the package is built from. This problem is an indication that the source environment that is

specified in Oracle's JD Edwards EnterpriseOne Change Table Configurator is not set up correctly or that the table exists in that environment.

## Solution

Verify that the specified environment is valid and has tables associated with the environment, and that the custom table cannot be found in that environment.

## Unable to Find Product Package After Installation

After you run the install manager to install the Software Master on the new system, the product package is not listed in Oracle's JD Edwards EnterpriseOne Software Updates application. This error occurs because the package name does not match the product package name.

## Solution

Remaster the Software Master and ensure that the update package name is the same as the product package name. Also, make sure that you have Oracle's latest JD Edwards EnterpriseOne Planner update installed.

# 10 Glossary

## Build Configuration File

Configurable settings in a text file that are used by a build program to generate ANT scripts. ANT is a software tool used for automating build processes. These scripts build published business services.

## charts

Tables of information in JD Edwards EnterpriseOne that appear on forms in the software.

## check-in repository

A repository for developers to check in and check out business service artifacts. There are multiple check-in repositories. Each can be used for a different purpose (for example, development, production, testing, and so on).

## control tables merge

A process that blends a customer's modifications to the control tables with the data that accompanies a new release.

## embedded event rule

An event rule that is specific to a particular table or application. Examples include form-to-form calls, hiding a field based on a processing option value, and calling a business function. Contrast with the business function event rule.

## Location Workbench

An application that, during the Installation Workbench process, copies all locations that are defined in the installation plan from the Location Master table in the Planner data source to the system data source.

## messaging server

A server that handles messages that are sent for use by other programs using a messaging API. Messaging servers typically employ a middleware program to perform their functions.

## Object Librarian Merge

A process that blends any modifications to the Object Librarian in a previous release into the Object Librarian in a new release.

## Package Workbench

An application that, during the Installation Workbench process, transfers the package information tables from the Planner data source to the system-release number data source. It also updates the Package Plan detail record to reflect completion.

## selection

Found on JD Edwards EnterpriseOne menus, a selection represents functions that you can access from a menu. To make a selection, type the associated number in the Selection field and press Enter.

## serialize

The process of converting an object or data into a format for storage or transmission across a network connection link with the ability to reconstruct the original data or objects when needed.

## Specification merge

A merge that comprises three merges: Object Librarian merge, Versions List merge, and Central Objects merge. The merges blend customer modifications with data that accompanies a new release.

## vocabulary override

An alternate description for a data dictionary item that appears on a specific JD Edwards EnterpriseOne form or report.

## web application server

A web server that enables web applications to exchange data with the back-end systems and databases used in eBusiness transactions.

## workgroup server

A server that usually contains subsets of data replicated from a master network server. A workgroup server does not perform application or batch processing.
