Primary Author: Chuck Murray

Contributors: Eric Belden, Bjorn Engsig, Nancy Greenberg, Pat Huey, Christopher Jones, Sharon Kennedy, Thomas Kyte, Simon Law, Bryn Llewellyn, Sheila Moore

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, delivered to U.S. Government end users are "commercial computer software" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, shall be subject to license terms and license restrictions applicable to the programs. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Xeon are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Opteron, the AMD logo, and the AMD Opteron logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

Changes in This Release for Oracle Database 2 Day Developer's Guide

Changes in Oracle Database 12c Release 2 (12.2)	xiv
Changes in Oracle Database 12c Release 1 (12.1)	xiv

1 Introduction to 2 Day Oracle Database Development

1.1	About This Document	1-1
1.2	About Oracle Database	1-2
1.2.1	About Schema Objects	1-2
1.2.2	About Oracle Database Access	1-4
1.2.2.1	About SQL*Plus	1-4
1.2.2.2	About SQL Developer	1-5
1.2.2.3	About Structured Query Language (SQL)	1-6
1.2.2.4	About Procedural Language/SQL (PL/SQL)	1-6
1.2.2.5	About Other Client Programs, Languages, and Development Tools	1-6
1.3	About Sample Schema HR	1-12

2 Connecting to Oracle Database and Exploring It

2.1	Connecting to Oracle Database from SQL*Plus	2-1
2.2	Connecting to Oracle Database from SQL Developer	2-3
2.3	Connecting to Oracle Database as User HR	2-4
2.3.1	Unlocking the HR Account	2-5
2.3.2	Connecting to Oracle Database as User HR from SQL*Plus	2-5

2.3.3	Connecting to Oracle Database as User HR from SQL Developer	2-6
2.4	Exploring Oracle Database with SQL*Plus	2-7
2.4.1	Viewing HR Schema Objects with SQL*Plus	2-7
2.4.2	Viewing EMPLOYEES Table Properties and Data with SQL*Plus	2-8
2.5	Exploring Oracle Database with SQL Developer	2-10
2.5.1	Tutorial: Viewing HR Schema Objects with SQL Developer	2-10
2.5.2	Tutorial: Viewing EMPLOYEES Table Properties and Data with SQL Developer	2-11
2.6	Selecting Table Data	2-12
2.6.1	About Queries	2-13
2.6.2	Running Queries in SQL Developer	2-13
2.6.3	Tutorial: Selecting All Columns of a Table	2-14
2.6.4	Tutorial: Selecting Specific Columns of a Table	2-15
2.6.5	Displaying Selected Columns Under New Headings	2-16
2.6.6	Selecting Data that Satisfies Specified Conditions	2-17
2.6.7	Sorting Selected Data	2-19
2.6.8	Selecting Data from Multiple Tables	2-20
2.6.9	Using Operators and Functions in Queries	2-21
2.6.9.1	Using Arithmetic Operators in Queries	2-23
2.6.9.2	Using Numeric Functions in Queries	2-23
2.6.9.3	Using the Concatenation Operator in Queries	2-24
2.6.9.4	Using Character Functions in Queries	2-25
2.6.9.5	Using Datetime Functions in Queries	2-26
2.6.9.6	Using Conversion Functions in Queries	2-27
2.6.9.7	Using Aggregate Functions in Queries	2-29
2.6.9.8	Using NULL-Related Functions in Queries	2-31
2.6.9.9	Using CASE Expressions in Queries	2-32
2.6.9.10	Using the DECODE Function in Queries	2-34

3 About DML Statements and Transactions

3.1	About Data Manipulation Language (DML) Statements	3-1
3.1.1	About the INSERT Statement	3-2
3.1.2	About the UPDATE Statement	3-4
3.1.3	About the DELETE Statement	3-5
3.2	About Transaction Control Statements	3-6
3.3	Committing Transactions	3-7
3.4	Rolling Back Transactions	3-8
3.5	Setting Savepoints in Transactions	3-11

4 Creating and Managing Schema Objects

4.1	About Data Definition Language (DDL) Statements	4-1
4.2	Creating and Managing Tables	4-2
4.2.1	About SQL Data Types	4-3
4.2.2	Creating Tables	4-3
4.2.2.1	Tutorial: Creating a Table with the Create Table Tool	4-4
4.2.2.2	Creating Tables with the CREATE TABLE Statement	4-5
4.2.3	Ensuring Data Integrity in Tables	4-6
4.2.3.1	About Constraints	4-6
4.2.3.2	Tutorial: Adding Constraints to Existing Tables	4-7
4.2.4	Tutorial: Adding Rows to Tables with the Insert Row Tool	4-11
4.2.5	Tutorial: Changing Data in Tables in the Data Pane	4-13
4.2.6	Tutorial: Deleting Rows from Tables with the Delete Selected Row(s) Tool	4-14
4.2.7	Managing Indexes	4-15
4.2.7.1	Tutorial: Adding an Index with the Create Index Tool	4-15
4.2.7.2	Tutorial: Changing an Index with the Edit Index Tool	4-16
4.2.7.3	Tutorial: Dropping an Index	4-17
4.2.8	Dropping Tables	4-18
4.3	Creating and Managing Views	4-18
4.3.1	Creating Views	4-19
4.3.1.1	Tutorial: Creating a View with the Create View Tool	4-19
4.3.1.2	Creating Views with the CREATE VIEW Statement	4-20
4.3.2	Changing Queries in Views	4-21
4.3.3	Tutorial: Changing View Names with the Rename Tool	4-21
4.3.4	Dropping a View	4-22
4.4	Creating and Managing Sequences	4-22
4.4.1	Tutorial: Creating a Sequence	4-23
4.4.2	Dropping Sequences	4-24
4.5	Creating and Managing Synonyms	4-25
4.5.1	Creating Synonyms	4-25
4.5.2	Dropping Synonyms	4-26

5 Developing Stored Subprograms and Packages

5.1	About Stored Subprograms	5-2
5.2	About Packages	5-2
5.3	About PL/SQL Identifiers	5-3
5.4	About PL/SQL Data Types	5-4
5.5	Creating and Managing Standalone Subprograms	5-5
5.5.1	About Subprogram Structure	5-5

5.5.2	Tutorial: Creating a Standalone Procedure	5-7
5.5.3	Tutorial: Creating a Standalone Function	5-9
5.5.4	Changing Standalone Subprograms	5-10
5.5.5	Tutorial: Testing a Standalone Function	5-11
5.5.6	Dropping Standalone Subprograms	5-12
5.6	Creating and Managing Packages	5-12
5.6.1	About Package Structure	5-13
5.6.2	Tutorial: Creating a Package Specification	5-14
5.6.3	Tutorial: Changing a Package Specification	5-15
5.6.4	Tutorial: Creating a Package Body	5-16
5.6.5	Dropping a Package	5-17
5.7	Declaring and Assigning Values to Variables and Constants	5-17
5.7.1	Tutorial: Declaring Variables and Constants in a Subprogram	5-18
5.7.2	Ensuring that Variables, Constants, and Parameters Have Correct Data Types	5-20
5.7.3	Tutorial: Changing Declarations to Use the %TYPE Attribute	5-21
5.7.4	Assigning Values to Variables	5-22
5.7.4.1	Assigning Values to Variables with the Assignment Operator	5-23
5.7.4.2	Assigning Values to Variables with the SELECT INTO Statement	5-24
5.8	Controlling Program Flow	5-25
5.8.1	About Control Statements	5-26
5.8.2	Using the IF Statement	5-26
5.8.3	Using the CASE Statement	5-27
5.8.4	Using the FOR LOOP Statement	5-29
5.8.5	Using the WHILE LOOP Statement	5-30
5.8.6	Using the Basic LOOP and EXIT WHEN Statements	5-32
5.9	Using Records and Cursors	5-33
5.9.1	About Records	5-34
5.9.2	Tutorial: Declaring a RECORD Type	5-35
5.9.3	Tutorial: Creating and Invoking a Subprogram with a Record Parameter	5-36
5.9.4	About Cursors	5-38
5.9.5	Using a Declared Cursor to Retrieve Result Set Rows One at a Time	5-39
5.9.6	Tutorial: Using a Declared Cursor to Retrieve Result Set Rows One at a Time	5-40
5.9.7	About Cursor Variables	5-41
5.9.8	Using a Cursor Variable to Retrieve Result Set Rows One at a Time	5-42
5.9.9	Tutorial: Using a Cursor Variable to Retrieve Result Set Rows One at a Time	5-43
5.10	Using Associative Arrays	5-46
5.10.1	About Collections	5-47
5.10.2	About Associative Arrays	5-47
5.10.3	Declaring Associative Arrays	5-48

5.10.4	Populating Associative Arrays	5-50
5.10.5	Traversing Dense Associative Arrays	5-51
5.10.6	Traversing Sparse Associative Arrays	5-52
5.11	Handling Exceptions (Runtime Errors)	5-53
5.11.1	About Exceptions and Exception Handlers	5-53
5.11.2	When to Use Exception Handlers	5-54
5.11.3	Handling Predefined Exceptions	5-55
5.11.4	Declaring and Handling User-Defined Exceptions	5-56

6 Using Triggers

6.1	About Triggers	6-1
6.2	Creating Triggers	6-3
6.2.1	About OLD and NEW Pseudorecords	6-4
6.2.2	Tutorial: Creating a Trigger that Logs Table Changes	6-4
6.2.3	Tutorial: Creating a Trigger that Generates a Primary Key for a Row Before It Is Inserted	6-5
6.2.4	Creating an INSTEAD OF Trigger	6-6
6.2.5	Tutorial: Creating Triggers that Log LOGON and LOGOFF Events	6-7
6.3	Changing Triggers	6-8
6.4	Disabling and Enabling Triggers	6-9
6.4.1	Disabling or Enabling a Single Trigger	6-9
6.4.2	Disabling or Enabling All Triggers on a Single Table	6-10
6.5	About Trigger Compilation and Dependencies	6-10
6.6	Dropping Triggers	6-11

7 Working in a Global Environment

7.1	About Globalization Support Features	7-1
7.1.1	About Language Support	7-2
7.1.2	About Territory Support	7-3
7.1.3	About Date and Time Formats	7-3
7.1.4	About Calendar Formats	7-4
7.1.5	About Numeric and Monetary Formats	7-5
7.1.6	About Linguistic Sorting and String Searching	7-6
7.1.7	About Length Semantics	7-6
7.1.8	About Unicode and SQL National Character Data Types	7-6
7.2	About Initial NLS Parameter Values	7-7
7.3	Viewing NLS Parameter Values	7-8
7.4	Changing NLS Parameter Values	7-9
7.4.1	Changing NLS Parameter Values for All SQL Developer Connections	7-10

7.4.2	Changing NLS Parameter Values for the Current SQL Function Invocation	7-11
7.5	About Individual NLS Parameters	7-12
7.5.1	About Locale and the NLS_LANG Parameter	7-13
7.5.2	About the NLS_LANGUAGE Parameter	7-14
7.5.3	About the NLS_TERRITORY Parameter	7-16
7.5.4	About the NLS_DATE_FORMAT Parameter	7-17
7.5.5	About the NLS_DATE_LANGUAGE Parameter	7-20
7.5.6	About NLS_TIMESTAMP_FORMAT and NLS_TIMESTAMP_TZ_FORMAT Parameters	7-21
7.5.7	About the NLS_CALENDAR Parameter	7-22
7.5.8	About the NLS_NUMERIC_CHARACTERS Parameter	7-23
7.5.9	About the NLS_CURRENCY Parameter	7-24
7.5.10	About the NLS_ISO_CURRENCY Parameter	7-26
7.5.11	About the NLS_DUAL_CURRENCY Parameter	7-27
7.5.12	About the NLS_SORT Parameter	7-27
7.5.13	About the NLS_COMP Parameter	7-29
7.5.14	About the NLS_LENGTH_SEMANTICS Parameter	7-31
7.6	Using Unicode in Globalized Applications	7-32
7.6.1	Representing Unicode String Literals in SQL and PL/SQL	7-33
7.6.2	Avoiding Data Loss During Character-Set Conversion	7-33

8 Building Effective Applications

8.1	Building Scalable Applications	8-1
8.1.1	About Scalable Applications	8-2
8.1.2	Using Bind Variables to Improve Scalability	8-2
8.1.3	Using PL/SQL to Improve Scalability	8-4
8.1.3.1	How PL/SQL Minimizes Parsing	8-5
8.1.3.2	About the EXECUTE IMMEDIATE Statement	8-5
8.1.3.3	About OPEN FOR Statements	8-6
8.1.3.4	About the DBMS_SQL Package	8-6
8.1.3.5	About Bulk SQL	8-7
8.1.4	About Concurrency and Scalability	8-9
8.1.4.1	About Sequences and Concurrency	8-10
8.1.4.2	About Latches and Concurrency	8-11
8.1.4.3	About Nonblocking Reads and Writes and Concurrency	8-11
8.1.4.4	About Shared SQL and Concurrency	8-11
8.1.5	Limiting the Number of Concurrent Sessions	8-11
8.1.6	Comparing Programming Techniques with Runstats	8-12
8.1.6.1	About Runstats	8-12
8.1.6.2	Setting Up Runstats	8-13

8.1.6.3	Using Runstats	8-16
8.1.7	Real-World Performance and Data Processing Techniques	8-16
8.1.7.1	About Iterative Data Processing	8-16
8.1.7.2	About Set-Based Processing	8-20
8.2	Recommended Programming Practices	8-21
8.2.1	Use Instrumentation Packages	8-21
8.2.2	Statistics Gathering and Application Tracing	8-22
8.2.3	Use Existing Functionality	8-22
8.2.4	Cover Database Tables with Editioning Views	8-25
8.3	Recommended Security Practices	8-25

9 Developing a Simple Oracle Database Application

9.1	About the Application	9-1
9.1.1	Purpose of the Application	9-1
9.1.2	Structure of the Application	9-2
9.1.2.1	Schema Objects of the Application	9-2
9.1.2.2	Schemas for the Application	9-3
9.1.3	Naming Conventions in the Application	9-4
9.2	Creating the Schemas for the Application	9-5
9.3	Granting Privileges to the Schemas	9-6
9.3.1	Granting Privileges to the app_data Schema	9-6
9.3.2	Granting Privileges to the app_code Schema	9-7
9.3.3	Granting Privileges to the app_admin Schema	9-7
9.3.4	Granting Privileges to the app_user and app_admin_user Schemas	9-7
9.4	Creating the Schema Objects and Loading the Data	9-8
9.4.1	Creating the Tables	9-8
9.4.2	Creating the Editioning Views	9-11
9.4.3	Creating the Triggers	9-11
9.4.3.1	Creating the Trigger to Enforce the First Business Rule	9-12
9.4.3.2	Creating the Trigger to Enforce the Second Business Rule	9-13
9.4.4	Creating the Sequences	9-14
9.4.5	Loading the Data	9-15
9.4.6	Adding the Foreign Key Constraint	9-17
9.4.7	Granting Privileges on the Schema Objects to Users	9-18
9.5	Creating the employees_pkg Package	9-18
9.5.1	Creating the Package Specification for employees_pkg	9-19
9.5.2	Creating the Package Body for employees_pkg	9-20
9.5.3	Tutorial: Showing How the employees_pkg Subprograms Work	9-22
9.5.4	Granting the Execute Privilege to app_user and app_admin_user	9-25
9.5.5	Tutorial: Invoking get_job_history as app_user or app_admin_user	9-26

9.6	Creating the admin_pkg Package	9-26
9.6.1	Creating the Package Specification for admin_pkg	9-27
9.6.2	Creating the Package Body for admin_pkg	9-28
9.6.3	Tutorial: Showing How the admin_pkg Subprograms Work	9-30
9.6.4	Granting the Execute Privilege to app_admin_user	9-31
9.6.5	Tutorial: Invoking add_department as app_admin_user	9-32

10 Deploying an Oracle Database Application

10.1	About Development and Deployment Environments	10-1
10.2	About Installation Scripts	10-1
10.2.1	About DDL Statements and Schema Object Dependencies	10-2
10.2.2	About INSERT Statements and Constraints	10-2
10.3	Creating Installation Scripts	10-3
10.3.1	Creating Installation Scripts with the Cart	10-4
10.3.2	Creating an Installation Script with the Database Export Wizard	10-5
10.3.3	Editing Installation Scripts that Create Sequences	10-7
10.3.4	Editing Installation Scripts that Create Triggers	10-7
10.3.5	Creating Installation Scripts for the Sample Application	10-8
10.3.5.1	Creating Installation Script schemas.sql	10-9
10.3.5.2	Creating Installation Script objects.sql	10-10
10.3.5.3	Creating Installation Script employees.sql	10-14
10.3.5.4	Creating Installation Script admin.sql	10-17
10.3.5.5	Creating Master Installation Script create_app.sql	10-19
10.4	Deploying the Sample Application	10-19
10.5	Checking the Validity of an Installation	10-21
10.6	Archiving the Installation Scripts	10-22

Index

List of Tables

5-1	Cursor Attribute Values	5-39
7-1	Initial Values of NLS Parameters in SQL Developer	7-7

Preface

This is the preface to the *Oracle Database 2 Day Developer's Guide*.

This document explains basic concepts behind application development with Oracle Database. It provides instructions for using the basic features of topics through Structured Query Language (SQL), and the Oracle server-based procedural extension to the SQL database language, Procedural Language/Structured Query Language (PL/SQL).

- **Audience**
This document is intended for anyone who wants to learn about Oracle Database application development, and is primarily an introduction to application development for developers who are new to Oracle Database.
- **Documentation Accessibility**
- **Related Documents**
When you are comfortable with the concepts and tasks in *Oracle Database 2 Day Developer's Guide*, Oracle recommends that you consult these other Oracle Database development documents.
- **Conventions**
Oracle Database 2 Day Developer's Guide uses these text conventions.

Audience

This document is intended for anyone who wants to learn about Oracle Database application development, and is primarily an introduction to application development for developers who are new to Oracle Database.

This document assumes that you have a general understanding of relational database concepts and an understanding of the operating system environment that you will use to develop applications with Oracle Database.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc>.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info> or visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs> if you are hearing impaired.

Related Documents

When you are comfortable with the concepts and tasks in *Oracle Database 2 Day Developer's Guide*, Oracle recommends that you consult these other Oracle Database development documents.

- *Oracle Database 2 Day + Application Express Developer's Guide*
- *Oracle Database 2 Day + Java Developer's Guide*
- *Oracle Database 2 Day + .NET Developer's Guide for Microsoft Windows*
- *Oracle Database 2 Day + PHP Developer's Guide*

For more information, see:

- *Oracle Database Concepts*
- *Oracle Database Development Guide*
- *Oracle Database SQL Language Reference*
- *Oracle Database PL/SQL Language Reference*

Conventions

Oracle Database 2 Day Developer's Guide uses these text conventions.

Convention	Meaning
boldface	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.
<i>italic</i>	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
monospace	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

Changes in This Release for Oracle Database 2 Day Developer's Guide

This preface contains the following.

- [Changes in Oracle Database 12c Release 2 \(12.2\)](#)
- [Changes in Oracle Database 12c Release 1 \(12.1\)](#)

Changes in Oracle Database 12c Release 2 (12.2)

For Oracle Database 12c Release 2 (12.2), *Oracle Database 2 Day Developer's Guide* has these changes:

- You are encouraged to use the currently available release of SQL Developer (see "[Connecting to Oracle Database from SQL Developer](#)").

Changes in Oracle Database 12c Release 1 (12.1)

For Oracle Database 12c Release 1 (12.1), *Oracle Database 2 Day Developer's Guide* has these changes:

- If you use SQL Developer, you must use version 3.2 or later (see "[Connecting to Oracle Database from SQL Developer](#)").
- [Connecting to Oracle Database and Exploring It](#), covers the topics previously covered in Chapter 1 through Chapter 3, has the new topic "[Exploring Oracle Database with SQL*Plus](#)", and has some new and changed examples.
- The schema objects that you create in the tutorials in [About DML Statements and Transactions](#), [Creating and Managing Schema Objects](#), and [Developing Stored Subprograms and Packages](#), (formerly Chapter 5, Chapter 6, and Chapter 7) are no longer used in a sample application.
- [Developing Stored Subprograms and Packages](#), has the new topic "[When to Use Exception Handlers](#)".
- New [Building Effective Applications](#), explains how to build scalable applications and use recommended programming and security practices.
- New [Developing a Simple Oracle Database Application](#), shows how to develop a simple Oracle Database application.
- [Deploying an Oracle Database Application](#), has the new topic "[Creating Installation Scripts with the Cart](#)" and explains how to deploy the application that you develop in [Developing a Simple Oracle Database Application](#).

1

Introduction to 2 Day Oracle Database Development

An Oracle Database developer is responsible for creating or maintaining the database components of an application that uses the Oracle technology stack. Oracle Database developers either develop applications or convert existing applications to run in the Oracle Database environment.

- [About This Document](#)
This document is the entry into the Oracle Database documentation set for application developers.
- [About Oracle Database](#)
Oracle Database groups related information into logical structures called **schemas**. The logical structures contain **schema objects**.
- [About Sample Schema HR](#)
The HR sample schema can be installed with Oracle Database. This schema contains information about employees—departments, locations, work histories, and related information. Like all schemas, HR has tables, views, indexes, procedures, functions, and other attributes. The examples and tutorials in this document use the schema.

See Also:

Oracle Database Concepts for more information about the duties of Oracle Database developers

1.1 About This Document

This document is the entry into the Oracle Database documentation set for application developers.

This document does the following:

- Explains the basic concepts behind development with Oracle Database
- Shows, with tutorials and examples, how to use basic features of SQL and PL/SQL
- Provides references to detailed information about subjects that it introduces
- Shows how to develop and deploy a simple Oracle Database application

Introduction to 2 Day Oracle Database Development (this chapter) describes the reader for whom this document is intended, outlines the organization of this document, introduces important Oracle Database concepts, and describes the sample schema used in the tutorials and examples in this document.

[Connecting to Oracle Database and Exploring It](#) explains how to connect to Oracle Database, how to view schema objects and the properties and data of Oracle Database tables, and how to use queries to retrieve data from an Oracle Database table.

[About DML Statements and Transactions](#) introduces data manipulation language (DML) statements and transactions. DML statements add, change, and delete Oracle Database table data. A transaction is a sequence of one or more SQL statements that Oracle Database treats as a unit: either all of the statements are performed, or none of them are.

[Creating and Managing Schema Objects](#) introduces data definition language (DDL) statements, which create, change, and drop schema objects.

[Developing Stored Subprograms and Packages](#) introduces stored subprograms and packages, which can be used as building blocks for many different database applications.

[Using Triggers](#) introduces triggers, which are stored PL/SQL units that automatically execute ("fire") in response to specified events.

[Working in a Global Environment](#) introduces globalization support—National Language Support (NLS) parameters and Unicode-related features of SQL and PL/SQL.

[Building Effective Applications](#) explains how to build scalable applications and use recommended programming and security practices.

[Developing a Simple Oracle Database Application](#) shows how to develop a simple Oracle Database application.

[Deploying an Oracle Database Application](#) explains how to deploy an Oracle Database application—that is, how to install it in one or more environments where other users can run it—using the application developed in [Developing a Simple Oracle Database Application](#) as an example.

1.2 About Oracle Database

Oracle Database groups related information into logical structures called **schemas**. The logical structures contain **schema objects**.

When you connect to the database by providing your user name and password, you specify the schema and indicate that you are its owner. In Oracle Database, the user name and the name of the schema to which the user connects are the same.

- [About Schema Objects](#)
Every object in an Oracle Database belongs to only one schema, and has a unique name with that schema.
- [About Oracle Database Access](#)
You can access Oracle Database only through a client program, such as SQL*Plus or SQL Developer.

1.2.1 About Schema Objects

Every object in an Oracle Database belongs to only one schema, and has a unique name with that schema.

Some of the objects that schemas can contain are:

- **Tables**

Tables are the basic units of data storage in Oracle Database. Tables hold all user-accessible data. Each table contains **rows** that represent individual data **records**. Rows are composed of **columns** that represent the **fields** of the records.

- **Indexes**

Indexes are optional objects that can improve the performance of data retrieval from tables. Indexes are created on one or more columns of a table, and are automatically maintained in the database.

- **Views**

You can create a view that combines information from several different tables into a single presentation. A view can rely on information from both tables and other views.

- **Sequences**

When all records of a table must be distinct, you can use a sequence to generate a serial list of unique integers for numeric columns, each of which represents the ID of one record.

- **Synonyms**

Synonyms are aliases for schema objects. You can use synonyms for security and convenience; for example, to hide the ownership of an object or to simplify SQL statements.

- **Stored subprograms**

Stored subprograms (also called **schema-level subprograms**) are procedures and functions that are stored in the database. They can be invoked from client applications that access the database.

Triggers are stored subprograms that are automatically run by the database when specified events occur in a particular table or view. Triggers can restrict access to specific data and perform logging.

- **Packages**

A package is a group of related subprograms, along with the explicit cursors and variables they use, stored in the database as a unit, for continued use. Like stored subprograms, package subprograms can be invoked from client applications that access the database.

Typically, the objects that an application uses belong to the same schema.

 **See Also:**

- [Oracle Database Concepts](#) for a comprehensive introduction to schema objects
- [Creating and Managing Tables](#)
- [Managing Indexes](#)
- [Creating and Managing Views](#)
- [Creating and Managing Sequences](#)
- [Creating and Managing Synonyms](#)
- [Developing Stored Subprograms and Packages](#)
- [Using Triggers](#)

1.2.2 About Oracle Database Access

You can access Oracle Database only through a client program, such as SQL*Plus or SQL Developer.

The client program's interface to Oracle Database is Structured Query Language (SQL). Oracle provides an extension to SQL called Procedural Language/SQL (PL/SQL).

- [About SQL*Plus](#)
SQL*Plus (pronounced *sequel plus*) is an interactive and batch query tool that is installed with every Oracle Database installation. It has a command-line user interface that acts as the client when connecting to the database.
- [About SQL Developer](#)
SQL Developer (pronounced *sequel developer*) is a graphical user interface for Oracle Database, that is available in the default installation of Oracle Database and by free download from the Oracle Technology Network.
- [About Structured Query Language \(SQL\)](#)
Structured Query Language (SQL) (pronounced *sequel*) is the set-based, high-level computer language with which all programs and users access data in Oracle Database.
- [About Procedural Language/SQL \(PL/SQL\)](#)
Procedural Language/SQL (PL/SQL) (pronounced *P L sequel*) is a native Oracle Database extension to SQL. It bridges the gap between declarative and imperative program control by adding procedural elements, such as conditional control and loops.
- [About Other Client Programs, Languages, and Development Tools](#)
Several other client programs, languages, and tools are available.

1.2.2.1 About SQL*Plus

SQL*Plus (pronounced *sequel plus*) is an interactive and batch query tool that is installed with every Oracle Database installation. It has a command-line user interface that acts as the client when connecting to the database.

SQL*Plus has its own commands and environment. In the SQL*Plus environment, you can enter and run SQL*Plus commands, SQL statements, PL/SQL statements, and operating system commands to perform tasks such as:

- Formatting, performing calculations on, storing, and printing query results
- Examining tables and object definitions
- Developing and running batch scripts
- Performing database administration

You can use SQL*Plus to generate reports interactively, to generate reports as batch processes, and to output the results to text file, to screen, or to HTML file for browsing on the Internet. You can generate reports dynamically using the HTML output facility.

You can use SQL*Plus in SQL Developer. For details, see *Oracle SQL Developer User's Guide*.

 **See Also:**

- ["Connecting to Oracle Database from SQL*Plus"](#)
- *SQL*Plus User's Guide and Reference* for information about SQL*Plus

1.2.2.2 About SQL Developer

SQL Developer (pronounced *sequel developer*) is a graphical user interface for Oracle Database, that is available in the default installation of Oracle Database and by free download from the Oracle Technology Network.

SQL Developer serves as a modern integrated development environment (IDE) for SQL and PL/SQL, and provides a graphical interface for managing database objects. You can also create reports, design data models, migrate third-party databases to Oracle, REST-enable tables and views, and deploy and manage Oracle REST Data Services. The SQL Worksheet allows you to enter and run SQL statements, PL/SQL statements, and SQL*Plus commands and scripts.

 **Note:**

SQL Developer often offers several ways to do a task, but this document does not explain every possible way.

 **See Also:**

- ["Connecting to Oracle Database from SQL Developer"](#)
- *Oracle SQL Developer User's Guide* for information about SQL Developer

1.2.2.3 About Structured Query Language (SQL)

Structured Query Language (SQL) (pronounced *sequel*) is the set-based, high-level computer language with which all programs and users access data in Oracle Database.

SQL is a declarative, or nonprocedural, language; that is, it describes what to do, but not how. You specify the desired result set (for example, the names of current employees), but not how to get it.

See Also:

- *Oracle Database Concepts* for a complete overview of SQL
- *Oracle Database SQL Language Reference* for complete information about SQL

1.2.2.4 About Procedural Language/SQL (PL/SQL)

Procedural Language/SQL (PL/SQL) (pronounced *P L sequel*) is a native Oracle Database extension to SQL. It bridges the gap between declarative and imperative program control by adding procedural elements, such as conditional control and loops.

In PL/SQL, you can declare constants and variables, procedures and functions, types and variables of those types, and triggers. You can handle exceptions (runtime errors). You can create PL/SQL units—procedures, functions, packages, types, and triggers—that are stored in the database for reuse by applications that use any of the Oracle Database programmatic interfaces.

The basic unit of a PL/SQL source program is the block, which groups related declarations and statements. A block has an optional declarative part, a required executable part, and an optional exception-handling part.

See Also:

- *Oracle Database Concepts* for a complete overview of PL/SQL
- *Oracle Database PL/SQL Language Reference* for complete information about PL/SQL

1.2.2.5 About Other Client Programs, Languages, and Development Tools

Several other client programs, languages, and tools are available.

 **Note:**

Some of the products on the preceding list do not ship with Oracle Database and must be downloaded separately.

- **Oracle Application Express**
Oracle Application Express is an application development and deployment tool that enables you to quickly create secure and scalable web applications even if you have limited previous programming experience. The embedded Application Builder tool assembles an HTML interface or a complete application that uses schema objects, such as tables or stored procedures, into a collection of pages that are linked through tabs, buttons, or hypertext links.
- **Oracle Java Database Connectivity (JDBC)**
Oracle Java Database Connectivity (JDBC) is an API that enables Java to send SQL statements to an object-relational database, such as Oracle Database. Oracle Database JDBC provides complete support for the JDBC 3.0 and JDBC RowSet (JSR-114) standards, advanced connection caching for both XA and non-XA connections, exposure of SQL and PL/SQL data types to Java, and fast SQL data access.
- **Hypertext Preprocessor (PHP)**
The Hypertext Preprocessor (PHP) is a powerful interpreted server-side scripting language for quick web application development. PHP is an open source language that is distributed under a BSD-style license. PHP is designed for embedding database access requests directly into HTML pages.
- **Oracle Call Interface (OCI)**
Oracle Call Interface (OCI) is the native C language API for accessing Oracle Database directly from C applications.
- **Oracle C++ Call Interface (OCCI)**
Oracle C++ Call Interface (OCCI) is the native C++ language API for accessing Oracle Database directly from C++ applications. Like OCI, OCCI supports both relational and object-oriented programming paradigms.
- **Open Database Connectivity (ODBC)**
Open Database Connectivity (ODBC) is a set of database access APIs that connect to the database, prepare, and then run SQL statements on the database. An application that uses an ODBC driver can access nonuniform data sources, such as spreadsheets and comma-delimited files.
- **Pro*C/C++ Precompiler**
The Pro*C/C++ precompiler lets you embed SQL statements in a C or C++ source file. The precompiler accepts the source program as input, translates the embedded SQL statements into standard Oracle runtime library calls, and generates a modified source program that you can compile, link, and run.
- **Pro*COBOL Precompiler**
The Pro*COBOL precompiler lets you embed SQL statements in a COBOL source file. The precompiler accepts the source program as input, translates the embedded SQL statements into standard Oracle runtime library calls, and generates a modified source program that you can compile, link, and run.

- [Microsoft .NET Framework](#)
The Microsoft .NET Framework is a multilanguage environment for building, deploying, and running applications and XML web services.
- [Oracle Provider for OLE DB \(OraOLEDB\)](#)
Oracle Provider for OLE DB (OraOLEDB) is an open standard data access methodology that uses a set of Component Object Model (COM) interfaces for accessing and manipulating different types of data. These interfaces are available from various database providers.

 **See Also:**

- *Oracle Database Concepts* for more information about tools for Oracle Database developers
- *Oracle Database Development Guide* for information about choosing a programming environment

1.2.2.5.1 Oracle Application Express

Oracle Application Express is an application development and deployment tool that enables you to quickly create secure and scalable web applications even if you have limited previous programming experience. The embedded Application Builder tool assembles an HTML interface or a complete application that uses schema objects, such as tables or stored procedures, into a collection of pages that are linked through tabs, buttons, or hypertext links.

 **See Also:**

Oracle Database 2 Day + Application Express Developer's Guide for more information about Oracle Application Express

1.2.2.5.2 Oracle Java Database Connectivity (JDBC)

Oracle Java Database Connectivity (JDBC) is an API that enables Java to send SQL statements to an object-relational database, such as Oracle Database. Oracle Database JDBC provides complete support for the JDBC 3.0 and JDBC RowSet (JSR-114) standards, advanced connection caching for both XA and non-XA connections, exposure of SQL and PL/SQL data types to Java, and fast SQL data access.

 **See Also:**

For more information about JDBC:

- *Oracle Database Concepts*
- *Oracle Database Development Guide*
- *Oracle Database 2 Day + Java Developer's Guide*

1.2.2.5.3 Hypertext Preprocessor (PHP)

The Hypertext Preprocessor (PHP) is a powerful interpreted server-side scripting language for quick web application development. PHP is an open source language that is distributed under a BSD-style license. PHP is designed for embedding database access requests directly into HTML pages.

 **See Also:**

Oracle Database 2 Day + PHP Developer's Guide for more information about PHP

1.2.2.5.4 Oracle Call Interface (OCI)

Oracle Call Interface (OCI) is the native C language API for accessing Oracle Database directly from C applications.

The OCI Software Development Kit is installed as part of the Oracle Instant Client, which enables you to run applications without installing the standard Oracle client or having an `ORACLE_HOME`. Your applications work without change, using significantly less disk space.

 **See Also:**

- *Oracle Database Development Guide* for more information about OCI
- *Oracle Call Interface Programmer's Guide* for complete information about OCI

1.2.2.5.5 Oracle C++ Call Interface (OCCI)

Oracle C++ Call Interface (OCCI) is the native C++ language API for accessing Oracle Database directly from C++ applications. Like OCI, OCCI supports both relational and object-oriented programming paradigms.

The OCCI Software Development Kit is also installed as part of the Oracle Instant Client, which enables you to run applications without installing the standard Oracle client or having an `ORACLE_HOME`. Your applications work without change, using significantly less disk space.

 **See Also:**

- *Oracle Database Development Guide* for more information about OCCI
- *Oracle C++ Call Interface Programmer's Guide* for complete information about OCCI

1.2.2.5.6 Open Database Connectivity (ODBC)

Open Database Connectivity (ODBC) is a set of database access APIs that connect to the database, prepare, and then run SQL statements on the database. An application that uses an ODBC driver can access nonuniform data sources, such as spreadsheets and comma-delimited files.

The Oracle ODBC driver conforms to ODBC 3.51 specifications. It supports all core APIs and a subset of Level 1 and Level 2 functions. Microsoft supplies the Driver manager component for the Windows platform.

Like OCI, OCCI, and JDBC, ODBC is part of the Oracle Instant Client installation.

 **See Also:**

- *Oracle Database Concepts*
- *Oracle Services for Microsoft Transaction Server Developer's Guide for Microsoft Windows* for information about using the Oracle ODBC driver with Windows
- *Oracle Database Administrator's Reference for Linux and UNIX-Based Operating Systems* for information about using Oracle ODBC driver on Linux

1.2.2.5.7 Pro*C/C++ Precompiler

The Pro*C/C++ precompiler lets you embed SQL statements in a C or C++ source file. The precompiler accepts the source program as input, translates the embedded SQL statements into standard Oracle runtime library calls, and generates a modified source program that you can compile, link, and run.

 **See Also:**

- *Oracle Database Concepts* for more information about Oracle precompilers
- *Oracle Database Development Guide* for more information about the Pro*C/C++ precompiler
- *Pro*C/C++ Programmer's Guide* for complete information about the Pro*C/C++ precompiler

1.2.2.5.8 Pro*COBOL Precompiler

The Pro*COBOL precompiler lets you embed SQL statements in a COBOL source file. The precompiler accepts the source program as input, translates the embedded SQL statements into standard Oracle runtime library calls, and generates a modified source program that you can compile, link, and run.

See Also:

- *Oracle Database Concepts* for more information about Oracle precompilers
- *Oracle Database Development Guide* for more information about the Pro*COBOL precompiler
- *Pro*COBOL Programmer's Guide* for complete information about the Pro*COBOL precompiler

1.2.2.5.9 Microsoft .NET Framework

The Microsoft .NET Framework is a multilanguage environment for building, deploying, and running applications and XML web services.

The main components of the Microsoft .NET Framework are:

- Common Language Runtime (CLR)
The Common Language Runtime (CLR) is a language-neutral development and runtime environment that provides services that help manage running applications.
- Framework Class Libraries (FCL)
The Framework Class Libraries (FCL) provide a consistent, object-oriented library of prepackaged functionality.

Oracle Data Provider for .NET (ODP.NET)

Oracle Data Provider for .NET (ODP.NET) provides fast and efficient ADO.NET data access from .NET applications to Oracle Database. ODP.NET allows developers to take advantage of advanced Oracle Database functionality that exists in Oracle Database, including SecureFiles, XML DB, and Advanced Queuing.

Oracle Developer Tools for Visual Studio (ODT)

Oracle Developer Tools for Visual Studio (ODT) is a set of application tools that integrate with the Visual Studio environment. These tools provide graphic user interface access to Oracle functionality, enable the user to perform a wide range of application development tasks, and improve development productivity and ease of use. Oracle Developer Tools supports the programming and implementation of .NET stored procedures using Visual Basic, C#, and other .NET languages.

.NET Stored Procedures

Oracle Database Extensions for .NET is a database option for Oracle Database on Windows. It makes it possible to build and run .NET stored procedures or functions with Oracle Database for Microsoft Windows using Visual Basic .NET or Visual C#.

After building .NET procedures and functions into a .NET assembly, you can deploy them in Oracle Database using the Oracle Deployment Wizard for .NET, a component of the Oracle Developer Tools for Visual Studio.

Oracle Providers for ASP.NET

Oracle Providers for ASP.NET offer ASP.NET developers an easy way to store state common to web applications within Oracle Database. These providers are modeled on existing Microsoft ASP.NET providers, sharing similar schema and programming interfaces to provide .NET developers a familiar interface. Oracle supports the Membership, Profile, Role, and other providers.

See Also:

- *Oracle Database 2 Day + .NET Developer's Guide for Microsoft Windows*
- *Oracle Data Provider for .NET Developer's Guide for Microsoft Windows*
- *Oracle Database Extensions for .NET Developer's Guide for Microsoft Windows*
- *Oracle Database Development Guide*

1.2.2.5.10 Oracle Provider for OLE DB (OraOLEDB)

Oracle Provider for OLE DB (OraOLEDB) is an open standard data access methodology that uses a set of Component Object Model (COM) interfaces for accessing and manipulating different types of data. These interfaces are available from various database providers.

See Also:

Oracle Provider for OLE DB Developer's Guide for Microsoft Windows for more information about OraOLEDB

1.3 About Sample Schema HR

The HR sample schema can be installed with Oracle Database. This schema contains information about employees—departments, locations, work histories, and related information. Like all schemas, HR has tables, views, indexes, procedures, functions, and other attributes. The examples and tutorials in this document use the schema.

 **See Also:**

- *Oracle Database Sample Schemas* for a complete description of the HR schema
- "[Connecting to Oracle Database as User HR](#)" for instructions for connecting to Oracle Database as the user HR

2

Connecting to Oracle Database and Exploring It

You can connect to Oracle Database only through a client program, such as SQL*Plus or SQL Developer. When connected to the database, you can view schema objects, view the properties and data of Oracle Database tables, and use queries to retrieve data from Oracle Database tables.

After connecting to Oracle Database through a client program, you enter and run commands in that client program. For details, see the documentation for your client program.

- [Connecting to Oracle Database from SQL*Plus](#)
SQL*Plus is a client program from which you can access Oracle Database. This topic shows how to start SQL*Plus and connect to Oracle Database.
- [Connecting to Oracle Database from SQL Developer](#)
SQL Developer is a client program with which you can access Oracle Database.
- [Connecting to Oracle Database as User HR](#)
To do the tutorials and examples in this document, you must connect to Oracle Database as the user `HR`.
- [Exploring Oracle Database with SQL*Plus](#)
If you are connected to Oracle Database from SQL*Plus as the user `HR`, you can view `HR` schema objects and the properties of the `EMPLOYEES` table.
- [Exploring Oracle Database with SQL Developer](#)
If you are connected to Oracle Database from SQL Developer as the user `HR`, you can view `HR` schema objects and the properties of the `EMPLOYEES` table.
- [Selecting Table Data](#)

2.1 Connecting to Oracle Database from SQL*Plus

SQL*Plus is a client program from which you can access Oracle Database. This topic shows how to start SQL*Plus and connect to Oracle Database.

 **Note:**

For steps 3 and 4 of the following procedure, you need a user name and password.

To connect to Oracle Database from SQL*Plus:

1. If you are on a Windows system, display a Windows command prompt.
2. At the command prompt, type `sqlplus` and then press the key **Enter**.

3. At the user name prompt, type your user name and then press the key **Enter**.
4. At the password prompt, type your password and then press the key **Enter**.

 **Note:**

For security, your password is not visible on your screen.

The system connects you to an Oracle Database instance.

You are in the SQL*Plus environment. At the `SQL>` prompt, you can enter and run SQL*Plus commands, SQL statements, PL/SQL statements, and operating system commands.

To exit SQL*Plus, type `exit` and press the key **Enter**.

 **Note:**

Exiting SQL*Plus ends the SQL*Plus session, but does not shut down the Oracle Database instance.

[Example 2-1](#) starts SQL*Plus, connects to Oracle Database, runs a SQL `SELECT` statement, and exits SQL*Plus. User input is **bold**.

Example 2-1 Connecting to Oracle Database from SQL*Plus

```
> sqlplus
SQL*Plus: Release 12.1.0.1.0 Production on Thu Dec 27 07:43:41 2012

Copyright (c) 1982, 2012, Oracle. All rights reserved.

Enter user-name: your_user_name
Enter password: your_password

Connected to:
Oracle Database 12c Enterprise Edition Release - 12.1.0.1.0 64bit Production

SQL> select count(*) from employees;

  COUNT(*)
-----
         107

SQL> exit

Disconnected from Oracle Database 12c Enterprise Edition Release - 12.1.0.1.0 64bit Production
>
```

 **See Also:**

- "Connecting to Oracle Database as User HR from SQL*Plus"
- "About SQL*Plus" for a brief description of SQL*Plus
- *SQL*Plus User's Guide and Reference* for more information about starting SQL*Plus and connecting to Oracle Database

2.2 Connecting to Oracle Database from SQL Developer

SQL Developer is a client program with which you can access Oracle Database.

You are encouraged to use the currently available release of SQL Developer, which you can download from:

<http://www.oracle.com/technetwork/developer-tools/sql-developer/downloads/>

This section assumes that SQL Developer is installed on your system, and shows how to start it and connect to Oracle Database. If SQL Developer is not installed on your system, then see *Oracle SQL Developer User's Guide* for installation instructions.

 **Note:**

For the following procedure:

- If you're using a SQL Developer kit that does not include the JDK, then the first time you start SQL Developer on your system, you must provide the path to the Java Development Kit.
- When prompted, you need to enter a user name and password.

To connect to Oracle Database from SQL Developer:

1. Start SQL Developer.

For instructions, see *Oracle SQL Developer User's Guide*.

If this is the first time you have started SQL Developer on your system, you are prompted to enter the path to the Java Development Kit (JDK) installation (for example, C:\Program Files\Java\jdk1.8.0_65). Either type the path after the prompt or browse to it, and then press the key **Enter**.

2. In the Connections frame, click the icon **New Connection**.
3. In the New/Select Database Connection window:

- a. Type the appropriate values in the fields Connection Name, Username, and Password.

For security, the password characters that you type appear as asterisks.

Near the Password field is the check box Save Password. By default, it is deselected. Oracle recommends accepting the default.

- b. If the Oracle pane is not showing, click the tab **Oracle**.

- c. In the Oracle pane, accept the default values.
(The default values are: Connection Type, Basic; Role, default, Hostname, localhost; Port, 1521; SID option, selected; SID field, xe.)
- d. Click the button **Test**.
The connection is tested. If the connection succeeds, the Status indicator changes from blank to *Success*.
- e. If the test succeeded, click the button **Connect**.
The New/Select Database Connection window closes. The Connections frame shows the connection whose name you entered in the Connection Name field in step 3.

You are in the SQL Developer environment.

To exit SQL Developer, select **Exit** from the File menu.

 **Note:**

Exiting SQL Developer ends the SQL Developer session, but does not shut down the Oracle Database instance. The next time you start SQL Developer, the connection you created using the preceding procedure still exists. SQL Developer prompts you for the password that you supplied in step 3 (unless you selected the check box Save Password).

 **See Also:**

- ["Connecting to Oracle Database as User HR from SQL Developer"](#)
- ["About SQL Developer"](#) for a brief description of SQL Developer
- *Oracle SQL Developer User's Guide* for more information about using SQL Developer to create connections to Oracle Database

2.3 Connecting to Oracle Database as User HR

To do the tutorials and examples in this document, you must connect to Oracle Database as the user `HR`.

The user `HR` owns the `HR` sample schema that the examples and tutorials in this document use.

- [Unlocking the HR Account](#)
You must unlock the HR account and reset its password before you can connect to Oracle Database as the user HR.
- [Connecting to Oracle Database as User HR from SQL*Plus](#)
You can use SQL*Plus to connect to Oracle Database as the HR user.
- [Connecting to Oracle Database as User HR from SQL Developer](#)
You can use SQL Developer to connect to Oracle Database as the HR user.

2.3.1 Unlocking the HR Account

You must unlock the HR account and reset its password before you can connect to Oracle Database as the user HR.

By default, when the HR schema is installed, the HR account is locked and its password is expired.

 **Note:**

For the following procedure, you need the name and password of a user who has the ALTER USER system privilege.

To unlock the HR account and reset its password:

1. Using SQL*Plus, connect to Oracle Database as a user with the ALTER USER system privilege.
2. At the SQL> prompt, unlock the HR account and reset its password:

 **Caution:**

Choose a secure password. For guidelines for secure passwords, see *Oracle Database Security Guide*.

```
ALTER USER HR ACCOUNT UNLOCK IDENTIFIED BY password;
```

The system responds:

```
User altered.
```

The HR account is unlocked and its password is password.

Now you can connect to Oracle Database as user HR with the password password.

 **See Also:**

- *Oracle Database 2 Day + Security Guide* for information about predefined user accounts provided by Oracle Database, including HR
- *Oracle SQL Developer User's Guide* for information about accessing SQL*Plus within SQL Developer

2.3.2 Connecting to Oracle Database as User HR from SQL*Plus

You can use SQL*Plus to connect to Oracle Database as the HR user.

 **Note:**

If the HR account is locked, see "[Unlocking the HR Account](#)" and then return to this section.

To connect to Oracle Database as user HR from SQL*Plus:

 **Note:**

For this task, you need the password for the HR account.

1. If you are connected to Oracle Database, close your current connection.
2. Follow the directions in "[Connecting to Oracle Database from SQL*Plus](#)", entering the user name `HR` at step 3 and the password for the HR account at step 4.

You are now connected to Oracle Database as the user HR.

 **See Also:**

*SQL*Plus User's Guide and Reference* for an example of using SQL*Plus to create an `HR` connection

2.3.3 Connecting to Oracle Database as User HR from SQL Developer

You can use SQL Developer to connect to Oracle Database as the HR user.

 **Note:**

If the HR account is locked, see "[Unlocking the HR Account](#)" and then return to this section.

To connect to Oracle Database as user HR from SQL Developer:

 **Note:**

For this task, you need the password for the HR account.

Follow the directions in "[Connecting to Oracle Database from SQL Developer](#)", entering the following values at steps 3:

- For Connection Name, enter `hr_conn`.

(You can enter a different name, but the tutorials in this document assume that you named the connection `hr_conn`.)

- For Username, enter HR.
- For Password, enter the password for the HR account.

You are now connected to Oracle Database as the user HR.

2.4 Exploring Oracle Database with SQL*Plus

If you are connected to Oracle Database from SQL*Plus as the user HR, you can view HR schema objects and the properties of the EMPLOYEES table.

Note:

If you are not connected to Oracle Database as user HR from SQL*Plus, see "[Connecting to Oracle Database as User HR from SQL*Plus](#)" and then return to this section.

- [Viewing HR Schema Objects with SQL*Plus](#)
With SQL*Plus, you can view the objects that belong to the HR schema by querying the static data dictionary view USER_OBJECTS.
- [Viewing EMPLOYEES Table Properties and Data with SQL*Plus](#)
You can a SQL*Plus command, the SQL SELECT statement, and static data dictionary views to view the properties and data of the HR.EMPLOYEES table.

2.4.1 Viewing HR Schema Objects with SQL*Plus

With SQL*Plus, you can view the objects that belong to the HR schema by querying the static data dictionary view USER_OBJECTS.

[Example 2-2](#) shows how to view the names and data types of the objects that belong to the HR schema.

Example 2-2 Viewing HR Schema Objects with SQL*Plus

```
COLUMN OBJECT_NAME FORMAT A25  
COLUMN OBJECT_TYPE FORMAT A25  
  
SELECT OBJECT_NAME, OBJECT_TYPE FROM USER_OBJECTS  
ORDER BY OBJECT_TYPE, OBJECT_NAME;
```

Result is similar to:

OBJECT_NAME	OBJECT_TYPE
-----	-----
COUNTRY_C_ID_PK	INDEX
DEPT_ID_PK	INDEX
DEPT_LOCATION_IX	INDEX
EMP_DEPARTMENT_IX	INDEX
EMP_EMAIL_UK	INDEX
EMP_EMP_ID_PK	INDEX
EMP_JOB_IX	INDEX
EMP_MANAGER_IX	INDEX

EMP_NAME_IX	INDEX
JHIST_DEPARTMENT_IX	INDEX
JHIST_EMPLOYEE_IX	INDEX
JHIST_EMP_ID_ST_DATE_PK	INDEX
JHIST_JOB_IX	INDEX
JOB_ID_PK	INDEX
LOC_CITY_IX	INDEX
LOC_COUNTRY_IX	INDEX
LOC_ID_PK	INDEX
LOC_STATE_PROVINCE_IX	INDEX
REG_ID_PK	INDEX
ADD_JOB_HISTORY	PROCEDURE
SECURE_DML	PROCEDURE
DEPARTMENTS_SEQ	SEQUENCE
EMPLOYEES_SEQ	SEQUENCE
LOCATIONS_SEQ	SEQUENCE
COUNTRIES	TABLE
DEPARTMENTS	TABLE
EMPLOYEES	TABLE
JOBS	TABLE
JOB_HISTORY	TABLE
LOCATIONS	TABLE
REGIONS	TABLE
SECURE_EMPLOYEES	TRIGGER
UPDATE_JOB_HISTORY	TRIGGER
EMP_DETAILS_VIEW	VIEW

34 rows selected.

See Also:

- *Oracle Database Reference* for information about USER_OBJECTS
- "[Selecting Table Data](#)" for information about using queries to view table data
- "[About Sample Schema HR](#)" for general information about the schema HR

2.4.2 Viewing EMPLOYEES Table Properties and Data with SQL*Plus

You can use a SQL*Plus command, the SQL SELECT statement, and static data dictionary views to view the properties and data of the HR.EMPLOYEES table.

You can use the SQL*Plus command DESCRIBE to view the properties of the columns of the EMPLOYEES table in the HR schema and the SQL statement SELECT to view the data. To view other properties of the table, use static data dictionary views (for example, USER_CONSTRAINTS, USER_INDEXES, and USER_TRIGGERS).

[Example 2-3](#) shows how to view the properties of the EMPLOYEES table in the HR schema.

Example 2-3 Viewing EMPLOYEES Table Properties with SQL*Plus

```
DESCRIBE EMPLOYEES
```

Result:

Name	Null?	Type
EMPLOYEE_ID	NOT NULL	NUMBER(6)
FIRST_NAME		VARCHAR2(20)
LAST_NAME	NOT NULL	VARCHAR2(25)
EMAIL	NOT NULL	VARCHAR2(25)
PHONE_NUMBER		VARCHAR2(20)
HIRE_DATE	NOT NULL	DATE
JOB_ID	NOT NULL	VARCHAR2(10)
SALARY		NUMBER(8,2)
COMMISSION_PCT		NUMBER(2,2)
MANAGER_ID		NUMBER(6)
DEPARTMENT_ID		NUMBER(4)

Example 2-4 shows how to view some data in the EMPLOYEES table in the HR schema.

Example 2-4 Viewing EMPLOYEES Table Data with SQL*Plus

```
COLUMN FIRST_NAME FORMAT A20
COLUMN LAST_NAME FORMAT A25
COLUMN PHONE_NUMBER FORMAT A20

SELECT LAST_NAME, FIRST_NAME, PHONE_NUMBER FROM EMPLOYEES
ORDER BY LAST_NAME;
```

Result is similar to:

LAST_NAME	FIRST_NAME	PHONE_NUMBER
Abel	Ellen	011.44.1644.429267
Ande	Sundar	011.44.1346.629268
Atkinson	Mozhe	650.124.6234
Austin	David	590.423.4569
Baer	Hermann	515.123.8888
Baida	Shelli	515.127.4563
Banda	Amit	011.44.1346.729268
Bates	Elizabeth	011.44.1343.529268
...		
Urman	Jose Manuel	515.124.4469
Vargas	Peter	650.121.2004

2.5 Exploring Oracle Database with SQL Developer

If you are connected to Oracle Database from SQL Developer as the user HR, you can view HR schema objects and the properties of the EMPLOYEES table.

- [Tutorial: Viewing HR Schema Objects with SQL Developer](#)
This tutorial shows how to use SQL Developer to view the objects that belong to the HR schema—that is, how to **browse** the HR schema.
- [Tutorial: Viewing EMPLOYEES Table Properties and Data with SQL Developer](#)
This tutorial shows how to use SQL Developer to view the properties and data of the EMPLOYEES table in the HR schema.

2.5.1 Tutorial: Viewing HR Schema Objects with SQL Developer

This tutorial shows how to use SQL Developer to view the objects that belong to the HR schema—that is, how to **browse** the HR schema.

 **Note:**

If you are not connected to Oracle Database as user HR from SQL Developer, see "[Connecting to Oracle Database as User HR from SQL Developer](#)" and then return to this tutorial.

To browse the HR schema:

1. In the Connections frame, to the left of the hr_conn icon, click the **plus sign (+)**.
If you are not connected to the database, the Connection Information window opens. If you are connected to the database, the hr_conn information expands (see the information that follows "Click OK" in step 2).
2. If the Connection Information window opens:
 - a. In the User Name field, enter `hr`.
 - b. In the Password field, enter the password for the user HR.
 - c. Click **OK**.

The hr_conn information expands: The plus sign becomes a minus sign (-), and under the hr_conn icon, a list of schema object types appears—Tables, Views,

Indexes, and so on. (If you click the minus sign, the hr_conn information collapses: The minus sign becomes a plus sign, and the list disappears.)

 **See Also:**

- *Oracle SQL Developer User's Guide* for more information about the SQL Developer user interface
- "[About Sample Schema HR](#)" for general information about schema HR

2.5.2 Tutorial: Viewing EMPLOYEES Table Properties and Data with SQL Developer

This tutorial shows how to use SQL Developer to view the properties and data of the EMPLOYEES table in the HR schema.

 **Note:**

If you are not browsing the HR schema, see "[Tutorial: Viewing HR Schema Objects with SQL Developer](#)" and then return to this tutorial.

To view the properties and data of the EMPLOYEES table:

1. In the Connections frame, expand **Tables**.
Under Tables, a list of the tables in the HR schema appears.
2. Select the table **EMPLOYEES**.
In the right frame of the Oracle SQL Developer window, in the Columns pane, a list of all columns of this table appears. To the right of each column are its properties—name, data type, and so on. (To see all column properties, move the horizontal scroll bar to the right.)
3. In the right frame, click the tab **Data**.
The Data pane appears, showing a numbered list of all records in this table. (To see more records, move the vertical scroll bar down. To see more columns of the records, move the horizontal scroll bar to the right.)
4. In the right frame, click the tab **Constraints**.
The Constraints pane appears, showing a list of all constraints on this table. To the right of each constraint are its properties—name, type, search condition, and so on. (To see all constraint properties, move the horizontal scroll bar to the right.)
5. Explore the other properties by clicking on the appropriate tabs.
To see the SQL statement for creating the EMPLOYEES table, click the **SQL** tab. The SQL statement appears in a pane named EMPLOYEES. To close this pane, click the **x** to the right of the name EMPLOYEES.

 **See Also:**

Oracle SQL Developer User's Guide for more information about the SQL Developer user interface

2.6 Selecting Table Data

 **Note:**

To do the tutorials and examples in this section, you must be connected to Oracle Database as the user HR from SQL Developer. For instructions, see "[Connecting to Oracle Database as User HR from SQL Developer](#)".

- [About Queries](#)
A **query**, or SQL SELECT statement, selects data from one or more tables or views.
- [Running Queries in SQL Developer](#)
This section explains how to run queries in SQL Developer, using the Worksheet.
- [Tutorial: Selecting All Columns of a Table](#)
This tutorial shows how to select all columns of the EMPLOYEES table.
- [Tutorial: Selecting Specific Columns of a Table](#)
This tutorial shows how to select only the columns FIRST_NAME, LAST_NAME, and DEPARTMENT_ID of the EMPLOYEES table.
- [Displaying Selected Columns Under New Headings](#)
In displayed query results, default column headings are column names. To display a column under a new heading, specify the new heading (**alias**) immediately after the column name. The alias renames the column for the duration of the query, but does not change its name in the database.
- [Selecting Data that Satisfies Specified Conditions](#)
To select only data that matches a specified condition, include the WHERE clause in the SELECT statement.
- [Sorting Selected Data](#)
When query results are displayed, records can be in any order, unless you specify their order with the ORDER BY clause.
- [Selecting Data from Multiple Tables](#)
To select data from multiple tables, you use a query that is called a **join**. The tables in a join must share at least one column name.
- [Using Operators and Functions in Queries](#)
The select_list of a query can include SQL expressions, which can include SQL operators and SQL functions. These operators and functions can have table data as operands and arguments. The SQL expressions are evaluated, and their values appear in the results of the query.

2.6.1 About Queries

A **query**, or SQL SELECT statement, selects data from one or more tables or views.

The simplest form of query has this syntax:

```
SELECT select_list FROM source_list
```

The *select_list* specifies the columns from which the data is to be selected, and the *source_list* specifies the tables or views that have these columns.

A query nested within another SQL statement is called a **subquery**.

In the SQL*Plus environment, you can enter a query (or any other SQL statement) after the SQL> prompt.

In the SQL Developer environment, you can enter a query (or any other SQL statement) in the Worksheet.

Note:

When the result of a query is displayed, records can be in any order, unless you specify their order with the ORDER BY clause. For more information, see "[Sorting Selected Data](#)".

See Also:

- *Oracle Database SQL Language Reference* for more information about queries and subqueries
- *Oracle Database SQL Language Reference* for more information about the SELECT statement
- *SQL*Plus User's Guide and Reference* for more information about the SQL*Plus command line interface
- *Oracle SQL Developer User's Guide* for information about using the Worksheet in SQL Developer

2.6.2 Running Queries in SQL Developer

This section explains how to run queries in SQL Developer, using the Worksheet.

Note:

The Worksheet is not limited to queries; you can use it to run any SQL statement.

To run queries in SQL Developer:

1. If the right frame of SQL Developer shows the hr_conn pane:
 - a. If the Worksheet subpane does not show, click the tab **Worksheet**.
 - b. Go to step 4.
2. Click the icon **SQL Worksheet**.
3. If the Select Connection window opens:
 - a. If the Connection field does not have the value hr_conn, select that value from the menu.
 - b. Click **OK**.

A pane appears with a tab labeled hr_conn and two subpanes, Worksheet and Query Builder. In the Worksheet, you can enter a SQL statement.

4. In the Worksheet, type a query (a SELECT statement).
5. Click the icon **Run Statement**.

The query runs. Under the Worksheet, the Query Result pane appears, showing the query result.

6. Under the hr_conn tab, click the icon **Clear**.

The query disappears, and you can enter another SQL statement in the Worksheet. When you run another SQL statement, its result appears in the Query Result pane, replacing the result of the previously run SQL statement.

**See Also:**

Oracle SQL Developer User's Guide for information about using the Worksheet in SQL Developer

2.6.3 Tutorial: Selecting All Columns of a Table

This tutorial shows how to select all columns of the EMPLOYEES table.

To select all columns of the EMPLOYEES Table:

1. If a pane with the tab hr_conn is there, select it. Otherwise, click the icon **SQL Worksheet**, as in "[Running Queries in SQL Developer](#)".
2. In the Worksheet, enter this query:

```
SELECT * FROM EMPLOYEES;
```

3. Click the icon **Run Statement**.

The query runs. Under the Worksheet, the Query Result pane appears, showing all columns of the EMPLOYEES table.

▲ Caution:

Be very careful about using `SELECT *` on tables with columns that store sensitive data, such as passwords or credit card information.

✎ See Also:

"Tutorial: Viewing `EMPLOYEES` Table Properties and Data with SQL Developer" for information about another way to view table data with SQL Developer

2.6.4 Tutorial: Selecting Specific Columns of a Table

This tutorial shows how to select only the columns `FIRST_NAME`, `LAST_NAME`, and `DEPARTMENT_ID` of the `EMPLOYEES` table.

To select only `FIRST_NAME`, `LAST_NAME`, and `DEPARTMENT_ID`:

1. If a pane with the tab `hr_conn` is there, select it. Otherwise, click the icon SQL Worksheet, as in "Running Queries in SQL Developer".
2. If the Worksheet pane contains a query, clear the query by clicking the icon **Clear**.
3. In the Worksheet, enter this query:

```
SELECT FIRST_NAME, LAST_NAME, DEPARTMENT_ID FROM EMPLOYEES;
```

4. Click the icon **Run Statement**.

The query runs. Under the Worksheet, the Query Result pane appears, showing the results of the query, which are similar to:

FIRST_NAME	LAST_NAME	DEPARTMENT_ID
Donald	OConnell	50
Douglas	Grant	50
Jennifer	Whalen	10
Michael	Hartstein	20
Pat	Fay	20
Susan	Mavris	40
Hermann	Baer	70
Shelley	Higgins	110
William	Gietz	110
Steven	King	90
Neena	Kochhar	90
FIRST_NAME	LAST_NAME	DEPARTMENT_ID
Lex	De Haan	90
...		
Kevin	Feeney	50

107 rows selected.

2.6.5 Displaying Selected Columns Under New Headings

In displayed query results, default column headings are column names. To display a column under a new heading, specify the new heading (**alias**) immediately after the column name. The alias renames the column for the duration of the query, but does not change its name in the database.

The query in [Example 2-5](#) selects the same columns as the query in "[Tutorial: Selecting Specific Columns of a Table](#)", but it also specifies aliases for them. Because the aliases are not enclosed in double quotation marks, they are displayed in uppercase letters.

If you enclose column aliases in double quotation marks, case is preserved, and the aliases can include spaces, as in [Example 2-6](#).

See Also:

Oracle Database SQL Language Reference for more information about the SELECT statement, including the column alias (c_alias)

Example 2-5 Displaying Selected Columns Under New Headings

```
SELECT FIRST_NAME First, LAST_NAME last, DEPARTMENT_ID DepT
FROM EMPLOYEES;
```

Result is similar to:

FIRST	LAST	DEPT
-----	-----	-----
Donald	OConnell	50
Douglas	Grant	50
Jennifer	Whalen	10
Michael	Hartstein	20
Pat	Fay	20
Susan	Mavris	40
Hermann	Baer	70
Shelley	Higgins	110
William	Gietz	110
Steven	King	90
Neena	Kochhar	90
FIRST	LAST	DEPT
-----	-----	-----
Lex	De Haan	90
...		
Kevin	Feeney	50

107 rows selected.

Example 2-6 Preserving Case and Including Spaces in Column Aliases

```
SELECT FIRST_NAME "Given Name", LAST_NAME "Family Name"
FROM EMPLOYEES;
```

Result is similar to:

Given Name	Family Name
Donald	OConnell
Douglas	Grant
Jennifer	Whalen
Michael	Hartstein
Pat	Fay
Susan	Mavris
Hermann	Baer
Shelley	Higgins
William	Gietz
Steven	King
Neena	Kochhar

Given Name	Family Name
Lex	De Haan
...	
Kevin	Feeney

107 rows selected.

2.6.6 Selecting Data that Satisfies Specified Conditions

To select only data that matches a specified condition, include the `WHERE` clause in the `SELECT` statement.

The condition in the `WHERE` clause can be any SQL condition (for information about SQL conditions, see *Oracle Database SQL Language Reference*).

The query in [Example 2-7](#) selects data only for employees in department 90.

To select data only for employees in departments 100, 110, and 120, use this `WHERE` clause:

```
WHERE DEPARTMENT_ID IN (100, 110, 120);
```

The query in [Example 2-8](#) selects data only for employees whose last names start with "Ma".

To select data only for employees whose last names include "ma", use this `WHERE` clause:

```
WHERE LAST_NAME LIKE '%ma%';
```

The query in [Example 2-9](#) tests for two conditions—whether the salary is at least 11000, and whether the commission percentage is not null.

See Also:

- *Oracle Database SQL Language Reference* for more information about the `SELECT` statement, including the `WHERE` clause
- *Oracle Database SQL Language Reference* for more information about SQL conditions

Example 2-7 Selecting Data from One Department

```
SELECT FIRST_NAME, LAST_NAME, DEPARTMENT_ID
FROM EMPLOYEES
WHERE DEPARTMENT_ID = 90;
```

Result is similar to:

FIRST_NAME	LAST_NAME	DEPARTMENT_ID
Steven	King	90
Neena	Kochhar	90
Lex	De Haan	90

3 rows selected.

Example 2-8 Selecting Data for Last Names that Start with the Same Substring

```
SELECT FIRST_NAME, LAST_NAME
FROM EMPLOYEES
WHERE LAST_NAME LIKE 'Ma%';
```

Result is similar to:

FIRST_NAME	LAST_NAME
Jason	Mallin
Steven	Markle
James	Marlow
Mattea	Marvins
Randall	Matos
Susan	Mavris

6 rows selected.

Example 2-9 Selecting Data that Satisfies Two Conditions

```
SELECT FIRST_NAME, LAST_NAME, SALARY, COMMISSION_PCT "%"
FROM EMPLOYEES
WHERE (SALARY >= 11000) AND (COMMISSION_PCT IS NOT NULL);
```

Result is similar to:

FIRST_NAME	LAST_NAME	SALARY	%
John	Russell	14000	.4
Karen	Partners	13500	.3
Alberto	Errazuriz	12000	.3
Gerald	Cambrault	11000	.3
Lisa	Ozer	11500	.25
Ellen	Abel	11000	.3

6 rows selected.

2.6.7 Sorting Selected Data

When query results are displayed, records can be in any order, unless you specify their order with the `ORDER BY` clause.

The query results in [Example 2-10](#) are sorted by `LAST_NAME`, in ascending order (the default).

Alternatively, in SQL Developer, you can omit the `ORDER BY` clause and double-click the name of the column to sort.

The sort criterion need not be included in the select list, as [Example 2-11](#) shows.

See Also:

Oracle Database SQL Language Reference for more information about the `SELECT` statement, including the `ORDER BY` clause

Example 2-10 Sorting Selected Data by `LAST_NAME`

```
SELECT FIRST_NAME, LAST_NAME, HIRE_DATE
FROM EMPLOYEES
ORDER BY LAST_NAME;
```

Result:

FIRST_NAME	LAST_NAME	HIRE_DATE
Ellen	Abel	11-MAY-04
Sundar	Ande	24-MAR-08
Mozhe	Atkinson	30-OCT-05
David	Austin	25-JUN-05
Hermann	Baer	07-JUN-02
Shelli	Baida	24-DEC-05
Amit	Banda	21-APR-08
Elizabeth	Bates	24-MAR-07
...		
FIRST_NAME	LAST_NAME	HIRE_DATE
Jose Manuel	Urman	07-MAR-06
Peter	Vargas	09-JUL-06
Clara	Vishney	11-NOV-05
Shanta	Vollman	10-OCT-05
Alana	Walsh	24-APR-06
Matthew	Weiss	18-JUL-04
Jennifer	Whalen	17-SEP-03
Eleni	Zlotkey	29-JAN-08

107 rows selected

Example 2-11 Sorting Selected Data by an Unselected Column

```
SELECT FIRST_NAME, HIRE_DATE
FROM EMPLOYEES
ORDER BY LAST_NAME;
```

Result:

```

FIRST_NAME          HIRE_DATE
-----
Ellen                11-MAY-04
Sundar              24-MAR-08
Mozhe               30-OCT-05
David               25-JUN-05
Hermann            07-JUN-02
Shelli             24-DEC-05
Amit               21-APR-08
Elizabeth          24-MAR-07
...
FIRST_NAME          HIRE_DATE
-----
Jose Manuel         07-MAR-06
Peter              09-JUL-06
Clara              11-NOV-05
Shanta            10-OCT-05
Alana             24-APR-06
Matthew           18-JUL-04
Jennifer          17-SEP-03
Eleni             29-JAN-08

```

107 rows selected.

2.6.8 Selecting Data from Multiple Tables

To select data from multiple tables, you use a query that is called a **join**. The tables in a join must share at least one column name.

Suppose that you want to select the `FIRST_NAME`, `LAST_NAME`, and `DEPARTMENT_NAME` of every employee. `FIRST_NAME` and `LAST_NAME` are in the `EMPLOYEES` table, and `DEPARTMENT_NAME` is in the `DEPARTMENTS` table. Both tables have `DEPARTMENT_ID`. You can use the query in [Example 2-12](#).

Table-name qualifiers are optional for column names that appear in only one table of a join, but are required for column names that appear in both tables. The following query is equivalent to the query in [Example 2-12](#):

```

SELECT FIRST_NAME "First",
       LAST_NAME  "Last",
       DEPARTMENT_NAME "Dept. Name"
FROM EMPLOYEES, DEPARTMENTS
WHERE EMPLOYEES.DEPARTMENT_ID = DEPARTMENTS.DEPARTMENT_ID
ORDER BY DEPARTMENT_NAME, LAST_NAME;

```

To make queries that use qualified column names more readable, use table aliases, as in the following example:

```

SELECT FIRST_NAME "First",
       LAST_NAME  "Last",
       DEPARTMENT_NAME "Dept. Name"
FROM EMPLOYEES e, DEPARTMENTS d
WHERE e.DEPARTMENT_ID = d.DEPARTMENT_ID
ORDER BY d.DEPARTMENT_NAME, e.LAST_NAME;

```

Although you create the aliases in the `FROM` clause, you can use them earlier in the query, as in the following example:

```

SELECT e.FIRST_NAME "First",
e.LAST_NAME "Last",
d.DEPARTMENT_NAME "Dept. Name"
FROM EMPLOYEES e, DEPARTMENTS d
WHERE e.DEPARTMENT_ID = d.DEPARTMENT_ID
ORDER BY d.DEPARTMENT_NAME, e.LAST_NAME;

```

 **See Also:**

Oracle Database SQL Language Reference for more information about joins

Example 2-12 Selecting Data from Two Tables (Joining Two Tables)

```

SELECT EMPLOYEES.FIRST_NAME "First",
EMPLOYEES.LAST_NAME "Last",
DEPARTMENTS.DEPARTMENT_NAME "Dept. Name"
FROM EMPLOYEES, DEPARTMENTS
WHERE EMPLOYEES.DEPARTMENT_ID = DEPARTMENTS.DEPARTMENT_ID
ORDER BY DEPARTMENTS.DEPARTMENT_NAME, EMPLOYEES.LAST_NAME;

```

Result:

First	Last	Dept. Name
William	Gietz	Accounting
Shelley	Higgins	Accounting
Jennifer	Whalen	Administration
Lex	De Haan	Executive
Steven	King	Executive
Neena	Kochhar	Executive
John	Chen	Finance
...		
Jose Manuel	Urman	Finance
Susan	Mavris	Human Resources
David	Austin	IT
...		
Valli	Pataballa	IT
Pat	Fay	Marketing
Michael	Hartstein	Marketing
Hermann	Baer	Public Relations
Shelli	Baida	Purchasing
...		
Sigal	Tobias	Purchasing
Ellen	Abel	Sales
...		
Eleni	Zlotkey	Sales
Mozhe	Atkinson	Shipping
...		
Matthew	Weiss	Shipping

106 rows selected.

2.6.9 Using Operators and Functions in Queries

The `select_list` of a query can include SQL expressions, which can include SQL operators and SQL functions. These operators and functions can have table data as

operands and arguments. The SQL expressions are evaluated, and their values appear in the results of the query.

- [Using Arithmetic Operators in Queries](#)
The basic arithmetic operators—+ (addition), - (subtraction), * (multiplication), and / (division)—operate on column values.
- [Using Numeric Functions in Queries](#)
Numeric functions accept numeric input and return numeric values. Each numeric function returns a single value for each row that is evaluated.
- [Using the Concatenation Operator in Queries](#)
The concatenation operator (||) combines two strings into one string, by appending the second string to the first. For example, 'a' || 'b' = 'ab'. You can use this operator to combine information from two columns or expressions in the same column of a query result.
- [Using Character Functions in Queries](#)
Character functions accept character input. Most return character values, but some return numeric values. Each character function returns a single value for each row that is evaluated.
- [Using Datetime Functions in Queries](#)
Datetime functions operate on DATE, time stamp, and interval values. Each datetime function returns a single value for each row that is evaluated.
- [Using Conversion Functions in Queries](#)
Conversion functions convert one data type to another.
- [Using Aggregate Functions in Queries](#)
An aggregate function takes a group of rows and returns a single result row. The group of rows can be an entire table or view.
- [Using NULL-Related Functions in Queries](#)
The NULL-related functions facilitate the handling of NULL values.
- [Using CASE Expressions in Queries](#)
A CASE expression lets you use IF ... THEN ... ELSE logic in SQL statements without invoking subprograms. There are two kinds of CASE expressions, simple and searched.
- [Using the DECODE Function in Queries](#)
The DECODE function compares an expression to several search values. Whenever the value of the expression matches a search value, DECODE returns the result associated with that search value. If DECODE finds no match, then it returns the default value (if specified) or NULL (if no default value is specified).

 **See Also:**

- *Oracle Database SQL Language Reference* for more information about SQL operators
- *Oracle Database SQL Language Reference* for more information about SQL functions

2.6.9.1 Using Arithmetic Operators in Queries

The basic arithmetic operators—+ (addition), - (subtraction), * (multiplication), and / (division)—operate on column values.

The query in [Example 2-13](#) displays LAST_NAME, SALARY (monthly pay), and annual pay for each employee in department 90, in descending order of SALARY.

Example 2-13 Using an Arithmetic Expression in a Query

```
SELECT LAST_NAME,
       SALARY "Monthly Pay",
       SALARY * 12 "Annual Pay"
FROM EMPLOYEES
WHERE DEPARTMENT_ID = 90
ORDER BY SALARY DESC;
```

Result:

LAST_NAME	Monthly Pay	Annual Pay
King	24000	288000
De Haan	17000	204000
Kochhar	17000	204000

2.6.9.2 Using Numeric Functions in Queries

Numeric functions accept numeric input and return numeric values. Each numeric function returns a single value for each row that is evaluated.

The numeric functions that SQL supports are listed and described in *Oracle Database SQL Language Reference*.

The query in [Example 2-14](#) uses the numeric function `ROUND` to display the daily pay of each employee in department 100, rounded to the nearest cent.

The query in [Example 2-15](#) uses the numeric function `TRUNC` to display the daily pay of each employee in department 100, truncated to the nearest dollar.

See Also:

Oracle Database SQL Language Reference for more information about SQL numeric functions

Example 2-14 Rounding Numeric Data

```
SELECT LAST_NAME,
       ROUND (((SALARY * 12)/365), 2) "Daily Pay"
FROM EMPLOYEES
WHERE DEPARTMENT_ID = 100
ORDER BY LAST_NAME;
```

Result:

LAST_NAME	Daily Pay
-----	-----

Chen	269.59
Faviet	295.89
Greenberg	394.52
Popp	226.85
Sciarra	253.15
Urman	256.44

6 rows selected.

Example 2-15 Truncating Numeric Data

```
SELECT LAST_NAME,
TRUNC ((SALARY * 12)/365) "Daily Pay"
FROM EMPLOYEES
WHERE DEPARTMENT_ID = 100
ORDER BY LAST_NAME;
```

Result:

LAST_NAME	Daily Pay
Chen	269
Faviet	295
Greenberg	394
Popp	226
Sciarra	253
Urman	256

6 rows selected.

2.6.9.3 Using the Concatenation Operator in Queries

The concatenation operator (||) combines two strings into one string, by appending the second string to the first. For example, 'a' || 'b' = 'ab'. You can use this operator to combine information from two columns or expressions in the same column of a query result.

The query in [Example 2-16](#) concatenates the first name, a space, and the last name of each selected employee.

See Also:

Oracle Database SQL Language Reference for more information about the concatenation operator

Example 2-16 Concatenating Character Data

```
SELECT FIRST_NAME || ' ' || LAST_NAME "Name"
FROM EMPLOYEES
WHERE DEPARTMENT_ID = 100
ORDER BY LAST_NAME;
```

Result:

Name
John Chen

```
Daniel Faviet
Nancy Greenberg
Luis Popp
Ismael Sciarra
Jose Manuel Urman
```

```
6 rows selected.
```

2.6.9.4 Using Character Functions in Queries

Character functions accept character input. Most return character values, but some return numeric values. Each character function returns a single value for each row that is evaluated.

The character functions that SQL supports are listed and described in *Oracle Database SQL Language Reference*.

The functions UPPER, INITCAP, and LOWER display their character arguments in uppercase, initial capital, and lowercase, respectively.

The query in [Example 2-17](#) displays LAST_NAME in uppercase, FIRST_NAME with the first character in uppercase and all others in lowercase, and EMAIL in lowercase.

See Also:

Oracle Database SQL Language Reference for more information about SQL character functions

Example 2-17 Changing the Case of Character Data

```
SELECT UPPER(LAST_NAME) "Last",
       INITCAP(FIRST_NAME) "First",
       LOWER(EMAIL) "E-Mail"
FROM EMPLOYEES
WHERE DEPARTMENT_ID = 100
ORDER BY EMAIL;
```

Result:

Last	First	E-Mail
FAVIET	Daniel	dfaviet
SCIARRA	Ismael	isciarra
CHEN	John	jchen
URMAN	Jose Manuel	jmurman
POPP	Luis	lpopp
GREENBERG	Nancy	ngreenbe

```
6 rows selected.
```

2.6.9.5 Using Datetime Functions in Queries

Datetime functions operate on DATE, time stamp, and interval values. Each datetime function returns a single value for each row that is evaluated.

The datetime functions that SQL supports are listed and described in *Oracle Database SQL Language Reference*.

For each DATE and time stamp value, Oracle Database stores this information:

- Year
- Month
- Date
- Hour
- Minute
- Second

For each time stamp value, Oracle Database also stores the fractional part of the second, whose precision you can specify. To store the time zone also, use the data type `TIMESTAMP WITH TIME ZONE` or `TIMESTAMP WITH LOCAL TIME ZONE`.

For more information about the DATE data type, see *Oracle Database SQL Language Reference*.

For more information about the TIMESTAMP data type, see *Oracle Database SQL Language Reference*.

For information about the other time stamp data types and the interval data types, see *Oracle Database SQL Language Reference*.

The query in [Example 2-18](#) uses the `EXTRACT` and `SYSDATE` functions to show how many years each employee in department 100 has been employed. The `SYSDATE` function returns the current date of the system clock as a DATE value. For more information about the `SYSDATE` function, see *Oracle Database SQL Language Reference*. For information about the `EXTRACT` function, see *Oracle Database SQL Language Reference*.

The query in [Example 2-19](#) uses the `SYSTIMESTAMP` function to display the current system date and time. The `SYSTIMESTAMP` function returns a `TIMESTAMP` value. For information about the `SYSTIMESTAMP` function, see *Oracle Database SQL Language Reference*.

The table in the `FROM` clause of the query, `DUAL`, is a one-row table that Oracle Database creates automatically along with the data dictionary. Select from `DUAL` when you want to compute a constant expression with the `SELECT` statement. Because `DUAL` has only one row, the constant is returned only once. For more information about selecting from `DUAL`, see *Oracle Database SQL Language Reference*.

 **See Also:**

Oracle Database SQL Language Reference for more information about SQL datetime functions

Example 2-18 Displaying the Number of Years Between Dates

```
SELECT LAST_NAME,
       (EXTRACT(YEAR FROM SYSDATE) - EXTRACT(YEAR FROM HIRE_DATE)) "Years Employed"
FROM EMPLOYEES
WHERE DEPARTMENT_ID = 100
ORDER BY "Years Employed";
```

Result:

LAST_NAME	Years Employed
Popp	5
Urman	6
Chen	7
Sciarra	7
Greenberg	10
Faviet	10

6 rows selected.

Example 2-19 Displaying System Date and Time

```
SELECT EXTRACT(HOUR FROM SYSTIMESTAMP) || ':' ||
       EXTRACT(MINUTE FROM SYSTIMESTAMP) || ':' ||
       ROUND(EXTRACT(SECOND FROM SYSTIMESTAMP), 0) || ', ' ||
       EXTRACT(MONTH FROM SYSTIMESTAMP) || '/' ||
       EXTRACT(DAY FROM SYSTIMESTAMP) || '/' ||
       EXTRACT(YEAR FROM SYSTIMESTAMP) "System Time and Date"
FROM DUAL;
```

Results depend on current SYSTIMESTAMP value, but have this format:

```
System Time and Date
-----
18:17:53, 12/27/2012
```

2.6.9.6 Using Conversion Functions in Queries

Conversion functions convert one data type to another.

The conversion functions that SQL supports are listed and described in *Oracle Database SQL Language Reference*.

The query in [Example 2-20](#) uses the TO_CHAR function to convert HIRE_DATE values (which are of type DATE) to character values that have the format FMMonth DD YYYY. FM removes leading and trailing blanks from the month name. FMMonth DD YYYY is an example of a **datetime format model**. For information about datetime format models, see *Oracle Database SQL Language Reference*.

The query in [Example 2-21](#) uses the TO_NUMBER function to convert POSTAL_CODE values (which are of type VARCHAR2) to values of type NUMBER, which it uses in calculations.

See Also:

- *Oracle Database SQL Language Reference* for more information about SQL conversion functions
- "[About the NLS_DATE_FORMAT Parameter](#)"

Example 2-20 Converting Dates to Characters Using a Format Template

```
SELECT LAST_NAME,
       HIRE_DATE,
       TO_CHAR(HIRE_DATE, 'FMMonth DD YYYY') "Date Started"
FROM EMPLOYEES
WHERE DEPARTMENT_ID = 100
ORDER BY LAST_NAME;
```

Result:

LAST_NAME	HIRE_DATE	Date Started
Chen	28-SEP-05	September 28 2005
Faviet	16-AUG-02	August 16 2002
Greenberg	17-AUG-02	August 17 2002
Popp	07-DEC-07	December 7 2007
Sciarra	30-SEP-05	September 30 2005
Urman	07-MAR-06	March 7 2006

6 rows selected.

Example 2-21 Converting Characters to Numbers

```
SELECT CITY,
       POSTAL_CODE "Old Code",
       TO_NUMBER(POSTAL_CODE) + 1 "New Code"
FROM LOCATIONS
WHERE COUNTRY_ID = 'US'
ORDER BY POSTAL_CODE;
```

Result:

CITY	Old Code	New Code
Southlake	26192	26193
South Brunswick	50090	50091
Seattle	98199	98200
South San Francisco	99236	99237

4 rows selected.

2.6.9.7 Using Aggregate Functions in Queries

An aggregate function takes a group of rows and returns a single result row. The group of rows can be an entire table or view.

The aggregate functions that SQL supports are listed and described in *Oracle Database SQL Language Reference*.

Aggregate functions are especially powerful when used with the GROUP BY clause, which groups query results by one or more columns, with a result for each group.

The query in [Example 2-22](#) uses the COUNT function and the GROUP BY clause to show how many people report to each manager. The wildcard character, *, represents an entire record.

[Example 2-22](#) shows that one employee does not report to a manager. The following query selects the first name, last name, and job title of that employee:

```
COLUMN FIRST_NAME FORMAT A10;
COLUMN LAST_NAME FORMAT A10;
COLUMN JOB_TITLE FORMAT A10;

SELECT e.FIRST_NAME,
       e.LAST_NAME,
       j.JOB_TITLE
FROM EMPLOYEES e, JOBS j
WHERE e.JOB_ID = j.JOB_ID
AND MANAGER_ID IS NULL;
```

Result:

```
FIRST_NAME LAST_NAME JOB_TITLE
-----
Steven      King      President
```

To have the query return only rows where aggregate values meet specified conditions, use an aggregate function in the HAVING clause of the query.

The query in [Example 2-23](#) shows how much each department spends annually on salaries, but only for departments for which that amount exceeds \$1,000,000.

The query in [Example 2-24](#) uses several aggregate functions to show statistics for the salaries of each JOB_ID.

See Also:

Oracle Database SQL Language Reference for more information about SQL aggregate functions

Example 2-22 Counting the Number of Rows in Each Group

```
SELECT MANAGER_ID "Manager",
       COUNT(*) "Number of Reports"
FROM EMPLOYEES
GROUP BY MANAGER_ID
ORDER BY MANAGER_ID;
```

Result:

Manager	Number of Reports
100	14
101	5
102	1
103	4
108	5
114	5
120	8
121	8
122	8
123	8
124	8
145	6
146	6
147	6
148	6
149	6
201	1
205	1
	1

19 rows selected.

Example 2-23 Limiting Aggregate Functions to Rows that Satisfy a Condition

```
SELECT DEPARTMENT_ID "Department",
SUM(SALARY*12) "All Salaries"
FROM EMPLOYEES
HAVING SUM(SALARY * 12) >= 1000000
GROUP BY DEPARTMENT_ID;
```

Result:

Department	All Salaries
50	1876800
80	3654000

Example 2-24 Using Aggregate Functions for Statistical Information

```
SELECT JOB_ID,
COUNT(*) "#",
MIN(SALARY) "Minimum",
ROUND(AVG(SALARY), 0) "Average",
MEDIAN(SALARY) "Median",
MAX(SALARY) "Maximum",
ROUND(STDDEV(SALARY)) "Std Dev"
FROM EMPLOYEES
GROUP BY JOB_ID
ORDER BY JOB_ID;
```

Result:

JOB_ID	#	Minimum	Average	Median	Maximum	Std Dev
AC_ACCOUNT	1	8300	8300	8300	8300	0
AC_MGR	1	12008	12008	12008	12008	0
AD_ASST	1	4400	4400	4400	4400	0
AD_PRES	1	24000	24000	24000	24000	0

AD_VP	2	17000	17000	17000	17000	0
FI_ACCOUNT	5	6900	7920	7800	9000	766
FI_MGR	1	12008	12008	12008	12008	0
HR_REP	1	6500	6500	6500	6500	0
IT_PROG	5	4200	5760	4800	9000	1926
MK_MAN	1	13000	13000	13000	13000	0
MK_REP	1	6000	6000	6000	6000	0
PR_REP	1	10000	10000	10000	10000	0
PU_CLERK	5	2500	2780	2800	3100	239
PU_MAN	1	11000	11000	11000	11000	0
SA_MAN	5	10500	12200	12000	14000	1525
SA_REP	30	6100	8350	8200	11500	1524
SH_CLERK	20	2500	3215	3100	4200	548
ST_CLERK	20	2100	2785	2700	3600	453
ST_MAN	5	5800	7280	7900	8200	1066

19 rows selected.

2.6.9.8 Using NULL-Related Functions in Queries

The NULL-related functions facilitate the handling of NULL values.

The NULL-related functions that SQL supports are listed and described in *Oracle Database SQL Language Reference*.

The query in [Example 2-25](#) returns the last name and commission of the employees whose last names begin with 'B'. If an employee receives no commission (that is, if COMMISSION_PCT is NULL), the NVL function substitutes "Not Applicable" for NULL.

The query in [Example 2-26](#) returns the last name, salary, and income of the employees whose last names begin with 'B', using the NVL2 function: If COMMISSION_PCT is not NULL, the income is the salary plus the commission; if COMMISSION_PCT is NULL, income is only the salary.

See Also:

- *Oracle Database SQL Language Reference* for more information about the NVL function
- *Oracle Database SQL Language Reference* for more information about the NVL2 function

Example 2-25 Substituting a String for a NULL Value

```
SELECT LAST_NAME,
       NVL(TO_CHAR(COMMISSION_PCT), 'Not Applicable') "COMMISSION"
FROM EMPLOYEES
WHERE LAST_NAME LIKE 'B%'
ORDER BY LAST_NAME;
```

Result:

LAST_NAME	COMMISSION
Baer	Not Applicable
Baida	Not Applicable
Banda	.1

```

Bates                .15
Bell                 Not Applicable
Bernstein            .25
Bissot               Not Applicable
Bloom                .2
Bull                 Not Applicable

```

9 rows selected.

Example 2-26 Specifying Different Expressions for NULL and Not NULL Values

```

SELECT LAST_NAME, SALARY,
       NVL2(COMMISSION_PCT, SALARY + (SALARY * COMMISSION_PCT), SALARY) INCOME
FROM EMPLOYEES WHERE LAST_NAME LIKE 'B%'
ORDER BY LAST_NAME;

```

Result:

LAST_NAME	SALARY	INCOME
Baer	10000	10000
Baida	2900	2900
Banda	6200	6820
Bates	7300	8395
Bell	4000	4000
Bernstein	9500	11875
Bissot	3300	3300
Bloom	10000	12000
Bull	4100	4100

9 rows selected.

2.6.9.9 Using CASE Expressions in Queries

A CASE expression lets you use IF ... THEN ... ELSE logic in SQL statements without invoking subprograms. There are two kinds of CASE expressions, simple and searched.

The query in [Example 2-27](#) uses a simple CASE expression to show the country name for each country code.

The query in [Example 2-28](#) uses a searched CASE expression to show proposed salary increases (15%, 10%, 5%, or 0%), based on date ranges associated with length of service.

See Also:

- *Oracle Database SQL Language Reference* for more information about CASE expressions
- *Oracle Database PL/SQL Language Reference* for more information about CASE expressions
- ["Using the DECODE Function in Queries"](#)
- ["Using the CASE Statement"](#)

Example 2-27 Using a Simple CASE Expression in a Query

```
SELECT UNIQUE COUNTRY_ID ID,  
       CASE COUNTRY_ID  
         WHEN 'AU' THEN 'Australia'  
         WHEN 'BR' THEN 'Brazil'  
         WHEN 'CA' THEN 'Canada'  
         WHEN 'CH' THEN 'Switzerland'  
         WHEN 'CN' THEN 'China'  
         WHEN 'DE' THEN 'Germany'  
         WHEN 'IN' THEN 'India'  
         WHEN 'IT' THEN 'Italy'  
         WHEN 'JP' THEN 'Japan'  
         WHEN 'MX' THEN 'Mexico'  
         WHEN 'NL' THEN 'Netherlands'  
         WHEN 'SG' THEN 'Singapore'  
         WHEN 'UK' THEN 'United Kingdom'  
         WHEN 'US' THEN 'United States'  
         ELSE 'Unknown'  
       END COUNTRY  
FROM LOCATIONS  
ORDER BY COUNTRY_ID;
```

Result:

```
ID COUNTRY  
-- -----  
AU Australia  
BR Brazil  
CA Canada  
CH Switzerland  
CN China  
DE Germany  
IN India  
IT Italy  
JP Japan  
MX Mexico  
NL Netherlands  
SG Singapore  
UK United Kingdom  
US United States
```

14 rows selected.

Example 2-28 Using a Searched CASE Expression in a Query

```
SELECT LAST_NAME "Name",  
       HIRE_DATE "Started",  
       SALARY "Salary",  
       CASE  
         WHEN HIRE_DATE < TO_DATE('01-Jan-03', 'dd-mon-yy')  
          THEN TRUNC(SALARY*1.15, 0)  
         WHEN HIRE_DATE >= TO_DATE('01-Jan-03', 'dd-mon-yy') AND  
              HIRE_DATE < TO_DATE('01-Jan-06', 'dd-mon-yy')  
          THEN TRUNC(SALARY*1.10, 0)  
         WHEN HIRE_DATE >= TO_DATE('01-Jan-06', 'dd-mon-yy') AND  
              HIRE_DATE < TO_DATE('01-Jan-07', 'dd-mon-yy')  
          THEN TRUNC(SALARY*1.05, 0)  
         ELSE SALARY  
       END "Proposed Salary"  
FROM EMPLOYEES
```

```
WHERE DEPARTMENT_ID = 100
ORDER BY HIRE_DATE;
```

Result:

Name	Started	Salary	Proposed Salary
Faviet	16-AUG-02	9000	10350
Greenberg	17-AUG-02	12008	13809
Chen	28-SEP-05	8200	9020
Sciarra	30-SEP-05	7700	8470
Urman	07-MAR-06	7800	8190
Popp	07-DEC-07	6900	6900

6 rows selected.

2.6.9.10 Using the DECODE Function in Queries

The DECODE function compares an expression to several search values. Whenever the value of the expression matches a search value, DECODE returns the result associated with that search value. If DECODE finds no match, then it returns the default value (if specified) or NULL (if no default value is specified).

The query in [Example 2-29](#) uses the DECODE function to show proposed salary increases for three different jobs. The expression is JOB_ID; the search values are 'PU_CLERK', 'SH_CLERK', and 'ST_CLERK'; and the default is SALARY.

 **Note:**

The arguments of the DECODE function can be any of the SQL numeric or character types. Oracle automatically converts the expression and each search value to the data type of the first search value before comparing. Oracle automatically converts the return value to the same data type as the first result. If the first result has the data type CHAR or if the first result is NULL, then Oracle converts the return value to the data type VARCHAR2.

 **See Also:**

- *Oracle Database SQL Language Reference* for information about the DECODE function
- ["Using CASE Expressions in Queries"](#)

Example 2-29 Using the DECODE Function in a Query

```
SELECT LAST_NAME, JOB_ID, SALARY,
       DECODE(JOB_ID,
              'PU_CLERK', SALARY * 1.10,
              'SH_CLERK', SALARY * 1.15,
              'ST_CLERK', SALARY * 1.20,
              SALARY) "Proposed Salary"
FROM EMPLOYEES
WHERE JOB_ID LIKE '%_CLERK'
```

```
AND LAST_NAME < 'E'  
ORDER BY LAST_NAME;
```

Result:

LAST_NAME	JOB_ID	SALARY	Proposed Salary
Atkinson	ST_CLERK	2800	3360
Baida	PU_CLERK	2900	3190
Bell	SH_CLERK	4000	4600
Bissot	ST_CLERK	3300	3960
Bull	SH_CLERK	4100	4715
Cabrio	SH_CLERK	3000	3450
Chung	SH_CLERK	3800	4370
Colmenares	PU_CLERK	2500	2750
Davies	ST_CLERK	3100	3720
Dellinger	SH_CLERK	3400	3910
Dilly	SH_CLERK	3600	4140

11 rows selected.

About DML Statements and Transactions

Data manipulation language (DML) statements add, change, and delete Oracle Database table data. A **transaction** is a sequence of one or more SQL statements that Oracle Database treats as a unit: either all of the statements are performed, or none of them are.

- [About Data Manipulation Language \(DML\) Statements](#)
Data manipulation language (DML) statements access and manipulate data in existing tables.
- [About Transaction Control Statements](#)
A **transaction** is a sequence of one or more SQL statements that Oracle Database treats as a unit: either all of the statements are performed, or none of them are. You need transactions to model business processes that require that several operations be performed as a unit.
- [Committing Transactions](#)
Committing a transaction makes its changes permanent, erases its savepoints, and releases its locks.
- [Rolling Back Transactions](#)
Rolling back a transaction undoes its changes. You can roll back the entire current transaction, or you can roll it back only to a specified savepoint.
- [Setting Savepoints in Transactions](#)
The SAVEPOINT statement marks a **savepoint** in a transaction—a point to which you can later roll back. Savepoints are optional, and a transaction can have multiple savepoints.

3.1 About Data Manipulation Language (DML) Statements

Data manipulation language (DML) statements access and manipulate data in existing tables.

In the SQL*Plus environment, you can enter a DML statement after the `SQL>` prompt.

In the SQL Developer environment, you can enter a DML statement in the Worksheet. Alternatively, you can use the SQL Developer Connections frame and tools to access and manipulate data.

To see the effect of a DML statement in SQL Developer, you might have to select the schema object type of the changed object in the Connections frame and then click the Refresh icon.

The effect of a DML statement is not permanent until you commit the transaction that includes it. A **transaction** is a sequence of SQL statements that Oracle Database treats as a unit (it can be a single DML statement). Until a transaction is committed, it can be rolled back (undone). For more information about transactions, see "[About Transaction Control Statements](#)".

- [About the INSERT Statement](#)
The INSERT statement inserts rows into an existing table.
- [About the UPDATE Statement](#)
The UPDATE statement updates (changes the values of) a set of existing table rows.
- [About the DELETE Statement](#)
The DELETE statement deletes rows from a table.

**See Also:**

Oracle Database SQL Language Reference for more information about DML statements

3.1.1 About the INSERT Statement

The INSERT statement inserts rows into an existing table.

The simplest recommended form of the INSERT statement has this syntax:

```
INSERT INTO table_name (list_of_columns)
VALUES (list_of_values);
```

Every column in `list_of_columns` must have a valid value in the corresponding position in `list_of_values`. Therefore, before you insert a row into a table, you must know what columns the table has, and what their valid values are. To get this information using SQL Developer, see "[Tutorial: Viewing EMPLOYEES Table Properties and Data with SQL Developer](#)". To get this information using SQL*Plus, use the DESCRIBE statement. For example:

```
DESCRIBE EMPLOYEES;
```

Result:

Name	Null?	Type
-----	-----	-----
EMPLOYEE_ID	NOT NULL	NUMBER(6)
FIRST_NAME		VARCHAR2(20)
LAST_NAME	NOT NULL	VARCHAR2(25)
EMAIL	NOT NULL	VARCHAR2(25)
PHONE_NUMBER		VARCHAR2(20)
HIRE_DATE	NOT NULL	DATE
JOB_ID	NOT NULL	VARCHAR2(10)
SALARY		NUMBER(8,2)
COMMISSION_PCT		NUMBER(2,2)
MANAGER_ID		NUMBER(6)
DEPARTMENT_ID		NUMBER(4)

The INSERT statement in [Example 3-1](#) inserts a row into the EMPLOYEES table for an employee for which all column values are known.

You need not know all column values to insert a row into a table, but you must know the values of all NOT NULL columns. If you do not know the value of a column that can be NULL, you can omit that column from `list_of_columns`. Its value defaults to NULL.

The INSERT statement in [Example 3-2](#) inserts a row into the EMPLOYEES table for an employee for which all column values are known except SALARY. For now, SALARY can have the value NULL. When you know the salary, you can change it with the UPDATE statement (see [Example 3-4](#)).

The INSERT statement in [Example 3-3](#) tries to insert a row into the EMPLOYEES table for an employee for which LAST_NAME is not known.

Example 3-1 Using the INSERT Statement When All Information Is Available

```
INSERT INTO EMPLOYEES (
  EMPLOYEE_ID,
  FIRST_NAME,
  LAST_NAME,
  EMAIL,
  PHONE_NUMBER,
  HIRE_DATE,
  JOB_ID,
  SALARY,
  COMMISSION_PCT,
  MANAGER_ID,
  DEPARTMENT_ID
)
VALUES (
  10,           -- EMPLOYEE_ID
  'George',    -- FIRST_NAME
  'Gordon',    -- LAST_NAME
  'GGORDON',   -- EMAIL
  '650.506.2222', -- PHONE_NUMBER
  '01-JAN-07', -- HIRE_DATE
  'SA_REP',    -- JOB_ID
  9000,        -- SALARY
  .1,          -- COMMISSION_PCT
  148,         -- MANAGER_ID
  80           -- DEPARTMENT_ID
);
```

Result:

1 row created.

Example 3-2 Using the INSERT Statement When Not All Information Is Available

```
INSERT INTO EMPLOYEES (
  EMPLOYEE_ID,
  FIRST_NAME,
  LAST_NAME,
  EMAIL,
  PHONE_NUMBER,
  HIRE_DATE,
  JOB_ID,           -- Omit SALARY; its value defaults to NULL.
  COMMISSION_PCT,
  MANAGER_ID,
  DEPARTMENT_ID
)
VALUES (
  20,           -- EMPLOYEE_ID
  'John',      -- FIRST_NAME
  'Keats',     -- LAST_NAME
  'JKEATS',    -- EMAIL
```

```
'650.506.3333', -- PHONE_NUMBER
'01-JAN-07',    -- HIRE_DATE
'SA_REP',      -- JOB_ID
.1,           -- COMMISSION_PCT
148,          -- MANAGER_ID
80            -- DEPARTMENT_ID
);
```

Result:

1 row created.

Example 3-3 Using the INSERT Statement Incorrectly

```
INSERT INTO EMPLOYEES (
  EMPLOYEE_ID,
  FIRST_NAME,      -- Omit LAST_NAME (error)
  EMAIL,
  PHONE_NUMBER,
  HIRE_DATE,
  JOB_ID,
  COMMISSION_PCT,
  MANAGER_ID,
  DEPARTMENT_ID
)
VALUES (
  20,              -- EMPLOYEE_ID
  'John',         -- FIRST_NAME
  'JOHN',         -- EMAIL
  '650.506.3333', -- PHONE_NUMBER
  '01-JAN-07',   -- HIRE_DATE
  'SA_REP',      -- JOB_ID
  .1,           -- COMMISSION_PCT
  148,          -- MANAGER_ID
  80            -- DEPARTMENT_ID
);
```

Result:

ORA-01400: cannot insert NULL into ("HR"."EMPLOYEES"."LAST_NAME")

**See Also:**

- *Oracle Database SQL Language Reference* for information about the INSERT statement
- *Oracle Database SQL Language Reference* for information about data types
- ["Tutorial: Adding Rows to Tables with the Insert Row Tool"](#)

3.1.2 About the UPDATE Statement

The UPDATE statement updates (changes the values of) a set of existing table rows.

A simple form of the UPDATE statement has this syntax:

```
UPDATE table_name  
SET column_name = value [, column_name = value]...  
[ WHERE condition ];
```

Each value must be valid for its column_name. If you include the WHERE clause, the statement updates column values only in rows that satisfy condition.

The UPDATE statement in [Example 3-4](#) updates the value of the SALARY column in the row that was inserted into the EMPLOYEES table in [Example 3-2](#), before the salary of the employee was known.

The UPDATE statement in [Example 3-5](#) updates the commission percentage for every employee in department 80.

Example 3-4 Using the UPDATE Statement to Add Data

```
UPDATE EMPLOYEES  
SET SALARY = 8500  
WHERE LAST_NAME = 'Keats';
```

Result:

1 row updated.

Example 3-5 Using the UPDATE Statement to Update Multiple Rows

```
UPDATE EMPLOYEES  
SET COMMISSION_PCT = COMMISSION_PCT + 0.05  
WHERE DEPARTMENT_ID = 80;
```

Result:

34 rows updated.

See Also:

- *Oracle Database SQL Language Reference* for information about the UPDATE statement
- *Oracle Database SQL Language Reference* for information about data types
- ["Tutorial: Changing Data in Tables in the Data Pane"](#)

3.1.3 About the DELETE Statement

The DELETE statement deletes rows from a table.

A simple form of the DELETE statement has this syntax:

```
DELETE FROM table_name [ WHERE condition ];
```

If you include the WHERE clause, the statement deletes only rows that satisfy condition. If you omit the WHERE clause, the statement deletes all rows from the table, but the empty table still exists. To delete a table, use the DROP TABLE statement.

The DELETE statement in [Example 3-6](#) deletes the rows inserted in [Example 3-1](#) and [Example 3-2](#).

Example 3-6 Using the DELETE Statement

```
DELETE FROM EMPLOYEES  
WHERE HIRE_DATE = TO_DATE('01-JAN-07', 'dd-mon-yy');
```

Result:

2 rows deleted.

See Also:

- *Oracle Database SQL Language Reference* for information about the DELETE statement
- *Oracle Database SQL Language Reference* for information about the DROP TABLE statement
- "[Tutorial: Deleting Rows from Tables with the Delete Selected Row\(s\) Tool](#)"

3.2 About Transaction Control Statements

A **transaction** is a sequence of one or more SQL statements that Oracle Database treats as a unit: either all of the statements are performed, or none of them are. You need transactions to model business processes that require that several operations be performed as a unit.

For example, when a manager leaves the company, a row must be inserted into the JOB_HISTORY table to show when the manager left, and for every employee who reports to that manager, the value of MANAGER_ID must be updated in the EMPLOYEES table. To model this process in an application, you must group the INSERT and UPDATE statements into a single transaction.

The basic **transaction control statements** are:

- SAVEPOINT, which marks a **savepoint** in a transaction—a point to which you can later roll back. Savepoints are optional, and a transaction can have multiple savepoints.
- COMMIT, which ends the current transaction, makes its changes permanent, erases its savepoints, and releases its locks.
- ROLLBACK, which rolls back (undoes) either the entire current transaction or only the changes made after the specified savepoint.

In the SQL*Plus environment, you can enter a transaction control statement after the SQL> prompt.

In the SQL Developer environment, you can enter a transaction control statement in the Worksheet. SQL Developer also has Commit Changes and Rollback Changes icons, which are explained in "[Committing Transactions](#)" and "[Rolling Back Transactions](#)".

 **Caution:**

If you do not explicitly commit a transaction, and the program terminates abnormally, then the database automatically rolls back the last uncommitted transaction.

Oracle recommends that you explicitly end transactions in application programs, by either committing them or rolling them back.

 **See Also:**

- *Oracle Database Concepts* for more information about transaction management
- *Oracle Database SQL Language Reference* for more information about transaction control statements

3.3 Committing Transactions

Committing a transaction makes its changes permanent, erases its savepoints, and releases its locks.

To explicitly commit a transaction, use either the COMMIT statement or (in the SQL Developer environment) the **Commit Changes** icon.

 **Note:**

Oracle Database issues an implicit COMMIT statement before and after any data definition language (DDL) statement. For information about DDL statements, see "[About Data Definition Language \(DDL\) Statements](#)".

Before you commit a transaction:

- Your changes are visible to you, but not to other users of the database instance.
- Your changes are not final—you can undo them with a ROLLBACK statement.

After you commit a transaction:

- Your changes are visible to other users, and to their statements that run after you commit your transaction.
- Your changes are final—you cannot undo them with a ROLLBACK statement.

[Example 3-7](#) adds one row to the REGIONS table (a very simple transaction), checks the result, and then commits the transaction.

Example 3-7 Committing a Transaction

Before transaction:

```
SELECT * FROM REGIONS
ORDER BY REGION_ID;
```

Result:

```
REGION_ID REGION_NAME
-----
          1 Europe
          2 Americas
          3 Asia
          4 Middle East and Africa
```

4 rows selected.

Transaction (add row to table):

```
INSERT INTO regions (region_id, region_name) VALUES (5, 'Africa');
```

Result:

1 row created.

Check that row was added:

```
SELECT * FROM REGIONS
ORDER BY REGION_ID;
```

Result:

```
REGION_ID REGION_NAME
-----
          1 Europe
          2 Americas
          3 Asia
          4 Middle East and Africa
          5 Africa
```

5 rows selected.

Commit transaction:

```
COMMIT;
```

Result:

Commit complete.

See Also:

Oracle Database SQL Language Reference for information about the COMMIT statement

3.4 Rolling Back Transactions

Rolling back a transaction undoes its changes. You can roll back the entire current transaction, or you can roll it back only to a specified savepoint.

To roll back the current transaction only to a specified savepoint, you must use the ROLLBACK statement with the TO SAVEPOINT clause.

To roll back the entire current transaction, use either the ROLLBACK statement without the TO SAVEPOINT clause, or (in the SQL Developer environment) the **Rollback Changes** icon.

Rolling back the entire current transaction:

- Ends the transaction
- Reverses all of its changes
- Erases all of its savepoints
- Releases any transaction locks

Rolling back the current transaction only to the specified savepoint:

- Does not end the transaction
- Reverses only the changes made after the specified savepoint
- Erases only the savepoints set after the specified savepoint (excluding the specified savepoint itself)
- Releases all table and row locks acquired after the specified savepoint

Other transactions that have requested access to rows locked after the specified savepoint must continue to wait until the transaction is either committed or rolled back. Other transactions that have not requested the rows can request and access the rows immediately.

To see the effect of a rollback in SQL Developer, you might have to click the **Refresh** icon.

As a result of [Example 3-7](#), the `REGIONS` table has a region called 'Middle East and Africa' and a region called 'Africa'. [Example 3-8](#) corrects this problem (a very simple transaction) and checks the change, but then rolls back the transaction and checks the rollback.

Example 3-8 Rolling Back an Entire Transaction

Before transaction:

```
SELECT * FROM REGIONS
ORDER BY REGION_ID;
```

Result:

```
REGION_ID REGION_NAME
-----
1 Europe
2 Americas
3 Asia
4 Middle East and Africa
5 Africa
```

5 rows selected.

Transaction (change table):

```
UPDATE REGIONS
SET REGION_NAME = 'Middle East'
WHERE REGION_NAME = 'Middle East and Africa';
```

Result:

1 row updated.

Check change:

```
SELECT * FROM REGIONS
ORDER BY REGION_ID;
```

Result:

```
REGION_ID REGION_NAME
-----
          1 Europe
          2 Americas
          3 Asia
          4 Middle East
          5 Africa
```

5 rows selected.

Roll back transaction:

```
ROLLBACK;
```

Result:

Rollback complete.

Check rollback:

```
SELECT * FROM REGIONS
ORDER BY REGION_ID;
```

Result:

```
REGION_ID REGION_NAME
-----
          1 Europe
          2 Americas
          3 Asia
          4 Middle East and Africa
          5 Africa
```

5 rows selected.

**See Also:**

Oracle Database SQL Language Reference for information about the ROLLBACK statement

3.5 Setting Savepoints in Transactions

The `SAVEPOINT` statement marks a **savepoint** in a transaction—a point to which you can later roll back. Savepoints are optional, and a transaction can have multiple savepoints.

[Example 3-9](#) does a transaction that includes several DML statements and several savepoints, and then rolls back the transaction to one savepoint, undoing only the changes made after that savepoint.

Example 3-9 Rolling Back a Transaction to a Savepoint

Check `REGIONS` table before transaction:

```
SELECT * FROM REGIONS
ORDER BY REGION_ID;
```

Result:

```
REGION_ID REGION_NAME
-----
1 Europe
2 Americas
3 Asia
4 Middle East and Africa
5 Africa
```

5 rows selected.

Check countries in region 4 before transaction:

```
SELECT COUNTRY_NAME, COUNTRY_ID, REGION_ID
FROM COUNTRIES
WHERE REGION_ID = 4
ORDER BY COUNTRY_NAME;
```

Result:

```
COUNTRY_NAME                CO REGION_ID
-----
Egypt                       EG         4
Israel                      IL         4
Kuwait                      KW         4
Nigeria                     NG         4
Zambia                      ZM         4
Zimbabwe                    ZW         4
```

6 rows selected.

Check countries in region 5 before transaction:

```
SELECT COUNTRY_NAME, COUNTRY_ID, REGION_ID
FROM COUNTRIES
WHERE REGION_ID = 5
ORDER BY COUNTRY_NAME;
```

Result:

no rows selected

Transaction, with several savepoints:

```
UPDATE REGIONS
SET REGION_NAME = 'Middle East'
WHERE REGION_NAME = 'Middle East and Africa';
```

```
UPDATE COUNTRIES
  SET REGION_ID = 5
  WHERE COUNTRY_ID = 'ZM';
SAVEPOINT zambia;
```

```
UPDATE COUNTRIES
  SET REGION_ID = 5
  WHERE COUNTRY_ID = 'NG';
SAVEPOINT nigeria;
```

```
UPDATE COUNTRIES
  SET REGION_ID = 5
  WHERE COUNTRY_ID = 'ZW';
SAVEPOINT zimbabwe;
```

```
UPDATE COUNTRIES
  SET REGION_ID = 5
  WHERE COUNTRY_ID = 'EG';
SAVEPOINT egypt;
```

Check REGIONS table after transaction:

```
SELECT * FROM REGIONS
ORDER BY REGION_ID;
```

Result:

```
REGION_ID REGION_NAME
-----
          1 Europe
          2 Americas
          3 Asia
          4 Middle East
          5 Africa
```

5 rows selected.

Check countries in region 4 after transaction:

```
SELECT COUNTRY_NAME, COUNTRY_ID, REGION_ID
FROM COUNTRIES
WHERE REGION_ID = 4
ORDER BY COUNTRY_NAME;
```

Result:

```
COUNTRY_NAME                                CO REGION_ID
-----
Israel                                       IL          4
Kuwait                                      KW          4
```

2 rows selected.

Check countries in region 5 after transaction:

```
SELECT COUNTRY_NAME, COUNTRY_ID, REGION_ID
FROM COUNTRIES
WHERE REGION_ID = 5
ORDER BY COUNTRY_NAME;
```

Result:

COUNTRY_NAME	CO	REGION_ID
-----	---	-----
Egypt	EG	5
Nigeria	NG	5
Zambia	ZM	5
Zimbabwe	ZW	5

4 rows selected.

```
ROLLBACK TO SAVEPOINT nigeria;
```

Check REGIONS table after rollback:

```
SELECT * FROM REGIONS
ORDER BY REGION_ID;
```

Result:

REGION_ID	REGION_NAME
-----	-----
1	Europe
2	Americas
3	Asia
4	Middle East
5	Africa

5 rows selected.

Check countries in region 4 after rollback:

```
SELECT COUNTRY_NAME, COUNTRY_ID, REGION_ID
FROM COUNTRIES
WHERE REGION_ID = 4
ORDER BY COUNTRY_NAME;
```

Result:

COUNTRY_NAME	CO	REGION_ID
-----	---	-----
Egypt	EG	4
Israel	IL	4
Kuwait	KW	4
Zimbabwe	ZW	4

4 rows selected.

Check countries in region 5 after rollback:

```
SELECT COUNTRY_NAME, COUNTRY_ID, REGION_ID
FROM COUNTRIES
WHERE REGION_ID = 5
ORDER BY COUNTRY_NAME;
```

Result:

COUNTRY_NAME	CO	REGION_ID
Nigeria	NG	5
Zambia	ZM	5

2 rows selected.

Creating and Managing Schema Objects

To create, change, and drop schema objects, you use data definition language (DDL) statements.

- [About Data Definition Language \(DDL\) Statements](#)
Data definition language (DDL) statements create, change, and drop schema objects. Before and after a DDL statement, Oracle Database issues an implicit COMMIT statement; therefore, you cannot roll back a DDL statement.
- [Creating and Managing Tables](#)
Tables are the basic units of data storage in Oracle Database. Tables hold all user-accessible data. Each table contains rows that represent individual data records. Rows are composed of columns that represent the fields of the records.
- [Creating and Managing Views](#)
A view presents a query result as a table. In most places that you can use a table, you can use a view. Views are useful when you need frequent access to information that is stored in several different tables.
- [Creating and Managing Sequences](#)
Sequences are schema objects from which you can generate unique sequential values, which are very useful when you need unique primary keys. Sequences are used through the pseudocolumns CURRVAL and NEXTVAL, which return the current and next values of the sequence, respectively.
- [Creating and Managing Synonyms](#)
A synonym is an alias for another schema object. Some reasons to use synonyms are security (for example, to hide the owner and location of an object) and convenience.

4.1 About Data Definition Language (DDL) Statements

Data definition language (DDL) statements create, change, and drop schema objects. Before and after a DDL statement, Oracle Database issues an implicit COMMIT statement; therefore, you cannot roll back a DDL statement.

 **Note:**

When creating schema objects, you must observe the schema object naming rules in *Oracle Database SQL Language Reference*.

In the SQL*Plus environment, you can enter a DDL statement after the `SQL>` prompt.

In the SQL Developer environment, you can enter a DDL statement in the Worksheet. Alternatively, you can use SQL Developer tools to create, change, and drop objects.

Some DDL statements that create schema objects have an optional `OR REPLACE` clause, which allows a statement to replace an existing schema object with another

that has the same name and type. When SQL Developer generates code for one of these statements, it always includes the OR REPLACE clause.

To see the effect of a DDL statement in SQL Developer, you might have to select the schema object type of the newly created object in the Connections frame and then click the **Refresh** icon.

See Also:

- *Oracle Database SQL Language Reference* for more information about DDL statements
- "[Committing Transactions](#)"

4.2 Creating and Managing Tables

Tables are the basic units of data storage in Oracle Database. Tables hold all user-accessible data. Each table contains rows that represent individual data records. Rows are composed of columns that represent the fields of the records.

Note:

To do the tutorials in this document, you must be connected to Oracle Database as the user HR from SQL Developer.

- [About SQL Data Types](#)
When you create a table, you must specify the SQL data type for each column, which determines what values the column can contain.
- [Creating Tables](#)
To create tables, use either the SQL Developer tool Create Table or the DDL statement CREATE TABLE.
- [Ensuring Data Integrity in Tables](#)
To ensure that the data in your tables satisfies the business rules that your application models, you can use constraints, application logic, or both.
- [Tutorial: Adding Rows to Tables with the Insert Row Tool](#)
This tutorial shows how to use the Insert Row tool to add six populated rows to the PERFORMANCE_PARTS table.
- [Tutorial: Changing Data in Tables in the Data Pane](#)
This tutorial shows how to change three of the WEIGHT values in the PERFORMANCE_PARTS table in the Data pane.
- [Tutorial: Deleting Rows from Tables with the Delete Selected Row\(s\) Tool](#)
This tutorial shows how to use the Delete Selected Row(s) tool to delete a row from the PERFORMANCE_PARTS table.

- [Managing Indexes](#)
You can create indexes on one or more columns of a table to speed SQL statement execution on that table. When properly used, indexes are the primary means of reducing disk input/output (I/O).
- [Dropping Tables](#)
To drop a table, use either the SQL Developer Connections frame and Drop tool, or the DDL statement DROP TABLE.

 **See Also:**

- ["Tutorial: Viewing EMPLOYEES Table Properties and Data with SQL Developer"](#)
- *Oracle SQL Developer User's Guide* for a SQL Developer tutorial that includes creating and populating tables
- *Oracle Database Concepts* for general information about tables

4.2.1 About SQL Data Types

When you create a table, you must specify the SQL data type for each column, which determines what values the column can contain.

For example, a column of type DATE can contain the value '01-MAY-05', but it cannot contain the numeric value 2 or the character value 'shoe'. SQL data types fall into two categories: built-in and user-defined. (PL/SQL has additional data types—see ["About PL/SQL Data Types"](#).)

 **See Also:**

- *Oracle Database SQL Language Reference* for a summary of built-in SQL data types
- *Oracle Database Concepts* for introductions to each of the built-in SQL data types
- *Oracle Database SQL Language Reference* for more information about user-defined data types
- ["About PL/SQL Data Types"](#)

4.2.2 Creating Tables

To create tables, use either the SQL Developer tool Create Table or the DDL statement CREATE TABLE.

This section shows how to use both of these ways to create these tables, which will contain data about employee evaluations:

- PERFORMANCE_PARTS, which contains the categories of employee performance that are evaluated and their relative weights

- EVALUATIONS, which contains employee information, evaluation date, job, manager, and department
- SCORES, which contains the scores assigned to each performance category for each evaluation

These tables appear in many tutorials and examples in this document.

- [Tutorial: Creating a Table with the Create Table Tool](#)
This tutorial shows how to create the `PERFORMANCE_PARTS` table using the SQL Developer tool Create Table.
- [Creating Tables with the CREATE TABLE Statement](#)
This section shows how to use the CREATE TABLE statement to create the EVALUATIONS and SCORES tables.

4.2.2.1 Tutorial: Creating a Table with the Create Table Tool

This tutorial shows how to create the `PERFORMANCE_PARTS` table using the SQL Developer tool Create Table.

To create the `PERFORMANCE_PARTS` table using the Create Table tool:

1. In the Connections frame, expand **hr_conn**.
2. In the list of schema object types, right-click **Tables**.
3. In the list of choices, click **New Table**.
The Create Table window opens, with default values for a new table, which has only one row.
4. For Schema, accept the default value, HR.
5. For Name, enter `PERFORMANCE_PARTS`.
6. In the default row:
 - For PK (primary key), accept the default option, deselected.
 - For Column Name, enter `PERFORMANCE_ID`.
 - For Type, accept the default value, VARCHAR2.
 - For Size, enter 2.
 - For Not Null, accept the default option, deselected.
7. Click **Add Column**.
8. For Column Name, enter `NAME`.
9. For Type, accept the default value, VARCHAR2.
10. For Size, enter 80.
11. Click **Add Column**.
12. For Column Name, enter `WEIGHT`.
13. For Type, select `NUMBER` from the menu.
14. Click **OK**.

The table `PERFORMANCE_PARTS` is created. Its name appears under Tables in the Connections frame.

To see the CREATE TABLE statement for creating this table, select PERFORMANCE_PARTS and click the tab **SQL**.

 **See Also:**

Oracle SQL Developer User's Guide for more information about using SQL Developer to create tables

4.2.2.2 Creating Tables with the CREATE TABLE Statement

This section shows how to use the CREATE TABLE statement to create the EVALUATIONS and SCORES tables.

The CREATE TABLE statement in [Example 4-1](#) creates the EVALUATIONS table.

The CREATE TABLE statement in [Example 4-2](#) creates the SCORES table.

In SQL Developer, in the Connections frame, if you expand Tables, you can see the tables EVALUATIONS and SCORES.

Example 4-1 Creating the EVALUATIONS Table with CREATE TABLE

```
CREATE TABLE EVALUATIONS (  
  EVALUATION_ID NUMBER(8,0),  
  EMPLOYEE_ID NUMBER(6,0),  
  EVALUATION_DATE DATE,  
  JOB_ID VARCHAR2(10),  
  MANAGER_ID NUMBER(6,0),  
  DEPARTMENT_ID NUMBER(4,0),  
  TOTAL_SCORE NUMBER(3,0)  
);
```

Result:

Table created.

Example 4-2 Creating the SCORES Table with CREATE TABLE

```
CREATE TABLE SCORES (  
  EVALUATION_ID NUMBER(8,0),  
  PERFORMANCE_ID VARCHAR2(2),  
  SCORE NUMBER(1,0)  
);
```

Result:

Table created.

 **See Also:**

Oracle Database SQL Language Reference for information about the CREATE TABLE statement

4.2.3 Ensuring Data Integrity in Tables

To ensure that the data in your tables satisfies the business rules that your application models, you can use constraints, application logic, or both.

Tip:

Wherever possible, use constraints instead of application logic. Oracle Database checks that all data obeys constraints much faster than application logic can.

- [About Constraints](#)
Constraints restrict the values that columns can have. Trying to change the data in a way that violates a constraint causes an error and rolls back the change. Trying to add a constraint to a populated table causes an error if existing data violates the constraint.
- [Tutorial: Adding Constraints to Existing Tables](#)
This tutorial shows how to add constraints to existing tables using both SQL Developer tools and the ALTER TABLE statement.

See Also:

- *Oracle Database Concepts* for additional general information about constraints
- *Oracle Database SQL Language Reference* for syntactic information about constraints
- *Oracle Database Development Guide* for information about enabling and disabling constraints
- "[Deploying the Sample Application](#)"

4.2.3.1 About Constraints

Constraints restrict the values that columns can have. Trying to change the data in a way that violates a constraint causes an error and rolls back the change. Trying to add a constraint to a populated table causes an error if existing data violates the constraint.

Constraints can be enabled and disabled. By default, they are created in the enabled state.

The constraint types are:

- **Not Null**, which prevents a value from being null
In the EMPLOYEES table, the column LAST_NAME has the NOT NULL constraint, which enforces the business rule that every employee must have a last name.

- **Unique**, which prevents multiple rows from having the same value in the same column or combination of columns, but allows some values to be null
In the EMPLOYEES table, the column EMAIL has the UNIQUE constraint, which enforces the business rule that an employee can have no email address, but cannot have the same email address as another employee.
- **Primary Key**, which is a combination of NOT NULL and UNIQUE
In the EMPLOYEES table, the column EMPLOYEE_ID has the PRIMARY KEY constraint, which enforces the business rule that every employee must have a unique employee identification number.
- **Foreign Key**, which requires values in one table to match values in another table
In the EMPLOYEES table, the column JOB_ID has a FOREIGN KEY constraint that references the JOBS table, which enforces the business rule that an employee cannot have a JOB_ID that is not in the JOBS table.
- **Check**, which requires that a value satisfy a specified condition
The EMPLOYEES table does not have CHECK constraints. However, suppose that EMPLOYEES needs a new column, EMPLOYEE_AGE, and that every employee must be at least 18. The constraint CHECK (EMPLOYEE_AGE >= 18) enforces the business rule.

 **Tip:**

Use check constraints only when other constraint types cannot provide the necessary checking.

- **REF**, which further describes the relationship between a REF column and the object that it references
A REF column references an object in another object type or in a relational table. For information about REF constraints, see *Oracle Database Concepts*.

 **See Also:**

- *Oracle Database Concepts* for additional general information about constraint types
- *Oracle Database SQL Language Reference* for syntactic information about constraints

4.2.3.2 Tutorial: Adding Constraints to Existing Tables

This tutorial shows how to add constraints to existing tables using both SQL Developer tools and the ALTER TABLE statement.

To add constraints to existing tables, use either SQL Developer tools or the DDL statement ALTER TABLE. This topic shows how to use both of these ways to add constraints to the tables created in "[Creating Tables](#)".

This tutorial has several procedures. The first procedure uses the Edit Table tool to add a Not Null constraint to the `NAMES` column of the `PERFORMANCE_PARTS` table. The remaining procedures show how to use other tools to add constraints; however, you could add the same constraints using the Edit Table tool.

 **Note:**

After any step of the tutorial, you can view the constraints that a table has:

1. In the Connections frame, select the name of the table.
2. In the right frame, click the tab **Constraints**.

For more information about viewing table properties and data, see "[Tutorial: Viewing EMPLOYEES Table Properties and Data with SQL Developer](#)".

To add a Not Null constraint using the Edit Table tool:

1. In the Connections frame, expand **hr_conn**.
2. In the list of schema object types, expand **Tables**.
3. In the list of tables, right-click **PERFORMANCE_PARTS**.
4. In the list of choices, click **Edit**.
5. In the Edit Table window, click the column **NAME**.
6. Select the property **Not Null**.
7. Click **OK**.

The Not Null constraint is added to the `NAME` column of the `PERFORMANCE_PARTS` table.

The following procedure uses the ALTER TABLE statement to add a Not Null constraint to the `WEIGHT` column of the `PERFORMANCE_PARTS` table.

To add a Not Null constraint using the ALTER TABLE statement:

1. If a pane with the tab **hr_conn** is there, select it. Otherwise, click the icon **SQL Worksheet**, as in "[Running Queries in SQL Developer](#)".
2. In the Worksheet pane, type this statement:

```
ALTER TABLE PERFORMANCE_PARTS  
MODIFY WEIGHT NOT NULL;
```

3. Click the icon **Run Statement**.

The statement runs, adding the Not Null constraint to the `WEIGHT` column of the `PERFORMANCE_PARTS` table.

The following procedure uses the Add Unique tool to add a Unique constraint to the `SCORES` table.

To add a Unique constraint using the Add Unique tool:

1. In the Connections frame, expand **hr_conn**.
2. In the list of schema object types, expand **Tables**.
3. In the list of tables, right-click **SCORES**.

4. In the list of choices, select **Constraint**.
5. In the list of choices, click **Add Unique**.
6. In the Add Unique window:
 - a. For Constraint Name, enter `SCORES_EVAL_PERF_UNIQUE`.
 - b. For Column 1, select **EVALUATION_ID** from the menu.
 - c. For Column 2, select **PERFORMANCE_ID** from the menu.
 - d. Click **Apply**.
7. In the Confirmation window, click **OK**.

A unique constraint named `SCORES_EVAL_PERF_UNIQUE` is added to the `SCORES` table.

The following procedure uses the Add Primary Key tool to add a Primary Key constraint to the `PERFORMANCE_ID` column of the `PERFORMANCE_PARTS` table.

To add a Primary Key constraint using the Add Primary Key tool:

1. In the Connections frame, expand **hr_conn**.
2. In the list of schema object types, expand **Tables**.
3. In the list of tables, right-click **PERFORMANCE_PARTS**.
4. In the list of choices, select **Constraint**.
5. In the list of choices, click **Add Primary Key**.
6. In the Add Primary Key window:
 - a. For Primary Key Name, enter `PERF_PERF_ID_PK`.
 - b. For Column 1, select **PERFORMANCE_ID** from the menu.
 - c. Click **Apply**.
7. In the Confirmation window, click **OK**.

A primary key constraint named `PERF_PERF_ID_PK` is added to the `PERFORMANCE_ID` column of the `PERFORMANCE_PARTS` table.

The following procedure uses the ALTER TABLE statement to add a Primary Key constraint to the `EVALUATION_ID` column of the `EVALUATIONS` table.

To add a Primary Key constraint using the ALTER TABLE statement:

1. If a pane with the tab **hr_conn** is there, select it. Otherwise, click the icon **SQL Worksheet**, as in "[Running Queries in SQL Developer](#)".
2. In the Worksheet pane, type this statement:

```
ALTER TABLE EVALUATIONS
ADD CONSTRAINT EVAL_EVAL_ID_PK PRIMARY KEY (EVALUATION_ID);
```

3. Click the icon **Run Statement**.

The statement runs, adding the Primary Key constraint to the `EVALUATION_ID` column of the `EVALUATIONS` table.

The following procedure uses the Add Foreign Key tool to add two Foreign Key constraints to the `SCORES` table.

To add two Foreign Key constraints using the Add Foreign Key tool:

1. In the Connections frame, expand **hr_conn**.
2. In the list of schema object types, expand **Tables**.
3. In the list of tables, right-click **SCORES**.
4. In the list of choices, select **Constraint**.
5. In the list of choices, click **Add Foreign Key**.
6. In the Add Foreign Key window:
 - a. For Constraint Name, enter `SCORES_EVAL_FK`.
 - b. For Column Name, select **EVALUATION_ID** from the menu.
 - c. For References Table Name, select **EVALUATIONS** from the menu.
 - d. For Referencing Column, select **EVALUATION_ID** from the menu.
 - e. Click **Apply**.
7. In the Confirmation window, click **OK**.

A foreign key constraint named `SCORES_EVAL_FK` is added to the `EVALUATION_ID` column of the `SCORES` table, referencing the `EVALUATION_ID` column of the `EVALUATIONS` table.

The following steps add another foreign key constraint to the `SCORES` table.

8. In the list of tables, right-click **SCORES**.
9. In the list of tables, select **Constraint**.
10. In the list of choices, click **Add Foreign Key**.

The Add Foreign Key window opens.

11. In the Add Foreign Key window:
 - a. For Constraint Name, enter `SCORES_PERF_FK`.
 - b. For Column Name, select **PERFORMANCE_ID** from the menu.
 - c. For Reference Table Name, select **PERFORMANCE_PARTS** from the menu.
 - d. For Referencing Column, select **PERFORMANCE_ID** from the menu.
 - e. Click **Apply**.
12. In the Confirmation window, click **OK**.

A foreign key constraint named `SCORES_PERF_FK` is added to the `EVALUATION_ID` column of the `SCORES` table, referencing the `EVALUATION_ID` column of the `EVALUATIONS` table.

The following procedure uses the `ALTER TABLE` statement to add a Foreign Key constraint to the `EMPLOYEE_ID` column of the `EVALUATIONS` table, referencing the `EMPLOYEE_ID` column of the `EMPLOYEES` table.

To add a Foreign Key constraint using the ALTER TABLE statement:

1. If a pane with the tab **hr_conn** is there, select it. Otherwise, click the icon **SQL Worksheet**, as in "[Running Queries in SQL Developer](#)".
2. In the Worksheet pane, type this statement:

```
ALTER TABLE EVALUATIONS
ADD CONSTRAINT EVAL_EMP_ID_FK FOREIGN KEY (EMPLOYEE_ID)
REFERENCES EMPLOYEES (EMPLOYEE_ID);
```

3. Click the icon **Run Statement**.

The statement runs, adding the Foreign Key constraint to the `EMPLOYEE_ID` column of the `EVALUATIONS` table, referencing the `EMPLOYEE_ID` column of the `EMPLOYEES` table.

The following procedure uses the Add Check tool to add a Check constraint to the `SCORES` table.

To add a Check constraint using the Add Check tool:

1. In the Connections frame, expand `hr_conn`.
2. In the list of schema object types, expand **Tables**.
3. In the list of tables, right-click **SCORES**.
4. In the list of choices, select **Constraint**.
5. In the list of choices, click **Add Check**.
6. In the Add Check window:
 - a. For Constraint Name, enter `SCORE_VALID`.
 - b. For Check Condition, enter `score >= 0 and score <+ 9`.
 - c. For Status, accept the default, `ENABLE`.
 - d. Click **Apply**.
7. In the Confirmation window, click **OK**.

A Check constraint named `SCORE_VALID` is added to the `SCORES` table.

 **See Also:**

- *Oracle Database SQL Language Reference* for more information about the `ALTER TABLE` statement
- *Oracle SQL Developer User's Guide* for information about adding constraints to a table when you create it with SQL Developer
- *Oracle Database SQL Language Reference* for information about adding constraints to a table when you create it with the `CREATE TABLE` statement

4.2.4 Tutorial: Adding Rows to Tables with the Insert Row Tool

This tutorial shows how to use the Insert Row tool to add six populated rows to the `PERFORMANCE_PARTS` table.

To add rows to the `PERFORMANCE_PARTS` table using the Insert Row tool:

1. In the Connections frame, expand `hr_conn`.
2. In the list of schema object types, expand **Tables**.

3. In the list of tables, select **PERFORMANCE_PARTS**.
4. In the right frame, click the tab **Data**.
The Data pane appears, showing the names of the columns of the PERFORMANCE_PARTS table and no rows.
5. In the Data pane, click the icon **Insert Row**.
A new row appears, with empty columns. A green border around the row number indicates that the insertion has not been committed.
6. Click the cell under the column heading PERFORMANCE_ID.
7. Type the value of PERFORMANCE_ID: WM
8. Either press the key **Tab** or click the cell under the column heading **NAME**.
9. Type the value of NAME: Workload Management
10. Either press the key **Tab** or click the cell under the column heading WEIGHT.
11. Type the value of WEIGHT: 0.2
12. Press the key **Enter**.
13. Add and populate a second row by repeating steps 5 through 12 with these values:
 - For PERFORMANCE_ID, type BR.
 - For NAME, type Building Relationships.
 - For WEIGHT, type 0.2.
14. Add and populate a third row by repeating steps 5 through 12 with these values:
 - For PERFORMANCE_ID, type CF.
 - For NAME, type Customer Focus.
 - For WEIGHT, type 0.2.
15. Add and populate a fourth row by repeating steps 5 through 12 with these values:
 - For PERFORMANCE_ID, type CM.
 - For NAME, type Communication.
 - For WEIGHT, type 0.2.
16. Add and populate a fifth row by repeating steps 5 through 12 with these values:
 - For PERFORMANCE_ID, type TW.
 - For NAME, type Teamwork.
 - For WEIGHT, type 0.2.
17. Add and populate a sixth row by repeating steps 5 through 12, using these values:
 - For PERFORMANCE_ID, type RO.
 - For NAME, type Results Orientation.
 - For WEIGHT, type 0.2.
18. Click the icon **Commit Changes**.
The green borders around the row numbers disappear.

Under the Data pane is the label Messages - Log.

19. Check the Messages - Log pane for the message `Commit Successful`.
20. In the Data Pane, check the new rows.

See Also:

["About the INSERT Statement"](#)

4.2.5 Tutorial: Changing Data in Tables in the Data Pane

This tutorial shows how to change three of the `WEIGHT` values in the `PERFORMANCE_PARTS` table in the Data pane.

The `PERFORMANCE_PARTS` table was populated in ["Tutorial: Adding Rows to Tables with the Insert Row Tool"](#).

To change data in the `PERFORMANCE_PARTS` table using the Data pane:

1. In the Connections frame, expand `hr_conn`.
2. In the list of schema object types, expand **Tables**.
3. In the list of tables, select **PERFORMANCE_PARTS**.
4. In the right frame, click the tab **Data**.
5. In the Data Pane, in the row where `NAME` is "Workload Management":
 - a. Click the **WEIGHT** value.
 - b. Enter the value `0.3`.
 - c. Press the key **Enter**.

An asterisk appears to the left of the row number to indicate that the change has not been committed.
6. In the row where **NAME** is "Building Relationships":
 - a. Click the **WEIGHT** value.
 - b. Enter the value `0.15`.
 - c. Press the key **Enter**.

An asterisk appears to the left of the row number to indicate that the change has not been committed.
7. In the row where **NAME** is "Customer Focus" :
 - a. Click the **WEIGHT** value.
 - b. Enter the value `0.15`.
 - c. Press the key **Enter**.

An asterisk appears to the left of the row number to indicate that the change has not been committed.
8. Click the icon **Commit Changes**.

The asterisks to the left of the row numbers disappear.

9. Under the Data pane, check the Messages - Log pane for the message `Commit Successful`.
10. In the Data Pane, check the new data.

See Also:

["About the UPDATE Statement"](#)

4.2.6 Tutorial: Deleting Rows from Tables with the Delete Selected Row(s) Tool

This tutorial shows how to use the Delete Selected Row(s) tool to delete a row from the `PERFORMANCE_PARTS` table.

The `PERFORMANCE_PARTS` table was populated in "[Tutorial: Adding Rows to Tables with the Insert Row Tool](#)").

To delete row from `PERFORMANCE_PARTS` using Delete Selected Row(s) tool:

1. In the Connections frame, expand `hr_conn`.
2. In the list of schema object types, expand **Tables**.
3. In the list of tables, select **`PERFORMANCE_PARTS`**.
4. In the right frame, click the tab **Data**.
5. In the Data pane, click the row where NAME is "Results Orientation".
6. Click the icon **Delete Selected Row(s)**.

A red border appears around the row number to indicate that the deletion has not been committed.

7. Click the icon **Commit Changes**.
The row is deleted.
8. Under the Data pane, check the Messages - Log pane for the message `Commit Successful`.

Note:

If you delete every row of a table, the empty table still exists. To delete a table, see "[Dropping Tables](#)".

See Also:

["About the DELETE Statement"](#)

4.2.7 Managing Indexes

You can create indexes on one or more columns of a table to speed SQL statement execution on that table. When properly used, indexes are the primary means of reducing disk input/output (I/O).

When you define a primary key on a table:

- If an existing index starts with the primary key columns, then Oracle Database uses that existing index for the primary key. The existing index need not be Unique.

For example, if you define the primary key (A, B), Oracle Database uses the existing index (A, B, C).

- If no existing index starts with the primary key columns and the constraint is immediate, then Oracle Database creates a Unique index on the primary key.
- If no existing index starts with the primary key columns and the constraint is deferrable, then Oracle Database creates a non-Unique index on the primary key.

For example, in "[Tutorial: Adding Constraints to Existing Tables](#)", you added a Primary Key constraint to the EVALUATION_ID column of the EVALUATIONS table. Therefore, if you select the EVALUATIONS table in the SQL Developer Connections frame and click the Indexes tab, the Indexes pane shows a Unique index on the EVALUATION_ID column.

- [Tutorial: Adding an Index with the Create Index Tool](#)
This tutorial shows how to use the Create Index tool to add an index to the EVALUATIONS table.
- [Tutorial: Changing an Index with the Edit Index Tool](#)
This tutorial shows how to use the Edit Index tool to reverse the sort order of the index EVAL_JOB_IX.
- [Tutorial: Dropping an Index](#)
This tutorial shows how to use the Connections frame and Drop tool to drop the index EVAL_JOB_IX.

See Also:

For more information about indexes:

- *Oracle Database Concepts*
- *Oracle Database Development Guide*

4.2.7.1 Tutorial: Adding an Index with the Create Index Tool

This tutorial shows how to use the Create Index tool to add an index to the EVALUATIONS table.

The EVALUATIONS table was created in [Example 4-1](#).

To create an index, use either the SQL Developer tool Create Index or the DDL statement CREATE INDEX. The equivalent DDL statement is:

```
CREATE INDEX EVAL_JOB_IX  
ON EVALUATIONS (JOB_ID ASC) NOPARALLEL;
```

To add an index to the EVALUATIONS table using the Create Index tool:

1. In the Connections frame, expand **hr_conn**.
2. In the list of schema object types, expand **Tables**.
3. In the list of tables, right-click **EVALUATIONS**.
4. In the list of choices, select **Index**.
5. In the list of choices, select **Create Index**.
6. In the Create Index window:
 - a. For Schema, accept the default, **HR**.
 - b. For Name, type **EVAL_JOB_IX**.
 - c. If the Definition pane does not show, select the tab **Definition**.
 - d. In the Definition pane, for Index Type, select **Unique** from the menu.
 - e. Click the icon **Add Expression**.
The Expression **EMPLOYEE_ID** with Order **<Not Specified>** appears.
 - f. Over **EMPLOYEE_ID**, type **JOB_ID**.
 - g. For Order, select **ASC** (ascending) from the menu.
 - h. Click **OK**.
Now the **EVALUATIONS** table has an index named **EVAL_JOB_IX** on the column **JOB_ID**.

See Also:

Oracle Database SQL Language Reference for information about the statement

4.2.7.2 Tutorial: Changing an Index with the Edit Index Tool

This tutorial shows how to use the Edit Index tool to reverse the sort order of the index **EVAL_JOB_IX**.

To change an index, use either the SQL Developer tool Edit Index or the DDL statements **DROP INDEX** and **CREATE INDEX**.

The equivalent DDL statements are:

```
DROP INDEX EVAL_JOB_ID;  
  
CREATE INDEX EVAL_JOB_IX  
ON EVALUATIONS (JOB_ID DESC) NOPARALLEL;
```

To reverse the sort order of the index EVAL_JOB_IX using the Edit Index tool:

1. In the Connections frame, expand **hr_conn**.
2. In the list of schema object types, expand **Indexes**.

3. In the list of indexes, right-click **EVAL_JOB_IX**.
4. In the list of choices, click **Edit**.
5. In the Edit Index window, change Order to **DESC**.
6. Click **OK**.
7. In the Confirm Replace window, click either **Yes** or **No**.

 **See Also:**

Oracle Database SQL Language Reference for information about the ALTER INDEX statement

4.2.7.3 Tutorial: Dropping an Index

This tutorial shows how to use the Connections frame and Drop tool to drop the index EVAL_JOB_IX.

To drop an index, use either the SQL Developer Connections frame and Drop tool or the DDL statement DROP INDEX. The equivalent DDL statement is:

```
DROP INDEX EVAL_JOB_ID;
```

To drop the index EVAL_JOB_IX:

1. In the Connections frame, expand **hr_conn**.
2. In the list of schema object types, expand **Indexes**.
3. In the list of indexes, right-click **EVAL_JOB_IX**.
4. In the list of choices, click **Drop**.
5. In the Drop window, click **Apply**.
6. In the Confirmation window, click **OK**.

 **See Also:**

Oracle Database SQL Language Reference for information about the DROP INDEX statement

4.2.8 Dropping Tables

To drop a table, use either the SQL Developer Connections frame and Drop tool, or the DDL statement DROP TABLE.

Caution:

Do not drop any tables that you created in "[Creating Tables](#)"—you need them for later tutorials. If you want to practice dropping tables, create simple ones and then drop them.

To drop a table using the Drop tool:

1. In the Connections frame, expand **hr_conn**.
2. In the list of schema object types, expand **Tables**.
3. In the list of tables, right-click the name of the table to drop.
4. In the list of choices, select **Table**.
5. In the list of choices, click **Drop**.
6. In the Drop window, click **Apply**.
7. In the Confirmation window, click **OK**.

See Also:

Oracle Database SQL Language Reference for information about the statement DROP TABLE

4.3 Creating and Managing Views

A view presents a query result as a table. In most places that you can use a table, you can use a view. Views are useful when you need frequent access to information that is stored in several different tables.

- [Creating Views](#)
To create views, use either the SQL Developer tool Create View or the DDL statement CREATE VIEW.
- [Changing Queries in Views](#)
To change the query in a view, use the DDL statement CREATE VIEW with the OR REPLACE clause.
- [Tutorial: Changing View Names with the Rename Tool](#)
This tutorial shows how to use the Rename tool to change the name of the SALESFORCE view.

- [Dropping a View](#)
To drop a view, use either the SQL Developer Connections frame and Drop tool or the DDL statement DROP VIEW.

 **See Also:**

- ["Selecting Table Data"](#) for information about queries
- *Oracle Database Concepts* for additional general information about views

4.3.1 Creating Views

To create views, use either the SQL Developer tool Create View or the DDL statement CREATE VIEW.

This topic shows how to use both of these ways to create these views:

- SALESFORCE, which contains the names and salaries of the employees in the Sales department
- EMP_LOCATIONS, which contains the names and locations of all employees
This view is used in ["Creating an INSTEAD OF Trigger"](#).
- [Tutorial: Creating a View with the Create View Tool](#)
This tutorial shows how to create the SALESFORCE view using the Create View tool.
- [Creating Views with the CREATE VIEW Statement](#)
This example shows how to use the CREATE VIEW statement to create the EMP_LOCATIONS view, which joins four tables.

 **See Also:**

- *Oracle SQL Developer User's Guide* for more information about using SQL Developer to create a view
- *Oracle Database SQL Language Reference* for more information about the statement CREATE VIEW

4.3.1.1 Tutorial: Creating a View with the Create View Tool

This tutorial shows how to create the SALESFORCE view using the Create View tool.

To create the SALESFORCE view using the Create View tool:

1. In the Connections frame, expand **hr_conn**.
2. In the list of schema object types, right-click **Views**.
3. In the list of choices, click **New View**.

The Create View window opens, with default values for a new view.

4. For Schema, accept the default value, HR.
5. For Name, enter SALESFORCE.
6. If the SQL Query pane does not show, click the tab **SQL Query**.
7. In the SQL Query pane, in the SQL Query field:
 - After **SELECT**, type:

```
FIRST_NAME || ' ' || LAST_NAME "Name", SALARY*12 "Annual Salary"
```
 - After **FROM**, type:

```
EMPLOYEES WHERE DEPARTMENT_ID = 80
```
8. Click **Check Syntax**.
9. Under Syntax Results, if the message is not *No errors found in SQL*, then return to step 7 and correct the syntax errors in the query.
10. Click **OK**.

The view SALESFORCE is created. To see it, expand Views in the Connections frame.

To see the CREATE VIEW statement for creating this view, select its name and click the tab **SQL**.

See Also:

Oracle SQL Developer User's Guide for more information about using SQL Developer to create views

4.3.1.2 Creating Views with the CREATE VIEW Statement

This example shows how to use the CREATE VIEW statement to create the EMP_LOCATIONS view, which joins four tables.

The CREATE VIEW statement in [Example 4-3](#) creates the EMP_LOCATIONS view, which joins four tables. (For information about joins, see "[Selecting Data from Multiple Tables](#)".)

Example 4-3 Creating the EMP_LOCATIONS View with CREATE VIEW

```
CREATE VIEW EMP_LOCATIONS AS
SELECT e.EMPLOYEE_ID,
       e.LAST_NAME || ', ' || e.FIRST_NAME NAME,
       d.DEPARTMENT_NAME DEPARTMENT,
       l.CITY CITY,
       c.COUNTRY_NAME COUNTRY
FROM EMPLOYEES e, DEPARTMENTS d, LOCATIONS l, COUNTRIES c
WHERE e.DEPARTMENT_ID = d.DEPARTMENT_ID AND
      d.LOCATION_ID = l.LOCATION_ID AND
      l.COUNTRY_ID = c.COUNTRY_ID
ORDER BY LAST_NAME;
```

Result:

View EMP_LOCATIONS created.

 **See Also:**

Oracle Database SQL Language Reference for information about the CREATE VIEW statement

4.3.2 Changing Queries in Views

To change the query in a view, use the DDL statement CREATE VIEW with the OR REPLACE clause.

The CREATE OR REPLACE VIEW statement in [Example 4-4](#) changes the query in the SALESFORCE view.

Example 4-4 Changing the Query in the SALESFORCE View

```
CREATE OR REPLACE VIEW SALESFORCE AS
  SELECT FIRST_NAME || ' ' || LAST_NAME "Name",
         SALARY*12 "Annual Salary"
  FROM EMPLOYEES
 WHERE DEPARTMENT_ID = 80 OR DEPARTMENT_ID = 20;
```

Result:

View SALESFORCE created.

 **See Also:**

Oracle Database SQL Language Reference for information about the CREATE VIEW with the OR REPLACE clause

4.3.3 Tutorial: Changing View Names with the Rename Tool

This tutorial shows how to use the Rename tool to change the name of the SALESFORCE view.

To change the name of a view, use either the SQL Developer tool Rename or the RENAME statement. The equivalent DDL statement is:

```
RENAME SALESFORCE to SALES_MARKETING;
```

To change the SALESFORCE view using the Rename tool:

1. In the Connections frame, expand **hr_conn**.
2. In the list of schema object types, expand **Views**.
3. In the list of views, right-click **SALESFORCE**.
4. In the list of choices, select **Rename**.
5. In the Rename window, in the New View Name field, type **SALES_MARKETING**.
6. Click **Apply**.
7. In the Confirmation window, click **OK**.

 **See Also:**

Oracle Database SQL Language Reference for information about the RENAME statement

4.3.4 Dropping a View

To drop a view, use either the SQL Developer Connections frame and Drop tool or the DDL statement DROP VIEW.

The following tutorial shows how to use the Connections frame and Drop tool to drop the view SALES_MARKETING (changed in "[Tutorial: Changing View Names with the Rename Tool](#)"). The equivalent DDL statement is:

```
DROP VIEW SALES_MARKETING;
```

To drop the view SALES_MARKETING using the Drop tool:

1. In the Connections frame, expand **hr_conn**.
2. In the a list of schema object types, expand **Views**.
3. In the a list of views, right-click **SALES_MARKETING**.
4. In the a list of choices, click **Drop**.
5. In the Drop window, click **Apply**.
6. In the Confirmation window, click **OK**.

 **See Also:**

Oracle Database SQL Language Reference for information about the DROP VIEW statement

4.4 Creating and Managing Sequences

Sequences are schema objects from which you can generate unique sequential values, which are very useful when you need unique primary keys. Sequences are used through the pseudocolumns CURRVAL and NEXTVAL, which return the current and next values of the sequence, respectively.

After creating a sequence, you must initialize it by using NEXTVAL to get its first value. Only after you initialize a sequence does CURRVAL return its current value.

The HR schema has three sequences: DEPARTMENTS_SEQUENCE, EMPLOYEES_SEQUENCE, and LOCATIONS_SEQUENCE.

 **Tip:**

When you plan to use a sequence to populate the primary key of a table, give the sequence a name that reflects this purpose. (This topic uses the naming convention `TABLE_NAME_SEQUENCE`.)

- [Tutorial: Creating a Sequence](#)
This tutorial shows how to use the Create Database Sequence tool to create a sequence to use to generate primary keys for the EVALUATIONS table.
- [Dropping Sequences](#)
To drop a sequence, use either the SQL Developer Connections frame and Drop tool, or the DDL statement `DROP SEQUENCE`.

 **See Also:**

- *Oracle Database Concepts* for information about the sequence generator
- *Oracle Database SQL Language Reference* for more information about the `CURRVAL` and `NEXTVAL` pseudocolumns
- *Oracle Database Administrator's Guide* for information about managing sequences
- ["Editing Installation Scripts that Create Sequences"](#)
- ["About Sequences and Concurrency"](#)

4.4.1 Tutorial: Creating a Sequence

This tutorial shows how to use the Create Database Sequence tool to create a sequence to use to generate primary keys for the EVALUATIONS table.

The EVALUATIONS table was created in [Example 4-1](#).

To create a sequence, use either the SQL Developer tool Create Sequence or the DDL statement `CREATE SEQUENCE`. The equivalent DDL statement is:

```
CREATE SEQUENCE evaluations_sequence  
INCREMENT BY 1  
START WITH 1 ORDER;
```

To create EVALUATIONS_SEQUENCE using the Create Database Sequence tool:

1. In the Connections frame, expand **hr_conn**.
2. In the list of schema object types, right-click **Sequences**.
3. In the list of choices, click **New Sequence**.
4. In the Create Sequence window, in the Name field, type `EVALUATIONS_SEQUENCE` over the default value "SEQUENCE1".
5. If the Properties pane does not show, click the tab **Properties**.

6. In the Properties pane:
 - a. In the field Increment, type 1.
 - b. In the field Start with, type 1.
 - c. For the remaining fields, accept the default values.
 - d. Click **OK**.

The sequence EVALUATIONS_SEQUENCE is created. Its name appears under Sequences in the Connections frame.

See Also:

- *Oracle SQL Developer User's Guide* for more information about using SQL Developer to create a sequence
- *Oracle Database SQL Language Reference* for information about the CREATE SEQUENCE statement
- "[Tutorial: Creating a Trigger that Generates a Primary Key for a Row Before It Is Inserted](#)" to learn how to create a trigger that inserts the primary keys created by EVALUATIONS_SEQUENCE into the EVALUATIONS table

4.4.2 Dropping Sequences

To drop a sequence, use either the SQL Developer Connections frame and Drop tool, or the DDL statement DROP SEQUENCE.

This statement drops the sequence EVALUATIONS_SEQUENCE:

```
DROP SEQUENCE EVALUATIONS_SEQUENCE;
```

Caution:

Do not drop the sequence EVALUATIONS_SEQUENCE—you need it for [Example 5-3](#). If you want to practice dropping sequences, create others and then drop them.

To drop a sequence using the Drop tool:

1. In the Connections frame, expand **hr_conn**.
2. In the list of schema object types, expand **Sequences**.
3. In the list of sequences, right-click the name of the sequence to drop.
4. In the list of choices, click **Drop**.
5. In the Drop window, click **Apply**.
6. In the Confirmation window, click **OK**.

 **See Also:**

Oracle Database SQL Language Reference for information about the DROP SEQUENCE statement

4.5 Creating and Managing Synonyms

A synonym is an alias for another schema object. Some reasons to use synonyms are security (for example, to hide the owner and location of an object) and convenience.

Examples of convenience are:

- Using a short synonym, such as `SALES`, for a long object name, such as `ACME_CO.SALES_DATA`
- Using a synonym for a renamed object, instead of changing that object name throughout the applications that use it

For example, if your application uses a table named `DEPARTMENTS`, and its name changes to `DIVISIONS`, you can create a `DEPARTMENTS` synonym for that table and continue to reference it by its original name.

- [Creating Synonyms](#)
To create a synonym, use either the SQL Developer tool Create Database Synonym or the DDL statement `CREATE SYNONYM`.
- [Dropping Synonyms](#)
To drop a synonym, use either the SQL Developer Connections frame and Drop tool, or the DDL statement `DROP SYNONYM`.

 **See Also:**

Oracle Database Concepts for additional general information about synonyms

4.5.1 Creating Synonyms

To create a synonym, use either the SQL Developer tool Create Database Synonym or the DDL statement `CREATE SYNONYM`.

The following tutorial shows how to use the Create Database Synonym tool to create the synonym `EMPL` for the `EMPLOYEES` table. The equivalent DDL statement is:

```
CREATE SYNONYM EMPL FOR EMPLOYEES;
```

To create the synonym `EMPL` using the Create Database Synonym tool:

1. In the Connections frame, expand `hr_conn`.
2. In the list of schema object types, right-click **Synonyms**.
3. In the list of choices, click **New Synonym**.
4. In the New Synonym window:

- a. In the Synonym Name field, type `EMPL`.
 - b. In the Object Owner field, select **HR** from the menu.
 - c. In the Object Name field, select **EMPLOYEES** from the menu.
The synonym refers to a specific schema object; in this case, the table `EMPLOYEES`.
 - d. Click **Apply**.
5. In the Confirmation window, click **OK**.
The synonym `EMPL` is created. To see it, expand **Synonyms** in the Connections frame. You can now use `EMPL` instead of `EMPLOYEES`.

**See Also:**

Oracle Database SQL Language Reference for information about the `CREATE SYNONYM` statement

4.5.2 Dropping Synonyms

To drop a synonym, use either the SQL Developer Connections frame and Drop tool, or the DDL statement `DROP SYNONYM`.

This statement drops the synonym `EMP`:

```
DROP SYNONYM EMP;
```

To drop a synonym using the Drop tool:

1. In the Connections frame, expand **hr_conn**.
2. In the list of schema object types, expand **Synonyms**.
3. In the list of synonyms, right-click the name of the synonym to drop.
4. In the list of choices, click **Drop**.
5. In the Drop window, click **Apply**.
6. In the Confirmation window, click **OK**.

**See Also:**

Oracle Database SQL Language Reference for information about the `DROP SYNONYM` statement

5

Developing Stored Subprograms and Packages

Stored subprograms and packages can be used as building blocks for many different database applications.

- [About Stored Subprograms](#)
A **stored subprogram** is a subprogram that is stored in the database. Because they are stored in the database, stored programs can be used as building blocks for many different database applications.
- [About Packages](#)
A **package** is a PL/SQL unit that consists of related subprograms and the declared cursors and variables that they use. Oracle recommends that you put your subprograms into packages.
- [About PL/SQL Identifiers](#)
Every PL/SQL subprogram, package, parameter, variable, constant, exception, and declared cursor has a name, which is a PL/SQL identifier.
- [About PL/SQL Data Types](#)
Every PL/SQL constant, variable, subprogram parameter, and function return value has a data type that determines its storage format, constraints, valid range of values, and operations that can be performed on it.
- [Creating and Managing Standalone Subprograms](#)
You can create and manage standalone PL/SQL subprograms.
- [Creating and Managing Packages](#)
You can create and manage PL/SQL packages.
- [Declaring and Assigning Values to Variables and Constants](#)
A variable or constant declared in a package specification is available to any program that has access to the package. A variable or constant declared in a package body or subprogram is local to that package or subprogram. When declaring a constant, you must assign it an initial value.
- [Controlling Program Flow](#)
Unlike SQL, which runs statements in the order in which you enter them, PL/SQL has control statements that let you control the flow of your program.
- [Using Records and Cursors](#)
You can store data values in records, and use a cursor as a pointer to a result set and related processing information.
- [Using Associative Arrays](#)
An associative array is a type of collection.
- [Handling Exceptions \(Runtime Errors\)](#)
You can handle exceptions that occur at run time with PL/SQL code.

5.1 About Stored Subprograms

A **stored subprogram** is a subprogram that is stored in the database. Because they are stored in the database, stored programs can be used as building blocks for many different database applications.

A **subprogram** is a PL/SQL unit that consists of SQL and PL/SQL statements that solve a specific problem or perform a set of related tasks. A subprogram can have parameters, whose values are supplied by the invoker. A subprogram can be either a procedure or a function. Typically, you use a procedure to perform an action and a function to compute and return a value.

Because stored subprograms are stored in the database, stored programs can be used as building blocks for many different database applications. A subprogram that is declared within another subprogram, or within an anonymous block, is called a **nested subprogram** or **local subprogram**. It cannot be invoked from outside the subprogram or block in which it is declared. An **anonymous block** is a block that is not stored in the database.

There are two kinds of stored subprograms:

- **Standalone subprogram**, which is created at schema level
- **Package subprogram**, which is created inside a package

Standalone subprograms are useful for testing pieces of program logic, but when you are sure that they work as intended, Oracle recommends that you put them into packages.

See Also:

- *Oracle Database Concepts* for general information about stored subprograms
- *Oracle Database PL/SQL Language Reference* for complete information about PL/SQL subprograms

5.2 About Packages

A **package** is a PL/SQL unit that consists of related subprograms and the declared cursors and variables that they use. Oracle recommends that you put your subprograms into packages.

Some reasons that Oracle recommends that you put your subprograms into packages are:

- Packages allow you to hide implementation details from client programs.
Hiding implementation details from client programs is a widely accepted best practice. Many Oracle customers follow this practice strictly, allowing client programs to access the database only by invoking PL/SQL subprograms. Some customers allow client programs to use SELECT statements to retrieve information from database tables, but require them to invoke PL/SQL subprograms for all business functions that change the database.

- Package subprograms must be qualified with package names when invoked from outside the package, which ensures that their names will always work when invoked from outside the package.

For example, suppose that you developed a schema-level procedure named CONTINUE before Oracle Database 11g . Oracle Database 11g introduced the CONTINUE statement. Therefore, if you ported your code to Oracle Database 11g , it would no longer compile. However, if you had developed your procedure inside a package, your code would refer to the procedure as `package_name.CONTINUE`, so the code would still compile.

 **Note:**

Oracle Database supplies many PL/SQL packages to extend database functionality and provide PL/SQL access to SQL features. You can use the supplied packages when creating your applications or for ideas in creating your own stored procedures. For information about these packages, see *Oracle Database PL/SQL Packages and Types Reference*.

 **See Also:**

- *Oracle Database Concepts* for general information about packages
- *Oracle Database PL/SQL Language Reference* for more reasons to use packages

- *Oracle Database PL/SQL Packages and Types Reference* for complete information about the PL/SQL packages that Oracle provides

5.3 About PL/SQL Identifiers

Every PL/SQL subprogram, package, parameter, variable, constant, exception, and declared cursor has a name, which is a PL/SQL identifier.

The minimum length of an identifier is one character; the maximum length is 30 characters. The first character must be a letter, but each later character can be either a letter, numeral, dollar sign (\$), underscore (_), or number sign (#). For example, these are acceptable identifiers:

```
X  
t2  
phone#  
credit_limit  
LastName  
oracle$number  
money$$$tree  
SN##  
try_again_
```

PL/SQL is not case-sensitive for identifiers. For example, PL/SQL considers these to be the same:

```
lastname  
LastName  
LASTNAME
```

You cannot use a PL/SQL reserved word as an identifier. You can use a PL/SQL keyword as an identifier, but it is not recommended. For lists of PL/SQL reserved words and keywords, see *Oracle Database PL/SQL Language Reference*.

See Also:

- *Oracle Database PL/SQL Language Reference* for additional general information about PL/SQL identifiers
- *Oracle Database PL/SQL Language Reference* for additional information about PL/SQL naming conventions
- *Oracle Database PL/SQL Language Reference* for information about the scope and visibility of PL/SQL identifiers
- *Oracle Database PL/SQL Language Reference* for information how to collect data on PL/SQL identifiers
- *Oracle Database PL/SQL Language Reference* for information about how PL/SQL resolves identifier names

5.4 About PL/SQL Data Types

Every PL/SQL constant, variable, subprogram parameter, and function return value has a data type that determines its storage format, constraints, valid range of values, and operations that can be performed on it.

A PL/SQL data type is either a SQL data type (such as VARCHAR2, NUMBER, or DATE) or a PL/SQL-only data type. The latter include BOOLEAN, RECORD, REF CURSOR, and many predefined subtypes. PL/SQL also lets you define your own subtypes.

A **subtype** is a subset of another data type, which is called its **base type**. A subtype has the same valid operations as its base type, but only a subset of its valid values. Subtypes can increase reliability, provide compatibility with ANSI/ISO types, and improve readability by indicating the intended use of constants and variables.

The predefined numeric subtype PLS_INTEGER is especially useful, because its operations use hardware arithmetic, rather than the library arithmetic that its base type uses.

You cannot use PL/SQL-only data types at schema level (that is, in tables or standalone subprograms). Therefore, to use these data types in a stored subprogram, you must put them in a package.

 **See Also:**

- *Oracle Database PL/SQL Language Reference* for general information about PL/SQL data types
- *Oracle Database PL/SQL Language Reference* for information about the PLS_INTEGER data type
- ["About SQL Data Types"](#)

5.5 Creating and Managing Standalone Subprograms

You can create and manage standalone PL/SQL subprograms.

 **Note:**

To do the tutorials in this document, you must be connected to Oracle Database as the user HR from SQL Developer.

- [About Subprogram Structure](#)
- [Tutorial: Creating a Standalone Procedure](#)
This tutorial shows how to use the Create Procedure tool to create a standalone procedure named ADD_EVALUATION that adds a row to the EVALUATIONS table.
- [Tutorial: Creating a Standalone Function](#)
This tutorial shows how to use the Create Function tool to create a standalone function named CALCULATE_SCORE that has three parameters and returns a value of type NUMBER.
- [Changing Standalone Subprograms](#)
To change a standalone subprogram, use either the SQL Developer tool Edit or the DDL statement ALTER PROCEDURE or ALTER FUNCTION.
- [Tutorial: Testing a Standalone Function](#)
This tutorial shows how to use the SQL Developer tool Run to test the standalone function CALCULATE_SCORE.
- [Dropping Standalone Subprograms](#)
To drop a standalone subprogram, use either the SQL Developer Connections frame and Drop tool, or the DDL statement DROP PROCEDURE or DROP FUNCTION.

5.5.1 About Subprogram Structure

A subprogram follows PL/SQL block structure; that is, it has:

- **Declarative part** (optional)

The declarative part contains declarations of types, constants, variables, exceptions, declared cursors, and nested subprograms. These items are local to the subprogram and cease to exist when the subprogram completes execution.

- **Executable part** (required)

The executable part contains statements that assign values, control execution, and manipulate data.

- **Exception-handling part** (optional)

The exception-handling part contains code that handles exceptions (runtime errors).

Comments can appear anywhere in PL/SQL code. The PL/SQL compiler ignores them. Adding comments to your program promotes readability and aids understanding. A **single-line comment** starts with a double hyphen (--) and extends to the end of the line. A **multiline comment** starts with a slash and asterisk (/*) and ends with an asterisk and a slash (*/).

The structure of a procedure is:

```
PROCEDURE name [ ( parameter_list ) ]
{ IS | AS }
[ declarative_part ]
BEGIN -- executable part begins
    statement; [ statement; ]...
[ EXCEPTION -- executable part ends, exception-handling part begins]
    exception_handler; [ exception_handler; ]... ]
END; /* exception-handling part ends if it exists;
       otherwise, executable part ends */
```

The structure of a function is like that of a procedure, except that it includes a `RETURN` clause and at least one `RETURN` statement (and some optional clauses that are beyond the scope of this document):

```
FUNCTION name [ ( parameter_list ) ] RETURN data_type [ clauses ]
{ IS | AS }
[ declarative_part ]
BEGIN -- executable part begins
    -- at least one statement must be a RETURN statement
    statement; [ statement; ]...
[ EXCEPTION -- executable part ends, exception-handling part begins]
    exception_handler; [ exception_handler; ]... ]
END; /* exception-handling part ends if it exists;
       otherwise, executable part ends */
```

The code that begins with `PROCEDURE` or `FUNCTION` and ends before `IS` or `AS` is the **subprogram signature**. The declarative, executable, and exception-handling parts comprise the **subprogram body**. The syntax of exception-handler is in "[About Exceptions and Exception Handlers](#)".

 **See Also:**

Oracle Database PL/SQL Language Reference for more information about subprogram parts

5.5.2 Tutorial: Creating a Standalone Procedure

This tutorial shows how to use the Create Procedure tool to create a standalone procedure named `ADD_EVALUATION` that adds a row to the `EVALUATIONS` table.

The `EVALUATIONS` table was created in [Example 4-1](#).

To create a standalone procedure, use either the SQL Developer tool Create Procedure or the DDL statement `CREATE PROCEDURE`.

To create a standalone procedure using Create Procedure tool:

1. In the Connections frame, expand `hr_conn`.
2. In the list of schema object types, right-click **Procedures**.
3. In the list of choices, click **New Procedure**.

The Create Procedure window opens.

4. For Schema, accept the default value, `HR`.
5. For Name, change `PROCEDURE1` to `ADD_EVALUATION`.
6. Click the icon **Add Parameter**.

A row appears under the column headings. Its fields have these default values: Name, `PARAM1`; Mode, `IN`; No Copy, deselected; Data Type, `VARCHAR2`; Default Value, empty.

7. For Name, change `PARAM1` to `EVALUATION_ID`.
8. For Mode, accept the default value, `IN`.
9. For Data Type, select **NUMBER** from the menu.
10. Leave Default Value empty.
11. Add a second parameter by repeating steps 6 through 10 with the Name `EMPLOYEE_ID` and the Data Type `NUMBER`.
12. Add a third parameter by repeating steps 6 through 10 with the Name `EVALUATION_DATE` and the Data Type `DATE`.
13. Add a fourth parameter by repeating steps 6 through 10 with the Name `JOB_ID` and the Data Type `VARCHAR2`.
14. Add a fifth parameter by repeating steps 6 through 10 with the Name `MANAGER_ID` and the Data Type `NUMBER`.
15. Add a sixth parameter by repeating steps 6 through 10 with the Name `DEPARTMENT_ID` and the Data Type `NUMBER`.
16. Add a seventh parameter by repeating steps 6 through 10 with the Name `TOTAL_SCORE` and the Data Type `NUMBER`.
17. Click **OK**.

```
CREATE OR REPLACE PROCEDURE ADD_EVALUATION
(
    EVALUATION_ID IN NUMBER
  , EMPLOYEE_ID IN NUMBER
  , EVALUATION_DATE IN DATE
  , JOB_ID IN VARCHAR2
```

```
, MANAGER_ID IN NUMBER
, DEPARTMENT_ID IN NUMBER
, TOTAL_SCORE IN NUMBER
) AS
BEGIN
  NULL;
END ADD_EVALUATION;
```

The title of the ADD_EVALUATION pane is in italic font, indicating that the procedure is not yet saved in the database.

Because the execution part of the procedure contains only the NULL statement, the procedure does nothing.

18. Replace the NULL statement with this statement:

```
INSERT INTO EVALUATIONS (
  evaluation_id,
  employee_id,
  evaluation_date,
  job_id,
  manager_id,
  department_id,
  total_score
)
VALUES (
  ADD_EVALUATION.evaluation_id,
  ADD_EVALUATION.employee_id,
  ADD_EVALUATION.evaluation_date,
  ADD_EVALUATION.job_id,
  ADD_EVALUATION.manager_id,
  ADD_EVALUATION.department_id,
  ADD_EVALUATION.total_score
);
```

(Qualifying the parameter names with the procedure name ensures that they are not confused with the columns that have the same names.)

19. From the File menu, select **Save**.

Oracle Database compiles the procedure and saves it. The title of the ADD_EVALUATION pane is no longer in italic font. The Message - Log pane has the message `Compiled`.

 **See Also:**

- *Oracle SQL Developer User's Guide* for another example of using SQL Developer to create a standalone procedure
- "[About Data Definition Language \(DDL\) Statements](#)" for general information that applies to the CREATE PROCEDURE statement
- *Oracle Database PL/SQL Language Reference* for information about the CREATE PROCEDURE statement

5.5.3 Tutorial: Creating a Standalone Function

This tutorial shows how to use the Create Function tool to create a standalone function named `CALCULATE_SCORE` that has three parameters and returns a value of type `NUMBER`.

To create a standalone function, use either the SQL Developer tool Create Function or the DDL statement `CREATE FUNCTION`.

To create a standalone function using Create Function tool:

1. In the Connections frame, expand `hr_conn`.
2. In the list of schema object types, right-click **Functions**.
3. In the list of choices, click **New Function**.

The Create Function window opens.

4. For Schema, accept the default value, `HR`.
5. For Name, change `FUNCTION1` to `CALCULATE_SCORE`.
6. For Return Type, select **NUMBER** from the menu.
7. Click the icon **Add Parameter**.

A row appears under the column headings. Its fields have these default values: Name, `PARAM1`; Mode, `IN`; No Copy, deselected; Data Type, `VARCHAR2`; Default Value, empty.

8. For Name, change `PARAM1` to `cat`.
9. For Mode, accept the default value, `IN`.
10. For Data Type, accept the default, `VARCHAR2`.
11. Leave Default Value empty.
12. Add a second parameter by repeating steps 7 through 11 with the Name `score` and the Data Type `NUMBER`.
13. Add a third parameter by repeating steps 7 through 11 with the Name `weight` and the Data Type `NUMBER`.
14. Click **OK**.

The `CALCULATE_SCORE` pane opens, showing the `CREATE FUNCTION` statement that created the function:

```
CREATE OR REPLACE FUNCTION CALCULATE_SCORE
(
  CAT IN VARCHAR2
  , SCORE IN NUMBER
  , WEIGHT IN NUMBER
) RETURN NUMBER AS
BEGIN
  RETURN NULL;
END CALCULATE_SCORE;
```

The title of the `CALCULATE_SCORE` pane is in italic font, indicating that the function is not yet saved in the database.

Because the only statement in the execution part of the function is the statement `RETURN NULL`, the function does nothing.

15. Replace `NULL` with `score * weight`.

16. From the File menu, select **Save**.

Oracle Database compiles the function and saves it. The title of the `CALCULATE_SCORE` pane is no longer in italic font. The Message - Log pane has the message `Compiled`.

 **See Also:**

- "[About Data Definition Language \(DDL\) Statements](#)" for general information that applies to the `CREATE FUNCTION` statement
- *Oracle Database PL/SQL Language Reference* for information about the `CREATE FUNCTION` statement

5.5.4 Changing Standalone Subprograms

To change a standalone subprogram, use either the SQL Developer tool Edit or the DDL statement `ALTER PROCEDURE` or `ALTER FUNCTION`.

To change a standalone subprogram using the Edit tool:

1. In the Connections frame, expand `hr_conn`.
2. In the list of schema object types, expand either **Functions** or **Procedures**.

A list of functions or procedures appears.

3. Click the function or procedure to change.

To the right of the Connections frame, a frame appears. Its top tab has the name of the subprogram to change. The Code pane shows the code that created the subprogram.

The Code pane is in write mode. (Clicking the pencil icon switches the mode from write mode to read only, or the reverse.)

4. In the Code pane, change the code.

The title of the pane changes to italic font, indicating that the change is not yet saved in the database.

5. From the File menu, select **Save**.

Oracle Database compiles the subprogram and saves it. The title of the pane is no longer in italic font. The Message - Log pane has the message `Compiled`.

 **See Also:**

- ["About Data Definition Language \(DDL\) Statements"](#) for general information that applies to the ALTER PROCEDURE and ALTER FUNCTION statements
- *Oracle Database PL/SQL Language Reference* for information about the ALTER PROCEDURE statement
- *Oracle Database PL/SQL Language Reference* for information about the ALTER FUNCTION statement

5.5.5 Tutorial: Testing a Standalone Function

This tutorial shows how to use the SQL Developer tool Run to test the standalone function `CALCULATE_SCORE`.

To test the `CALCULATE_SCORE` function using the Run tool:

1. In the Connections frame, expand `hr_conn`.
2. In the list of schema object types, expand **Functions**.
3. In the list of functions, right-click `CALCULATE_SCORE`.
4. In the list of choices, click **Run**.

The Run PL/SQL window opens. Its PL/SQL Block frame includes this code:

```
v_Return := CALCULATE_SCORE (  
    CAT => CAT,  
    SCORE => SCORE,  
    WEIGHT => WEIGHT  
);
```

5. Change the values of `SCORE` and `WEIGHT` to 8 and 0.2, respectively:

```
v_Return := CALCULATE_SCORE (  
    CAT => CAT,  
    SCORE => 8,  
    WEIGHT => 0.2  
);
```

6. Click **OK**.

Under the Code pane, the Running window opens, showing this result:

```
Connecting to the database hr_conn.  
Process exited.  
Disconnecting from the database hr_conn.
```

To the right of the tab Running is the tab Output Variables.

7. Click the tab **Output Variables**.

Two frames appear, Variable and Value, which contain the values `<Return Value>` and 1.6, respectively.

 **See Also:**

Oracle SQL Developer User's Guide for information about using SQL Developer to run and debug procedures and functions

5.5.6 Dropping Standalone Subprograms

To drop a standalone subprogram, use either the SQL Developer Connections frame and Drop tool, or the DDL statement `DROP PROCEDURE` or `DROP FUNCTION`.

 **Caution:**

Do not drop the procedure `ADD_EVALUATION` or the function `CALCULATE_SCORE`—you need them for later tutorials. If you want to practice dropping subprograms, create simple ones and then drop them.

To drop a standalone subprogram using the Drop tool:

1. In the Connections frame, expand **hr_conn**.
2. In the list of schema object types, expand either **Functions** or **Procedures**.
3. In the list of functions or procedures, right-click the name of the function or procedure to drop.
4. In the list of choices, click **Drop**.
5. In the Drop window, click **Apply**.
6. In the Confirmation window, click **OK**.

 **See Also:**

- "[About Data Definition Language \(DDL\) Statements](#)" for general information that applies to the `DROP PROCEDURE` and `DROP FUNCTION` statements
- *Oracle Database SQL Language Reference* for information about the `DROP PROCEDURE` statement
- *Oracle Database SQL Language Reference* for information about the `DROP FUNCTION` statement

5.6 Creating and Managing Packages

You can create and manage PL/SQL packages.

- [About Package Structure](#)
A package always has a specification, and usually has a body. The specification defines the package itself, and is an application program interface (API). The body defines the queries for the declared cursors, and the code for the subprograms, that are declared in the package specification.
- [Tutorial: Creating a Package Specification](#)
This tutorial shows how to use the Create Package tool to create a specification for a package named EMP_EVAL, which appears in many tutorials and examples in this document.
- [Tutorial: Changing a Package Specification](#)
This tutorial shows how to use the Edit tool to change the specification for the EMP_EVAL package, which appears in many tutorials and examples in this document. Specifically, the tutorial shows how to add declarations for a procedure, EVAL_DEPARTMENT, and a function, CALCULATE_SCORE.
- [Tutorial: Creating a Package Body](#)
This tutorial shows how to use the Create Body tool to create a body for the EMP_EVAL package, which appears in many examples and tutorials in this document.
- [Dropping a Package](#)
To drop a package (both specification and body), use either the SQL Developer Connections frame and Drop tool, or the DDL statement DROP PACKAGE.

**See Also:**

"[Tutorial: Declaring Variables and Constants in a Subprogram](#)", which shows how to change a package body

5.6.1 About Package Structure

A package always has a specification, and usually has a body. The specification defines the package itself, and is an application program interface (API). The body defines the queries for the declared cursors, and the code for the subprograms, that are declared in the package specification.

The **package specification** defines the package, declaring the types, variables, constants, exceptions, declared cursors, and subprograms that can be referenced from outside the package. A package specification is an **application program interface (API)**: It has all the information that client programs need to invoke its subprograms, but no information about their implementation.

The **package body** defines the queries for the declared cursors, and the code for the subprograms, that are declared in the package specification (therefore, a package with neither declared cursors nor subprograms does not need a body). The package body can also define **local subprograms**, which are not declared in the specification and can be invoked only by other subprograms in the package. Package body contents are hidden from client programs. You can change the package body without invalidating the applications that call the package.

 **See Also:**

- *Oracle Database PL/SQL Language Reference* for more information about the package specification
- *Oracle Database PL/SQL Language Reference* for more information about the package body

5.6.2 Tutorial: Creating a Package Specification

This tutorial shows how to use the Create Package tool to create a specification for a package named EMP_EVAL, which appears in many tutorials and examples in this document.

To create a package specification, use either the SQL Developer tool Create Package or the DDL statement CREATE PACKAGE.

To create a package specification using Create Package tool:

1. In the Connections frame, expand **hr_conn**.
2. In the list of schema object types, right-click **Packages**.
3. In the list of choices, click **New Package**.

The Create Package window opens. The field Schema has the value HR, the field Name has the default value PACKAGE1, and the check box Add New Source In Lowercase is deselected.

4. For Schema, accept the default value, HR.
5. For Name, change the value PACKAGE1 to EMP_EVAL.
6. Click **OK**.

The EMP_EVAL pane opens, showing the CREATE PACKAGE statement that created the package:

```
CREATE OR REPLACE PACKAGE emp_eval AS

    /* TODO enter package declarations (types, exceptions, methods etc) here */

END emp_eval;
```

The title of the pane is in italic font, indicating that the package is not saved to the database.

7. (Optional) In the CREATE PACKAGE statement, replace the comment with declarations.

If you do not do this step now, you can do it later, as in "[Tutorial: Changing a Package Specification](#)".

8. From the File menu, select **Save**.

Oracle Database compiles the package and saves it. The title of the EMP_EVAL pane is no longer in italic font.

 **See Also:**

Oracle Database PL/SQL Language Reference for information about the CREATE PACKAGE statement (for the package specification)

5.6.3 Tutorial: Changing a Package Specification

This tutorial shows how to use the Edit tool to change the specification for the EMP_EVAL package, which appears in many tutorials and examples in this document. Specifically, the tutorial shows how to add declarations for a procedure, EVAL_DEPARTMENT, and a function, CALCULATE_SCORE.

To change a package specification, use either the SQL Developer tool Edit or the DDL statement CREATE PACKAGE with the OR REPLACE clause.

To change EMP_EVAL package specification using the Edit tool:

1. In the Connections frame, expand **hr_conn**.
2. In the list of schema object types, expand **Packages**.
3. In the list of packages, right-click **EMP_EVAL**.
4. In the list of choices, click **Edit**.

The EMP_EVAL pane opens, showing the CREATE PACKAGE statement that created the package:

```
CREATE OR REPLACE PACKAGE emp_eval AS

    /* TODO enter package declarations (types, exceptions, methods etc) here */

END emp_eval;
```

The title of the pane is not in italic font, indicating that the package is saved in the database.

5. In the EMP_EVAL pane, replace the comment with this code:

```
PROCEDURE eval_department ( dept_id IN NUMBER );

FUNCTION calculate_score ( evaluation_id IN NUMBER
                        , performance_id IN NUMBER)
RETURN NUMBER;
```

The title of the EMP_EVAL pane changes to italic font, indicating that the changes have not been saved to the database.

6. Click the icon **Compile**.

The changed package specification compiles and is saved to the database. The title of the EMP_EVAL pane is no longer in italic font.

 **See Also:**

Oracle Database PL/SQL Language Reference for information about the CREATE PACKAGE statement with the OR REPLACE clause

5.6.4 Tutorial: Creating a Package Body

This tutorial shows how to use the Create Body tool to create a body for the EMP_EVAL package, which appears in many examples and tutorials in this document.

To create a package body, use either the SQL Developer tool Create Body or the DDL statement CREATE PACKAGE BODY.

To create a body for the package EMP_EVAL using the Create Body tool:

1. In the Connections frame, expand **hr_conn**.
2. In the list of schema object types, expand **Packages**.
3. In the list of packages, right-click **EMP_EVAL**.
4. In the list of choices, click **Create Body**.

The EMP_EVAL Body pane appears, showing the automatically generated code for the package body:

```
CREATE OR REPLACE
PACKAGE BODY EMP_EVAL AS

    PROCEDURE eval_department(dept_id IN NUMBER) AS
    BEGIN
        -- TODO implementation required for PROCEDURE EMP_EVAL.eval_department
        NULL;
    END eval_department;

    FUNCTION calculate_score ( evaluation_id IN NUMBER
                              , performance_id IN NUMBER)
    RETURN NUMBER AS

    BEGIN
        -- TODO implementation required for FUNCTION EMP_EVAL.calculate_score
        RETURN NULL;
    END calculate_score;

END EMP_EVAL;
```

The title of the pane is in italic font, indicating that the code is not saved in the database.

5. (Optional) In the CREATE PACKAGE BODY statement:
 - Replace the comments with executable statements.
 - (Optional) In the executable part of the procedure, either delete NULL or replace it with an executable statement.
 - (Optional) In the executable part of the function, either replace NULL with another expression.

If you do not do this step now, you can do it later, as in "[Tutorial: Declaring Variables and Constants in a Subprogram](#)".

6. Click the icon **Compile**.

The changed package body compiles and is saved to the database. The title of the EMP_EVAL Body pane is no longer in italic font.

 **See Also:**

Oracle Database PL/SQL Language Reference for information about the CREATE PACKAGE BODY statement (for the package body)

5.6.5 Dropping a Package

To drop a package (both specification and body), use either the SQL Developer Connections frame and Drop tool, or the DDL statement DROP PACKAGE.

 **Caution:**

Do not drop the package EMP_EVAL—you need it for later tutorials. If you want to practice dropping packages, create simple ones and then drop them.

To drop a package using the Drop tool:

1. In the Connections frame, expand **hr_conn**.
2. In the list of schema object types, expand **Packages**.
A list of packages appears.
3. In the list of packages, right-click the name of the package to drop.
4. In the list of choices, click **Drop Package**.
5. In the Drop window, click **Apply**.
6. In the Confirmation window, click **OK**.

 **See Also:**

Oracle Database PL/SQL Language Reference for information about the DROP PACKAGE statement

5.7 Declaring and Assigning Values to Variables and Constants

A variable or constant declared in a package specification is available to any program that has access to the package. A variable or constant declared in a package body or subprogram is local to that package or subprogram. When declaring a constant, you must assign it an initial value.

One significant advantage that PL/SQL has over SQL is that PL/SQL lets you declare and use variables and constants.

A variable or constant declared in a package specification is available to any program that has access to the package. A variable or constant declared in a package body or subprogram is local to that package or subprogram.

A **variable** holds a value of a particular data type. Your program can change the value at runtime. A **constant** holds a value that cannot be changed.

A variable or constant can have any PL/SQL data type. When declaring a variable, you can assign it an initial value; if you do not, its initial value is NULL. When declaring a constant, you must assign it an initial value. To assign an initial value to a variable or constant, use the assignment operator (`:=`).

 **Tip:**

Declare all values that do not change as constants. This practice optimizes your compiled code and makes your source code easier to maintain.

- [Tutorial: Declaring Variables and Constants in a Subprogram](#)
This tutorial shows how to use the SQL Developer tool Edit to declare variables and constants in the EMP_EVAL.CALCULATE_SCORE function. (This tutorial is also an example of changing a package body.)
- [Ensuring that Variables, Constants, and Parameters Have Correct Data Types](#)
Ensure that variables, constants, and parameters have the correct data types by declaring them with the %TYPE attribute.
- [Tutorial: Changing Declarations to Use the %TYPE Attribute](#)
This tutorial shows how to use the SQL Developer tool Edit to change the declarations of the variables, constants, and formal parameters of the EMP_EVAL.CALCULATE_SCORE function to use the %TYPE attribute.
- [Assigning Values to Variables](#)

 **See Also:**

Oracle Database PL/SQL Language Reference for general information about variables and constants

5.7.1 Tutorial: Declaring Variables and Constants in a Subprogram

This tutorial shows how to use the SQL Developer tool Edit to declare variables and constants in the EMP_EVAL.CALCULATE_SCORE function. (This tutorial is also an example of changing a package body.)

The EMP_EVAL.CALCULATE_SCORE function is specified in "[Tutorial: Creating a Package Specification](#)".

To declare variables and constants in CALCULATE_SCORE function:

1. In the Connections frame, expand **hr_conn**.
2. In the list of schema object types, expand **Packages**.
3. In the list of packages, expand **EMP_EVAL**.
4. In the list of choices, right-click **EMP_EVAL Body**.

A list of choices appears.

5. In the list of choices, click **Edit**.

The EMP_EVAL Body pane appears, showing the code for the package body:

```
CREATE OR REPLACE
PACKAGE BODY EMP_EVAL AS

    PROCEDURE eval_department ( dept_id IN NUMBER ) AS

    BEGIN
        -- TODO implementation required for PROCEDURE EMP_EVAL.eval_department
        NULL;
    END eval_department;

    FUNCTION calculate_score ( evaluation_id IN NUMBER
                              , performance_id IN NUMBER)
                              RETURN NUMBER AS

    BEGIN
        -- TODO implementation required for FUNCTION EMP_EVAL.calculate_score
        RETURN NULL;
    END calculate_score;

END EMP_EVAL;
```

6. Between RETURN NUMBER AS and BEGIN, add these variable and constant declarations:

```
n_score      NUMBER(1,0);          -- variable
n_weight     NUMBER;              -- variable
max_score    CONSTANT NUMBER(1,0) := 9; -- constant, initial value 9
max_weight   CONSTANT NUMBER(8,8) := 1; -- constant, initial value 1
```

The title of the EMP_EVAL Bodypane changes to italic font, indicating that the code is not saved in the database.

7. From the File menu, select **Save**.

Oracle Database compiles and saves the changed package body. The title of the EMP_EVAL Body pane is no longer in italic font.

 **See Also:**

- *Oracle Database PL/SQL Language Reference* for general information about declaring variables and constants
- ["Assigning Values to Variables with the Assignment Operator"](#)

5.7.2 Ensuring that Variables, Constants, and Parameters Have Correct Data Types

Ensure that variables, constants, and parameters have the correct data types by declaring them with the %TYPE attribute.

After "[Tutorial: Declaring Variables and Constants in a Subprogram](#)", the code for the EMP_EVAL.CALCULATE_SCORE function is:

```
FUNCTION calculate_score ( evaluation_id IN NUMBER
                          , performance_id IN NUMBER )
  RETURN NUMBER AS
  n_score      NUMBER(1,0);      -- variable
  n_weight     NUMBER;          -- variable
  max_score    CONSTANT NUMBER(1,0) := 9; -- constant, initial value 9
  max_weight   CONSTANT NUMBER(8,8) := 1; -- constant, initial value 1
BEGIN
  -- TODO implementation required for FUNCTION EMP_EVAL.calculate_score
  RETURN NULL;
END calculate_score;
```

The variables, constants, and parameters of the function represent values from the tables SCORES and PERFORMANCE_PARTS (created in "[Creating Tables](#)"):

- Variable n_score will hold a value from the column SCORE.Scores and constant max_score will be compared to such values.
- Variable n_weight will hold a value from the column PERFORMANCE_PARTS.WEIGHT and constant max_weight will be compared to such values.
- Parameter evaluation_id will hold a value from the column SCORE.EVALUATION_ID.
- Parameter performance_id will hold a value from the column SCORE.PERFORMANCE_ID.

Therefore, each variable, constant, and parameter has the same data type as its corresponding column.

If the data types of the columns change, you want the data types of the variables, constants, and parameters to change to the same data types; otherwise, the CALCULATE_SCORE function is invalidated.

To ensure that the data types of the variables, constants, and parameters always match those of the columns, declare them with the %TYPE attribute. The %TYPE attribute supplies the data type of a table column or another variable, ensuring the correct data type assignment.

 **See Also:**

- *Oracle Database PL/SQL Language Reference* for more information about the %TYPE attribute
- *Oracle Database PL/SQL Language Reference* for the syntax of the %TYPE attribute

5.7.3 Tutorial: Changing Declarations to Use the %TYPE Attribute

This tutorial shows how to use the SQL Developer tool Edit to change the declarations of the variables, constants, and formal parameters of the EMP_EVAL.CALCULATE_SCORE function to use the %TYPE attribute.

The EMP_EVAL.CALCULATE_SCORE function is shown in "[Tutorial: Declaring Variables and Constants in a Subprogram](#)".

To change the declarations in CALCULATE_SCORE to use %TYPE:

1. In the Connections frame, expand **hr_conn**.
2. In the list of schema object types, expand **Packages**.
3. In the list of packages, expand **EMP_EVAL**.
4. In the list of choices, right-click **EMP_EVAL Body**.
5. In the list of choices, click **Edit**.

The EMP_EVAL Bodypane appears, showing the code for the package body:

```
CREATE OR REPLACE
PACKAGE BODY emp_eval AS

    PROCEDURE eval_department ( dept_id IN NUMBER ) AS
    BEGIN
        -- TODO implementation required for PROCEDURE EMP_EVAL.eval_department
        NULL;
    END eval_department;

    FUNCTION calculate_score ( evaluation_id IN NUMBER
                              , performance_id IN NUMBER )
                              RETURN NUMBER AS
    n_score      NUMBER(1,0);      -- variable
    n_weight     NUMBER;          -- variable
    max_score    CONSTANT NUMBER(1,0) := 9; -- constant, initial value 9
    max_weight   CONSTANT NUMBER(8,8) := 1; -- constant, initial value 1
    BEGIN
        -- TODO implementation required for FUNCTION EMP_EVAL.calculate_score
        RETURN NULL;
    END calculate_score;

END emp_eval;
```

6. In the code for the function, make the changes shown in bold font:

```
FUNCTION calculate_score ( evaluation_id IN SCORES.EVALUATION_ID%TYPE
                          , performance_id IN SCORES.PERFORMANCE_ID%TYPE )
                          RETURN NUMBER AS
```

```
n_score      SCORES.SCORE%TYPE;
n_weight     PERFORMANCE_PARTS.WEIGHT%TYPE;
max_score    CONSTANT SCORES.SCORE%TYPE := 9;
max_weight   CONSTANT PERFORMANCE_PARTS.WEIGHT%TYPE := 1;
```

7. Right-click **EMP_EVAL**.

8. In the list of choices, click **Edit**.

The EMP_EVAL pane opens, showing the CREATE PACKAGE statement that created the package:

```
CREATE OR REPLACE PACKAGE EMP_EVAL AS

PROCEDURE eval_department(dept_id IN NUMBER);
FUNCTION calculate_score(evaluation_id IN NUMBER
                        , performance_id IN NUMBER)
                        RETURN NUMBER;

END EMP_EVAL;
```

9. In the code for the function, make the changes shown in bold font:

```
FUNCTION calculate_score(evaluation_id IN scores.evaluation_id%TYPE
                        , performance_id IN scores.performance_id%TYPE)
```

10. Right-click **EMP_EVAL**.

11. In the list of choices, click **Compile**.

12. Right-click **EMP_EVAL Body**.

13. In the list of choices, click **Compile**.

5.7.4 Assigning Values to Variables

You can assign a value to a variable in these ways:

- Use the assignment operator to assign it the value of an expression.
- Use the SELECT INTO or FETCH statement to assign it a value from a table.
- Pass it to a subprogram as an OUT or IN OUT parameter, and then assign the value inside the subprogram.
- Bind the variable to a value.
- [Assigning Values to Variables with the Assignment Operator](#)
With the assignment operator (:=), you can assign the value of an expression to a variable in either the declarative or executable part of a subprogram.
- [Assigning Values to Variables with the SELECT INTO Statement](#)
To use table values in subprograms or packages, you must assign them to variables with SELECT INTO statements.

 **See Also:**

- *Oracle Database PL/SQL Language Reference* for more information about assigning values to variables
- *Oracle Database 2 Day + .NET Developer's Guide for Microsoft Windows* for information about binding variables
- *Oracle Database 2 Day + PHP Developer's Guide* for information about binding variables
- *Oracle Database 2 Day + Java Developer's Guide* for information about binding variables

5.7.4.1 Assigning Values to Variables with the Assignment Operator

With the assignment operator (`:=`), you can assign the value of an expression to a variable in either the declarative or executable part of a subprogram.

In the declarative part of a subprogram, you can assign an initial value to a variable when you declare it. The syntax is:

```
variable_name data_type := expression;
```

In the executable part of a subprogram, you can assign a value to a variable with an assignment statement. The syntax is:

```
variable_name := expression;
```

[Example 5-1](#) shows, in bold font, the changes to make to the EMP_EVAL.CALCULATE_SCORE function to add a variable, `running_total`, and use it as the return value of the function. The assignment operator appears in both the declarative and executable parts of the function. (The data type of `running_total` must be NUMBER, rather than SCORES.SCORE%TYPE or PERFORMANCE_PARTS.WEIGHT%TYPE, because it holds the product of two NUMBER values with different precisions and scales.)

 **See Also:**

- *Oracle Database PL/SQL Language Reference* for variable declaration syntax
- *Oracle Database PL/SQL Language Reference* for assignment statement syntax

Example 5-1 Assigning Values to a Variable with Assignment Operator

```
FUNCTION calculate_score(evaluation_id IN SCORES.EVALUATION_ID%TYPE
                        , performance_id IN SCORES.PERFORMANCE_ID%TYPE)
RETURN NUMBER AS
n_score      SCORES.SCORE%TYPE;
n_weight     PERFORMANCE_PARTS.WEIGHT%TYPE;
running_total NUMBER := 0;
```

```

max_score      CONSTANT SCORES.SCORE%TYPE := 9;
max_weight     CONSTANT PERFORMANCE_PARTS.WEIGHT%TYPE:= 1;
BEGIN
  running_total := max_score * max_weight;
  RETURN running_total;
END calculate_score;

```

5.7.4.2 Assigning Values to Variables with the SELECT INTO Statement

To use table values in subprograms or packages, you must assign them to variables with SELECT INTO statements.

[Example 5-2](#) shows, in bold font, the changes to make to the EMP_EVAL.CALCULATE_SCORE function to have it calculate running_total from table values.

The ADD_EVAL procedure in [Example 5-3](#) inserts a row into the EVALUATIONS table, using values from the corresponding row in the EMPLOYEES table. Add the ADD_EVAL procedure to the body of the EMP_EVAL package, but not to the specification. Because it is not in the specification, ADD_EVAL is local to the package—it can be invoked only by other subprograms in the package, not from outside the package.

See Also:

Oracle Database PL/SQL Language Reference for more information about the SELECT INTO statement

Example 5-2 Assigning Table Values to Variables with SELECT INTO

```

FUNCTION calculate_score ( evaluation_id IN scores.evaluation_id%TYPE
                          , performance_id IN scores.performance_id%TYPE )
  RETURN NUMBER AS

  n_score      scores.score%TYPE;
  n_weight     performance_parts.weight%TYPE;
  running_total NUMBER := 0;
  max_score    CONSTANT scores.score%TYPE := 9;
  max_weight   CONSTANT performance_parts.weight%TYPE:= 1;
BEGIN
  SELECT s.score INTO n_score
  FROM SCORES s
  WHERE evaluation_id = s.evaluation_id
  AND performance_id = s.performance_id;

  SELECT p.weight INTO n_weight
  FROM PERFORMANCE_PARTS p
  WHERE performance_id = p.performance_id;

  running_total := n_score * n_weight;
  RETURN running_total;
END calculate_score;

```

Example 5-3 Inserting a Table Row with Values from Another Table

```

PROCEDURE add_eval ( employee_id IN EMPLOYEES.EMPLOYEE_ID%TYPE
                   , today IN DATE )

```

```
AS
job_id      EMPLOYEES.JOB_ID%TYPE;
manager_id  EMPLOYEES.MANAGER_ID%TYPE;
department_id EMPLOYEES.DEPARTMENT_ID%TYPE;
BEGIN
  INSERT INTO EVALUATIONS (
    evaluation_id,
    employee_id,
    evaluation_date,
    job_id,
    manager_id,
    department_id,
    total_score
  )
  SELECT
    evaluations_sequence.NEXTVAL, -- evaluation_id
    add_eval.employee_id,      -- employee_id
    add_eval.today,            -- evaluation_date
    e.job_id,                  -- job_id
    e.manager_id,              -- manager_id
    e.department_id,          -- department_id
    0                           -- total_score
  FROM employees e;

  IF SQL%ROWCOUNT = 0 THEN
    RAISE NO_DATA_FOUND;
  END IF;
END add_eval;
```

5.8 Controlling Program Flow

Unlike SQL, which runs statements in the order in which you enter them, PL/SQL has control statements that let you control the flow of your program.

- [About Control Statements](#)
PL/SQL has three categories of control statements: conditional selection statements, loop statements, and sequential control statements.
- [Using the IF Statement](#)
The IF statement either executes or skips a sequence of statements, depending on the value of a Boolean expression.
- [Using the CASE Statement](#)
The CASE statement chooses from a sequence of conditions, and executes the corresponding statement.
- [Using the FOR LOOP Statement](#)
The FOR LOOP statement repeats a sequence of statements once for each integer in the range lower_bound through upper_bound.
- [Using the WHILE LOOP Statement](#)
The WHILE LOOP statement repeats a sequence of statements while a condition is TRUE.
- [Using the Basic LOOP and EXIT WHEN Statements](#)
The basic LOOP statement repeats a sequence of statements.

5.8.1 About Control Statements

PL/SQL has three categories of control statements: conditional selection statements, loop statements, and sequential control statements.

Conditional selection statements let you execute different statements for different data values. The conditional selection statements are `IF` and `CASE`.

Loop statements let you repeat the same statements with a series of different data values. The loop statements are `FOR LOOP`, `WHILE LOOP`, and `BASIC LOOP`. The `EXIT` statement transfers control to the end of a loop. The `CONTINUE` statement exits the current iteration of a loop and transfers control to the next iteration. Both `EXIT` and `CONTINUE` have an optional `WHEN` clause, in which you can specify a condition.

Sequential control statements let you go to a specified labeled statement or to do nothing. The sequential control statements are `GOTO` and `NULL`.

See Also:

Oracle Database PL/SQL Language Reference for an overview of PL/SQL control statements

5.8.2 Using the IF Statement

The `IF` statement either executes or skips a sequence of statements, depending on the value of a Boolean expression.

The `IF` statement has this syntax:

```
IF boolean_expression THEN statement [, statement ]
[ ELSIF boolean_expression THEN statement [, statement ] ]...
[ ELSE statement [, statement ] ]
END IF;
```

Suppose that your company evaluates employees twice a year in the first 10 years of employment, but only once a year afterward. You want a function that returns the evaluation frequency for an employee. You can use an `IF` statement to determine the return value of the function, as in [Example 5-4](#).

Add the `EVAL_FREQUENCY` function to the body of the `EMP_EVAL` package, but not to the specification. Because it is not in the specification, `EVAL_FREQUENCY` is local to the package—it can be invoked only by other subprograms in the package, not from outside the package.

Tip:

When using a PL/SQL variable in a SQL statement, as in the second `SELECT` statement in [Example 5-4](#), qualify the variable with the subprogram name to ensure that it is not mistaken for a table column.

 **See Also:**

- *Oracle Database PL/SQL Language Reference* for the syntax of the IF statement
- *Oracle Database PL/SQL Language Reference* for more information about using the IF statement

Example 5-4 IF Statement that Determines Return Value of Function

```

FUNCTION eval_frequency (emp_id IN EMPLOYEES.EMPLOYEE_ID%TYPE)
    RETURN PLS_INTEGER
AS
    h_date    EMPLOYEES.HIRE_DATE%TYPE;
    today     EMPLOYEES.HIRE_DATE%TYPE;
    eval_freq PLS_INTEGER;
BEGIN
    SELECT SYSDATE INTO today FROM DUAL;

    SELECT HIRE_DATE INTO h_date
    FROM EMPLOYEES
    WHERE EMPLOYEE_ID = eval_frequency.emp_id;

    IF ((h_date + (INTERVAL '120' MONTH)) < today) THEN
        eval_freq := 1;
    ELSE
        eval_freq := 2;
    END IF;

    RETURN eval_freq;
END eval_frequency;

```

5.8.3 Using the CASE Statement

The CASE statement chooses from a sequence of conditions, and executes the corresponding statement.

The simple CASE statement evaluates a single expression and compares it to several potential values. It has this syntax:

```

CASE expression
WHEN value THEN statement
[ WHEN value THEN statement ]...
[ ELSE statement [, statement ]... ]
END CASE;

```

The searched CASE statement evaluates multiple Boolean expressions and chooses the first one whose value is TRUE. For information about the searched CASE statement, see *Oracle Database PL/SQL Language Reference*.

 **Tip:**

When you can use either a CASE statement or nested IF statements, use a CASE statement—it is both more readable and more efficient.

Suppose that, if an employee is evaluated only once a year, you want the EVAL_FREQUENCY function to suggest a salary increase, which depends on the JOB_ID.

Change the EVAL_FREQUENCY function as shown in bold font in [Example 5-5](#). (For information about the procedures that prints the strings, DBMS_OUTPUT.PUT_LINE, see *Oracle Database PL/SQL Packages and Types Reference*.)

Example 5-5 CASE Statement that Determines Which String to Print

```
FUNCTION eval_frequency (emp_id IN EMPLOYEES.EMPLOYEE_ID%TYPE)
    RETURN PLS_INTEGER
AS
    h_date      EMPLOYEES.HIRE_DATE%TYPE;
    today       EMPLOYEES.HIRE_DATE%TYPE;
    eval_freq   PLS_INTEGER;
    j_id        EMPLOYEES.JOB_ID%TYPE;

BEGIN
    SELECT SYSDATE INTO today FROM DUAL;

    SELECT HIRE_DATE, JOB_ID INTO h_date, j_id
    FROM EMPLOYEES
    WHERE EMPLOYEE_ID = eval_frequency.emp_id;

    IF ((h_date + (INTERVAL '12' MONTH)) < today) THEN
        eval_freq := 1;

        CASE j_id
            WHEN 'PU_CLERK' THEN DBMS_OUTPUT.PUT_LINE(
                'Consider 8% salary increase for employee # ' || emp_id);
            WHEN 'SH_CLERK' THEN DBMS_OUTPUT.PUT_LINE(
                'Consider 7% salary increase for employee # ' || emp_id);
            WHEN 'ST_CLERK' THEN DBMS_OUTPUT.PUT_LINE(
                'Consider 6% salary increase for employee # ' || emp_id);
            WHEN 'HR_REP' THEN DBMS_OUTPUT.PUT_LINE(
                'Consider 5% salary increase for employee # ' || emp_id);
            WHEN 'PR_REP' THEN DBMS_OUTPUT.PUT_LINE(
                'Consider 5% salary increase for employee # ' || emp_id);
            WHEN 'MK_REP' THEN DBMS_OUTPUT.PUT_LINE(
                'Consider 4% salary increase for employee # ' || emp_id);
            ELSE DBMS_OUTPUT.PUT_LINE(
                'Nothing to do for employee # ' || emp_id);
        END CASE;
    ELSE
        eval_freq := 2;
    END IF;

    RETURN eval_freq;
END eval_frequency;
```

 See Also:

- "Using CASE Expressions in Queries"
- *Oracle Database PL/SQL Language Reference* for the syntax of the CASE statement
- *Oracle Database PL/SQL Language Reference* for more information about using the CASE statement

5.8.4 Using the FOR LOOP Statement

The FOR LOOP statement repeats a sequence of statements once for each integer in the range `lower_bound` through `upper_bound`.

The syntax of the FOR LOOP is:

```
FOR counter IN lower_bound..upper_bound LOOP
    statement [, statement ]...
END LOOP;
```

The statements between LOOP and END LOOP can use counter, but cannot change its value.

Suppose that, instead of only suggesting a salary increase, you want the EVAL_FREQUENCY function to report what the salary would be if it increased by the suggested amount every year for five years.

Change the EVAL_FREQUENCY function as shown in bold font in [Example 5-6](#). (For information about the procedure that prints the strings, `DBMS_OUTPUT.PUT_LINE`, see *Oracle Database PL/SQL Packages and Types Reference*.)

Example 5-6 FOR LOOP Statement that Computes Salary After Five Years

```
FUNCTION eval_frequency (emp_id IN EMPLOYEES.EMPLOYEE_ID%TYPE)
    RETURN PLS_INTEGER
AS
    h_date      EMPLOYEES.HIRE_DATE%TYPE;
    today       EMPLOYEES.HIRE_DATE%TYPE;
    eval_freq   PLS_INTEGER;
    j_id        EMPLOYEES.JOB_ID%TYPE;
    sal         EMPLOYEES.SALARY%TYPE;
    sal_raise  NUMBER(3,3) := 0;

BEGIN
    SELECT SYSDATE INTO today FROM DUAL;

    SELECT HIRE_DATE, JOB_ID, SALARY INTO h_date, j_id, sal
    FROM EMPLOYEES
    WHERE EMPLOYEE_ID = eval_frequency.emp_id;

    IF ((h_date + (INTERVAL '12' MONTH)) < today) THEN
        eval_freq := 1;

        CASE j_id
            WHEN 'PU_CLERK' THEN sal_raise := 0.08;
            WHEN 'SH_CLERK' THEN sal_raise := 0.07;
            WHEN 'ST_CLERK' THEN sal_raise := 0.06;
        END CASE;
    END IF;
END;
```

```
WHEN 'HR_REP' THEN sal_raise := 0.05;
WHEN 'PR_REP' THEN sal_raise := 0.05;
WHEN 'MK_REP' THEN sal_raise := 0.04;
ELSE NULL;
END CASE;

IF (sal_raise != 0) THEN
  BEGIN
    DBMS_OUTPUT.PUT_LINE('If salary ' || sal || ' increases by ' ||
      ROUND((sal_raise * 100),0) ||
      '% each year for 5 years, it will be:');

    FOR i IN 1..5 LOOP
      sal := sal * (1 + sal_raise);
      DBMS_OUTPUT.PUT_LINE(ROUND(sal, 2) || ' after ' || i || ' year(s)');
    END LOOP;
  END;
END IF;

ELSE
  eval_freq := 2;
END IF;

RETURN eval_freq;
END eval_frequency;
```

 **See Also:**

- *Oracle Database PL/SQL Language Reference* for the syntax of the FOR LOOP statement
- *Oracle Database PL/SQL Language Reference* for more information about using the FOR LOOP statement

5.8.5 Using the WHILE LOOP Statement

The WHILE LOOP statement repeats a sequence of statements while a condition is TRUE.

The syntax of the WHILE LOOP statement is:

```
WHILE condition LOOP
  statement [, statement ]...
END LOOP;
```

 **Note:**

If the statements between LOOP and END LOOP never cause condition to become FALSE, then the WHILE LOOP statement runs indefinitely.

Suppose that the EVAL_FREQUENCY function uses the WHILE LOOP statement instead of the FOR LOOP statement and ends after the proposed salary exceeds the maximum salary for the JOB_ID.

Change the EVAL_FREQUENCY function as shown in bold font in [Example 5-7](#). (For information about the procedures that prints the strings, DBMS_OUTPUT.PUT_LINE, see *Oracle Database PL/SQL Packages and Types Reference*.)

Example 5-7 WHILE LOOP Statement that Computes Salary to Maximum

```
FUNCTION eval_frequency (emp_id IN EMPLOYEES.EMPLOYEE_ID%TYPE)
    RETURN PLS_INTEGER
AS
    h_date      EMPLOYEES.HIRE_DATE%TYPE;
    today       EMPLOYEES.HIRE_DATE%TYPE;
    eval_freq   PLS_INTEGER;
    j_id        EMPLOYEES.JOB_ID%TYPE;
    sal         EMPLOYEES.SALARY%TYPE;
    sal_raise   NUMBER(3,3) := 0;
    sal_max     JOBS.MAX_SALARY%TYPE;

BEGIN
    SELECT SYSDATE INTO today FROM DUAL;

    SELECT HIRE_DATE, j.JOB_ID, SALARY, MAX_SALARY INTO h_date, j_id, sal, sal_max
FROM EMPLOYEES e, JOBS j
    WHERE EMPLOYEE_ID = eval_frequency.emp_id AND JOB_ID = eval_frequency.j_id;

    IF ((h_date + (INTERVAL '12' MONTH)) < today) THEN
        eval_freq := 1;

        CASE j_id
            WHEN 'PU_CLERK' THEN sal_raise := 0.08;
            WHEN 'SH_CLERK' THEN sal_raise := 0.07;
            WHEN 'ST_CLERK' THEN sal_raise := 0.06;
            WHEN 'HR_REP'   THEN sal_raise := 0.05;
            WHEN 'PR_REP'   THEN sal_raise := 0.05;
            WHEN 'MK_REP'   THEN sal_raise := 0.04;
            ELSE NULL;
        END CASE;

        IF (sal_raise != 0) THEN
            BEGIN
                DBMS_OUTPUT.PUT_LINE('If salary ' || sal || ' increases by ' ||
                    ROUND((sal_raise * 100),0) ||
                    '% each year, it will be:');

                WHILE sal <= sal_max LOOP
                    sal := sal * (1 + sal_raise);
                    DBMS_OUTPUT.PUT_LINE(ROUND(sal, 2));
                END LOOP;

                DBMS_OUTPUT.PUT_LINE('Maximum salary for this job is ' || sal_max);
            END;
        END IF;
    ELSE
        eval_freq := 2;
    END IF;

    RETURN eval_freq;
END eval_frequency;
```

 **See Also:**

- *Oracle Database PL/SQL Language Reference* for the syntax of the WHILE LOOP statement
- *Oracle Database PL/SQL Language Reference* for more information about using the WHILE LOOP statement

5.8.6 Using the Basic LOOP and EXIT WHEN Statements

The basic LOOP statement repeats a sequence of statements.

The syntax of the basic LOOP statement is:

```
LOOP
    statement [, statement ]...
END LOOP;
```

At least one statement must be an EXIT statement; otherwise, the LOOP statement runs indefinitely.

The EXIT WHEN statement (the EXIT statement with its optional WHEN clause) exits a loop when a condition is TRUE and transfers control to the end of the loop.

In the EVAL_FREQUENCY function, in the last iteration of the WHILE LOOP statement, the last computed value usually exceeds the maximum salary.

Change the WHILE LOOP statement to a basic LOOP statement that includes an EXIT WHEN statement, as in [Example 5-8](#).

Example 5-8 Using the EXIT WHEN Statement

```
FUNCTION eval_frequency (emp_id IN EMPLOYEES.EMPLOYEE_ID%TYPE)
    RETURN PLS_INTEGER
AS
    h_date      EMPLOYEES.HIRE_DATE%TYPE;
    today       EMPLOYEES.HIRE_DATE%TYPE;
    eval_freq   PLS_INTEGER;
    j_id        EMPLOYEES.JOB_ID%TYPE;
    sal         EMPLOYEES.SALARY%TYPE;
    sal_raise   NUMBER(3,3) := 0;
    sal_max     JOBS.MAX_SALARY%TYPE;

BEGIN
    SELECT SYSDATE INTO today FROM DUAL;

    SELECT HIRE_DATE, j.JOB_ID, SALARY, MAX_SALARY INTO h_date, j_id, sal, sal_max
    FROM EMPLOYEES e, JOBS j
    WHERE EMPLOYEE_ID = eval_frequency.emp_id AND JOB_ID = eval_frequency.j_id;

    IF ((h_date + (INTERVAL '12' MONTH)) < today) THEN
        eval_freq := 1;

        CASE j_id
            WHEN 'PU_CLERK' THEN sal_raise := 0.08;
            WHEN 'SH_CLERK' THEN sal_raise := 0.07;
            WHEN 'ST_CLERK' THEN sal_raise := 0.06;
            WHEN 'HR_REP'   THEN sal_raise := 0.05;
```

```
        WHEN 'PR_REP' THEN sal_raise := 0.05;
        WHEN 'MK_REP' THEN sal_raise := 0.04;
        ELSE NULL;
    END CASE;

    IF (sal_raise != 0) THEN
    BEGIN
        DBMS_OUTPUT.PUT_LINE('If salary ' || sal || ' increases by ' ||
            ROUND((sal_raise * 100),0) ||
            '% each year, it will be:');

        LOOP
            sal := sal * (1 + sal_raise);
            EXIT WHEN sal > sal_max;
            DBMS_OUTPUT.PUT_LINE(ROUND(sal,2));
        END LOOP;

        DBMS_OUTPUT.PUT_LINE('Maximum salary for this job is ' || sal_max);
    END;
    END IF;
    ELSE
        eval_freq := 2;
    END IF;

    RETURN eval_freq;
END eval_frequency;
```

5.9 Using Records and Cursors

You can store data values in records, and use a cursor as a pointer to a result set and related processing information.

- [About Records](#)
A **record** is a PL/SQL composite variable that can store data values of different types. You can treat Internal components (**fields**) like scalar variables. You can pass entire records as subprogram parameters. Records are useful for holding data from table rows, or from certain columns of table rows.
- [Tutorial: Declaring a RECORD Type](#)
This tutorial shows how to use the SQL Developer tool Edit to declare a RECORD type, `sal_info`, whose fields can hold salary information for an employee—job ID, minimum and maximum salary for that job ID, current salary, and suggested raise.

- [Tutorial: Creating and Invoking a Subprogram with a Record Parameter](#)
This tutorial shows how to use the SQL Developer tool Edit to create and invoke a subprogram with a parameter of the record type `sal_info`.
- [About Cursors](#)
When Oracle Database executes a SQL statement, it stores the result set and processing information in an unnamed private SQL area. A pointer to this unnamed area, called a **cursor**, lets you retrieve the result set one row at a time. **Cursor attributes** return information about the state of the cursor.
- [Using a Declared Cursor to Retrieve Result Set Rows One at a Time](#)
You can use a declared cursor to retrieve result set rows one at a time.

5.9.1 About Records

A **record** is a PL/SQL composite variable that can store data values of different types. You can treat internal components (**fields**) like scalar variables. You can pass entire records as subprogram parameters. Records are useful for holding data from table rows, or from certain columns of table rows.

A **record** is a PL/SQL composite variable that can store data values of different types, similar to a struct type in C, C++, or Java. The internal components of a record are called **fields**. To access a record field, you use **dot notation**:
`record_name.field_name`.

You can treat record fields like scalar variables. You can also pass entire records as subprogram parameters.

Records are useful for holding data from table rows, or from certain columns of table rows. Each record field corresponds to a table column.

There are three ways to create a record:

- Declare a **RECORD** type and then declare a variable of that type.

The syntax is:

```
TYPE record_name IS RECORD
  ( field_name data_type [:= initial_value]
    [, field_name data_type [:= initial_value ] ]... );

variable_name record_name;
```

- Declare a variable of the type table_name%ROWTYPE.

The fields of the record have the same names and data types as the columns of the table.

- Declare a variable of the type cursor_name%ROWTYPE.

The fields of the record have the same names and data types as the columns of the table in the FROM clause of the cursor SELECT statement.

See Also:

- *Oracle Database PL/SQL Language Reference* for more information about defining RECORD types and declaring records of that type
- *Oracle Database PL/SQL Language Reference* for the syntax of a RECORD type definition
- *Oracle Database PL/SQL Language Reference* for more information about the %ROWTYPE attribute
- *Oracle Database PL/SQL Language Reference* for the syntax of the %ROWTYPE attribute

5.9.2 Tutorial: Declaring a RECORD Type

This tutorial shows how to use the SQL Developer tool Edit to declare a RECORD type, sal_info, whose fields can hold salary information for an employee—job ID, minimum and maximum salary for that job ID, current salary, and suggested raise.

To declare RECORD type sal_info:

1. In the Connections frame, expand **hr_conn**.
Under the hr_conn icon, a list of schema object types appears.
2. Expand **Packages**.
A list of packages appears.
3. Right-click **EMP_EVAL**.
A list of choices appears.
4. Click **Edit**.

The EMP_EVAL pane opens, showing the CREATE PACKAGE statement that created the package:

```
CREATE OR REPLACE PACKAGE EMP_EVAL AS
```

```

PROCEDURE eval_department(dept_id IN NUMBER);
FUNCTION calculate_score(evaluation_id IN NUMBER
                        , performance_id IN NUMBER)
RETURN NUMBER;

END EMP_EVAL;

```

5. In the EMP_EVAL pane, immediately before END EMP_EVAL, add this code:

```

TYPE sal_info IS RECORD
( j_id      jobs.job_id%type
  , sal_min  jobs.min_salary%type
  , sal_max  jobs.max_salary%type
  , sal      employees.salary%type
  , sal_raise NUMBER(3,3) );

```

The title of the pane is in italic font, indicating that the changes have not been saved to the database.

6. Click the icon **Compile**.

The changed package specification compiles and is saved to the database. The title of the EMP_EVAL pane is no longer in italic font.

Now you can declare records of the type sal_info, as in "[Tutorial: Creating and Invoking a Subprogram with a Record Parameter](#)".

5.9.3 Tutorial: Creating and Invoking a Subprogram with a Record Parameter

This tutorial shows how to use the SQL Developer tool Edit to create and invoke a subprogram with a parameter of the record type sal_info.

The record type sal_info was created in "[Tutorial: Declaring a RECORD Type](#)".

This tutorial shows how to use the SQL Developer tool Edit to do the following:

- Create a procedure, SALARY_SCHEDULE, which has a parameter of type sal_info.
- Change the EVAL_FREQUENCY function so that it declares a record, emp_sal, of the type sal_info, populates its fields, and passes it to the SALARY_SCHEDULE procedure.

Because EVAL_FREQUENCY will invoke SALARY_SCHEDULE, the declaration of SALARY_SCHEDULE must precede the declaration of EVAL_FREQUENCY (otherwise the package will not compile). However, the definition of SALARY_SCHEDULE can be anywhere in the package body.

To create SALARY_SCHEDULE and change EVAL_FREQUENCY:

1. In the Connections frame, expand **hr_conn**.
2. In the list of schema object types, expand **Packages**.
3. In the list of packages, expand **EMP_EVAL**.
4. In the list of choices, right-click **EMP_EVAL Body**.
5. In the list of choices, click **Edit**.

The EMP_EVAL Bodypane appears, showing the code for the package body.

6. In the EMP_EVAL Body pane, immediately before END EMP_EVAL, add this definition of the SALARY_SCHEDULE procedure:

```
PROCEDURE salary_schedule (emp IN sal_info) AS
    accumulating_sal NUMBER;
BEGIN
    DBMS_OUTPUT.PUT_LINE('If salary ' || emp.sal ||
        ' increases by ' || ROUND((emp.sal_raise * 100),0) ||
        '% each year, it will be:');

    accumulating_sal := emp.sal;

    WHILE accumulating_sal <= emp.sal_max LOOP
        accumulating_sal := accumulating_sal * (1 + emp.sal_raise);
        DBMS_OUTPUT.PUT_LINE(ROUND(accumulating_sal,2) || ', ');
    END LOOP;
END salary_schedule;
```

The title of the pane is in italic font, indicating that the changes have not been saved to the database.

7. In the EMP_EVAL Body pane, enter the code shown in bold font, in this position:

```
CREATE OR REPLACE
PACKAGE BODY EMP_EVAL AS

FUNCTION eval_frequency (emp_id EMPLOYEES.EMPLOYEE_ID%TYPE)
    RETURN PLS_INTEGER;
PROCEDURE salary_schedule(emp IN sal_info);
PROCEDURE add_eval(employee_id IN employees.employee_id%type, today IN DATE);

PROCEDURE eval_department (dept_id IN NUMBER) AS
```

8. Edit the EVAL_FREQUENCY function, making the changes shown in bold font:

```
FUNCTION eval_frequency (emp_id EMPLOYEES.EMPLOYEE_ID%TYPE)
    RETURN PLS_INTEGER
AS
    h_date      EMPLOYEES.HIRE_DATE%TYPE;
    today       EMPLOYEES.HIRE_DATE%TYPE;
    eval_freq   PLS_INTEGER;
    emp_sal     SAL_INFO; -- replaces sal, sal_raise, and sal_max

BEGIN
    SELECT SYSDATE INTO today FROM DUAL;

    SELECT HIRE_DATE INTO h_date
    FROM EMPLOYEES
    WHERE EMPLOYEE_ID = eval_frequency.emp_id;

    IF ((h_date + (INTERVAL '120' MONTH)) < today) THEN
        eval_freq := 1;

        /* populate emp_sal */

        SELECT j.JOB_ID, j.MIN_SALARY, j.MAX_SALARY, e.SALARY
        INTO emp_sal.j_id, emp_sal.sal_min, emp_sal.sal_max, emp_sal.sal
        FROM EMPLOYEES e, JOBS j
        WHERE e.EMPLOYEE_ID = eval_frequency.emp_id
        AND j.JOB_ID = eval_frequency.emp_id;

        emp_sal.sal_raise := 0; -- default
```

```

CASE emp_sal.j_id
  WHEN 'PU_CLERK' THEN emp_sal.sal_raise := 0.08;
  WHEN 'SH_CLERK' THEN emp_sal.sal_raise := 0.07;
  WHEN 'ST_CLERK' THEN emp_sal.sal_raise := 0.06;
  WHEN 'HR_REP' THEN emp_sal.sal_raise := 0.05;
  WHEN 'PR_REP' THEN emp_sal.sal_raise := 0.05;
  WHEN 'MK_REP' THEN emp_sal.sal_raise := 0.04;
  ELSE NULL;
END CASE;

IF (emp_sal.sal_raise != 0) THEN
  salary_schedule(emp_sal);
END IF;
ELSE
  eval_freq := 2;
END IF;

RETURN eval_freq;
END eval_frequency;

```

9. Click **Compile**.

5.9.4 About Cursors

When Oracle Database executes a SQL statement, it stores the result set and processing information in an unnamed private SQL area. A pointer to this unnamed area, called a **cursor**, lets you retrieve the result set one row at a time. **Cursor attributes** return information about the state of the cursor.

Every time you run either a SQL DML statement or a PL/SQL SELECT INTO statement, PL/SQL opens an **implicit cursor**. You can get information about this cursor from its attributes, but you cannot control it. After the statement runs, the database closes the cursor; however, its attribute values remain available until another DML or SELECT INTO statement runs.

PL/SQL also lets you declare cursors. A **declared cursor** has a name and is associated with a query (SQL SELECT statement)—usually one that returns multiple rows. After declaring a cursor, you must process it, either implicitly or explicitly. To process the cursor implicitly, use a cursor FOR LOOP. The syntax is:

```

FOR record_name IN cursor_name LOOP
  statement
  [ statement ]...
END LOOP;

```

To process the cursor explicitly, open it (with the OPEN statement), fetch rows from the result set either one at a time or in bulk (with the FETCH statement), and close the cursor (with the CLOSE statement). After closing the cursor, you can neither fetch records from the result set nor see the cursor attribute values.

The syntax for the value of an implicit cursor attribute is SQL%attribute (for example, SQL%FOUND). SQL%attribute always refers to the most recently run DML or SELECT INTO statement.

The syntax for the value of a declared cursor attribute is cursor_name%attribute (for example, c1%FOUND).

[Table 5-1](#) lists the cursor attributes and the values that they can return. (Implicit cursors have additional attributes that are beyond the scope of this book.)

Table 5-1 Cursor Attribute Values

Attribute	Values for Declared Cursor	Values for Implicit Cursor
%FOUND	If cursor is open ¹ but no fetch was attempted, NULL. If the most recent fetch returned a row, TRUE. If the most recent fetch did not return a row, FALSE.	If no DML or SELECT INTO statement has run, NULL. If the most recent DML or SELECT INTO statement returned a row, TRUE. If the most recent DML or SELECT INTO statement did not return a row, FALSE.
%NOTFOUND	If cursor is open ¹ but no fetch was attempted, NULL. If the most recent fetch returned a row, FALSE. If the most recent fetch did not return a row, TRUE.	If no DML or SELECT INTO statement has run, NULL. If the most recent DML or SELECT INTO statement returned a row, FALSE. If the most recent DML or SELECT INTO statement did not return a row, TRUE.
%ROWCOUNT	If cursor is open ¹ , a number greater than or equal to zero.	NULL if no DML or SELECT INTO statement has run; otherwise, a number greater than or equal to zero.
%ISOPEN	If cursor is open, TRUE; if not, FALSE.	Always FALSE.

¹ If the cursor is not open, the attribute raises the predefined exception `INVALID_CURSOR`.

5.9.5 Using a Declared Cursor to Retrieve Result Set Rows One at a Time

You can use a declared cursor to retrieve result set rows one at a time.

The following procedure uses each necessary statement in its simplest form, but provides references to its complete syntax.

To use a declared cursor to retrieve result set rows one at a time:**1. In the declarative part:****a. Declare the cursor:**

```
CURSOR cursor_name IS query;
```

For complete declared cursor declaration syntax, see *Oracle Database PL/SQL Language Reference*.

b. Declare a record to hold the row returned by the cursor:

```
record_name cursor_name%ROWTYPE;
```

For complete %ROWTYPE syntax, see *Oracle Database PL/SQL Language Reference*.

2. In the executable part:**a. Open the cursor:**

```
OPEN cursor_name;
```

For complete OPEN statement syntax, see *Oracle Database PL/SQL Language Reference*.

b. Fetch rows from the cursor (rows from the result set) one at a time, using a LOOP statement that has syntax similar to this:

```
LOOP
  FETCH cursor_name INTO record_name;
  EXIT WHEN cursor_name%NOTFOUND;
  -- Process row that is in record_name:
  statement;
  [ statement; ]...
END LOOP;
```

For complete FETCH statement syntax, see *Oracle Database PL/SQL Language Reference*.

c. Close the cursor:

```
CLOSE cursor_name;
```

For complete CLOSE statement syntax, see *Oracle Database PL/SQL Language Reference*.

5.9.6 Tutorial: Using a Declared Cursor to Retrieve Result Set Rows One at a Time

This tutorial shows how to implement the procedure `EMP_EVAL.EVAL_DEPARTMENT`, which uses a declared cursor, `emp_cursor`.

To implement the `EMP_EVAL.EVAL_DEPARTMENT` procedure:**1. In the `EMP_EVAL` package specification, change the declaration of the `EVAL_DEPARTMENT` procedure as shown in bold font:**

```
PROCEDURE eval_department(dept_id IN employees.department_id%TYPE);
```

2. In the EMP_EVAL package body, change the definition of the EVAL_DEPARTMENT procedure as shown in bold font:

```

PROCEDURE eval_department (dept_id IN employees.department_id%TYPE)
AS
  CURSOR emp_cursor IS
    SELECT * FROM EMPLOYEES
    WHERE DEPARTMENT_ID = eval_department.dept_id;

  emp_record EMPLOYEES%ROWTYPE; -- for row returned by cursor
  all_evals BOOLEAN; -- true if all employees in dept need evaluations
  today DATE;

BEGIN
  today := SYSDATE;

  IF (EXTRACT(MONTH FROM today) < 6) THEN
    all_evals := FALSE; -- only new employees need evaluations
  ELSE
    all_evals := TRUE; -- all employees need evaluations
  END IF;

  OPEN emp_cursor;

  DBMS_OUTPUT.PUT_LINE (
    'Determining evaluations necessary in department # ' ||
    dept_id );

  LOOP
    FETCH emp_cursor INTO emp_record;
    EXIT WHEN emp_cursor%NOTFOUND;

    IF all_evals THEN
      add_eval(emp_record.employee_id, today);
    ELSIF (eval_frequency(emp_record.employee_id) = 2) THEN
      add_eval(emp_record.employee_id, today);
    END IF;
  END LOOP;

  DBMS_OUTPUT.PUT_LINE('Processed ' || emp_cursor%ROWCOUNT || ' records.');
```

```

  CLOSE emp_cursor;
END eval_department;
```

(For a step-by-step example of changing a package body, see "[Tutorial: Declaring Variables and Constants in a Subprogram](#)".)

3. Compile the EMP_EVAL package specification.
4. Compile the EMP_EVAL package body.

5.9.7 About Cursor Variables

A **cursor variable** is like a cursor that it is not limited to one query. You can open a cursor variable for a query, process the result set, and then use the cursor variable for another query. Cursor variables are useful for passing query results between subprograms.

For information about cursors, see "[About Cursors](#)".

To declare a cursor variable, you declare a REF CURSOR type, and then declare a variable of that type (therefore, a cursor variable is often called a **REF CURSOR**). A REF CURSOR type can be either strong or weak.

A **strong REF CURSOR type** specifies a **return type**, which is the RECORD type of its cursor variables. The PL/SQL compiler does not allow you to use these **strongly typed** cursor variables for queries that return rows that are not of the return type. Strong REF CURSOR types are less error-prone than weak ones, but weak ones are more flexible.

A **weak REF CURSOR type** does not specify a return type. The PL/SQL compiler accepts **weakly typed** cursor variables in any queries. Weak REF CURSOR types are interchangeable; therefore, instead of creating weak REF CURSOR types, you can use the predefined type weak cursor type SYS_REFCURSOR.

After declaring a cursor variable, you must open it for a specific query (with the OPEN FOR statement), fetch rows one at a time from the result set (with the FETCH statement), and then either close the cursor (with the CLOSE statement) or open it for another specific query (with the OPEN FOR statement). Opening the cursor variable for another query closes it for the previous query. After closing a cursor variable for a specific query, you can neither fetch records from the result set of that query nor see the cursor attribute values for that query.

See Also:

- *Oracle Database PL/SQL Language Reference* for more information about using cursor variables
- *Oracle Database PL/SQL Language Reference* for the syntax of cursor variable declaration

5.9.8 Using a Cursor Variable to Retrieve Result Set Rows One at a Time

You can use a cursor variable to retrieve result set rows one at a time.

The following procedure uses each of the necessary statements in its simplest form, but provides references to their complete syntax.

To use a cursor variable to retrieve result set rows one at a time:

1. In the declarative part:
 - a. Declare the REF CURSOR type:

```
TYPE cursor_type IS REF CURSOR [ RETURN return_type ];
```

For complete REF CURSOR type declaration syntax, see *Oracle Database PL/SQL Language Reference*.

- b. Declare a cursor variable of that type:

```
cursor_variable cursor_type;
```

For complete cursor variable declaration syntax, see *Oracle Database PL/SQL Language Reference*.

- c. Declare a record to hold the row returned by the cursor:

```
record_name return_type;
```

For complete information about record declaration syntax, see *Oracle Database PL/SQL Language Reference*.

2. In the executable part:

- a. Open the cursor variable for a specific query:

```
OPEN cursor_variable FOR query;
```

For complete information about OPEN FOR statement syntax, see *Oracle Database PL/SQL Language Reference*.

- b. Fetch rows from the cursor variable (rows from the result set) one at a time, using a LOOP statement that has syntax similar to this:

```
LOOP
  FETCH cursor_variable INTO record_name;
  EXIT WHEN cursor_variable%NOTFOUND;
  -- Process row that is in record_name:
  statement;
  [ statement; ]...
END LOOP;
```

For complete information about FETCH statement syntax, see *Oracle Database PL/SQL Language Reference*.

- c. Close the cursor variable:

```
CLOSE cursor_variable;
```

Alternatively, you can open the cursor variable for another query, which closes it for the current query.

For complete information about CLOSE statement syntax, see *Oracle Database PL/SQL Language Reference*.

5.9.9 Tutorial: Using a Cursor Variable to Retrieve Result Set Rows One at a Time

This tutorial shows how to change the EMP_EVAL.EVAL_DEPARTMENT procedure so that it uses a cursor variable instead of a declared cursor (which lets it process multiple departments) and how to make EMP_EVAL.EVAL_DEPARTMENT and EMP_EVAL.ADD_EVAL more efficient.

How this tutorial makes EMP_EVAL.EVAL_DEPARTMENT and EMP_EVAL.ADD_EVAL more efficient: Instead of passing one field of a record to ADD_EVAL and having ADD_EVAL use three queries to extract three other fields of the same record, EVAL_DEPARTMENT passes the entire record to ADD_EVAL, and ADD_EVAL uses dot notation to access the values of the other three fields.

To change the EMP_EVAL.EVAL_DEPARTMENT procedure to use a cursor variable:

1. In the EMP_EVAL package specification, add the procedure declaration and the REF CURSOR type definition, as shown in bold font:

```
CREATE OR REPLACE
PACKAGE emp_eval AS

    PROCEDURE eval_department (dept_id IN employees.department_id%TYPE);

    PROCEDURE eval_everyone;

    FUNCTION calculate_score(eval_id IN scores.evaluation_id%TYPE
                            , perf_id IN scores.performance_id%TYPE)
        RETURN NUMBER;

    TYPE SAL_INFO IS RECORD
        ( j_id jobs.job_id%type
          , sal_min jobs.min_salary%type
          , sal_max jobs.max_salary%type
          , salary employees.salary%type
          , sal_raise NUMBER(3,3));

    TYPE emp_refcursor_type IS REF CURSOR RETURN employees%ROWTYPE;
END emp_eval;
```

2. In the EMP_EVAL package body, add a forward declaration for the procedure EVAL_LOOP_CONTROL and change the declaration of the procedure ADD_EVAL, as shown in bold font:

```
CREATE OR REPLACE
PACKAGE BODY EMP_EVAL AS

    FUNCTION eval_frequency (emp_id IN EMPLOYEES.EMPLOYEE_ID%TYPE)
        RETURN PLS_INTEGER;

    PROCEDURE salary_schedule(emp IN sal_info);

    PROCEDURE add_eval(emp_record IN EMPLOYEES%ROWTYPE, today IN DATE);

    PROCEDURE eval_loop_control(emp_cursor IN emp_refcursor_type);
    ...
```

(For a step-by-step example of changing a package body, see "[Tutorial: Declaring Variables and Constants in a Subprogram](#)".)

3. Change the EVAL_DEPARTMENT procedure to retrieve three separate result sets based on the department, and to invoke the EVAL_LOOP_CONTROL procedure, as shown in bold font:

```
PROCEDURE eval_department(dept_id IN employees.department_id%TYPE) AS
    emp_cursor emp_refcursor_type;
    current_dept departments.department_id%TYPE;

BEGIN
    current_dept := dept_id;

    FOR loop_c IN 1..3 LOOP
        OPEN emp_cursor FOR
            SELECT *
```

```

        FROM employees
        WHERE current_dept = eval_department.dept_id;

DBMS_OUTPUT.PUT_LINE
('Determining necessary evaluations in department #' ||
 current_dept);

eval_loop_control(emp_cursor);

DBMS_OUTPUT.PUT_LINE
('Processed ' || emp_cursor%ROWCOUNT || ' records.');
```

```

CLOSE emp_cursor;
current_dept := current_dept + 10;
END LOOP;
END eval_department;
```

4. Change the ADD_EVAL procedure as shown in bold font:

```

PROCEDURE add_eval(emp_record IN employees%ROWTYPE, today IN DATE)
AS
-- (Delete local variables)
BEGIN
    INSERT INTO EVALUATIONS (
        evaluation_id,
        employee_id,
        evaluation_date,
        job_id,
        manager_id,
        department_id,
        total_score
    )
    VALUES (
        evaluations_sequence.NEXTVAL, -- evaluation_id
emp_record.employee_id, -- employee_id
        today, -- evaluation_date
emp_record.job_id, -- job_id
emp_record.manager_id, -- manager_id
emp_record.department_id, -- department_id
        0 -- total_score
    );
END add_eval;
```

5. Before END EMP_EVAL, add the following procedure, which fetches the individual records from the result set and processes them:

```

PROCEDURE eval_loop_control (emp_cursor IN emp_refcursor_type) AS
    emp_record      EMPLOYEES%ROWTYPE;
    all_evals       BOOLEAN;
    today           DATE;
BEGIN
    today := SYSDATE;

    IF (EXTRACT(MONTH FROM today) < 6) THEN
        all_evals := FALSE;
    ELSE
        all_evals := TRUE;
    END IF;

    LOOP
        FETCH emp_cursor INTO emp_record;
        EXIT WHEN emp_cursor%NOTFOUND;
```

```

    IF all_evals THEN
        add_eval(emp_record, today);
    ELSIF (eval_frequency(emp_record.employee_id) = 2) THEN
        add_eval(emp_record, today);
    END IF;
END LOOP;
END eval_loop_control;

```

6. Before `END EMP_EVAL`, add the following procedure, which retrieves a result set that contains all employees in the company:

```

PROCEDURE eval_everyone AS
    emp_cursor emp_refcursor_type;
BEGIN
    OPEN emp_cursor FOR SELECT * FROM employees;
    DBMS_OUTPUT.PUT_LINE('Determining number of necessary evaluations. ');
    eval_loop_control(emp_cursor);
    DBMS_OUTPUT.PUT_LINE('Processed ' || emp_cursor%ROWCOUNT || ' records. ');
    CLOSE emp_cursor;
END eval_everyone;

```

7. Compile the `EMP_EVAL` package specification.
8. Compile the `EMP_EVAL` package body.

5.10 Using Associative Arrays

An associative array is a type of collection.

- [About Collections](#)
A **collection** is a PL/SQL composite variable that stores elements of the same type in a specified order, similar to a one-dimensional array. The internal components of a collection are called **elements**. Each element has a unique subscript that identifies its position in the collection.
- [About Associative Arrays](#)
An **associative array** is an unbounded set of key-value pairs. Each key is unique, and serves as the subscript of the element that holds the corresponding value. Therefore, you can access elements without knowing their positions in the array, and without traversing the array.
- [Declaring Associative Arrays](#)
To declare an associative array, you declare an associative array type and then declare a variable of that type.
- [Populating Associative Arrays](#)
The most efficient way to populate a dense associative array is usually with a `SELECT` statement with a `BULK COLLECT INTO` clause.
- [Traversing Dense Associative Arrays](#)
A **dense associative array** (indexed by integer) has no gaps between elements—every element between the first and last element is defined and has a value (which can be `NULL`).
- [Traversing Sparse Associative Arrays](#)
A **sparse associative array** (indexed by string) might have gaps between elements.

 **See Also:**

For more information about collections:

- *Oracle Database Concepts*
- *Oracle Database PL/SQL Language Reference*

5.10.1 About Collections

A **collection** is a PL/SQL composite variable that stores elements of the same type in a specified order, similar to a one-dimensional array. The internal components of a collection are called **elements**. Each element has a unique subscript that identifies its position in the collection.

To access a collection element, you use **subscript notation**:
collection_name(element_subscript).

You can treat collection elements like scalar variables. You can also pass entire collections as subprogram parameters (if neither the sending nor receiving subprogram is a standalone subprogram).

A **collection method** is a built-in PL/SQL subprogram that either returns information about a collection or operates on a collection. To invoke a collection method, you use **dot notation**: collection_name.method_name. For example, collection_name.COUNT returns the number of elements in the collection.

PL/SQL has three types of collections:

- Associative arrays (formerly called "PL/SQL tables" or "index-by tables")
- Nested tables
- Variable arrays (varrays)

This document explains only associative arrays.

 **See Also:**

- *Oracle Database PL/SQL Language Reference* for more information about PL/SQL collection types
- *Oracle Database PL/SQL Language Reference* for more information about collection methods

5.10.2 About Associative Arrays

An **associative array** is an unbounded set of key-value pairs. Each key is unique, and serves as the subscript of the element that holds the corresponding value. Therefore, you can access elements without knowing their positions in the array, and without traversing the array.

The data type of the key can be either PLS_INTEGER or VARCHAR2 (length).

If the data type of the key is `PLS_INTEGER` and the associative array is **indexed by integer** and is **dense** (that is, has no gaps between elements), then every element between the first and last element is defined and has a value (which can be `NULL`).

If the key type is `VARCHAR2` (length), the associative array is **indexed by string** (of length characters) and is **sparse**; that is, it might have gaps between elements.

When traversing a dense associative array, you need not beware of gaps between elements; when traversing a sparse associative array, you do.

To assign a value to an associative array element, you can use an assignment operator:

```
array_name(key) := value
```

If key is not in the array, then the assignment statement adds the key-value pair to the array. Otherwise, the statement changes the value of `array_name(key)` to `value`.

Associative arrays are useful for storing data temporarily. They do not use the disk space or network operations that tables require. However, because associative arrays are intended for temporary storage, you cannot manipulate them with DML statements.

If you declare an associative array in a package and assign values to the variable in the package body, then the associative array exists for the life of the database session. Otherwise, it exists for the life of the subprogram in which you declare it.

See Also:

Oracle Database PL/SQL Language Reference for more information about associative arrays

5.10.3 Declaring Associative Arrays

To declare an associative array, you declare an associative array type and then declare a variable of that type.

The simplest syntax is:

```
TYPE array_type IS TABLE OF element_type INDEX BY key_type;
```

```
array_name array_type;
```

An efficient way to declare an associative array is with a cursor, using the following procedure. The procedure uses each necessary statement in its simplest form, but provides references to its complete syntax.

To use a cursor to declare an associative array:

1. In the declarative part:
 - a. Declare the cursor:

```
CURSOR cursor_name IS query;
```

For complete declared cursor declaration syntax, see *Oracle Database PL/SQL Language Reference*.

b. Declare the associative array type:

```
TYPE array_type IS TABLE OF cursor_name%ROWTYPE
INDEX BY { PLS_INTEGER | VARCHAR2 length }
```

For complete associative array type declaration syntax, see *Oracle Database PL/SQL Language Reference*.

c. Declare an associative array variable of that type:

```
array_name array_type;
```

For complete variable declaration syntax, see *Oracle Database PL/SQL Language Reference*.

Example 5-9 uses the preceding procedure to declare two associative arrays, `employees_jobs` and `jobs_`, and then declares a third associative array, `job_titles`, without using a cursor. The first two arrays are indexed by integer; the third is indexed by string.

 **Note:**

The `ORDER BY` clause in the declaration of `employees_jobs_cursor` determines the storage order of the elements of the associative array `employee_jobs`.

Example 5-9 Declaring Associative Arrays

```
DECLARE
-- Declare cursor:

CURSOR employees_jobs_cursor IS
SELECT FIRST_NAME, LAST_NAME, JOB_ID
FROM EMPLOYEES
ORDER BY JOB_ID, LAST_NAME, FIRST_NAME;

-- Declare associative array type:

TYPE employees_jobs_type IS TABLE OF employees_jobs_cursor%ROWTYPE
INDEX BY PLS_INTEGER;

-- Declare associative array:

employees_jobs employees_jobs_type;

-- Use same procedure to declare another associative array:

CURSOR jobs_cursor IS
SELECT JOB_ID, JOB_TITLE
FROM JOBS;

TYPE jobs_type IS TABLE OF jobs_cursor%ROWTYPE
INDEX BY PLS_INTEGER;

jobs_ jobs_type;

-- Declare associative array without using cursor:
```

```

TYPE job_titles_type IS TABLE OF JOBS.JOB_TITLE%TYPE
  INDEX BY JOBS.JOB_ID%TYPE; -- jobs.job_id%type is varchar2(10)

job_titles job_titles_type;

BEGIN
  NULL;
END;
/

```

See Also:

- ["About Cursors"](#)
- *Oracle Database PL/SQL Language Reference* for associative array declaration syntax

5.10.4 Populating Associative Arrays

The most efficient way to populate a dense associative array is usually with a SELECT statement with a BULK COLLECT INTO clause.

Note:

If a dense associative array is so large that a SELECT statement would return a result set too large to fit in memory, then do not use a SELECT statement. Instead, populate the array with a cursor and the FETCH statement with the clauses BULK COLLECT INTO and LIMIT. For information about using the FETCH statement with BULK COLLECT INTO clause, see *Oracle Database PL/SQL Language Reference*.

You cannot use a SELECT statement to populate a sparse associative array (such as `job_titles` in ["Declaring Associative Arrays"](#)). Instead, you must use an assignment statement inside a loop statement. For information about loop statements, see ["Controlling Program Flow"](#).

[Example 5-10](#) uses SELECT statements to populate the associative arrays `employees_jobs` and `jobs_`, which are indexed by integer. Then it uses an assignment statement inside a FOR LOOP statement to populate the associative array `job_titles`, which is indexed by string.

Example 5-10 Populating Associative Arrays

```

-- Declarative part from Example 5-9 goes here.

BEGIN
  -- Populate associative arrays indexed by integer:

  SELECT FIRST_NAME, LAST_NAME, JOB_ID BULK COLLECT INTO employees_jobs
     FROM EMPLOYEES ORDER BY JOB_ID, LAST_NAME, FIRST_NAME;

  SELECT JOB_ID, JOB_TITLE BULK COLLECT INTO jobs_ FROM JOBS;

```

```

-- Populate associative array indexed by string:

FOR i IN 1..jobs_.COUNT() LOOP
  job_titles(jobs_(i).job_id) := jobs_(i).job_title;
END LOOP;
END;
/

```

See Also:

["About Cursors"](#)

5.10.5 Traversing Dense Associative Arrays

A **dense associative array** (indexed by integer) has no gaps between elements—every element between the first and last element is defined and has a value (which can be NULL).

You can traverse a dense array with a FOR LOOP statement, as in [Example 5-11](#).

When inserted in the executable part of [Example 5-10](#), after the code that populates the `employees_jobs` array, the FOR LOOP statement in [Example 5-11](#) prints the elements of the `employees_jobs` array in the order in which they were stored. Their storage order was determined by the ORDER BY clause in the declaration of `employees_jobs_cursor`, which was used to declare `employees_jobs` (see [Example 5-9](#)).

The upper bound of the FOR LOOP statement, `employees_jobs.COUNT`, invokes a collection method that returns the number of elements in the array. For more information about COUNT, see *Oracle Database PL/SQL Language Reference*.

Example 5-11 Traversing a Dense Associative Array

```

-- Code that populates employees_jobs must precede this code:

FOR i IN 1..employees_jobs.COUNT LOOP
  DBMS_OUTPUT.PUT_LINE(
    RPAD(employees_jobs(i).first_name, 23) ||
    RPAD(employees_jobs(i).last_name, 28) || employees_jobs(i).job_id);
END LOOP;

```

5.10.6 Traversing Sparse Associative Arrays

A **sparse associative array** (indexed by string) might have gaps between elements.

You can traverse it with a WHILE LOOP statement, as in [Example 5-12](#).

To run the code in [Example 5-12](#), which prints the elements of the job_titles array:

1. At the end of the declarative part of [Example 5-9](#), insert this variable declaration:

```
i jobs.job_id%TYPE;
```

2. In the executable part of [Example 5-10](#), after the code that populates the job_titles array, insert the code from [Example 5-12](#).

Example 5-12 Traversing a Sparse Associative Array

```
/* Declare this variable in declarative part:
```

```
   i jobs.job_id%TYPE;
```

```
   Add this code to the executable part,
   after code that populates job_titles:
```

```
*/
```

```
i := job_titles.FIRST;
```

```
WHILE i IS NOT NULL LOOP
  DBMS_OUTPUT.PUT_LINE(RPAD(i, 12) || job_titles(i));
  i := job_titles.NEXT(i);
END LOOP;
```

Result:

```
AC_ACCOUNT Public Accountant
AC_MGR      Accounting Manager
AD_ASST     Administration Assistant
AD_PRE     President
AD_VP      Administration Vice President
FI_ACCOUNT Accountant
FI_MGR     Finance Manager
```

[Example 5-12](#) includes two collection method invocations, `job_titles.FIRST` and `job_titles.NEXT(i)`. `job_titles.FIRST` returns the first element of `job_titles`, and `job_titles.NEXT(i)` returns the subscript that succeeds `i`. For more information about `FIRST`, see *Oracle Database PL/SQL Language Reference*. For more information about `NEXT`, see *Oracle Database PL/SQL Language Reference*.

5.11 Handling Exceptions (Runtime Errors)

You can handle exceptions that occur at run time with PL/SQL code.

- [About Exceptions and Exception Handlers](#)
When a runtime error occurs in PL/SQL code, an **exception** is raised. If the subprogram (or block) in which the exception is raised has an exception-handling part, then control transfers to it; otherwise, execution stops.
- [When to Use Exception Handlers](#)
Oracle recommends using exception handlers only in these situations.
- [Handling Predefined Exceptions](#)
You can handle predefined exceptions.
- [Declaring and Handling User-Defined Exceptions](#)
You can declare and handle user-defined exceptions.

See Also:

Oracle Database PL/SQL Language Reference for more information about handling PL/SQL errors

5.11.1 About Exceptions and Exception Handlers

When a runtime error occurs in PL/SQL code, an **exception** is raised. If the subprogram (or block) in which the exception is raised has an exception-handling part, then control transfers to it; otherwise, execution stops.

Runtime errors can arise from design faults, coding mistakes, hardware failures, and many other sources.

Oracle Database has many **predefined exceptions**, which it raises automatically when a program violates database rules or exceeds system-dependent limits. For example, if a `SELECT INTO` statement returns no rows, then Oracle Database raises

the predefined exception `NO_DATA_FOUND`. For a summary of predefined PL/SQL exceptions, see *Oracle Database PL/SQL Language Reference*.

PL/SQL lets you define (declare) your own exceptions. An exception declaration has this syntax:

```
exception_name EXCEPTION;
```

Unlike a predefined exception, a **user-defined exception** must be raised explicitly, using either the `RAISE` statement or the `DBMS_STANDARD.RAISE_APPLICATION_ERROR` procedure. For example:

```
IF condition THEN RAISE exception_name;
```

For information about the `DBMS_STANDARD.RAISE_APPLICATION_ERROR` procedure, see *Oracle Database PL/SQL Language Reference*.

The exception-handling part of a subprogram contains one or more exception handlers. An **exception handler** has this syntax:

```
WHEN { exception_name [ OR exception_name ]... | OTHERS } THEN  
    statement; [ statement; ]...
```

("About Subprogram Structure" shows where to put the exception-handling part of a subprogram.)

A `WHEN OTHERS` exception handler handles unexpected runtime errors. If used, it must be last. For example:

```
EXCEPTION  
    WHEN exception_1 THEN  
        statement; [ statement; ]...  
    WHEN exception_2 OR exception_3 THEN  
        statement; [ statement; ]...  
    WHEN OTHERS THEN  
        statement; [ statement; ]...  
        RAISE; -- Reraise the exception (very important).  
END;
```

An alternative to the `WHEN OTHERS` exception handler is the `EXCEPTION_INIT` pragma, which associates a user-defined exception name with an Oracle Database error number.

See Also:

- *Oracle Database PL/SQL Language Reference* for more information about exception declaration syntax
- *Oracle Database PL/SQL Language Reference* for more information about exception handler syntax
- *Oracle Database PL/SQL Language Reference* for more information about the `EXCEPTION_INIT` pragma

5.11.2 When to Use Exception Handlers

Oracle recommends using exception handlers only in these situations.

- You expect an exception and want to handle it.

For example, you expect that eventually, a `SELECT INTO` statement will return no rows, causing Oracle Database to raise the predefined exception `NO_DATA_FOUND`. You want your subprogram or block to handle that exception (which is not an error) and then continue, as in [Example 5-13](#).

- You must relinquish or close a resource.

For example:

```
...
file := UTL_FILE.OPEN ...
BEGIN
  [statement statement]... -- If this code fails for any reason,
EXCEPTION
  WHEN OTHERS THEN
    UTL_FILE.FCLOSE(file);    -- then you want to close the file.
    RAISE;                   -- Reraise the exception (very important).
END;
UTL_FILE.FCLOSE(file);
...
```

- At the top level of the code, you want to log the error.

For example, a client process might issue this block:

```
BEGIN
  proc(...);
EXCEPTION
  WHEN OTHERS THEN
    log_error_using_autonomous_transaction(...);
    RAISE; -- Reraise the exception (very important).
END;
/
```

Alternatively, the standalone subprogram that the client invokes can include the same exception-handling logic—but only at the top level.

5.11.3 Handling Predefined Exceptions

You can handle predefined exceptions.

[Example 5-13](#) shows, in bold font, how to change the `EMP_EVAL.EVAL_DEPARTMENT` procedure to handle the predefined exception `NO_DATA_FOUND`. Make this change and compile the changed procedure. (For an example of how to change a package body, see "[Tutorial: Declaring Variables and Constants in a Subprogram](#)".)

Example 5-13 Handling Predefined Exception `NO_DATA_FOUND`

```
PROCEDURE eval_department(dept_id IN employees.department_id%TYPE) AS
  emp_cursor emp_refcursor_type;
  current_dept departments.department_id%TYPE;
BEGIN
  current_dept := dept_id;

  FOR loop_c IN 1..3 LOOP
    OPEN emp_cursor FOR
      SELECT *
      FROM employees
```

```

WHERE current_dept = eval_department.dept_id;

DBMS_OUTPUT.PUT_LINE
('Determining necessary evaluations in department #' ||
current_dept);

eval_loop_control(emp_cursor);

DBMS_OUTPUT.PUT_LINE
('Processed ' || emp_cursor%ROWCOUNT || ' records.');
```

```

CLOSE emp_cursor;
current_dept := current_dept + 10;
END LOOP;
EXCEPTION
WHEN NO_DATA_FOUND THEN
  DBMS_OUTPUT.PUT_LINE ('The query did not return a result set');
END eval_department;
```

See Also:

Oracle Database PL/SQL Language Reference for more information about predefined exceptions

5.11.4 Declaring and Handling User-Defined Exceptions

You can declare and handle user-defined exceptions.

[Example 5-14](#) shows, in bold font, how to change the EMP_EVAL.CALCULATE_SCORE function to declare and handle two user-defined exceptions, wrong_weight and wrong_score. Make this change and compile the changed function. (For an example of how to change a package body, see "[Tutorial: Declaring Variables and Constants in a Subprogram](#)".)

Example 5-14 Handling User-Defined Exceptions

```

FUNCTION calculate_score ( evaluation_id IN scores.evaluation_id%TYPE
                          , performance_id IN scores.performance_id%TYPE )
RETURN NUMBER AS

weight_wrong EXCEPTION;
score_wrong EXCEPTION;
n_score      scores.score%TYPE;
n_weight     performance_parts.weight%TYPE;
running_total NUMBER := 0;
max_score    CONSTANT scores.score%TYPE := 9;
max_weight   CONSTANT performance_parts.weight%TYPE:= 1;
BEGIN
  SELECT s.score INTO n_score
  FROM SCORES s
  WHERE evaluation_id = s.evaluation_id
  AND performance_id = s.performance_id;

  SELECT p.weight INTO n_weight
  FROM PERFORMANCE_PARTS p
  WHERE performance_id = p.performance_id;
```

```
BEGIN
  IF (n_weight > max_weight) OR (n_weight < 0) THEN
    RAISE weight_wrong;
  END IF;
END;

BEGIN
  IF (n_score > max_score) OR (n_score < 0) THEN
    RAISE score_wrong;
  END IF;
END;

running_total := n_score * n_weight;
RETURN running_total;

EXCEPTION
  WHEN weight_wrong THEN
    DBMS_OUTPUT.PUT_LINE(
      'The weight of a score must be between 0 and ' || max_weight);
    RETURN -1;
  WHEN score_wrong THEN
    DBMS_OUTPUT.PUT_LINE(
      'The score must be between 0 and ' || max_score);
    RETURN -1;
END calculate_score;
```

6

Using Triggers

Triggers are stored PL/SQL units that automatically execute ("fire") in response to specified events.

- [About Triggers](#)
A **trigger** is a PL/SQL unit that is stored in the database and (if it is in the enabled state) automatically executes ("fires") in response to a specified event.
- [Creating Triggers](#)
To create triggers, use either the SQL Developer graphical interface or the DDL statement CREATE TRIGGER.
- [Changing Triggers](#)
To change a trigger, use either the SQL Developer tool Edit or the DDL statement CREATE TRIGGER with the OR REPLACE clause.
- [Disabling and Enabling Triggers](#)
You might need to temporarily disable triggers that reference objects that are unavailable, or to upload a large amount of data without the delay that triggers cause (as in a recovery operation). After the referenced objects become available, or you have finished uploading the data, you can re-enable the triggers.
- [About Trigger Compilation and Dependencies](#)
Compiled triggers depend on the schema objects on which they are defined. If an object on which a trigger depends is dropped, or changed such that there is a mismatch between the trigger and the object, then the trigger is invalidated.
- [Dropping Triggers](#)

6.1 About Triggers

A **trigger** is a PL/SQL unit that is stored in the database and (if it is in the enabled state) automatically executes ("fires") in response to a specified event.

A trigger has this structure:

```
TRIGGER trigger_name
  triggering_event
  [ trigger_restriction ]
BEGIN
  triggered_action;
END;
```

The *trigger_name* must be unique for triggers in the schema. A trigger can have the same name as another kind of object in the schema (for example, a table); however, Oracle recommends using a naming convention that avoids confusion.

If the trigger is in the **enabled** state, the *triggering_event* causes the database to execute the *triggered_action* if the *trigger_restriction* is either TRUE or omitted. The *triggering_event* is associated with either a table, a view, a schema, or the database, and it is one of these:

- DML statement (described in "[About Data Manipulation Language \(DML\) Statements](#)")
- DDL statement (described in "[About Data Definition Language \(DDL\) Statements](#)")
- Database operation (SERVERERROR, LOGON, LOGOFF, STARTUP, or SHUTDOWN)

If the trigger is in the **disabled** state, the triggering_event does not cause the database to execute the triggered_action, even if the trigger_restriction is TRUE or omitted.

By default, a trigger is created in the enabled state. You can disable an enabled trigger, and enable a disabled trigger.

Unlike a subprogram, a trigger cannot be invoked directly. A trigger is invoked only by its triggering event, which can be caused by any user or application. You might be unaware that a trigger is executing unless it causes an error that is not handled properly.

A **simple trigger** can fire at exactly one of these **timing points**:

- Before the triggering event executes (**statement-level BEFORE trigger**)
- After the triggering event executes (**statement-level AFTER trigger**)
- Before each row that the event affects (**row-level BEFORE trigger**)
- After each row that the event affects (**row-level AFTER trigger**)

A **compound trigger** can fire at multiple timing points. For information about compound triggers, see *Oracle Database PL/SQL Language Reference*.

An **INSTEAD OF trigger** is defined on a view, and its triggering event is a DML statement. Instead of executing the DML statement, Oracle Database executes the INSTEAD OF trigger. For more information, see "[Creating an INSTEAD OF Trigger](#)".

A **system trigger** is defined on a schema or the database. A trigger defined on a schema fires for each event associated with the owner of the schema (the current user). A trigger defined on a database fires for each event associated with all users.

One use of triggers is to enforce business rules that apply to all client applications. For example, suppose that data added to the EMPLOYEES table must have a certain format, and that many client applications can add data to this table. A trigger on the table can ensure the proper format of all data added to it. Because the trigger executes whenever any client adds data to the table, no client can circumvent the rules, and the code that enforces the rules can be stored and maintained only in the trigger, rather than in every client application. For other uses of triggers, see *Oracle Database PL/SQL Language Reference*.

See Also:

Oracle Database PL/SQL Language Reference for complete information about triggers

6.2 Creating Triggers

To create triggers, use either the SQL Developer graphical interface or the DDL statement `CREATE TRIGGER`.

This section shows how to use both of these ways to create triggers.

By default, a trigger is created in the enabled state. To create a trigger in disabled state, use the `CREATE TRIGGER` statement with the `DISABLE` clause.

 **Note:**

To create triggers, you must have appropriate privileges; however, for this discussion, you do not need this additional information.

 **Note:**

To do the tutorials in this document, you must be connected to Oracle Database as the user `HR` from SQL Developer.

- [About OLD and NEW Pseudorecords](#)
When a row-level trigger fires, the PL/SQL runtime system creates and populates the two pseudorecords `OLD` and `NEW`. They are called pseudorecords because they have some, but not all, of the properties of records.
- [Tutorial: Creating a Trigger that Logs Table Changes](#)
This tutorial shows how to use the `CREATE TRIGGER` statement to create a trigger, `EVAL_CHANGE_TRIGGER`, which adds a row to the table `EVALUATIONS_LOG` whenever an `INSERT`, `UPDATE`, or `DELETE` statement changes the `EVALUATIONS` table.
- [Tutorial: Creating a Trigger that Generates a Primary Key for a Row Before It Is Inserted](#)
This tutorial shows how to use the SQL Developer Create Trigger tool to create a trigger that fires before a row is inserted into the `EVALUATIONS` table, and generates the unique number for the primary key of that row, using `EVALUATIONS_SEQUENCE`.
- [Creating an INSTEAD OF Trigger](#)
A view presents the output of a query as a table. If you want to change a view as you would change a table, then you must create `INSTEAD OF` triggers. Instead of changing the view, they change the underlying tables.
- [Tutorial: Creating Triggers that Log LOGON and LOGOFF Events](#)
This tutorial shows how to use the `CREATE TRIGGER` statement to create two triggers, `HR_LOGON_TRIGGER` and `HR_LOGOFF_TRIGGER`. *After* someone logs on as user `HR`, `HR_LOGON_TRIGGER` adds a row to the table `HR_USERS_LOG`. *Before* someone logs off as user `HR`, `HR_LOGOFF_TRIGGER` adds a row to the table `HR_USERS_LOG`.

 **See Also:**

- *Oracle SQL Developer User's Guide* for information about SQL Developer dialog boxes for creating objects
- *Oracle Database PL/SQL Language Reference* for more information about the CREATE TRIGGER statement
- ["Editing Installation Scripts that Create Triggers"](#)

6.2.1 About OLD and NEW Pseudorecords

When a row-level trigger fires, the PL/SQL runtime system creates and populates the two pseudorecords OLD and NEW. They are called pseudorecords because they have some, but not all, of the properties of records.

For the row that the trigger is processing:

- For an INSERT trigger, OLD contains no values, and NEW contains the new values.
- For an UPDATE trigger, OLD contains the old values, and NEW contains the new values.
- For a DELETE trigger, OLD contains the old values, and NEW contains no values.

To reference a pseudorecord, put a colon before its name—:OLD or :NEW—as in [Example 6-1](#).

 **See Also:**

Oracle Database PL/SQL Language Reference for more information about OLD and NEW pseudorecords

6.2.2 Tutorial: Creating a Trigger that Logs Table Changes

This tutorial shows how to use the CREATE TRIGGER statement to create a trigger, EVAL_CHANGE_TRIGGER, which adds a row to the table EVALUATIONS_LOG whenever an INSERT, UPDATE, or DELETE statement changes the EVALUATIONS table.

The trigger adds the row *after* the triggering statement executes, and uses the **conditional predicates** **INSERTING**, **UPDATING**, and **DELETING** to determine which of the three possible DML statements fired the trigger.

EVAL_CHANGE_TRIGGER is a **statement-level trigger** and an **AFTER trigger**.

To create EVALUATIONS_LOG and EVAL_CHANGE_TRIGGER:

1. Create the EVALUATIONS_LOG table:

```
CREATE TABLE EVALUATIONS_LOG ( log_date DATE
                               , action VARCHAR2(50));
```

2. Create EVAL_CHANGE_TRIGGER:

```
CREATE OR REPLACE TRIGGER EVAL_CHANGE_TRIGGER
  AFTER INSERT OR UPDATE OR DELETE
  ON EVALUATIONS
  DECLARE
    log_action EVALUATIONS_LOG.action%TYPE;
  BEGIN
    IF INSERTING THEN
      log_action := 'Insert';
    ELSIF UPDATING THEN
      log_action := 'Update';
    ELSIF DELETING THEN
      log_action := 'Delete';
    ELSE
      DBMS_OUTPUT.PUT_LINE('This code is not reachable.');
```

```
    END IF;

    INSERT INTO EVALUATIONS_LOG (log_date, action)
      VALUES (SYSDATE, log_action);
  END;
```

See Also:

Oracle Database PL/SQL Language Reference for more information about conditional predicates

6.2.3 Tutorial: Creating a Trigger that Generates a Primary Key for a Row Before It Is Inserted

This tutorial shows how to use the SQL Developer Create Trigger tool to create a trigger that fires before a row is inserted into the EVALUATIONS table, and generates the unique number for the primary key of that row, using EVALUATIONS_SEQUENCE.

The sequence EVALUATIONS_SEQUENCE (created in "[Tutorial: Creating a Sequence](#)") generates primary keys for the EVALUATIONS table (created in "[Creating Tables](#)"). However, these primary keys are not inserted into the table automatically.

This tutorial shows how to use the SQL Developer Create Trigger tool to create a trigger named NEW_EVALUATION_TRIGGER, which fires *before* a row is inserted into the EVALUATIONS table, and generates the unique number for the primary key of that row, using EVALUATIONS_SEQUENCE. The trigger fires once *for each row* affected by the triggering INSERT statement.

NEW_EVALUATION_TRIGGER is a **row-level trigger** and a **BEFORE trigger**.

To create the NEW_EVALUATION trigger:

1. In the Connections frame, expand **hr_conn**.
2. In the list of schema object types, right-click **Triggers**.
3. In the list of choices, click **New Trigger**.
4. In the Create Trigger window:

- a. In the Name field, type `NEW_EVALUATION_TRIGGER` over the default value `TRIGGER1`.
- b. For Base Object, select **EVALUATIONS** from the menu.
- c. Move **INSERT** from Available Events to Selected Events.
(Select **INSERT** and click >.)
- d. Deselect the option **Statement Level**.
- e. Click **OK**.

The `NEW_EVALUATION_TRIGGER` pane opens, showing the `CREATE TRIGGER` statement that created the trigger:

```
CREATE OR REPLACE
TRIGGER NEW_EVALUATION_TRIGGER
BEFORE INSERT ON EVALUATIONS
FOR EACH ROW
BEGIN
  NULL;
END;
```

The title of the `NEW_EVALUATION_TRIGGER` pane is in italic font, indicating that the trigger is not yet saved in the database.

5. In the `CREATE TRIGGER` statement, replace `NULL` with this:

```
:NEW.evaluation_id := evaluations_sequence.NEXTVAL
```

6. From the File menu, select **Save**.

Oracle Database compiles the procedure and saves it. The title of the `NEW_EVALUATION_TRIGGER` pane is no longer in italic font.

6.2.4 Creating an INSTEAD OF Trigger

A view presents the output of a query as a table. If you want to change a view as you would change a table, then you must create `INSTEAD OF` triggers. Instead of changing the view, they change the underlying tables.

For example, consider the view `EMP_LOCATIONS`, whose `NAME` column is created from the `LAST_NAME` and `FIRST_NAME` columns of the `EMPLOYEES` table:

```
CREATE VIEW EMP_LOCATIONS AS
SELECT e.EMPLOYEE_ID,
       e.LAST_NAME || ', ' || e.FIRST_NAME NAME,
       d.DEPARTMENT_NAME DEPARTMENT,
       l.CITY CITY,
       c.COUNTRY_NAME COUNTRY
FROM   EMPLOYEES e, DEPARTMENTS d, LOCATIONS l, COUNTRIES c
WHERE  e.DEPARTMENT_ID = d.DEPARTMENT_ID AND
       d.LOCATION_ID = l.LOCATION_ID AND
       l.COUNTRY_ID = c.COUNTRY_ID
ORDER BY LAST_NAME;
```

To update the view `EMP_LOCATIONS.NAME` (created in "[Creating Views with the CREATE VIEW Statement](#)"), you must update `EMPLOYEES.LAST_NAME` and `EMPLOYEES.FIRST_NAME`. This is what the `INSTEAD OF` trigger in [Example 6-1](#) does.

NEW and OLD are **pseudorecords** that the PL/SQL runtime engine creates and populates whenever a row-level trigger fires. OLD and NEW store the original and new values, respectively, of the record being processed by the trigger. They are called pseudorecords because they do not have all properties of PL/SQL records.

Example 6-1 Creating an INSTEAD OF Trigger

```
CREATE OR REPLACE TRIGGER update_name_view_trigger
INSTEAD OF UPDATE ON emp_locations
BEGIN
    UPDATE employees SET
        first_name = substr( :NEW.name, instr( :new.name, ',' )+2),
        last_name = substr( :NEW.name, 1, instr( :new.name, ',' )-1)
    WHERE employee_id = :OLD.employee_id;
END;
```

See Also:

- *Oracle Database PL/SQL Language Reference* for more information about INSTEAD OF triggers
- *Oracle Database PL/SQL Language Reference* for more information about OLD and NEW

6.2.5 Tutorial: Creating Triggers that Log LOGON and LOGOFF Events

This tutorial shows how to use the CREATE TRIGGER statement to create two triggers, HR_LOGON_TRIGGER and HR_LOGOFF_TRIGGER. *After* someone logs on as user HR, HR_LOGON_TRIGGER adds a row to the table HR_USERS_LOG. *Before* someone logs off as user HR, HR_LOGOFF_TRIGGER adds a row to the table HR_USERS_LOG.

HR_LOGON_TRIGGER and HR_LOGOFF_TRIGGER are **system triggers**. HR_LOGON_TRIGGER is an **AFTER trigger** and HR_LOGOFF_TRIGGER is a **BEFORE trigger**.

To create HR_USERS_LOG, HR_LOGON_TRIGGER, and HR_LOGOFF_TRIGGER:

1. Create the HR_USERS_LOG table:

```
CREATE TABLE hr_users_log (
    user_name VARCHAR2(30),
    activity VARCHAR2(20),
    event_date DATE
);
```

2. Create HR_LOGON_TRIGGER:

```
CREATE OR REPLACE TRIGGER hr_logon_trigger
    AFTER LOGON
    ON HR.SCHEMA
BEGIN
    INSERT INTO hr_users_log (user_name, activity, event_date)
```

```
VALUES (USER, 'LOGON', SYSDATE);
END;
```

3. Create HR_LOGOFF_TRIGGER:

```
CREATE OR REPLACE TRIGGER hr_logoff_trigger
  BEFORE LOGOFF
  ON HR.SCHEMA
BEGIN
  INSERT INTO hr_users_log (user_name, activity, event_date)
  VALUES (USER, 'LOGOFF', SYSDATE);
END;
```

See Also:

Oracle Database PL/SQL Language Reference for more information about system triggers

6.3 Changing Triggers

To change a trigger, use either the SQL Developer tool Edit or the DDL statement CREATE TRIGGER with the OR REPLACE clause.

To change a trigger using the Edit tool:

1. In the Connections frame, expand **hr_conn**.
2. In the list of schema object types, expand **Triggers**.
3. In the list of triggers, click the trigger to change.
4. In the frame to the right of the Connections frame, the Code pane appears, showing the code that created the trigger.

The Code pane is in write mode. (Clicking the pencil icon switches the mode from write mode to read only, or the reverse.)

5. In the Code pane, change the code.

The title of the pane is in italic font, indicating that the change is not yet saved in the database.

6. From the File menu, select **Save**.

Oracle Database compiles the trigger and saves it. The title of the pane is no longer in italic font.

See Also:

- ["About Data Definition Language \(DDL\) Statements"](#) for general information that applies to the CREATE OR REPLACE TRIGGER statement
- *Oracle Database PL/SQL Language Reference* for more information about the CREATE OR REPLACE TRIGGER statement

6.4 Disabling and Enabling Triggers

You might need to temporarily disable triggers that reference objects that are unavailable, or to upload a large amount of data without the delay that triggers cause (as in a recovery operation). After the referenced objects become available, or you have finished uploading the data, you can re-enable the triggers.

- [Disabling or Enabling a Single Trigger](#)
To disable or enable a single trigger, use either the Disable Trigger or Enable Trigger tool or the ALTER TRIGGER statement with the DISABLE or ENABLE clause.
- [Disabling or Enabling All Triggers on a Single Table](#)
To disable or enable all triggers on a specific table, use either the Disable All Triggers or Enable All Triggers tool or the ALTER TABLE statement with the DISABLE ALL TRIGGERS or ENABLE ALL TRIGGERS clause.

See Also:

- *Oracle Database PL/SQL Language Reference* for more information about the ALTER TRIGGER statement
- *Oracle Database SQL Language Reference* for more information about the ALTER TABLE statement

6.4.1 Disabling or Enabling a Single Trigger

To disable or enable a single trigger, use either the Disable Trigger or Enable Trigger tool or the ALTER TRIGGER statement with the DISABLE or ENABLE clause.

For example, these statements disable and enable the eval_change_trigger:

```
ALTER TRIGGER eval_change_trigger DISABLE;  
ALTER TRIGGER eval_change_trigger ENABLE;
```

To use the Disable Trigger or Enable Trigger tool:

1. In the Connections frame, expand **hr_conn**.
2. In the list of schema object types, expand **Triggers**.
3. In the list of triggers, right-click the desired trigger.
4. In the list of choices, select **Disable** or **Enable**.
5. In the Disable or Enable window, click **Apply**.
6. In the Confirmation window, click **OK**.

6.4.2 Disabling or Enabling All Triggers on a Single Table

To disable or enable all triggers on a specific table, use either the Disable All Triggers or Enable All Triggers tool or the ALTER TABLE statement with the DISABLE ALL TRIGGERS or ENABLE ALL TRIGGERS clause.

For example, these statements disable and enable all triggers on the evaluations table:

```
ALTER TABLE evaluations DISABLE ALL TRIGGERS;  
ALTER TABLE evaluations ENABLE ALL TRIGGERS;
```

To use the Disable All Triggers or Enable All Triggers tool:

1. In the Connections frame, expand **hr_conn**.
2. In the list of schema object types, expand **Tables**.
3. In the list of tables, right-click the desired table.
4. In the list of choices, select **Triggers**.
5. In the list of choices, select **Disable All** or **Enable All**.
6. In the Disable All or Enable All window, click **Apply**.
7. In the Confirmation window, click **OK**.

6.5 About Trigger Compilation and Dependencies

Compiled triggers depend on the schema objects on which they are defined. If an object on which a trigger depends is dropped, or changed such that there is a mismatch between the trigger and the object, then the trigger is invalidated.

Running a CREATE TRIGGER statement compiles the trigger being created. If this compilation causes an error, then the CREATE TRIGGER statement fails. To see the compilation errors, use this statement:

```
SELECT * FROM USER_ERRORS WHERE TYPE = 'TRIGGER';
```

Compiled triggers depend on the schema objects on which they are defined. For example, NEW_EVALUATION_TRIGGER depends on the EVALUATIONS table:

```
CREATE OR REPLACE  
TRIGGER NEW_EVALUATION_TRIGGER  
BEFORE INSERT ON EVALUATIONS  
FOR EACH ROW  
BEGIN  
    :NEW.evaluation_id := evaluations_seq.NEXTVAL;  
END;
```

To see the schema objects on which triggers depend, use this statement:

```
SELECT * FROM ALL_DEPENDENCIES WHERE TYPE = 'TRIGGER';
```

If an object on which a trigger depends is dropped, or changed such that there is a mismatch between the trigger and the object, then the trigger is invalidated. The next time the trigger is invoked, it is recompiled. To recompile a trigger immediately, use the ALTER TRIGGER statement with the COMPILE clause. For example:

```
ALTER TRIGGER NEW_EVALUATION_TRIGGER COMPILE;
```

 **See Also:**

Oracle Database PL/SQL Language Reference for more information about trigger compilation and dependencies

6.6 Dropping Triggers

You must drop a trigger before dropping the objects on which it depends.

To drop a trigger, use either the SQL Developer Connections frame and Drop tool, or the DDL statement `DROP TRIGGER`.

This statement drops the trigger `EVAL_CHANGE_TRIGGER`:

```
DROP TRIGGER EVAL_CHANGE_TRIGGER;
```

To drop a trigger using the Drop tool:

1. In the Connections frame, expand **hr_conn**.
2. In the list of schema object types, expand **Triggers**.
3. In the list of triggers, right-click the name of the trigger to drop.
4. In the list of choices, click **Drop Trigger**.
5. In the Drop window, click **Apply**.
6. In the Confirmation window, click **y**.

 **See Also:**

- "[About Data Definition Language \(DDL\) Statements](#)" for general information that applies to the `DROP TRIGGER` statement
- *Oracle Database PL/SQL Language Reference* for information about the `DROP TRIGGER` statement

7

Working in a Global Environment

Globalization support features enable multilingual applications to run simultaneously from anywhere in the world. Applications can render the content of the user interface, and process data, using the native language and locale preferences of the user.

- [About Globalization Support Features](#)
Globalization support features enable you to develop multilingual applications that can be run simultaneously from anywhere in the world. An application can render the content of the user interface, and process data, using the native language and locale preferences of the user.
- [About Initial NLS Parameter Values](#)
Except in SQL Developer, the initial values of NLS parameters are set by database initialization parameters.
- [Viewing NLS Parameter Values](#)
To view the current values of NLS parameters, use the SQL Developer report National Language Support Parameters.
- [Changing NLS Parameter Values](#)
You can change the value of one or more NLS parameters in any of these ways.
- [About Individual NLS Parameters](#)
Many individual NLS parameters are available.
- [Using Unicode in Globalized Applications](#)
You can insert and retrieve Unicode data. Data is transparently converted among the database and client programs, which ensures that client programs are independent of the database character set and national character set.

7.1 About Globalization Support Features

Globalization support features enable you to develop multilingual applications that can be run simultaneously from anywhere in the world. An application can render the content of the user interface, and process data, using the native language and locale preferences of the user.

Note:

In the past, Oracle called globalization support **National Language Support (NLS)**, but NLS is actually a subset of globalization support. NLS is the ability to choose a national language and store data using a specific character set. NLS is implemented with NLS parameters.

- [About Language Support](#)
Oracle Database enables you to store, process, and retrieve data in native languages. The languages that can be stored in a database are all languages

written in scripts that are encoded by Oracle-supported character sets. Through the use of Unicode databases and data types, Oracle Database supports most contemporary languages.

- [About Territory Support](#)
The default local time format, date format, and numeric and monetary conventions depend on the local territory setting.
- [About Date and Time Formats](#)
Different countries have different conventions for displaying the hour, day, month, and year.
- [About Calendar Formats](#)
Different countries use different calendars.
- [About Numeric and Monetary Formats](#)
Different countries have different numeric and monetary conventions.
- [About Linguistic Sorting and String Searching](#)
Different languages have different sort orders (collating sequences). Also, different countries or cultures that use the same alphabets sort words differently. For example, in Danish, Æ is after Z, and Y and Ü are considered to be variants of the same letter.
- [About Length Semantics](#)
To calculate the number of characters in a string, using byte length, you must know the number of bytes in each character in the character set.
- [About Unicode and SQL National Character Data Types](#)
Unicode is a character encoding system that defines every character in most of the spoken languages in the world. In Unicode, every character has a unique code, regardless of the platform, program, or language.

See Also:

Oracle Database Globalization Support Guide for more information about globalization support features

7.1.1 About Language Support

Oracle Database enables you to store, process, and retrieve data in native languages. The languages that can be stored in a database are all languages written in scripts that are encoded by Oracle-supported character sets. Through the use of Unicode databases and data types, Oracle Database supports most contemporary languages.

Additional support is available for a subset of the languages. The database can, for example, display dates using translated month names, and can sort text data according to cultural conventions.

In this document, the term **language support** refers to the additional language-dependent functionality, and not to the ability to store text of a specific language. For example, language support includes displaying dates or sorting text according to specific locales and cultural conventions. Additionally, for some supported languages, Oracle Database provides translated server messages and a translated user interface for the database utilities.

 **See Also:**

- ["About the NLS_LANGUAGE Parameter"](#)
- *Oracle Database Globalization Support Guide* for a complete list of languages that Oracle Database supports
- *Oracle Database Globalization Support Guide* for a list of languages into which Oracle Database messages are translated

7.1.2 About Territory Support

The default local time format, date format, and numeric and monetary conventions depend on the local territory setting.

Oracle Database supports cultural conventions that are specific to geographical locations. The default local time format, date format, and numeric and monetary conventions depend on the local territory setting. Setting different NLS parameters enables the database session to use different cultural settings. For example, you can set the euro (EUR) as the primary currency and the Japanese yen (JPY) as the secondary currency for a given database session, even when the territory is AMERICA.

 **See Also:**

- ["About the NLS_TERRITORY Parameter"](#)
- *Oracle Database Globalization Support Guide* for a complete list of territories that Oracle Database supports

7.1.3 About Date and Time Formats

Different countries have different conventions for displaying the hour, day, month, and year.

For example, this table shows the local date and time format for five countries and gives an example of each format:

Country	Date Format	Example	Time Format	Example
China	yyyy-mm-dd	2005-02-28	hh24:mi:ss	13:50:23
Estonia	dd.mm.yyyy	28.02.2005	hh24:mi:ss	13:50:23
Germany	dd.mm.rr	28.02.05	hh24:mi:ss	13:50:23
UK	dd/mm/yyyy	28/02/2005	hh24:mi:ss	13:50:23
US	mm/dd/yyyy	02/28/2005	hh:mi:ssx ^{ff} am	1:50:23.555 PM

 **See Also:**

- ["About the NLS_DATE_FORMAT Parameter"](#)
- ["About the NLS_DATE_LANGUAGE Parameter"](#)
- ["About NLS_TIMESTAMP_FORMAT and NLS_TIMESTAMP_TZ_FORMAT Parameters"](#)
- *Oracle Database Globalization Support Guide* for information about date/time data types and time zone support
- *Oracle Database SQL Language Reference* for information about date and time formats

7.1.4 About Calendar Formats

Different countries use different calendars.

Oracle Database stores this calendar information for each territory:

- **First day of the week**

Sunday in some cultures, Monday in others. Set by the NLS_TERRITORY parameter.
- **First week of the calendar year**

Some countries use week numbers for scheduling, planning, and bookkeeping. In the ISO standard, this week number can differ from the week number of the calendar year. For example, 1st Jan 2005 is in ISO week number 53 of 2004. An ISO week starts on Monday and ends on Sunday. To support the ISO standard, Oracle Database provides the IW date format element, which returns the ISO week number. The first calendar week of the year is set by the NLS_TERRITORY parameter.
- **Number of days and months in a year**

Oracle Database supports six calendar systems in addition to the Gregorian calendar, which is the default. These additional calendar systems are:

 - Japanese Imperial
Has the same number of months and days as the Gregorian calendar, but the year starts with the beginning of each Imperial Era.
 - ROC Official
Has the same number of months and days as the Gregorian calendar, but the year starts with the founding of the Republic of China.
 - Persian
The first six months have 31 days each, the next five months have 30 days each, and the last month has either 29 days or (in leap year) 30 days.
 - Thai Buddha uses a Buddhist calendar.
 - Arabic Hijrah has 12 months and 354 or 355 days.
 - English Hijrah has 12 months and 354 or 355 days.

The calendar system is specified by the NLS_CALENDAR parameter.

- **First year of era**

The Islamic calendar starts from the year of the Hegira. The Japanese Imperial calendar starts from the beginning of an Emperor's reign (for example, 1998 is the tenth year of the Heisei era).

 **See Also:**

- ["About the NLS_TERRITORY Parameter"](#)
- ["About the NLS_CALENDAR Parameter"](#)
- *Oracle Database Globalization Support Guide* for information about calendar formats

7.1.5 About Numeric and Monetary Formats

Different countries have different numeric and monetary conventions.

This table shows the local numeric and monetary format for five countries and gives an example of each format:

Country	Numeric Format	Monetary Format
China	1,234,567.89	©1,234.56
Estonia	1 234 567,89	1 234,56 kr
Germany	1.234.567,89	1.234,56€
UK	1,234,567.89	£1,234.56
US	1,234,567.89	\$1,234.56

 **See Also:**

- ["About the NLS_NUMERIC_CHARACTERS Parameter"](#)
- ["About the NLS_CURRENCY Parameter"](#)
- ["About the NLS_ISO_CURRENCY Parameter"](#)
- ["About the NLS_DUAL_CURRENCY Parameter"](#)
- *Oracle Database Globalization Support Guide* for information about numeric and list parameters
- *Oracle Database Globalization Support Guide* for information about monetary parameters
- *Oracle Database SQL Language Reference* for information about number format models

7.1.6 About Linguistic Sorting and String Searching

Different languages have different sort orders (collating sequences). Also, different countries or cultures that use the same alphabets sort words differently. For example, in Danish, Æ is after Z, and Y and Ü are considered to be variants of the same letter.

See Also:

- ["About the NLS_SORT Parameter"](#)
- ["About the NLS_COMP Parameter"](#)
- *Oracle Database Globalization Support Guide* for more information about linguistic sorting and string searching

7.1.7 About Length Semantics

To calculate the number of characters in a string, using byte length, you must know the number of bytes in each character in the character set.

In single-byte character sets, the number of bytes and the number of characters in a string are the same. In multibyte character sets, a character or code point consists of one or more bytes. Calculating the number of characters based on byte length can be difficult in a variable-width character set. Calculating column length in bytes is called **byte semantics**, while measuring column length in characters is called **character semantics**.

Character semantics is useful for specifying the storage requirements for multibyte strings of varying widths. For example, in a Unicode database (AL32UTF8), suppose that you must have a VARCHAR2 column that can store up to five Chinese characters with five English characters. Using byte semantics, this column requires 15 bytes for the Chinese characters, which are 3 bytes long, and 5 bytes for the English characters, which are 1 byte long, for a total of 20 bytes. Using character semantics, the column requires 10 characters.

See Also:

- ["About the NLS_LENGTH_SEMANTICS Parameter"](#)
- *Oracle Database Globalization Support Guide* for information about character sets and length semantics

7.1.8 About Unicode and SQL National Character Data Types

Unicode is a character encoding system that defines every character in most of the spoken languages in the world. In Unicode, every character has a unique code, regardless of the platform, program, or language.

You can store Unicode characters in an Oracle Database in two ways:

- You can create a Unicode database that enables you to store UTF-8 encoded characters as SQL character data types (CHAR, VARCHAR2, CLOB, and LONG).
- You can declare columns and variables that have SQL national character data types.

The **SQL national character data types** are NCHAR, NVARCHAR2, and NCLOB. They are also called **Unicode data types**, because they are used only for storing Unicode data.

The national character set, which is used for all SQL national character data types, is specified when the database is created. The national character set can be either UTF8 or AL16UTF16 (default).

When you declare a column or variable of the type NCHAR or NVARCHAR2, the length that you specify is the number of characters, not the number of bytes.

See Also:

- *Oracle Database Globalization Support Guide* for more information about Unicode
- *Oracle Database Globalization Support Guide* for more information about storing Unicode characters in an Oracle Database
- *Oracle Database Globalization Support Guide* for more information about SQL national character data types

7.2 About Initial NLS Parameter Values

Except in SQL Developer, the initial values of NLS parameters are set by database initialization parameters.

The DBA can set the values of initialization parameters in the initialization parameter file, and they take effect the next time the database is started.

In SQL Developer, the initial values of NLS parameters are as shown in [Table 7-1](#).

Table 7-1 Initial Values of NLS Parameters in SQL Developer

Parameter	Initial Value
NLS_CALENDAR	GREGORIAN
NLS_CHARACTERSET	AL32UTF8
NLS_COMP	BINARY
NLS_CURRENCY	\$
NLS_DATE_FORMAT	DD-MON-RR
NLS_DATE_LANGUAGE	AMERICAN
NLS_DUAL_CURRENCY	\$
NLS_ISO_CURRENCY	AMERICA
NLS_LANGUAGE	AMERICAN

Table 7-1 (Cont.) Initial Values of NLS Parameters in SQL Developer

Parameter	Initial Value
NLS_LENGTH_SEMANTICS	BYTE
NLS_NCHAR_CHARACTERSET	AL16UTF16
NLS_NCHAR_CONV_EXCP	FALSE
NLS_NUMERIC_CHARACTERS	.,
NLS_SORT	BINARY
NLS_TERRITORY	AMERICA
NLS_TIMESTAMP_FORMAT	DD-MON-RR HH.MI.SSXFF AM
NLS_TIMESTAMP_TZ_FORMAT	DD-MON-RR HH.MI.SSXFF AM TZR
NLS_TIME_FORMAT	HH.MI.SSXFF AM
NLS_TIME_TZ_FORMAT	HH.MI.SSXFF AM TZR

 **See Also:**

Oracle Database Administrator's Guide for information about initialization parameters and initialization parameter files

7.3 Viewing NLS Parameter Values

To view the current values of NLS parameters, use the SQL Developer report National Language Support Parameters.

To view the National Language Support Parameters report:

1. From the SQL Developer menu View, select **Reports**.
2. In the Reports pane, expand **Data Dictionary Reports**.
3. In the list of reports, expand **About Your Database**.
4. In the list of reports, select **National Language Support Parameters**.
5. In the Select Connection window, select **hr_conn**.
6. Click **OK**.

The Select Connection window closes and the National Language Support Parameters pane appears, showing the names of the NLS parameters and their current values.

 **See Also:**

Oracle SQL Developer User's Guide for more information about SQL Developer reports

7.4 Changing NLS Parameter Values

You can change the value of one or more NLS parameters in any of these ways.

- Change the values for all SQL Developer connections, current and future.
- On the client, change the settings of the corresponding NLS environment variables.

Only on the client, the new values of the NLS environment variables override the values of the corresponding NLS parameters.

You can use environment variables to specify locale-dependent behavior for the client. For example, on a Linux system, this statement sets the value of the NLS_SORT environment variable to `FRENCH`, overriding the value of the NLS_SORT parameter:

```
% setenv NLS_SORT FRENCH
```

 **Note:**

Environment variables might be platform-dependent.

- Change the values only for the current session, using an `ALTER SESSION` statement with this syntax:

```
ALTER SESSION SET parameter_name=parameter_value  
[ parameter_name=parameter_value ]... ;
```

Only in the current session, the new values override those set in all of the preceding ways.

You can use the `ALTER SESSION` to test your application with the settings for different locales.

- Change the values only for the current SQL function invocation.

Only for the current SQL function invocation, the new values override those set in all of the preceding ways.

- [Changing NLS Parameter Values for All SQL Developer Connections](#)
You can change the values of NLS parameters for all SQL Developer connections, current and future.
- [Changing NLS Parameter Values for the Current SQL Function Invocation](#)
SQL functions whose behavior depends on the values of NLS parameters are called **locale-dependent**. Some locale-dependent SQL functions have optional NLS parameters.

 **See Also:**

- *Oracle Database SQL Language Reference* for more information about the ALTER SESSION statement
- *Oracle Database Globalization Support Guide* for more information about setting NLS parameters

7.4.1 Changing NLS Parameter Values for All SQL Developer Connections

You can change the values of NLS parameters for all SQL Developer connections, current and future.

To change National Language Support Parameter values:

1. From the SQL Developer menu Tools, select **Preferences**.
 2. In the Preferences window, in the left frame, expand **Database**.
 3. In the list of database preferences, click **NLS**.
- A list of NLS parameters and their current values appears. The value fields are menus.
4. From the menu to the right of each parameter whose value you want to change, select the desired value.
 5. Click **OK**.

The NLS parameters now have the values that you specified. To verify these values, see "[Viewing NLS Parameter Values](#)".

 **Note:**

If the NLS parameter values do not reflect your changes, click the icon **Run Report**.

 **See Also:**

Oracle SQL Developer User's Guide for more information about SQL Developer preferences

7.4.2 Changing NLS Parameter Values for the Current SQL Function Invocation

SQL functions whose behavior depends on the values of NLS parameters are called **locale-dependent**. Some locale-dependent SQL functions have optional NLS parameters.

The local-dependent functions that have optional NLS parameters are:

- TO_CHAR
- TO_DATE
- TO_NUMBER
- NLS_UPPER
- NLS_LOWER
- NLS_INITCAP
- NLSSORT

In all of the preceding functions, you can specify these NLS parameters:

- NLS_DATE_LANGUAGE
- NLS_DATE_LANGUAGE
- NLS_NUMERIC_CHARACTERS
- NLS_CURRENCY
- NLS_ISO_CURRENCY
- NLS_DUAL_CURRENCY
- NLS_CALENDAR
- NLS_SORT

In the NLSSORT function, you can also specify these NLS parameters:

- NLS_LANGUAGE
- NLS_TERRITORY
- NLS_DATE_FORMAT

To specify NLS parameters in a function, use this syntax:

```
'parameter=value' ['parameter=value']...
```

Suppose that you want NLS_DATE_LANGUAGE to be AMERICAN when this query is evaluated:

```
SELECT last_name FROM employees WHERE hire_date > '01-JAN-1999';
```

You can set NLS_DATE_LANGUAGE to AMERICAN before running the query:

```
ALTER SESSION SET NLS_DATE_LANGUAGE=American;  
SELECT last_name FROM employees WHERE hire_date > '01-JAN-1999';
```

Alternatively, you can set `NLS_DATE_LANGUAGE` to `AMERICAN` inside the query, using the locale-dependent SQL function `TO_DATE` with its optional `NLS_DATE_LANGUAGE` parameter:

```
SELECT last_name FROM employees
WHERE hire_date > TO_DATE('01-JAN-1999', 'DD-MON-YYYY',
                        'NLS_DATE_LANGUAGE=AMERICAN');
```

 **Tip:**

Using session default values for NLS parameters in SQL functions usually results in better performance. Therefore, specify optional NLS parameters in locale-dependent SQL functions only in SQL statements that must not use the default NLS parameter values.

 **See Also:**

Oracle Database Globalization Support Guide for more information about locale-dependent SQL functions with optional NLS parameters

7.5 About Individual NLS Parameters

Many individual NLS parameters are available.

- [About Locale and the NLS_LANG Parameter](#)
A **locale** is a linguistic and cultural environment in which a system or application runs. The simplest way to specify a locale for Oracle Database software is to set the `NLS_LANG` parameter.
- [About the NLS_LANGUAGE Parameter](#)
This parameter specifies the default language of the database.
- [About the NLS_TERRITORY Parameter](#)
This parameter specifies default conventions for date format, time stamp format, decimal and group separator, local currency symbol, ISO currency symbol, and dual currency symbol.
- [About the NLS_DATE_FORMAT Parameter](#)
This parameter specifies the default date format to use with the `TO_CHAR` and `TO_DATE` functions.
- [About the NLS_DATE_LANGUAGE Parameter](#)
This parameter specifies the language for names and abbreviations of days and months that are produced by: SQL functions `TO_CHAR` and `TO_DATE`, the default date format (set by `NLS_DATE_FORMAT`), and symbols for the default-language equivalents of AM, PM, AD, and BC.
- [About NLS_TIMESTAMP_FORMAT and NLS_TIMESTAMP_TZ_FORMAT Parameters](#)
This parameter specifies the default date format for the `TIMESTAMP` and `TIMESTAMP WITH LOCAL TIME ZONE` data types.

- [About the NLS_CALENDAR Parameter](#)
This parameter specifies the calendar system for the database.
- [About the NLS_NUMERIC_CHARACTERS Parameter](#)
This parameter specifies the decimal character (which separates the integer and decimal parts of a number) and group separator (which separates integer groups to show thousands and millions, for example). The group separator is the character returned by the numeric format element G.
- [About the NLS_CURRENCY Parameter](#)
This parameter specifies the local currency symbol (the character string returned by the numeric format element L).
- [About the NLS_ISO_CURRENCY Parameter](#)
This parameter specifies the ISO currency symbol (the string returned by the numeric format element C).
- [About the NLS_DUAL_CURRENCY Parameter](#)
This parameter specifies the dual currency symbol (introduced to support the euro currency symbol during the euro transition period).
- [About the NLS_SORT Parameter](#)
This parameter specifies the linguistic sort order (collating sequence) for queries that have the ORDER BY clause.
- [About the NLS_COMP Parameter](#)
This parameter specifies the character-comparison behavior of SQL operations.
- [About the NLS_LENGTH_SEMANTICS Parameter](#)
This parameter specifies the length semantics for columns of the character data types CHAR, VARCHAR2, and LONG; that is, whether these columns are specified in bytes or in characters. (Applies only to columns that are declared after the parameter is set.)

 **See Also:**

- *Oracle Database Globalization Support Guide* for more information about setting up a globalization support environment
- ["Changing NLS Parameter Values"](#)

7.5.1 About Locale and the NLS_LANG Parameter

A **locale** is a linguistic and cultural environment in which a system or application runs. The simplest way to specify a locale for Oracle Database software is to set the NLS_LANG parameter.

The NLS_LANG parameter sets the default values of the parameters NLS_LANGUAGE and NLS_TERRITORY for both the server session (for example, SQL statement processing) and the client application (for example, display formatting in Oracle Database tools). The NLS_LANG parameter also sets the character set that the client application uses for data entered or displayed.

The default value of NLS_LANG is set during database installation. You can use the ALTER SESSION statement to change the values of NLS parameters, including those

set by `NLS_LANG`, for your session. However, only the client can change the NLS settings in the client environment.

 **See Also:**

- *Oracle Database Globalization Support Guide* for more information about specifying a locale with the `NLS_LANG` parameter
- *Oracle Database Globalization Support Guide* for information about languages, territories, character sets, and other locale data supported by Oracle Database
- ["About the NLS_LANGUAGE Parameter"](#)
- ["About the NLS_TERRITORY Parameter"](#)
- ["Changing NLS Parameter Values"](#)

7.5.2 About the NLS_LANGUAGE Parameter

This parameter specifies the default language of the database.

Specifies: Default language of the database. Default conventions for:

- Language for server messages
- Language for names and abbreviations of days and months that are specified in the SQL functions `TO_CHAR` and `TO_DATE`
- Symbols for default-language equivalents of AM, PM, AD, and BC
- Default sorting order for character data when the `ORDER BY` clause is specified
- Writing direction
- Affirmative and negative response strings (for example, YES and NO)

Acceptable Values: Any language name that Oracle supports. For a list, see *Oracle Database Globalization Support Guide*.

Default Value: Set by `NLS_LANG`, described in ["About Locale and the NLS_LANG Parameter"](#).

Sets default values of:

- `NLS_DATE_LANGUAGE`, described in ["About the NLS_DATE_LANGUAGE Parameter"](#).
- `NLS_SORT`, described in ["About the NLS_SORT Parameter"](#).

[Example 7-1](#) shows how setting `NLS_LANGUAGE` to `ITALIAN` and `GERMAN` affects server messages and month abbreviations.

To try this example in SQL Developer, enter the statements and queries in the Worksheet. For information about the Worksheet, see ["Running Queries in SQL Developer"](#). The results shown here are from SQL*Plus; their format is slightly different in SQL Developer.

Example 7-1 NLS_LANGUAGE Affects Server Message and Month Abbreviations

1. Note the current value of NLS_LANGUAGE.
2. If the value in step 1 is not ITALIAN, change it:

```
ALTER SESSION SET NLS_LANGUAGE=ITALIAN;
```

3. Query a nonexistent table:

```
SELECT * FROM nonexistent_table;
```

Result:

```
SELECT * FROM nonexistent_table
      *
ERROR at line 1:
ORA-00942: tabella o vista inesistente
```

4. Run this query:

```
SELECT LAST_NAME, HIRE_DATE
FROM EMPLOYEES
WHERE EMPLOYEE_ID IN (111, 112, 113);
```

Result:

LAST_NAME	HIRE_DATE
-----	-----
Sciarra	30- SET -97
Urman	07- MAR -98
Popp	07- DIC -99

3 rows selected.

5. Change the value of NLS_LANGUAGE to GERMAN:

```
ALTER SESSION SET NLS_LANGUAGE=GERMAN;
```

6. Repeat the query from step 3.

Result:

```
SELECT * FROM nonexistent_table
      *
ERROR at line 1:
ORA-00942: Tabelle oder View nicht vorhanden
```

7. Repeat the query from step 4.

Result:

LAST_NAME	HIRE_DATE
-----	-----
Sciarra	30- SEP -97
Urman	07- MRZ -98
Popp	07- DEZ -99

3 rows selected.

8. Set NLS_LANGUAGE to the value that it had at step 1.

 **See Also:**

- *Oracle Database Globalization Support Guide* for more information about the NLS_LANGUAGE parameter
- ["About Language Support"](#)
- ["Changing NLS Parameter Values"](#)

7.5.3 About the NLS_TERRITORY Parameter

This parameter specifies default conventions for date format, time stamp format, decimal and group separator, local currency symbol, ISO currency symbol, and dual currency symbol.

Specifies: Default conventions for:

- Date format
- Time stamp format
- Decimal character and group separator
- Local currency symbol
- ISO currency symbol
- Dual currency symbol

Acceptable Values: Any territory name that Oracle supports. For a list, see *Oracle Database Globalization Support Guide*.

Default Value: Set by NLS_LANG, described in ["About Locale and the NLS_LANG Parameter"](#).

Sets default values of:

- NLS_DATE_FORMAT, described in ["About the NLS_DATE_FORMAT Parameter"](#).
- NLS_TIMESTAMP_FORMAT and NLS_TIMESTAMP_TZ_FORMAT, described in ["About NLS_TIMESTAMP_FORMAT and NLS_TIMESTAMP_TZ_FORMAT Parameters"](#).
- NLS_NUMERIC_CHARACTERS, described in ["About the NLS_NUMERIC_CHARACTERS Parameter"](#).
- NLS_CURRENCY, described in ["About the NLS_CURRENCY Parameter"](#).
- NLS_ISO_CURRENCY, described in ["About the NLS_ISO_CURRENCY Parameter"](#).
- NLS_DUAL_CURRENCY, described in ["About the NLS_DUAL_CURRENCY Parameter"](#).

Example 7-2 shows how setting NLS_TERRITORY to JAPAN and AMERICA affects the currency symbol.

To try this example in SQL Developer, enter the statements and queries in the Worksheet. For information about the Worksheet, see ["Running Queries in SQL"](#)

Developer". The results shown here are from SQL*Plus; their format is slightly different in SQL Developer.

Example 7-2 NLS_TERRITORY Affects Currency Symbol

1. Note the current value of NLS_TERRITORY.
2. If the value in step 1 is not JAPAN, change it:

```
ALTER SESSION SET NLS_TERRITORY=JAPAN;
```

3. Run this query:

```
SELECT TO_CHAR(SALARY, 'L99G999D99') SALARY
FROM EMPLOYEES
WHERE EMPLOYEE_ID IN (100, 101, 102);
```

Result:

```
SALARY
-----
          @24,000.00
          @17,000.00
          @17,000.00
```

3 rows selected.

4. Change the value of NLS_TERRITORY to AMERICA:

```
ALTER SESSION SET NLS_TERRITORY=AMERICA;
```

5. Repeat the query from step 3.

Result:

```
SALARY
-----
          $24,000.00
          $17,000.00
          $17,000.00
```

3 rows selected.

6. Set NLS_TERRITORY to the value that it had at step 1.

See Also:

- *Oracle Database Globalization Support Guide* for more information about the NLS_TERRITORY parameter
- ["About Territory Support"](#)
- ["Changing NLS Parameter Values"](#)

7.5.4 About the NLS_DATE_FORMAT Parameter

This parameter specifies the default date format to use with the TO_CHAR and TO_DATE functions.

Specifies: Default date format to use with the TO_CHAR and TO_DATE functions (which are introduced in ["Using Conversion Functions in Queries"](#)).

Acceptable Values: Any any valid datetime format model. For example:

```
NLS_DATE_FORMAT='MM/DD/YYYY'
```

For information about datetime format models, see *Oracle Database SQL Language Reference*.

Default Value: Set by NLS_TERRITORY, described in ["About the NLS_TERRITORY Parameter"](#).

The default date format might not correspond to the convention used in a given territory. To get dates in localized formats, you can use the 'DS' (short date) and 'DL' (long date) formats.

[Example 7-3](#) shows how setting NLS_TERRITORY to AMERICA and FRANCE affects the default, short, and long date formats.

[Example 7-4](#) changes the value of NLS_DATE_FORMAT, overriding the default value set by NLS_TERRITORY.

To try the examples in SQL Developer, enter the statements and queries in the Worksheet. For information about the Worksheet, see ["Running Queries in SQL Developer"](#). The results shown here are from SQL*Plus; their format is slightly different in SQL Developer.

Example 7-3 NLS_TERRITORY Affects Date Formats

- Note the current value of NLS_TERRITORY.
- If the value in step 1 is not AMERICA, change it:

```
ALTER SESSION SET NLS_TERRITORY=AMERICA;
```

- Run this query:

```
SELECT hire_date "Default",
       TO_CHAR(hire_date,'DS') "Short",
       TO_CHAR(hire_date,'DL') "Long"
FROM employees
WHERE employee_id IN (111, 112, 113);
```

Result:

```
Default      Short      Long
-----
30-SEP-05 9/30/2005 Friday, September 30, 2005
07-MAR-98 3/7/2006  Tuesday, March 07, 2006
07-DEC-99 12/7/2007 Friday, December 07, 2007
```

3 rows selected.

- Change the value of NLS_TERRITORY to FRANCE:

```
ALTER SESSION SET NLS_TERRITORY=FRANCE;
```

- Repeat the query from step 3.

Result:

```
Default      Short      Long
-----
```

```
30/09/05 30/09/2005 friday 30 september 2005
07/03/06 07/03/2006 tuesday 7 march 2006
07/12/07 07/12/2007 friday 7 december 2007
```

3 rows selected.

(To get the names of the days and months in French, you must set either NLS_LANGUAGE or NLS_DATE_LANGUAGE to FRENCH before running the query.)

- Set NLS_TERRITORY to the value that it had at step 1.

Example 7-4 NLS_DATE_FORMAT Overrides NLS_TERRITORY

- Note the current values of NLS_TERRITORY and NLS_DATE_FORMAT.
- If the value of NLS_TERRITORY in step 1 is not AMERICA, change it:

```
ALTER SESSION SET NLS_TERRITORY=AMERICA;
```

- If the value of NLS_DATE_FORMAT in step 1 is not 'Day Month ddth', change it:

```
ALTER SESSION SET NLS_DATE_FORMAT='Day Month ddth';
```

- Run this query (from previous example, step 3):

```
SELECT hire_date "Default",
       TO_CHAR(hire_date,'DS') "Short",
       TO_CHAR(hire_date,'DL') "Long"
FROM employees
WHERE employee_id IN (111, 112, 113);
```

Result:

Default	Short	Long
-----	-----	-----
Friday September 30th	9/30/2005	Tuesday, September 30, 2005
Tuesday March 07th	3/7/2006	Saturday, March 07, 2006
Friday December 07th	12/7/2007	Tuesday, December 07, 2007

3 rows selected.

- Set NLS_TERRITORY and NLS_DATE_FORMAT to the values that they had at step 1.

See Also:

- Oracle Database Globalization Support Guide* for more information about the NLS_DATE_FORMAT parameter
- Oracle Database SQL Language Reference* for more information about the TO_CHAR function
- Oracle Database SQL Language Reference* for more information about the TO_DATE function
- ["About Date and Time Formats"](#)
- ["Changing NLS Parameter Values"](#)

7.5.5 About the NLS_DATE_LANGUAGE Parameter

This parameter specifies the language for names and abbreviations of days and months that are produced by: SQL functions TO_CHAR and TO_DATE, the default date format (set by NLS_DATE_FORMAT), and symbols for the default-language equivalents of AM, PM, AD, and BC.

Specifies: Language for names and abbreviations of days and months that are produced by:

- SQL functions TO_CHAR and TO_DATE (which are introduced in "[Using Conversion Functions in Queries](#)")
- Default date format (set by NLS_DATE_FORMAT, described in "[About the NLS_DATE_FORMAT Parameter](#)")
- Symbols for default-language equivalents of AM, PM, AD, and BC

Acceptable Values: Any language name that Oracle supports. For a list, see *Oracle Database Globalization Support Guide*.

Default Value: Set by NLS_LANGUAGE, described in "[About the NLS_LANGUAGE Parameter](#)".

[Example 7-5](#) shows how setting NLS_DATE_LANGUAGE to FRENCH and SWEDISH affects the displayed system date.

To try this example in SQL Developer, enter the statements and queries in the Worksheet. For information about the Worksheet, see "[Running Queries in SQL Developer](#)". The results shown here are from SQL*Plus; their format is slightly different in SQL Developer.

Example 7-5 NLS_DATE_LANGUAGE Affects Displayed SYSDATE

1. Note the current value of NLS_DATE_LANGUAGE.
2. If the value of NLS_DATE_LANGUAGE in step 1 is not FRENCH, change it:

```
ALTER SESSION SET NLS_DATE_LANGUAGE=FRENCH;
```

3. Run this query:

```
SELECT TO_CHAR(SYSDATE, 'Day:Dd Month yyyy') "System Date"  
FROM DUAL;
```

Result:

```
System Date  
-----  
Vendredi:28 December 2012
```

4. Change the value of NLS_DATE_LANGUAGE to SWEDISH:

```
ALTER SESSION SET NLS_DATE_LANGUAGE=SWEDISH;
```

5. Repeat the query from step 3.

Result:

```
System Date  
-----  
Fredag :28 December 2012
```

6. Set `NLS_DATE_LANGUAGE` to the value that it had at step 1.

 **See Also:**

- *Oracle Database Globalization Support Guide* for more information about the `NLS_DATE_LANGUAGE` parameter
- *Oracle Database SQL Language Reference* for more information about the `TO_CHAR` function
- *Oracle Database SQL Language Reference* for more information about the `y` function
- ["About Date and Time Formats"](#)
- ["Changing NLS Parameter Values"](#)

7.5.6 About `NLS_TIMESTAMP_FORMAT` and `NLS_TIMESTAMP_TZ_FORMAT` Parameters

This parameter specifies the default date format for the `TIMESTAMP` audiotape and `TIMESTAMP WITH LOCAL TIME ZONE` audiotape.

Specify: Default date format for:

- `TIMESTAMP` audiotape
- `TIMESTAMP WITH LOCAL TIME ZONE` audiotape

Acceptable Values: Any any valid datetime format model. For example:

```
NLS_TIMESTAMP_FORMAT='YYYY-MM-DD HH:MI:SS.FF'  
NLS_TIMESTAMP_TZ_FORMAT='YYYY-MM-DD HH:MI:SS.FF TZh:TzM'
```

For information about datetime format models, see *Oracle Database SQL Language Reference*.

Default Value: Set by `NLS_TERRITORY`, described in ["About the `NLS_TERRITORY` Parameter"](#).

 **See Also:**

- *Oracle Database Globalization Support Guide* for more information about the NLS_TIMESTAMP_FORMAT parameter
- *Oracle Database Globalization Support Guide* for more information about the NLS_TIMESTAMP_TZ_FORMAT parameter
- *Oracle Database Globalization Support Guide* for information about date/time data types and time zone support
- *Oracle Database SQL Language Reference* for more information about the TIMESTAMP datatype
- *Oracle Database SQL Language Reference* for more information about the TIMESTAMP WITH LOCAL TIME ZONE data type
- ["About Date and Time Formats"](#)
- ["Changing NLS Parameter Values"](#)

7.5.7 About the NLS_CALENDAR Parameter

This parameter specifies the calendar system for the database.

Specifies: Calendar system for the database.

Acceptable Values: Any calendar system that Oracle supports. For a list, see *Oracle Database Globalization Support Guide*.

Default Value: `Gregorian`

[Example 7-6](#) shows how setting NLS_CALENDAR to 'English Hijrah' and Gregorian affects the displayed system date.

To try this example in SQL Developer, enter the statements and queries in the Worksheet. For information about the Worksheet, see ["Running Queries in SQL Developer"](#). The results shown here are from SQL*Plus; their format is slightly different in SQL Developer.

Example 7-6 NLS_CALENDAR Affects Displayed SYSDATE

1. Note the current value of NLS_CALENDAR.
2. If the value of NLS_CALENDAR in step 1 is not 'English Hijrah', change it:

```
ALTER SESSION SET NLS_CALENDAR='English Hijrah';
```

3. Run this query:

```
SELECT SYSDATE FROM DUAL;
```

Result:

```
SYSDATE
-----
17 Safar          1434
```

4. Change the value of NLS_CALENDAR to 'Gregorian':

```
ALTER SESSION SET NLS_CALENDAR='Gregorian';
```

5. Run this query:

```
SELECT SYSDATE FROM DUAL;
```

Result:

```
SYSDATE  
-----  
31-DEC-12
```

6. Set NLS_CALENDAR to the value that it had at step 1.

 See Also:

- *Oracle Database Globalization Support Guide* for more information about the NLS_CALENDAR parameter
- ["About Calendar Formats"](#)
- ["Changing NLS Parameter Values"](#)

7.5.8 About the NLS_NUMERIC_CHARACTERS Parameter

This parameter specifies the decimal character (which separates the integer and decimal parts of a number) and group separator (which separates integer groups to show thousands and millions, for example). The group separator is the character returned by the numeric format element G.

Specifies: Decimal character (which separates the integer and decimal parts of a number) and group separator (which separates integer groups to show thousands and millions, for example). The group separator is the character returned by the numeric format element G.

Acceptable Values: Any two different single-byte characters except:

- A numeric character
- Plus (+)
- Minus (-)
- Less than (<)
- Greater than (>)

Default Value: Set by NLS_TERRITORY, described in ["About the NLS_TERRITORY Parameter"](#).

In a SQL statement, you can represent a number as either:

- Numeric literal
A numeric literal is not enclosed in quotation marks, always uses a period (.) as the decimal character, and never contains a group separator.
- Text literal
A text literal is enclosed in single quotation marks. It is implicitly or explicitly converted to a number, if required, according to the current NLS settings.

[Example 7-7](#) shows how two different NLS_NUMERIC_CHARACTERS settings affect the displayed result of the same query.

To try this example in SQL Developer, enter the statements and queries in the Worksheet. For information about the Worksheet, see "[Running Queries in SQL Developer](#)". The results shown here are from SQL*Plus; their format is slightly different in SQL Developer.

Example 7-7 NLS_NUMERIC_CHARACTERS Affects Decimal Character and Group Separator

1. Note the current value of NLS_NUMERIC_CHARACTERS.
2. If the value of NLS_NUMERIC_CHARACTERS in step 1 is not ", ." (decimal character is comma and group separator is period), change it:

```
ALTER SESSION SET NLS_NUMERIC_CHARACTERS=',.';
```

3. Run this query:

```
SELECT TO_CHAR(4000, '9G999D99') "Number" FROM DUAL;
```

Result:

```
Number  
-----  
4.000,00
```

4. Change the value of NLS_NUMERIC_CHARACTERS to ", ." (decimal character is period and group separator is comma):

```
ALTER SESSION SET NLS_NUMERIC_CHARACTERS=',.';
```

5. Run this query:

```
SELECT TO_CHAR(4000, '9G999D99') "Number" FROM DUAL;
```

Result:

```
Number  
-----  
4,000.00
```

6. Set NLS_NUMERIC_CHARACTERS to the value that it had at step 1.

See Also:

- *Oracle Database Globalization Support Guide* for more information about the NLS_NUMERIC_CHARACTERS parameter
- "[About Numeric and Monetary Formats](#)"
- "[Changing NLS Parameter Values](#)"

7.5.9 About the NLS_CURRENCY Parameter

This parameter specifies the local currency symbol (the character string returned by the numeric format element L).

Specifies: Local currency symbol (the character string returned by the numeric format element L).

Acceptable Values: Any valid currency symbol string.

Default Value: Set by NLS_TERRITORY, described in "[About the NLS_TERRITORY Parameter](#)".

[Example 7-8](#) changes the value of NLS_CURRENCY, overriding the default value set by NLS_TERRITORY. To try this example in SQL Developer, enter the statements and queries in the Worksheet. For information about the Worksheet, see "[Running Queries in SQL Developer](#)". The results shown here are from SQL*Plus; their format is slightly different in SQL Developer.

Example 7-8 NLS_CURRENCY Overrides NLS_TERRITORY

1. Note the current values of NLS_TERRITORY and NLS_CURRENCY.
2. If the value of NLS_TERRITORY in step 1 is not AMERICA, change it:

```
ALTER SESSION SET NLS_TERRITORY=AMERICA;
```

3. Run this query:

```
SELECT TO_CHAR(salary, 'L099G999D99') "Salary"
FROM EMPLOYEES
WHERE salary > 13000;
```

Result:

```
Salary
-----
          $024,000.00
          $017,000.00
          $017,000.00
          $014,000.00
          $013,500.00
```

4. Change the value of NLS_CURRENCY to '©':

```
ALTER SESSION SET NLS_CURRENCY='©';
```

5. Run this query:

```
SELECT TO_CHAR(salary, 'L099G999D99') "Salary"
FROM EMPLOYEES
WHERE salary > 13000;
```

Result:

```
Salary
-----
          ©024,000.00
          ©017,000.00
          ©017,000.00
          ©014,000.00
          ©013,500.00
```

6. Set NLS_TERRITORY and NLS_CURRENCY to the values that they had at step 1.

 **See Also:**

- *Oracle Database Globalization Support Guide* for more information about the NLS_CURRENCY parameter
- ["About Numeric and Monetary Formats"](#)
- ["Changing NLS Parameter Values"](#)

7.5.10 About the NLS_ISO_CURRENCY Parameter

This parameter specifies the ISO currency symbol (the string returned by the numeric format element C).

Specifies: ISO currency symbol (the character string returned by the numeric format element C).

Acceptable Values: Any valid currency symbol string.

Default Value: Set by NLS_TERRITORY, described in ["About the NLS_TERRITORY Parameter"](#).

Local currency symbols can be ambiguous, but ISO currency symbols are unique.

[Example 7-9](#) shows that the territories AUSTRALIA and AMERICA have the same local currency symbol, but different ISO currency symbols.

To try this example in SQL Developer, enter the statements and queries in the Worksheet. For information about the Worksheet, see ["Running Queries in SQL Developer"](#). The results shown here are from SQL*Plus; their format is slightly different in SQL Developer.

Example 7-9 NLS_ISO_CURRENCY

1. Note the current values of NLS_TERRITORY and NLS_ISO_CURRENCY.
2. If the value of NLS_TERRITORY in step 1 is not AUSTRALIA, change it:

```
ALTER SESSION SET NLS_TERRITORY=AUSTRALIA;
```

3. Run this query:

```
SELECT TO_CHAR(salary, 'L099G999D99') "Local",
       TO_CHAR(salary, 'C099G999D99') "ISO"
FROM EMPLOYEES
WHERE salary > 15000;
```

Result:

Local	ISO
\$024,000.00	AUD024,000.00
\$017,000.00	AUD017,000.00
\$017,000.00	AUD017,000.00

4. Change the value of NLS_TERRITORY to AMERICA:

```
ALTER SESSION SET NLS_TERRITORY=AMERICA;
```

5. Run this query:

```
SELECT TO_CHAR(salary, 'L099G999D99') "Local",
       TO_CHAR(salary, 'C099G999D99') "ISO"
FROM EMPLOYEES
WHERE salary > 15000;
```

Result:

Local	ISO
\$024,000.00	USD024,000.00
\$017,000.00	USD017,000.00
\$017,000.00	USD017,000.00

- Set NLS_TERRITORY and NLS_ISO_CURRENCY to the values that they had at step 1.

See Also:

- *Oracle Database Globalization Support Guide* for more information about the NLS_ISO_CURRENCY parameter
- ["About Numeric and Monetary Formats"](#)
- ["Changing NLS Parameter Values"](#)

7.5.11 About the NLS_DUAL_CURRENCY Parameter

This parameter specifies the dual currency symbol (introduced to support the euro currency symbol during the euro transition period).

Specifies: Dual currency symbol (introduced to support the euro currency symbol during the euro transition period).

Acceptable Values: Any valid currency symbol string.

Default Value: Set by NLS_TERRITORY, described in ["About the NLS_TERRITORY Parameter"](#).

See Also:

- *Oracle Database Globalization Support Guide* for more information about the NLS_DUAL_CURRENCY parameter
- ["About Numeric and Monetary Formats"](#)
- ["Changing NLS Parameter Values"](#)

7.5.12 About the NLS_SORT Parameter

This parameter specifies the linguistic sort order (collating sequence) for queries that have the ORDER BY clause.

Specifies: Linguistic sort order (collating sequence) for queries that have the ORDER BY clause.

Acceptable Values:

- BINARY

Sort order is based on the binary sequence order of either the database character set or the national character set, depending on the data type.

- Any linguistic sort name that Oracle supports

Sort order is based on the order of the specified linguistic sort name. The linguistic sort name is usually the same as the language name, but not always. For a list of supported linguistic sort names, see *Oracle Database Globalization Support Guide*.

Default Value: Set by NLS_LANGUAGE, described in "[About the NLS_LANGUAGE Parameter](#)".

[Example 7-10](#) shows how two different NLS_SORT settings affect the displayed result of the same query. The settings are BINARY and Traditional Spanish (SPANISH_M). Traditional Spanish treats ch, ll, and ñ as letters that follow c, l, and n, respectively.

To try this example in SQL Developer, enter the statements and queries in the Worksheet. For information about the Worksheet, see "[Running Queries in SQL Developer](#)". The results shown here are from SQL*Plus; their format is slightly different in SQL Developer.

Case-Insensitive and Accent-Insensitive Sorts

Operations inside Oracle Database are sensitive to the case and the accents of the characters. To perform a case-insensitive sort, append _CI to the value of the NLS_SORT parameter (for example, BINARY_CI or GERMAN_CI). To perform a sort that is both case-insensitive and accent-insensitive, append _AI to the value of the NLS_SORT parameter (for example, BINARY_AI or FRENCH_M_AI).

Example 7-10 NLS_SORT Affects Linguistic Sort Order

1. Create table for Spanish words:

```
CREATE TABLE temp (name VARCHAR2(15));
```

2. Populate table with some Spanish words:

```
INSERT INTO temp (name) VALUES ('laguna');
INSERT INTO temp (name) VALUES ('llama');
INSERT INTO temp (name) VALUES ('loco');
```

3. Note the current value of NLS_SORT.
4. If the value of NLS_SORT in step 3 is not BINARY, change it:

```
ALTER SESSION SET NLS_SORT=BINARY;
```

5. Run this query:

```
SELECT * FROM temp ORDER BY name;
```

Result:

```
NAME
-----
laguna
```

```
llama
loco
```

- Change the value of NLS_SORT to SPANISH_M (Traditional Spanish):

```
ALTER SESSION SET NLS_SORT=SPANISH_M;
```

- Repeat the query from step 5.

Result:

```
NAME
-----
laguna
loco
llama
```

- Drop the table:

```
DROP TABLE temp;
```

- Set NLS_SORT to the value that it had at step 3.

See Also:

- Oracle Database Globalization Support Guide* for more information about the NLS_SORT parameter
- Oracle Database Globalization Support Guide* for more information about case-insensitive and accent-insensitive sorts
- ["About Linguistic Sorting and String Searching"](#)
- ["Changing NLS Parameter Values"](#)

7.5.13 About the NLS_COMP Parameter

This parameter specifies the character-comparison behavior of SQL operations.

Specifies: Character-comparison behavior of SQL operations.

Acceptable Values:

- BINARY
SQL compares the binary codes of characters. One character is greater than another if it has a higher binary code.
- LINGUISTIC
SQL performs a linguistic comparison based on the value of the NLS_SORT parameter, described in ["About the NLS_SORT Parameter"](#).
- ANSI
This value is provided only for backward compatibility.

Default Value: BINARY

[Example 7-11](#) shows that the result of a query can depend on the NLS_COMP setting.

To try this example in SQL Developer, enter the statements and queries in the Worksheet. For information about the Worksheet, see "[Running Queries in SQL Developer](#)". The results shown here are from SQL*Plus; their format is slightly different in SQL Developer.

Example 7-11 NLS_COMP Affects SQL Character Comparison

1. Note the current values of NLS_SORT and NLS_COMP.
2. If the values of NLS_SORT and NLS_COMP in step 1 are not SPANISH_M (Traditional Spanish) and BINARY, respectively, change them:

```
ALTER SESSION SET NLS_SORT=SPANISH_M NLS_COMP=BINARY;
```

3. *Run this query:

```
SELECT LAST_NAME FROM EMPLOYEES  
WHERE LAST_NAME LIKE 'C%';
```

Result:

```
LAST_NAME  
-----  
Cabrio  
Cambrault  
Cambrault  
Chen  
Chung  
Colmenares  
  
6 rows selected
```

4. Change the value of NLS_COMP to LINGUISTIC:

```
ALTER SESSION SET NLS_COMP=LINGUISTIC;
```

5. Repeat the query from step 3.

Result:

```
LAST_NAME  
-----  
Cabrio  
Cambrault  
Cambrault  
Colmenares  
  
4 rows selected
```

This time, Chen and Chung are not returned because Traditional Spanish treats `ch` as a single character that follows `c`.

6. Set NLS_SORT and NLS_COMP to the values that they had in step 1.

 **See Also:**

- *Oracle Database Globalization Support Guide* for more information about the NLS_COMP parameter
- ["About Linguistic Sorting and String Searching"](#)
- ["Changing NLS Parameter Values"](#)

7.5.14 About the NLS_LENGTH_SEMANTICS Parameter

This parameter specifies the length semantics for columns of the character data types CHAR, VARCHAR2, and LONG; that is, whether these columns are specified in bytes or in characters. (Applies only to columns that are declared after the parameter is set.)

Specifies: Length semantics for columns of the character data types CHAR, VARCHAR2, and LONG; that is, whether these columns are specified in bytes or in characters. (Applies only to columns that are declared after the parameter is set.)

Acceptable Values:

- BYTE
New CHAR, VARCHAR2, and LONG columns are specified in bytes.
- CHAR
New CHAR, VARCHAR2, and LONG columns are specified in characters.

Default Value: BYTE

To try this example in SQL Developer, enter the statements and queries in the Worksheet. For information about the Worksheet, see ["Running Queries in SQL Developer"](#). The results shown here are from SQL*Plus; their format is slightly different in SQL Developer.

Example 7-12 NLS_LENGTH_SEMANTICS Affects Storage of VARCHAR2 Column

1. Note the current values of NLS_LENGTH_SEMANTICS.
2. If the value of NLS_LENGTH_SEMANTICS in step 1 is not BYTE, change it:

```
ALTER SESSION SET NLS_LENGTH_SEMANTICS=BYTE;
```

3. Create a table with a VARCHAR2 column:

```
CREATE TABLE SEMANTICS_BYTE(SOME_DATA VARCHAR2(20));
```

4. Click the tab **Connections**.
5. In the Connections frame, expand **hr_conn**.
6. In the list of schema object types, expand **Tables**.
7. In the list of tables, select **SEMANTICS_BYTE**.

To the right of the Connections frame, the Columns pane shows that for Column Name SOME_DATA, the Data Type is VARCHAR2(20 BYTE).

8. Change the value of NLS_LENGTH_SEMANTICS to CHAR:

```
ALTER SESSION SET NLS_LENGTH_SEMANTICS=CHAR;
```

9. Create another table with a VARCHAR2 column:

```
CREATE TABLE SEMANTICS_CHAR(SOME_DATA VARCHAR2(20));
```

10. In the Connections frame, click the **Refresh icon**.

The list of tables now includes SEMANTICS_CHAR.

11. Select **SEMANTICS_CHAR**.

The Columns pane shows that for Column Name SOME_DATA, the Data Type is VARCHAR2(20 CHAR).

12. Select **SEMANTICS_BYTE** again.

The Columns pane shows that for Column Name SOME_DATA, the Data Type is still VARCHAR2(20 BYTE).

13. Set the value of NLS_LENGTH_SEMANTICS to the value that it had in step 1.

See Also:

- [Oracle Database Globalization Support Guide](#) for more information about the NLS_LENGTH_SEMANTICS parameter
- ["About Length Semantics"](#)
- ["Changing NLS Parameter Values"](#)

7.6 Using Unicode in Globalized Applications

You can insert and retrieve Unicode data. Data is transparently converted among the database and client programs, which ensures that client programs are independent of the database character set and national character set.

- [Representing Unicode String Literals in SQL and PL/SQL](#)
There are three ways to represent a Unicode string literal in SQL or PL/SQL.
- [Avoiding Data Loss During Character-Set Conversion](#)
As part of a SQL or PL/SQL statement, a literal (with or without the prefix N) is encoded in the same character set as the rest of the statement. On the client side, the statement is encoded in the client character set, which is determined by the NLS_LANG parameter. On the server side, the statement is encoded in the database character set.

See Also:

- [Oracle Database Globalization Support Guide](#) for more information about SQL and PL/SQL programming with Unicode
- [Oracle Database Globalization Support Guide](#) for general information about programming with Unicode

7.6.1 Representing Unicode String Literals in SQL and PL/SQL

There are three ways to represent a Unicode string literal in SQL or PL/SQL.

The three ways to represent a Unicode string literal in SQL or PL/SQL are:

- N'string'

Example: N'résumé'.

Limitations: See "[Avoiding Data Loss During Character-Set Conversion](#)".

- NCHR(number)

The SQL function NCHR returns the character whose binary equivalent is number in the national character set. The character returned has data type NVARCHAR2.

Example: NCHR(36) represents \$ in the default national character set, AL16UTF16.

Limitations: Portability of the value of NCHR(number) is limited to applications that use the same national character set.

- UNISTR('string')

The SQL function UNISTR converts string to the national character set.

For portability and data preservation, Oracle recommends that string contain only ASCII characters and Unicode encoding values. A Unicode encoding value has the form \xxxx, where xxxx is the hexadecimal value of a character code value in UCS-2 encoding format.

Example: UNISTR('G\0061ry') represents 'Gary'

ASCII characters are converted to the database character set and then to the national character set. Unicode encoding values are converted directly to the national character set.

See Also:

- *Oracle Database Globalization Support Guide* for more information about Unicode string literals
- *Oracle Database SQL Language Reference* for more information about the NCHR function
- *Oracle Database SQL Language Reference* for more information about the UNISTR function

7.6.2 Avoiding Data Loss During Character-Set Conversion

As part of a SQL or PL/SQL statement, a literal (with or without the prefix N) is encoded in the same character set as the rest of the statement. On the client side, the statement is encoded in the client character set, which is determined by the NLS_LANG parameter. On the server side, the statement is encoded in the database character set.

When the SQL or PL/SQL statement is transferred from the client to the database, its character set is converted accordingly. If the database character set does not contain

all characters that the client used in the text literals, then data is lost in this conversion. NCHAR string literals are more vulnerable than CHAR text literals, because they are designed to be independent of the database character set.

To avoid data loss in conversion to an incompatible database character set, you can activate the NCHAR literal replacement functionality. For more information, see *Oracle Database Globalization Support Guide*.

Building Effective Applications

Effective applications are scalable and use recommended programming and security practices.

- [Building Scalable Applications](#)
Design your applications to use the same resources, regardless of user populations and data volumes, and not to overload system resources.
- [Recommended Programming Practices](#)
Use the following recommended programming practices.
- [Recommended Security Practices](#)
When granting privileges on the schema objects that comprise your application, use the **principle of least privilege**.

See Also:

Oracle Database Development Guide for more information about creating and deploying applications that are optimized for Oracle Database

8.1 Building Scalable Applications

Design your applications to use the same resources, regardless of user populations and data volumes, and not to overload system resources.

- [About Scalable Applications](#)
A **scalable** application can process a larger workload with a proportional increase in system resource usage.
- [Using Bind Variables to Improve Scalability](#)
Bind variables, used correctly, let you develop efficient, scalable applications.
- [Using PL/SQL to Improve Scalability](#)
Certain PL/SQL features can help you to improve application scalability.
- [About Concurrency and Scalability](#)
Concurrency is the simultaneous execution of multiple transactions. The better your application handles concurrency, the more scalable it is. A **scalable** application can process a larger workload with a proportional increase in system resource usage.
- [Limiting the Number of Concurrent Sessions](#)
The more concurrent sessions you have, the more concurrency-based waits you have, and the slower your response time is.
- [Comparing Programming Techniques with Runstats](#)
The Runstats tool lets you compare the performance of two programming techniques to see which is better.

- [Real-World Performance and Data Processing Techniques](#)
A common task in database applications in a data warehouse environment is querying or modifying a huge data set. The problem for application developers is how to achieve high performance when processing large data sets.

8.1.1 About Scalable Applications

A **scalable** application can process a larger workload with a proportional increase in system resource usage.

A **scalable** application can process a larger workload with a proportional increase in system resource usage. For example, if you double its workload, a scalable application uses twice as many system resources.

An **unscalable** application exhausts a system resource; therefore, if you increase the application workload, no more throughput is possible. Unscalable applications result in fixed throughputs and poor response times.

Examples of resource exhaustion are:

- Hardware exhaustion
- Table scans in high-volume transactions causing inevitable disk input/output (I/O) shortages
- Excessive network requests causing network and scheduling bottlenecks
- Memory allocation causing paging and swapping
- Excessive process and thread allocation causing operating system thrashing

Design your applications to use the same resources, regardless of user populations and data volumes, and not to overload system resources.

8.1.2 Using Bind Variables to Improve Scalability

Bind variables, used correctly, let you develop efficient, scalable applications.

A **bind variable** is a placeholder in a SQL statement that must be replaced with a valid value or value address for the statement to execute successfully. By using bind variables, you can write a SQL statement that accepts inputs or parameters at run time.

Just as a subprogram can have parameters, whose values are supplied by the invoker, a SQL statement can have bind variable placeholders, whose values (called bind variables) are supplied at runtime. Just as a subprogram is compiled once and then run many times with different parameters, a SQL statement with bind variable placeholders is hard parsed once and then soft parsed with different bind variables.

A **hard parse**, which includes optimization and row source generation, is a very CPU-intensive operation. A **soft parse**, which skips optimization and row source generation and proceeds straight to execution, is usually much faster than a hard parse of the same statement. (For an overview of SQL processing, which includes the difference between a hard and soft parse, see *Oracle Database Concepts*.)

Not only is a hard parse a CPU-intensive operation, it is an unscalable operation, because it cannot be done concurrently with many other operations. For more information about concurrency and scalability, see "[About Concurrency and Scalability](#)".

[Example 8-1](#) shows the performance difference between a query without a bind variable and a semantically equivalent query with a bind variable. The former is slower and uses many more latches (for information about how latches affect scalability, see ["About Latches and Concurrency"](#)). To collect and display performance statistics, the example uses the Runstats tool, described in ["Comparing Programming Techniques with Runstats"](#).

 **Note:**

- [Example 8-1](#) shows the performance cost *for a single user*. As more users are added, the cost escalates rapidly.
- The result of [Example 8-1](#) was produced with this setting:

```
SET SERVEROUTPUT ON FORMAT TRUNCATED
```

 **Note:**

- Using bind variables instead of string literals is the most effective way to make your code invulnerable to SQL injection attacks. For details, see *Oracle Database PL/SQL Language Reference*.
- Bind variables sometimes reduce the efficiency of data warehousing systems. Because most queries take so long, the optimizer tries to produce the best plan for each query rather than the best generic query. Using bind variables sometimes forces the optimizer to produce the best generic query. For information about improving performance in data warehousing systems, see *Oracle Database Data Warehousing Guide*.

Although soft parsing is more efficient than hard parsing, the cost of soft parsing a statement many times is still very high. To maximize the efficiency and scalability of your application, minimize parsing. The easiest way to minimize parsing is to use PL/SQL.

Example 8-1 Bind Variable Improves Performance

```
CREATE TABLE t ( x VARCHAR2(5) );

DECLARE
  TYPE rc IS REF CURSOR;
  l_cursor rc;
BEGIN
  runstats_pkg.rs_start; -- Collect statistics for query without bind variable

  FOR i IN 1 .. 5000 LOOP
    OPEN l_cursor FOR 'SELECT x FROM t WHERE x = ' || TO_CHAR(i);
    CLOSE l_cursor;
  END LOOP;

  runstats_pkg.rs_middle; -- Collect statistics for query with bind variable

  FOR i IN 1 .. 5000 LOOP
    OPEN l_cursor FOR 'SELECT x FROM t WHERE x = :x' USING i;
```

```

        CLOSE l_cursor;
    END LOOP;

    runstats_pkg.rs_stop(500); -- Stop collecting statistics
end;
/

```

Result is similar to:

8.1.3 Using PL/SQL to Improve Scalability

Certain PL/SQL features can help you to improve application scalability.

- [How PL/SQL Minimizes Parsing](#)
PL/SQL, which is optimized for database access, silently caches statements. In PL/SQL, when you close a cursor, the cursor closes from your perspective—that is, you cannot use it where an open cursor is required—but PL/SQL actually keeps the cursor open and caches its statement.
- [About the EXECUTE IMMEDIATE Statement](#)
The EXECUTE IMMEDIATE statement builds and runs a dynamic SQL statement in a single operation.
- [About OPEN FOR Statements](#)
The OPEN FOR statement has the following basic syntax.
- [About the DBMS_SQL Package](#)
The DBMS_SQL package is an API for building, running, and describing dynamic SQL statements. You must use the DBMS_SQL package instead of the EXECUTE IMMEDIATE statement if the PL/SQL compiler cannot determine at compile time the number or types of output host variables (select list items) or input bind variables.
- [About Bulk SQL](#)
Bulk SQL reduces the number of "round trips" between PL/SQL and SQL, thereby using fewer resources.

8.1.3.1 How PL/SQL Minimizes Parsing

PL/SQL, which is optimized for database access, silently caches statements. In PL/SQL, when you close a cursor, the cursor closes from your perspective—that is, you cannot use it where an open cursor is required—but PL/SQL actually keeps the cursor open and caches its statement.

If you use the cached statement again, PL/SQL uses the same cursor, thereby avoiding a parse. (PL/SQL closes cached statements if necessary—for example, if your program must open another cursor but doing so would exceed the `init.ora` setting of `OPEN_CURSORS`.)

PL/SQL can silently cache only SQL statements that cannot change at runtime.

8.1.3.2 About the EXECUTE IMMEDIATE Statement

The EXECUTE IMMEDIATE statement builds and runs a dynamic SQL statement in a single operation.

The basic syntax of the EXECUTE IMMEDIATE statement is:

```
EXECUTE IMMEDIATE sql_statement
```

sql_statement is a string that represents a SQL statement. If *sql_statement* has the same value every time the EXECUTE IMMEDIATE statement runs, then PL/SQL can cache the EXECUTE IMMEDIATE statement. If *sql_statement* can be different every time the EXECUTE IMMEDIATE statement runs, then PL/SQL cannot cache the EXECUTE IMMEDIATE statement.

 **See Also:**

- *Oracle Database PL/SQL Language Reference* for information about EXECUTE IMMEDIATE
- "[About the DBMS_SQL Package](#)"

8.1.3.3 About OPEN FOR Statements

The OPEN FOR statement has the following basic syntax.

The basic syntax of the OPEN FOR statement is:

```
OPEN cursor_variable FOR query
```

Your application can open cursor_variable for several different queries before closing it. Because PL/SQL cannot determine the number of different queries until runtime, PL/SQL cannot cache the OPEN FOR statement.

If you do not need to use a cursor variable, then use a declared cursor, for both better performance and ease of programming. For details, see *Oracle Database Development Guide*.

 **See Also:**

- *Oracle Database PL/SQL Language Reference* for information about OPEN FOR
- "[About Cursor Variables](#)"
- "[About Cursors](#)"

8.1.3.4 About the DBMS_SQL Package

The DBMS_SQL package is an API for building, running, and describing dynamic SQL statements. You must use the DBMS_SQL package instead of the EXECUTE IMMEDIATE statement if the PL/SQL compiler cannot determine at compile time the number or types of output host variables (select list items) or input bind variables.

The DBMS_SQL package is an API for building, running, and describing dynamic SQL statements. Using the DBMS_SQL package takes more effort than using the EXECUTE IMMEDIATE statement, but you must use the DBMS_SQL package if the PL/SQL compiler cannot determine at compile time the number or types of output host variables (select list items) or input bind variables.

 See Also:

- *Oracle Database PL/SQL Language Reference* for more information about when to use the DBMS_SQL package
- *Oracle Database PL/SQL Packages and Types Reference* for complete information about the DBMS_SQL package
- "About the EXECUTE IMMEDIATE Statement"

8.1.3.5 About Bulk SQL

Bulk SQL reduces the number of "round trips" between PL/SQL and SQL, thereby using fewer resources.

Without bulk SQL, you retrieve one row at a time from the database (SQL), process it (PL/SQL), and return it to the database (SQL). With bulk SQL, you retrieve a set of rows from the database, process the set of rows, and then return the whole set to the database.

Oracle recommends using Bulk SQL when you retrieve multiple rows from the database *and* return them to the database, as in [Example 8-2](#). You do not need bulk SQL if you retrieve multiple rows but do not return them; for example:

```
FOR x IN (SELECT * FROM t WHERE ... ) -- Retrieve row set (implicit array fetch)
  LOOP
    DBMS_OUTPUT.PUT_LINE(t.x);      -- Process rows but do not return them
  END LOOP;
```

[Example 8-2](#) loops through a table *t* with a column *object_name*, retrieving sets of 100 rows, processing them, and returning them to the database. (Limiting the bulk FETCH statement to 100 rows requires an explicit cursor.)

[Example 8-3](#) does the same job as [Example 8-2](#), without bulk SQL.

As these TKPROF reports for [Example 8-2](#) and [Example 8-3](#) show, using bulk SQL for this job uses almost 50% less CPU time:

```
SELECT ROWID RID, OBJECT_NAME FROM T T_BULK
```

call	count	cpu	elapsed	disk	query	current	rows
total	721	0.17	0.17	0	22582	0	71825

```
UPDATE T SET OBJECT_NAME = :B1 WHERE ROWID = :B2
```

call	count	cpu	elapsed	disk	query	current	rows
Parse	1	0.00	0.00	0	0	0	0
Execute	719	12.83	13.77	0	71853	74185	71825
Fetch	0	0.00	0.00	0	0	0	0
total	720	12.83	13.77	0	71853	74185	71825

```
SELECT ROWID RID, OBJECT_NAME FROM T T_SLOW_BY_SLOW
```

```

call      count      cpu    elapsed      disk    query    current    rows
-----
total     721         0.17     0.17         0      22582         0      71825
*****
UPDATE T SET OBJECT_NAME = :B2 WHERE ROWID = :B1
*****

call      count      cpu    elapsed      disk    query    current    rows
-----
Parse     1           0.00     0.00         0         0         0         0
Execute  71824       21.25    22.25         0      71836      73950      71824
Fetch     0           0.00     0.00         0         0         0         0
-----
total     71825       21.25    22.25         0      71836      73950      71824

```

However, using bulk SQL for this job uses more CPU time—and more code—than using a single SQL statement, as this `TKPROF` report shows:

```

UPDATE T SET OBJECT_NAME = SUBSTR(OBJECT_NAME,2) || SUBSTR(OBJECT_NAME,1,1)

call      count      cpu    elapsed      disk    query    current    rows
-----
Parse     1           0.00     0.00         0         0         0         0
Execute   1           1.30     1.44         0        2166      75736      71825
Fetch     0           0.00     0.00         0         0         0         0
-----
total     2           1.30     1.44         0        2166      75736      71825

```

Example 8-2 Bulk SQL

```

CREATE OR REPLACE PROCEDURE bulk AS
  TYPE ridArray IS TABLE OF ROWID;
  TYPE onameArray IS TABLE OF t.object_name%TYPE;

  CURSOR c is SELECT ROWID rid, object_name -- explicit cursor
              FROM t t_bulk;

  l_rids   ridArray;
  l_onames onameArray;
  N        NUMBER := 100;
BEGIN
  OPEN c;
  LOOP
    FETCH c BULK COLLECT
    INTO l_rids, l_onames LIMIT N; -- retrieve N rows from t

    FOR i in 1 .. l_rids.COUNT
      LOOP -- process N rows
        l_onames(i) := substr(l_onames(i),2) || substr(l_onames(i),1,1);
      END LOOP;

    FORALL i in 1 .. l_rids.count -- return processed rows to t
      UPDATE t
      SET object_name = l_onames(i)
      WHERE ROWID = l_rids(i);
      EXIT WHEN c%NOTFOUND;
    END LOOP;
  CLOSE c;
END;
/

```

Example 8-3 Without Bulk SQL

```
CREATE OR REPLACE PROCEDURE slow_by_slow AS
BEGIN
  FOR x IN (SELECT rowid rid, object_name FROM t t_slow_by_slow)
  LOOP
    x.object_name := substr(x.object_name,2) || substr(x.object_name,1,1);

    UPDATE t
    SET object_name = x.object_name
    WHERE rowid = x.rid;
  END LOOP;
END;
```

8.1.4 About Concurrency and Scalability

Concurrency is the simultaneous execution of multiple transactions. The better your application handles concurrency, the more scalable it is. A **scalable** application can process a larger workload with a proportional increase in system resource usage.

Concurrency is the simultaneous execution of multiple transactions. Statements within concurrent transactions can update the same data. The better your application handles concurrency, the more scalable it is. A **scalable** application can process a larger workload with a proportional increase in system resource usage. For example, if you double its workload, a scalable application uses twice as many system resources.

Concurrent transactions must produce meaningful and consistent results. Therefore, a multiuser database must provide the following:

- **Data concurrency**, which ensures that users can access data at the same time.
- **Data consistency**, which ensures that each user sees a consistent view of the data, including visible changes from his or her own transactions and committed transactions of other users

Oracle Database maintains data consistency by using a multiversion consistency model and various types of locks and transaction isolation levels. For an overview of the Oracle Database locking mechanism, see *Oracle Database Concepts*. For an overview of Oracle Database transaction isolation levels, see *Oracle Database Concepts*.

To describe consistent transaction behavior when transactions run concurrently, database researchers have defined a transaction isolation category called **serializable**. A **serializable transaction** operates in an environment that appears to be a single-user database. Serializable transactions are desirable in specific cases, but for 99% of the work load, read committed isolation is perfect.

Oracle Database has features that improve concurrency and scalability—for example, sequences, latches, nonblocking reads and writes, and shared SQL.

- [About Sequences and Concurrency](#)
Sequences eliminate serialization, thereby improving the concurrency and scalability of your application.
- [About Latches and Concurrency](#)
An increase in latches means more concurrency-based waits, and therefore a decrease in scalability.
- [About Nonblocking Reads and Writes and Concurrency](#)
In Oracle Database, **nonblocking reads and writes** let queries execute concurrently with changes to the data they are reading, without blocking or stopping. Nonblocking reads and writes let one session read data while another session is changing that data.
- [About Shared SQL and Concurrency](#)
Oracle Database compiles a SQL statement into an executable object once, and then other sessions can reuse the object for as long as it exists. This Oracle Database feature, called **shared SQL**, lets the database do very resource-intensive operations—compiling and optimizing SQL statements—only once, instead of every time a session uses the same SQL statement.

 **See Also:**

Oracle Database Concepts for more information about data concurrency and consistency

8.1.4.1 About Sequences and Concurrency

Sequences eliminate serialization, thereby improving the concurrency and scalability of your application.

A **sequence** is a schema object from which multiple users can generate unique integers, which is very useful when you need unique primary keys.

Without sequences, unique primary key values must be produced programmatically. A user gets a new primary key value by selecting the most recently produced value and incrementing it. This technique requires a lock during the transaction and causes multiple users to wait for the next primary key value—that is, the transactions serialize. Sequences eliminate serialization, thereby improving the concurrency and scalability of your application.

 **See Also:**

- *Oracle Database Concepts* for information about concurrent access to sequences
- ["Creating and Managing Sequences"](#)

8.1.4.2 About Latches and Concurrency

An increase in latches means more concurrency-based waits, and therefore a decrease in scalability.

A **latch** is a simple, low-level serialization mechanism that coordinates multiuser access to shared data structures. Latches protect shared memory resources from corruption when accessed by multiple processes.

An increase in latches means more concurrency-based waits, and therefore a decrease in scalability. If you can use either an approach that runs slightly faster during development or one that uses fewer latches, use the latter.

See Also:

- *Oracle Database Concepts* for information about latches
- *Oracle Database Concepts* for information about mutexes, which are like latches for single objects

8.1.4.3 About Nonblocking Reads and Writes and Concurrency

In Oracle Database, **nonblocking reads and writes** let queries execute concurrently with changes to the data they are reading, without blocking or stopping. Nonblocking reads and writes let one session read data while another session is changing that data.

8.1.4.4 About Shared SQL and Concurrency

Oracle Database compiles a SQL statement into an executable object once, and then other sessions can reuse the object for as long as it exists. This Oracle Database feature, called **shared SQL**, lets the database do very resource-intensive operations—compiling and optimizing SQL statements—only once, instead of every time a session uses the same SQL statement.

See Also:

- *Oracle Database Concepts* for more information about shared SQL

8.1.5 Limiting the Number of Concurrent Sessions

The more concurrent sessions you have, the more concurrency-based waits you have, and the slower your response time is.

If your computer has n CPU cores, then at most n sessions can really be concurrently active. Each additional "concurrent" session must wait for a CPU core to be available before it can become active. If some waiting sessions are waiting only for I/O, then increasing the number of concurrent sessions to slightly more than n might slightly

improve runtime performance. However, increasing the number of concurrent sessions too much will significantly reduce runtime performance.

The SESSIONS initialization parameter determines the maximum number of concurrent users in the system. For details, see *Oracle Database Reference*.

 **See Also:**

<http://www.youtube.com/watch?v=xNDnVOCdvQ0> for a video that shows the effect of reducing the number of concurrent sessions on a computer with 12 CPU cores from thousands to 96

8.1.6 Comparing Programming Techniques with Runstats

The Runstats tool lets you compare the performance of two programming techniques to see which is better.

- [About Runstats](#)
The Runstats tool lets you compare the performance of two programming techniques to see which is better.
- [Setting Up Runstats](#)
The Runstats tool is implemented as a package that uses a view and a temporary table.
- [Using Runstats](#)
This topic gives the syntax for using the Runstats tool.

8.1.6.1 About Runstats

The Runstats tool lets you compare the performance of two programming techniques to see which is better.

Runstats measures:

- Elapsed time for each technique in hundredths of seconds (hsec)
- Elapsed time for the first technique as a percentage of that of the second technique
- System statistics for the two techniques (for example, parse calls)
- Latching for the two techniques

Of the preceding measurements, the most important is latching (see "[About Latches and Concurrency](#)").

 **See Also:**

[Example 8-1](#), which uses Runstats

8.1.6.2 Setting Up Runstats

The Runstats tool is implemented as a package that uses a view and a temporary table.

 **Note:**

For step 1 of the following procedure, you need the SELECT privilege on the dynamic performance views V\$STATNAME, V\$MYSTAT, and V\$LATCH. If you cannot get this privilege, then have someone who has the privilege create the view in step 1 and grant you the SELECT privilege on it.

To set up the Runstats tool:

1. Create the view that Runstats uses:

```
CREATE OR REPLACE VIEW stats
AS SELECT 'STAT..' || a.name name, b.value
FROM V$STATNAME a, V$MYSTAT b
WHERE a.statistic# = b.statistic#
UNION ALL
SELECT 'LATCH.' || name, gets
FROM V$LATCH;
```

2. Create the temporary table that Runstats uses:

```
DROP TABLE run_stats;

CREATE GLOBAL TEMPORARY TABLE run_stats
( runid VARCHAR2(15),
  name VARCHAR2(80),
  value INT )
ON COMMIT PRESERVE ROWS;
```

3. Create this package specification:

```
CREATE OR REPLACE PACKAGE runstats_pkg
AS
  PROCEDURE rs_start;
  PROCEDURE rs_middle;
  PROCEDURE rs_stop( p_difference_threshold IN NUMBER DEFAULT 0 );
end;
/
```

The parameter `p_difference_threshold` controls the amount of statistics and latching data that Runstats displays. Runstats displays data only when the difference for the two techniques is greater than `p_difference_threshold`. By default, Runstats displays all data.

4. Create this package body:

```
CREATE OR REPLACE PACKAGE BODY runstats_pkg
AS
  g_start NUMBER;
  g_run1 NUMBER;
  g_run2 NUMBER;
```

```
PROCEDURE rs_start
IS
BEGIN
  DELETE FROM run_stats;

  INSERT INTO run_stats
  SELECT 'before', stats.* FROM stats;

  g_start := DBMS_UTILITY.GET_TIME;
END rs_start;

PROCEDURE rs_middle
IS
BEGIN
  g_run1 := (DBMS_UTILITY.GET_TIME - g_start);

  INSERT INTO run_stats
  SELECT 'after 1', stats.* FROM stats;

  g_start := DBMS_UTILITY.GET_TIME;
END rs_middle;

PROCEDURE rs_stop( p_difference_threshold IN NUMBER DEFAULT 0 )
IS
BEGIN
  g_run2 := (DBMS_UTILITY.GET_TIME - g_start);

  DBMS_OUTPUT.PUT_LINE
  ('Run 1 ran in ' || g_run1 || ' hsec');

  DBMS_OUTPUT.PUT_LINE
  ('Run 2 ran in ' || g_run2 || ' hsec');

  DBMS_OUTPUT.PUT_LINE
  ('Run 1 ran in ' || round(g_run1/g_run2*100, 2) || '% of the time of run
2');

  DBMS_OUTPUT.PUT_LINE( CHR(9) );

  INSERT INTO run_stats
  SELECT 'after 2', stats.* FROM stats;

  DBMS_OUTPUT.PUT_LINE
  ( RPAD( 'Name', 30 ) ||
    LPAD( 'Run 1', 14 ) ||
    LPAD( 'Run 2', 14 ) ||
    LPAD( 'Difference', 14 )
  );

  FOR x IN
  ( SELECT RPAD( a.name, 30 ) ||
    TO_CHAR( b.value - a.value, '9,999,999,999' ) ||
    TO_CHAR( c.value - b.value, '9,999,999,999' ) ||
    TO_CHAR( ( (c.value - b.value) - (b.value - a.value)),
    '9,999,999,999' ) data
  FROM run_stats a, run_stats b, run_stats c
  WHERE a.name = b.name
    AND b.name = c.name
    AND a.runid = 'before'
    AND b.runid = 'after 1'
    AND c.runid = 'after 2'
```

```

        AND (c.value - a.value) > 0
        AND abs((c.value - b.value) - (b.value - a.value)) >
            p_difference_threshold
    ORDER BY ABS((c.value - b.value) - (b.value - a.value))
) LOOP
    DBMS_OUTPUT.PUT_LINE( x.data );
END LOOP;

DBMS_OUTPUT.PUT_LINE( CHR(9) );

DBMS_OUTPUT.PUT_LINE(
    'Run 1 latches total compared to run 2 -- difference and percentage' );

DBMS_OUTPUT.PUT_LINE
( LPAD( 'Run 1', 14) ||
  LPAD( 'Run 2', 14) ||
  LPAD( 'Diff', 14) ||
  LPAD( 'Pct', 10)
);

FOR x IN
( SELECT TO_CHAR( run1, '9,999,999,999' ) ||
      TO_CHAR( run2, '9,999,999,999' ) ||
      TO_CHAR( diff, '9,999,999,999' ) ||
      TO_CHAR( ROUND( g_run1/g_run2*100, 2), '99,999.99' ) || '%' data
  FROM ( SELECT SUM (b.value - a.value) run1,
            SUM (c.value - b.value) run2,
            SUM ( (c.value - b.value) - (b.value - a.value)) diff
        FROM run_stats a, run_stats b, run_stats c
        WHERE a.name = b.name
              AND b.name = c.name
              AND a.runid = 'before'
              AND b.runid = 'after 1'
              AND c.runid = 'after 2'
              AND a.name like 'LATCH%'
        )
) LOOP
    DBMS_OUTPUT.PUT_LINE( x.data );
END LOOP;

END rs_stop;

END;
/

```

8.1.6.3 Using Runstats

This topic gives the syntax for using the Runstats tool.

To use Runstats to compare two programming techniques, invoke the `runstats_pkg` procedures from an anonymous block, using this syntax:

```
[ DECLARE local_declarations ]  
BEGIN  
    runstats_pkg.rs_start;  
    code_for_first_technique  
    runstats_pkg.rs_middle;  
    code_for_second_technique  
    runstats_pkg.rs_stop(n);  
END;  
/
```

See Also:

[Example 8-1](#), which uses Runstats

8.1.7 Real-World Performance and Data Processing Techniques

A common task in database applications in a data warehouse environment is querying or modifying a huge data set. The problem for application developers is how to achieve high performance when processing large data sets.

Processing techniques fall into two categories: iterative, and set-based. Over years of testing, the Real-World Performance group has discovered that **set-based processing techniques perform orders of magnitude better** for database applications that process large data sets.

This topic includes the following major subtopics:

- [About Iterative Data Processing](#)
In iterative processing, applications use conditional logic to loop through a set of rows.
- [About Set-Based Processing](#)
Set-based processing is a SQL technique that processes a data set inside the database.

8.1.7.1 About Iterative Data Processing

In iterative processing, applications use conditional logic to loop through a set of rows.

Typically, although not necessarily, iterative processing uses a client/server model as follows:

1. Transfer a group of rows from the database server to the client application.
2. Process the group within the client application.
3. Transfer the processed group back to the database server.

You can implement iterative algorithms using three main techniques: row-by-row processing, array processing, and manual parallelism.

Iterative Processing: Row-By-Row

In row-by-row processing, a single process loops through a data set and operates on a single row a time. In a typical implementation, the application retrieves each row from the database, processes it in the middle tier, and then sends the row back to the database, which executes DML and commits.

Assume that your functional requirement is to query an external table named `ext_scan_events`, and then insert its rows into a heap-organized staging table named `stage1_scan_events`. The following PL/SQL block uses a row-by-row technique to meet this requirement:

```
declare
  cursor c is select s.* from ext_scan_events s;
  r c%rowtype;
begin
  open c;
  loop
    fetch c into r;
    exit when c%notfound;
    insert into stage1_scan_events d values r;
    commit;
  end loop;
  close c;
end;
```

The row-by-row technique has the following advantages:

- It performs well on small data sets.
- The looping algorithm is familiar to all professional developers, easy to write quickly, and easy to understand.

The row-by-row technique has the following disadvantages:

- Processing time can be unacceptably long for large data sets.
- The application executes serially, and thus cannot exploit the native parallel processing features of Oracle Database running on modern hardware.

See Also: RWP #7 Set-Based Processing

Iterative Processing: Arrays

Array processing is identical to row-by-row processing, except that it processes a group of rows in each iteration rather than a single row.

Assume that your functional requirement is the same as in Example X-X: query an external table named `ext_scan_events`, and then insert its rows into a heap-organized staging table named `stage1_scan_events`. The following PL/SQL block uses an array technique to meet this requirement:

```
declare
  cursor c is select s.* from ext_scan_events s;
  type t is table of c%rowtype index by binary_integer;
  a t;
  rows binary_integer := 0;
begin
  open c;
```

```

loop
  fetch c bulk collect into a limit array_size;
  exit when a.count = 0;
  forall i in 1..a.count
    insert into stagel_scan_events d values a(i);
  commit;
end loop;
close c;
end;

```

The preceding code differs from the equivalent row-by-row code in using a BULK COLLECT operator in the FETCH STATEMENT, which is limited by the `array_size` value of type PLS_INTEGER. For example, if `array_size` is set to 100, then the application fetches rows in groups of 100.

The array technique has the following advantages over the row-by-row technique:

- The array enables the application to process a group of rows at the same time, which means that it reduces network round trips, COMMIT time, and the code path in the client and server.
- The database is more efficient because the server process batches the inserts, and commits after every group of inserts rather than after every insert.

The disadvantages of this technique are the same as for row-by-row processing. Processing time can be unacceptable for large data sets. Also, the application must run serially on a single CPU core, and thus cannot exploit the native parallelism of Oracle Database.

Iterative Processing: Manual Parallelism

Manual parallelism uses the same iterative algorithm as row-by-row and array processing, but enables multiple server processes to divide the work and run in parallel.

Assume the functional requirement is the same as in the row-by-row and array examples. The primary differences are as follows:

- The scan event records are stored in a mass of flat files.
- 32 server processes must run in parallel, with each server process querying a different external table.
- You use PL/SQL to achieve the parallelism by executing 32 threads of the same PL/SQL program, with each thread running simultaneously as a separate job managed by Oracle Scheduler. A job is the combination of a schedule and a program.

The following PL/SQL code uses manual parallelism:

```

declare
  sqlstmt varchar2(1024) := q'[
-- BEGIN embedded anonymous block
  cursor c is select s.* from ext_scan_events_${thr} s;
  type t is table of c%rowtype index by binary_integer;
  a t;
  rows binary_integer := 0;
begin
  for r in (select ext_file_name from ext_scan_events_dets where
ora_hash(file_seq_nbr,${thrs}) = ${thr})
  loop
    execute immediate

```

```

        'alter table ext_scan_events_${thr} location' || '(' || r.ext_file_name || ')';
open c;
loop
    fetch c bulk collect into a limit ${array_size};
    exit when a.count = 0;
    forall i in 1..a.count
        insert into stage1_scan_events d values a(i);
    commit;
-- demo instrumentation
    rows := rows + a.count; if rows > 1e3 then exit when not
sd_control.p_progress('loading','userdefined',rows); rows := 0; end if;
    end loop;
    close c;
    end loop;
end;
-- END embedded anonymous block
]';

begin
    sqlstmt := replace(sqlstmt, '${array_size}', to_char(array_size));
    sqlstmt := replace(sqlstmt, '${thr}', thr);
    sqlstmt := replace(sqlstmt, '${thrs}', thrs);
    execute immediate sqlstmt;
end;

```

The `ORA_HASH` function divides the `ext_scan_events_dets` table into 32 evenly distributed buckets, and then the `SELECT` statement retrieves the file names for bucket 0. For each file name in the bucket, the program sets the location of the external table to this file name. The program then uses batch processing to query the external table, insert into the staging table, and then commit.

While job 1 is executing, the other 31 Oracle Scheduler jobs execute in parallel. In this way, each job simultaneously reads a different subset of the scan event files, and inserts the records from its subset into the same staging table.

The manual parallelism technique has the following advantages over the alternative iterative techniques:

- It performs far better on large data sets because server processes are working in parallel.
- When the application uses `ORA_HASH` to distribute the workload, each thread of execution can access the same amount of data, which means that the parallel processes can finish at the same time.

The manual parallelism technique has the following disadvantages:

- The code is relatively lengthy, complicated, and difficult to understand.
- The application must perform a certain amount of preparatory work before the database can begin the main work, which is processing the rows in parallel.
- If multiple threads perform the same operations on a common set of database objects, then lock and latch contention is possible.
- Parallel processing consumes significant CPU resources compared to the competing iterative techniques.

See Also: RWP #8: Set-Based Parallel Processing

8.1.7.2 About Set-Based Processing

Set-based processing is a SQL technique that processes a data set inside the database.

In a set-based model, the SQL statement defines the result, and allows the database to determine the most efficient way to obtain it. In contrast, iterative algorithms use conditional logic to pull each row or group of rows from the database to the client application, process the data on the client, and then send the data back to the database. Set-based processing eliminates the network round-trip and database API overhead because the data never leaves the database.

Assume the same functional requirement as in the previous examples. The following SQL statements meet this requirement using a set-based algorithm:

```
alter session enable parallel dml;
insert /*+ APPEND */ into stagel_scan_events d
  select s.* from ext_scan_events s;
commit;
```

Because the INSERT statement contains a subquery of the ext_scan_events table, a *single* SQL statement reads and writes all rows. Also, the application executes a *single* COMMIT after the database has inserted all rows. In contrast, iterative applications execute a COMMIT after the insert of each row or each group of rows.

The set-based technique has significant advantages over iterative techniques:

- As demonstrated in Real-World Performance demonstrations and classes, the performance on large data sets is orders of magnitude faster. It is not unusual for the run time of a program to drop from several hours to several seconds.
- A side-effect of the orders of magnitude increase in processing speed is that DBAs can eliminate long-running and error-prone batch jobs, and innvoate business processes in real time.
- The length of the code is significantly shorter, a short as two or three lines of code, because SQL defines the result and not the access method.
- In contrast to manual parallelism, parallel DML is optimized for performance because the database, rather than the application, manages the processes.
- When joining data sets, the database automatically uses highly efficient hash joins instead of relatively inefficient application-level loops.
- The APPEND hint forces a direct-path load, which means that the database creates no redo and undo, thereby avoiding the waste of I/O and CPU.

Set-based processing does have some potential disadvantages:

- The techniques are unfamiliar to many database developers, so they may be more difficult.
- Because a set-based model is completely different from an iterative model, changing it requires completely rewriting the source code.

See Also: RWP #7 Set-Based Processing, RWP #8: Set-Based Parallel Processing, RWP #9: Set-Based Processing--Data Deduplication, RWP #10: Set-Based Processing--Data Transformations, and RWP #11: Set-Based Processing--Data Aggregation

8.2 Recommended Programming Practices

Use the following recommended programming practices.

- **Use Instrumentation Packages**
Oracle Database supplies instrumentation packages whose subprograms let your application generate trace information whenever necessary. Using this trace information, you can debug your application without a debugger and identify code that performs badly.
- **Statistics Gathering and Application Tracing**
Database statistics provide information about the type of load on the database and the internal and external resources used by the database. To accurately diagnose performance problems with the database using ADDM, statistics must be available.
- **Use Existing Functionality**
An application that uses existing functionality is easier to develop and maintain than one that does not, and it also runs faster.
- **Cover Database Tables with Editioning Views**
If your application uses database tables, then cover each one with an editioning view so that you can use edition-based redefinition (EBR) to upgrade the database component of your application while it is in use, thereby minimizing or eliminating down time.

8.2.1 Use Instrumentation Packages

Oracle Database supplies instrumentation packages whose subprograms let your application generate trace information whenever necessary. Using this trace information, you can debug your application without a debugger and identify code that performs badly.

Instrumentation provides your application with considerable functionality; therefore, it is not overhead. Overhead is something that you can remove without losing much benefit.

Some instrumentation packages that Oracle Database supplies are:

- **DBMS_APPLICATION_INFO**, which enables a system administrator to track the performance of your application by module.
For more information about **DBMS_APPLICATION_INFO**, see *Oracle Database PL/SQL Packages and Types Reference*.
- **DBMS_SESSION**, which enables your application to access session information and set preferences and security levels
For more information about **DBMS_SESSION**, see *Oracle Database PL/SQL Packages and Types Reference*.
- **UTL_FILE**, which enables your application to read and write operating system text files
For more information about **UTL_FILE**, see *Oracle Database PL/SQL Packages and Types Reference*.

 **See Also:**

Oracle Database PL/SQL Packages and Types Reference for a summary of PL/SQL packages that Oracle Database supplies

8.2.2 Statistics Gathering and Application Tracing

Database statistics provide information about the type of load on the database and the internal and external resources used by the database. To accurately diagnose performance problems with the database using ADDM, statistics must be available.

For information about statistics gathering, see *Oracle Database 2 Day + Performance Tuning Guide*.

 **Note:**

If Oracle Enterprise Manager is unavailable, then you can gather statistics using DBMS_MONITOR subprograms, described in *Oracle Database PL/SQL Packages and Types Reference*.

Oracle Database provides several tracing tools that can help you monitor and analyze Oracle Database applications. For details, see *Oracle Database SQL Tuning Guide*.

8.2.3 Use Existing Functionality

An application that uses existing functionality is easier to develop and maintain than one that does not, and it also runs faster.

When developing your application, use the existing functionality of your programming language, your operating system, Oracle Database, and the PL/SQL packages and types that Oracle Database supplies as much as possible.

Examples of existing functionality that many developers reinvent are:

- **Constraints**
For introductory information about constraints, see "[Ensuring Data Integrity in Tables](#)."
- **SQL functions** (functions that are "built into" SQL)
For information about SQL functions, see *Oracle Database SQL Language Reference*.
- **Sequences** (which can generate unique sequential values)
See "[Creating and Managing Sequences](#)".
- **Auditing** (the monitoring and recording of selected user database actions)
For introductory information about auditing, see *Oracle Database 2 Day + Security Guide*.

- **Replication** (the process of copying and maintaining database objects, such as tables, in multiple databases that comprise a distributed database system)
For information about replication, see the Oracle GoldenGate documentation..
- **Message queuing** (how web-based business applications communicate with each other)
For introductory information about Oracle Database Advanced Queuing (AQ), see *Oracle Database Advanced Queuing User's Guide*.
- **Maintaining a history of record changes**
For introductory information about Workspace Manager, see *Oracle Database Workspace Manager Developer's Guide*.

In [Example 8-4](#), two concurrent transactions dequeue messages stored in a table (that is, each transaction finds and locks the next unprocessed row of the table). Rather than simply invoking the DBMS_AQ.DEQUEUE procedure (described in *Oracle Database PL/SQL Packages and Types Reference*), the example creates a function-based index on the table and then uses that function in each transaction to retrieve the rows and display the messages.

The code in [Example 8-4](#) implements a feature similar to a DBMS_AQ.DEQUEUE invocation but with fewer capabilities. The development time saved by using existing functionality (in this case, function-based indexes) can be large.

Example 8-4 Concurrent Dequeuing Transactions

Create table:

```
DROP TABLE t;
CREATE TABLE t
  ( id          NUMBER PRIMARY KEY,
    processed_flag VARCHAR2(1),
    payload     VARCHAR2(20)
  );
```

Create index on table:

```
CREATE INDEX t_idx ON
  t( DECODE( processed_flag, 'N', 'N' ) );
```

Populate table:

```
INSERT INTO t
  SELECT r,
         CASE WHEN MOD(r,2) = 0 THEN 'N' ELSE 'Y' END,
         'payload ' || r
  FROM (SELECT LEVEL r FROM DUAL CONNECT BY LEVEL <= 5);
```

Show table:

```
SELECT * FROM t;
```

Result:

```

      ID P PAYLOAD
-----
      1 Y payload 1
      2 N payload 2
      3 Y payload 3
      4 N payload 4
```

```
5 Y payload 5
```

```
5 rows selected.
```

First transaction:

```
DECLARE
  l_rec t%ROWTYPE;
  CURSOR c IS
    SELECT *
    FROM t
    WHERE DECODE(processed_flag,'N','N') = 'N'
    FOR UPDATE
    SKIP LOCKED;
BEGIN
  OPEN c;

  FETCH c INTO l_rec;

  IF ( c%FOUND ) THEN
    DBMS_OUTPUT.PUT_LINE( 'Got row ' || l_rec.id || ', ' || l_rec.payload );
  END IF;

  CLOSE c;
END;
/
```

Result:

```
Got row 2, payload 2
```

Concurrent transaction:

```
DECLARE
  PRAGMA AUTONOMOUS_TRANSACTION;
  l_rec t%ROWTYPE;
  CURSOR c IS
    SELECT *
    FROM t
    WHERE DECODE(processed_flag,'N','N') = 'N'
    FOR UPDATE
    SKIP LOCKED;
BEGIN
  OPEN c;

  FETCH c INTO l_rec;

  IF ( c%FOUND ) THEN
    DBMS_OUTPUT.PUT_LINE( 'Got row ' || l_rec.id || ', ' || l_rec.payload );
  END IF;

  CLOSE c;
  COMMIT;
END;
/
```

Result:

```
Got row 4, payload 4
```

- *Oracle Database New Features Guide* (with each release)
- *Oracle Database Concepts* (with each release)

8.2.4 Cover Database Tables with Editioning Views

If your application uses database tables, then cover each one with an editioning view so that you can use edition-based redefinition (EBR) to upgrade the database component of your application while it is in use, thereby minimizing or eliminating down time.

For information about edition-based redefinition, see *Oracle Database Development Guide*.

8.3 Recommended Security Practices

When granting privileges on the schema objects that comprise your application, use the **principle of least privilege**.

That is, give users *only* the privileges that they need. For more information about the principle of least privilege, see *Oracle Database 2 Day + Security Guide*.

 **See Also:**

"[Using Bind Variables to Improve Scalability](#)" for information about using bind variables instead of string literals, which is the most effective way to make your code invulnerable to SQL injection attacks

Developing a Simple Oracle Database Application

By following the instructions for developing this simple application, you learn the general procedure for developing Oracle Database applications.

- [About the Application](#)
The application has the following purpose, structure, and naming conventions.
- [Creating the Schemas for the Application](#)
Using the procedure in this section, create the schemas for the application.
- [Granting Privileges to the Schemas](#)
To grant privileges to schemas, use the SQL statement GRANT.
- [Creating the Schema Objects and Loading the Data](#)
This section shows how to create the tables, editioning views, triggers, and sequences for the application, how to load data into the tables, and how to grant privileges on these schema objects to the users that need them.
- [Creating the employees_pkg Package](#)
This section shows how to create the employees_pkg package, how its subprograms work, how to grant the execute privilege on the package to the users who need it, and how those users can invoke one of its subprograms.
- [Creating the admin_pkg Package](#)
This section shows how to create the admin_pkg package, how its subprograms work, how to grant the execute privilege on the package to the user who needs it, and how that user can invoke one of its subprograms.

9.1 About the Application

The application has the following purpose, structure, and naming conventions.

- [Purpose of the Application](#)
The application is intended for two kinds of users in a company.
- [Structure of the Application](#)
The application uses the following schema objects and schemas.
- [Naming Conventions in the Application](#)
The application uses these naming conventions.

9.1.1 Purpose of the Application

The application is intended for two kinds of users in a company.

- Typical users (managers of employees)
- Application administrators

Typical users can do the following:

- Get the employees in a given department
- Get the job history for a given employee
- Show general information for a given employee (name, department, job, manager, salary, and so on)
- Change the salary of a given employee
- Change the job of a given employee

Application administrators can do the following:

- Change the ID, title, or salary range of an existing job
- Add a new job
- Change the ID, name, or manager of an existing department
- Add a new department

9.1.2 Structure of the Application

The application uses the following schema objects and schemas.

- [Schema Objects of the Application](#)
- [Schemas for the Application](#)

9.1.2.1 Schema Objects of the Application

The application is composed of these schema objects:

- Four tables, which store data about:
 - Jobs
 - Departments
 - Employees
 - Job history of employees
- Four editioning views, which cover the tables, enabling you to use edition-based redefinition (EBR) to upgrade the finished application when it is in use
- Two triggers, which enforce business rules
- Two sequences that generate unique primary keys for new departments and new employees
- Two packages:
 - employees_pkg, the application program interface (API) for typical users
 - admin_pkg, the API for application administrators

The typical users and application administrators access the application only through its APIs. Therefore, they can change the data only by invoking package subprograms.

 **See Also:**

- ["About Oracle Database"](#) for information about schema objects
- *Oracle Database Development Guide* for information about EBR

9.1.2.2 Schemas for the Application

For security, the application uses these five schemas (or users), each of which has *only* the privileges that it needs:

- `app_data`, who owns all the schema objects except the packages and loads its tables with data from tables in the sample schema HR

The developers who create the packages never work in this schema. Therefore, they cannot accidentally alter or drop application schema objects.

- `app_code`, who owns only the package `employees_pkg`

The developers of `employees_pkg` work in this schema.

- `app_admin`, who owns only the package `admin_pkg`

The developers of `admin_pkg` work in this schema.

- `app_user`, the typical application user, who owns nothing and can only execute `employees_pkg`

The middle-tier application server connects to the database in the connection pool as `app_user`. If this schema is compromised—by a SQL injection bug, for example—the attacker can see and change only what `employees_pkg` subprograms let it see and change. The attacker cannot drop tables, escalate privileges, create or alter schema objects, or anything else.

- `app_admin_user`, an application administrator, who owns nothing and can only execute `admin_pkg` and `employees_pkg`

The connection pool for this schema is very small, and only privileged users can access it. If this schema is compromised, the attacker can see and change only what `admin_pkg` and `employees_pkg` subprograms let it see and change.

Suppose that instead of `app_user` and `app_admin_user`, the application had only one schema that owned nothing and could execute both `employees_pkg` and `admin_pkg`. The connection pool for this schema would have to be large enough for both the typical users and the application administrators. If there were a SQL injection bug in `employees_pkg`, a typical user who exploited that bug could access `admin_pkg`.

Suppose that instead of `app_data`, `app_code`, and `app_admin`, the application had only one schema that owned all the schema objects, including the packages. The packages would then have all privileges on the tables, which would be both unnecessary and undesirable.

For example, suppose that you have an audit trail table, `AUDIT_TRAIL`. You want the developers of `employees_pkg` to be able to write to `AUDIT_TRAIL`, but not read or change it. You want the developers of `admin_pkg` to be able to read `AUDIT_TRAIL` and write to it, but not change it. If `AUDIT_TRAIL`, `employees_pkg`, and `admin_pkg` belong to the same schema, then the developers of the two packages have all privileges on `AUDIT_TRAIL`. However, if `AUDIT_TRAIL` belongs to `app_data`,

employees_pkg belongs to app_code, and admin_pkg belongs to app_admin, then you can connect to the database as app_data and do this:

```
GRANT INSERT ON AUDIT_TRAIL TO app_code;
GRANT INSERT, SELECT ON AUDIT_TRAIL TO app_admin;
```

See Also:

- ["About Oracle Database"](#) for information about schemas
- ["About Sample Schema HR"](#) for information about sample schema HR
- ["Recommended Security Practices"](#)

9.1.3 Naming Conventions in the Application

The application uses these naming conventions.

Item	Name
Table	<i>table#</i>
Editing view for <i>table#</i>	<i>table</i>
Trigger on editing view <i>table</i>	<i>table_{a b}event[_fer]</i> where: <ul style="list-style-type: none"> • a identifies an AFTER trigger. • b identifies a BEFORE trigger. • fer identifies a FOR EACH ROW trigger. • event identifies the event that fires the trigger. For example: i for INSERT, iu for INSERT or UPDATE, d for DELETE.
PRIMARY KEY constraint in <i>table#</i>	<i>table_pk</i>
NOT NULL constraint on <i>table#.column</i>	<i>table_column_not_null</i> ¹
UNIQUE constraint on <i>table#.column</i>	<i>table_column_unique</i> ¹
CHECK constraint on <i>table#.column</i>	<i>table_column_check</i> ¹
REF constraint on <i>table1#.column</i> to <i>table2#.column</i>	<i>table1_to_table2_fk</i> ¹
REF constraint on <i>table1#.column1</i> to <i>table2#.column2</i>	<i>table1_col1_to_table2_col2_fk</i> ^{1 2}
Sequence for <i>table#</i>	<i>table_sequence</i>
Parameter name	<i>p_name</i>
Local variable name	<i>l_name</i>

¹ *table*, *table1*, and *table2* are abbreviated to emp for employees, dept for departments, and job_hist for job_history.

² *col1* and *col2* are abbreviations of column names *column1* and *column2*. A constraint name cannot have more than 30 characters.

9.2 Creating the Schemas for the Application

Using the procedure in this section, create the schemas for the application.

The schema names are:

- app_data
- app_code
- app_admin
- app_user
- app_admin_user

 **Note:**

For the following procedure, you need the name and password of a user who has the CREATE USER and DROP USER system privileges.

To create the schema (or user) *schema_name*:

1. Using SQL*Plus, connect to Oracle Database as a user with the CREATE USER and DROP USER system privileges.

The SQL> prompt appears.

2. In case the schema exists, drop the schema and its objects with this SQL statement:

```
DROP USER schema_name CASCADE;
```

If the schema existed, the system responds:

```
User dropped.
```

If the schema did not exist, the system responds:

```
DROP USER schema_name CASCADE
*
ERROR at line 1:
ORA-01918: user 'schema_name' does not exist
```

3. If *schema_name* is either app_data, app_code, or app_admin, then create the schema with this SQL statement:

```
CREATE USER schema_name IDENTIFIED BY password
DEFAULT TABLESPACE USERS
QUOTA UNLIMITED ON USERS
ENABLE EDITIONS;
```

Otherwise, create the schema with this SQL statement:

```
CREATE USER schema_name IDENTIFIED BY password
ENABLE EDITIONS;
```

 **Caution:**

Choose a secure password. For guidelines for secure passwords, see *Oracle Database Security Guide*.

The system responds:

User created.

4. (Optional) In SQL Developer, create a connection for the schema, using the instructions in ["Connecting to Oracle Database from SQL Developer"](#).

 **See Also:**

- ["About the Application"](#)
- ["Connecting to Oracle Database from SQL*Plus"](#)
- *Oracle Database SQL Language Reference* for information about the `DROP USER` statement
- *Oracle Database SQL Language Reference* for information about the `CREATE USER` statement

9.3 Granting Privileges to the Schemas

To grant privileges to schemas, use the SQL statement `GRANT`.

You can enter the `GRANT` statements either in SQL*Plus or in the Worksheet of SQL Developer. For security, grant each schema *only* the privileges that it needs.

- [Granting Privileges to the app_data Schema](#)
- [Granting Privileges to the app_code Schema](#)
- [Granting Privileges to the app_admin Schema](#)
- [Granting Privileges to the app_user and app_admin_user Schemas](#)

 **See Also:**

- ["About the Application"](#)
- *Oracle Database SQL Language Reference* for information about the `GRANT` statement

9.3.1 Granting Privileges to the app_data Schema

Grant to the `app_data` schema *only* the privileges to do the following:

- Connect to Oracle Database:

```
GRANT CREATE SESSION TO app_data;
```
- Create the tables, views, triggers, and sequences for the application:

```
GRANT CREATE TABLE, CREATE VIEW, CREATE TRIGGER, CREATE SEQUENCE TO app_data;
```
- Load data from four tables in the sample schema HR into its own tables:

```
GRANT SELECT ON HR.DEPARTMENTS TO app_data;  
GRANT SELECT ON HR.EMPLOYEES TO app_data;  
GRANT SELECT ON HR.JOB_HISTORY TO app_data;  
GRANT SELECT ON HR.JOBS TO app_data;
```

9.3.2 Granting Privileges to the app_code Schema

Grant to the app_code schema *only* the privileges to do the following:

- Connect to Oracle Database:

```
GRANT CREATE SESSION TO app_code;
```
- Create the package employees_pkg:

```
GRANT CREATE PROCEDURE TO app_code;
```
- Create a synonym (for convenience):

```
GRANT CREATE SYNONYM TO app_code;
```

9.3.3 Granting Privileges to the app_admin Schema

Grant to the app_admin schema *only* the privileges to do the following:

- Connect to Oracle Database:

```
GRANT CREATE SESSION TO app_admin;
```
- Create the package admin_pkg:

```
GRANT CREATE PROCEDURE TO app_admin;
```
- Create a synonym (for convenience):

```
GRANT CREATE SYNONYM TO app_admin;
```

9.3.4 Granting Privileges to the app_user and app_admin_user Schemas

Grant to the app_user and app_admin_user schemas *only* the privileges to do the following:

- Connect to Oracle Database:

```
GRANT CREATE SESSION TO app_user;  
GRANT CREATE SESSION TO app_admin_user;
```
- Create synonyms (for convenience):

```
GRANT CREATE SYNONYM TO app_user;  
GRANT CREATE SYNONYM TO app_admin_user;
```

9.4 Creating the Schema Objects and Loading the Data

This section shows how to create the tables, editioning views, triggers, and sequences for the application, how to load data into the tables, and how to grant privileges on these schema objects to the users that need them.

To create the schema objects and load the data:

1. Connect to Oracle Database as user `app_data`.
For instructions, see either "[Connecting to Oracle Database from SQL*Plus](#)" or "[Connecting to Oracle Database from SQL Developer](#)".
2. Create the tables, with all necessary constraints except the foreign key constraint that you must add after you load the data.
3. Create the editioning views.
4. Create the triggers.
5. Create the sequences.
6. Load the data into the tables.
7. Add the foreign key constraint.

- [Creating the Tables](#)
- [Creating the Editioning Views](#)
- [Creating the Triggers](#)
- [Creating the Sequences](#)
- [Loading the Data](#)
- [Adding the Foreign Key Constraint](#)
- [Granting Privileges on the Schema Objects to Users](#)

9.4.1 Creating the Tables

This section shows how to create the tables for the application, with all necessary constraints except one, which you must add after you load the data.

Note:

You must be connected to Oracle Database as user `app_data`.

In the following procedure, you can enter the statements either in SQL*Plus or in the Worksheet of SQL Developer. Alternatively, you can create the tables with the SQL Developer tool Create Table.

To create the tables:

1. Create `jobs#`, which stores information about the jobs in the company (one row for each job):

```
CREATE TABLE jobs#
( job_id      VARCHAR2(10)
  CONSTRAINT jobs_pk PRIMARY KEY,
  job_title   VARCHAR2(35)
  CONSTRAINT jobs_job_title_not_null NOT NULL,
  min_salary  NUMBER(6)
  CONSTRAINT jobs_min_salary_not_null NOT NULL,
  max_salary  NUMBER(6)
  CONSTRAINT jobs_max_salary_not_null NOT NULL
)
/
```

2. Create departments#, which stores information about the departments in the company (one row for each department):

```
CREATE TABLE departments#
( department_id  NUMBER(4)
  CONSTRAINT departments_pk PRIMARY KEY,
  department_name VARCHAR2(30)
  CONSTRAINT department_name_not_null NOT NULL
  CONSTRAINT department_name_unique UNIQUE,
  manager_id    NUMBER(6)
)
/
```

3. Create employees#, which stores information about the employees in the company (one row for each employee):

```
CREATE TABLE employees#
( employee_id    NUMBER(6)
  CONSTRAINT employees_pk PRIMARY KEY,
  first_name     VARCHAR2(20)
  CONSTRAINT emp_first_name_not_null NOT NULL,
  last_name      VARCHAR2(25)
  CONSTRAINT emp_last_name_not_null NOT NULL,
  email_addr     VARCHAR2(25)
  CONSTRAINT emp_email_addr_not_null NOT NULL,
  hire_date      DATE
  DEFAULT TRUNC(SYSDATE)
  CONSTRAINT emp_hire_date_not_null NOT NULL
  CONSTRAINT emp_hire_date_check
    CHECK(TRUNC(hire_date) = hire_date),
  country_code   VARCHAR2(5)
  CONSTRAINT emp_country_code_not_null NOT NULL,
  phone_number   VARCHAR2(20)
  CONSTRAINT emp_phone_number_not_null NOT NULL,
  job_id         CONSTRAINT emp_job_id_not_null NOT NULL
  CONSTRAINT emp_jobs_fk REFERENCES jobs#,
  job_start_date DATE
  CONSTRAINT emp_job_start_date_not_null NOT NULL,
  CONSTRAINT emp_job_start_date_check
    CHECK(TRUNC(JOB_START_DATE) = job_start_date),
  salary         NUMBER(6)
  CONSTRAINT emp_salary_not_null NOT NULL,
  manager_id    CONSTRAINT emp_mgr_to_empno_fk REFERENCES employees#,
  department_id CONSTRAINT emp_to_dept_fk REFERENCES departments#
)
/
```

The reasons for the REF constraints are:

- An employee must have an existing job. That is, values in the column `employees#.job_id` must also be values in the column `jobs#.job_id`.
- An employee must have a manager who is also an employee. That is, values in the column `employees#.manager_id` must also be values in the column `employees#.employee_id`.
- An employee must work in an existing department. That is, values in the column `employees#.department_id` must also be values in the column `departments#.department_id`.

Also, the manager of an employee must be the manager of the department in which the employee works. That is, values in the column `employees#.manager_id` must also be values in the column `departments#.manager_id`. However, you could not specify the necessary constraint when you created `departments#`, because `employees#` did not exist yet. Therefore, you must add a foreign key constraint to `departments#` later (see "[Adding the Foreign Key Constraint](#)").

4. Create `job_history#`, which stores the job history of each employee in the company (one row for each job held by the employee):

```
CREATE TABLE job_history#
( employee_id CONSTRAINT job_hist_to_employees_fk REFERENCES employees#,
  job_id       CONSTRAINT job_hist_to_jobs_fk   REFERENCES jobs#,
  start_date   DATE
              CONSTRAINT job_hist_start_date_not_null NOT NULL,
  end_date     DATE
              CONSTRAINT job_hist_end_date_not_null  NOT NULL,
  department_id
              CONSTRAINT job_hist_to_departments_fk REFERENCES departments#
              CONSTRAINT job_hist_dept_id_not_null  NOT NULL,
              CONSTRAINT job_history_pk PRIMARY KEY(employee_id,start_date),
              CONSTRAINT job_history_date_check CHECK( start_date < end_date )
)
/
```

The reasons for the REF constraints are that the employee, job, and department must exist. That is:

- Values in the column `job_history#.employee_id` must also be values in the column `employees#.employee_id`.
- Values in the column `job_history#.job_id` must also be values in the column `jobs#.job_id`.
- Values in the column `job_history#.department_id` must also be values in the column `departments#.department_id`.

See Also:

"[Creating Tables](#)"

9.4.2 Creating the Editioning Views

 **Note:**

You must be connected to Oracle Database as user `app_data`.

To create the editioning views, use the following statements (in any order). You can enter the statements either in SQL*Plus or in the Worksheet of SQL Developer. Alternatively, you can create the editioning views with the SQL Developer tool Create View.

```
CREATE OR REPLACE EDITIONING VIEW jobs AS SELECT * FROM jobs#  
/  
CREATE OR REPLACE EDITIONING VIEW departments AS SELECT * FROM departments#  
/  
CREATE OR REPLACE EDITIONING VIEW employees AS SELECT * FROM employees#  
/  
CREATE OR REPLACE EDITIONING VIEW job_history AS SELECT * FROM job_history#  
/
```

 **Note:**

The application must always reference the base tables through the editioning views. Otherwise, the editioning views do not cover the tables and you cannot use EBR to upgrade the finished application when it is in use.

 **See Also:**

- ["Creating Views"](#)
- *Oracle Database Development Guide* for general information about editioning views
- *Oracle Database Development Guide* for information about preparing an application to use editioning views

9.4.3 Creating the Triggers

 **Note:**

You must be connected to Oracle Database as user `app_data`.

The triggers in the application enforce these business rules:

- An employee with job *j* must have a salary between the minimum and maximum salaries for job *j*.
- If an employee with job *j* has salary *s*, then you cannot change the minimum salary for *j* to a value greater than *s* or the maximum salary for *j* to a value less than *s*. (To do so would make existing data invalid.)
- [Creating the Trigger to Enforce the First Business Rule](#)
The first business rule is: An employee with job *j* must have a salary between the minimum and maximum salaries for job *j*.
- [Creating the Trigger to Enforce the Second Business Rule](#)
The second business rule is: If an employee with job *j* has salary *s*, then you cannot change the minimum salary for *j* to a value greater than *s* or the maximum salary for *j* to a value less than *s*. (To do so would make existing data invalid.)

See Also:

[Using Triggers](#), for information about triggers

9.4.3.1 Creating the Trigger to Enforce the First Business Rule

The first business rule is: An employee with job *j* must have a salary between the minimum and maximum salaries for job *j*.

This rule could be violated either when a new row is inserted into the employees table or when the salary or job_id column of the employees table is updated.

To enforce the rule, create the following trigger on the editioning view employees. You can enter the CREATE TRIGGER statement either in SQL*Plus or in the Worksheet of SQL Developer. Alternatively, you can create the trigger with the SQL Developer tool Create Trigger.

```
CREATE OR REPLACE TRIGGER employees_aiufer
AFTER INSERT OR UPDATE OF salary, job_id ON employees FOR EACH ROW
DECLARE
    l_cnt NUMBER;
BEGIN
    LOCK TABLE jobs IN SHARE MODE; -- Ensure that jobs does not change
                                   -- during the following query.

    SELECT COUNT(*) INTO l_cnt
    FROM jobs
    WHERE job_id = :NEW.job_id
    AND :NEW.salary BETWEEN min_salary AND max_salary;

    IF (l_cnt<>1) THEN
        RAISE_APPLICATION_ERROR( -20002,
            CASE
                WHEN :new.job_id = :old.job_id
                THEN 'Salary modification invalid'
                ELSE 'Job reassignment puts salary out of range'
            END );
    END IF;
END;
/
```

`LOCK TABLE jobs IN SHARE MODE` prevents other users from changing the table `jobs` while the trigger is querying it. Preventing changes to `jobs` during the query is necessary because nonblocking reads prevent the trigger from "seeing" changes that other users make to `jobs` while the trigger is changing employees (and prevent those users from "seeing" the changes that the trigger makes to employees).

Another way to prevent changes to `jobs` during the query is to include the `FOR UPDATE` clause in the `SELECT` statement. However, `SELECT FOR UPDATE` restricts concurrency more than `LOCK TABLE jobs IN SHARE MODE` does.

`LOCK TABLE jobs IN SHARE MODE` prevents other users from changing jobs, but not from locking jobs in share mode themselves. Changes to jobs will probably be much rarer than changes to employees. Therefore, locking jobs in share mode provides more concurrency than locking a single row of jobs in exclusive mode.

See Also:

- *Oracle Database Development Guide* for information about locking tables `IN SHARE MODE`
- *Oracle Database PL/SQL Language Reference* for information about `SELECT FOR UPDATE`
- ["Creating Triggers"](#)
- ["Tutorial: Showing How the employees_pkg Subprograms Work"](#) to see how the `employees_aifer` trigger works

9.4.3.2 Creating the Trigger to Enforce the Second Business Rule

The second business rule is: If an employee with job j has salary s , then you cannot change the minimum salary for j to a value greater than s or the maximum salary for j to a value less than s . (To do so would make existing data invalid.)

This rule could be violated when the `min_salary` or `max_salary` column of the `jobs` table is updated.

To enforce the rule, create the following trigger on the editing view `jobs`. You can enter the `CREATE TRIGGER` statement either in `SQL*Plus` or in the Worksheet of `SQL Developer`. Alternatively, you can create the trigger with the `SQL Developer` tool `Create Trigger`.

```
CREATE OR REPLACE TRIGGER jobs_aifer
AFTER UPDATE OF min_salary, max_salary ON jobs FOR EACH ROW
WHEN (NEW.min_salary > OLD.min_salary OR NEW.max_salary < OLD.max_salary)
DECLARE
    l_cnt NUMBER;
BEGIN
    LOCK TABLE employees IN SHARE MODE;

    SELECT COUNT(*) INTO l_cnt
    FROM employees
    WHERE job_id = :NEW.job_id
    AND salary NOT BETWEEN :NEW.min_salary and :NEW.max_salary;

    IF (l_cnt>0) THEN
```

```
RAISE_APPLICATION_ERROR( -20001,  
    'Salary update would violate ' || l_cnt || ' existing employee records' );  
END IF;  
END;  
/
```

`LOCK TABLE employees IN SHARE MODE` prevents other users from changing the table `employees` while the trigger is querying it. Preventing changes to `employees` during the query is necessary because nonblocking reads prevent the trigger from "seeing" changes that other users make to `employees` while the trigger is changing jobs (and prevent those users from "seeing" the changes that the trigger makes to jobs).

For this trigger, `SELECT FOR UPDATE` is not an alternative to `LOCK TABLE IN SHARE MODE`. While you are trying to change the salary range for this job, this trigger must prevent other users from changing a salary to be outside the new range. Therefore, the trigger must lock all rows in the `employees` table that have this `job_id` and lock all rows that someone could update to have this `job_id`.

One alternative to `LOCK TABLE employees IN SHARE MODE` is to use the `DBMS_LOCK` package to create a named lock with the name of the `job_id` and then use triggers on both the `employees` and `jobs` tables to use this named lock to prevent concurrent updates. However, using `DBMS_LOCK` and multiple triggers negatively impacts runtime performance.

Another alternative to `LOCK TABLE employees IN SHARE MODE` is to create a trigger on the `employees` table which, for each changed row of `employees`, locks the corresponding job row in `jobs`. However, this approach causes excessive work on updates to the `employees` table, which are frequent.

`LOCK TABLE employees IN SHARE MODE` is simpler than the preceding alternatives, and changes to the `jobs` table are rare and likely to happen at application maintenance time, when locking the table does not inconvenience users.

See Also:

- *Oracle Database Development Guide* for information about locking tables with `SHARE MODE`
- *Oracle Database PL/SQL Packages and Types Reference* for information about the `DBMS_LOCK` package
- ["Creating Triggers"](#)
- ["Tutorial: Showing How the admin_pkg Subprograms Work"](#)

9.4.4 Creating the Sequences

Note:

You must be connected to Oracle Database as user `app_data`.

To create the sequences that generate unique primary keys for new departments and new employees, use the following statements (in either order). You can enter the statements either in SQL*Plus or in the Worksheet of SQL Developer. Alternatively, you can create the sequences with the SQL Developer tool Create Sequence.

```
CREATE SEQUENCE employees_sequence START WITH 210;  
CREATE SEQUENCE departments_sequence START WITH 275;
```

To avoid conflict with the data that you will load from tables in the sample schema HR, the starting numbers for `employees_sequence` and `departments_sequence` must exceed the maximum values of `employees.employee_id` and `departments.department_id`, respectively. After "[Loading the Data](#)", this query displays these maximum values:

```
SELECT MAX(e.employee_id), MAX(d.department_id)  
FROM employees e, departments d;
```

Result:

```
MAX(E.EMPLOYEE_ID) MAX(D.DEPARTMENT_ID)  
-----  
                206                270
```

See Also:

["Creating and Managing Sequences"](#)

9.4.5 Loading the Data

Note:

You must be connected to Oracle Database as user `app_data`.

Load the tables of the application with data from tables in the sample schema HR.

Note:

The following procedure references the tables of the application through their editing views.

In the following procedure, you can enter the statements either in SQL*Plus or in the Worksheet of SQL Developer.

To load data into the tables:

1. Load jobs with data from the table HR.JOBS:

```
INSERT INTO jobs (job_id, job_title, min_salary, max_salary)  
SELECT job_id, job_title, min_salary, max_salary
```

```

FROM HR.JOBS
/

```

Result:

19 rows created.

2. Load departments with data from the table HR.DEPARTMENTS:

```

INSERT INTO departments (department_id, department_name, manager_id)
SELECT department_id, department_name, manager_id
FROM HR.DEPARTMENTS
/

```

Result:

27 rows created.

3. Load employees with data from the tables HR.EMPLOYEES and HR.JOB_HISTORY, using searched CASE expressions and SQL functions to get employees.country_code and employees.phone_number from HR.phone_number and SQL functions and a scalar subquery to get employees.job_start_date from HR.JOB_HISTORY:

```

INSERT INTO employees (employee_id, first_name, last_name, email_addr,
hire_date, country_code, phone_number, job_id, job_start_date, salary,
manager_id, department_id)
SELECT employee_id, first_name, last_name, email, hire_date,
CASE WHEN phone_number LIKE '011.%'
THEN '+' || SUBSTR( phone_number, INSTR( phone_number, '.' )+1,
INSTR( phone_number, '.', 1, 2 ) - INSTR( phone_number, '.' ) - 1 )
ELSE '+1'
END country_code,
CASE WHEN phone_number LIKE '011.%'
THEN SUBSTR( phone_number, INSTR(phone_number, '.', 1, 2 )+1 )
ELSE phone_number
END phone_number,
job_id,
NVL( (SELECT MAX(end_date+1)
FROM HR.JOB_HISTORY jh
WHERE jh.employee_id = employees.employee_id), hire_date),
salary, manager_id, department_id
FROM HR.EMPLOYEES
/

```

Result:

107 rows created.

 **Note:**

The preceding `INSERT` statement fires the trigger created in "[Creating the Trigger to Enforce the First Business Rule](#)".

4. Load job_history with data from the table HR.JOB_HISTORY:

```

INSERT INTO job_history (employee_id, job_id, start_date, end_date,
department_id)
SELECT employee_id, job_id, start_date, end_date, department_id

```

```
FROM HR.JOB_HISTORY  
/
```

Result:

10 rows created.

5. Commit the changes:

```
COMMIT;
```

 **See Also:**

- ["Using NULL-Related Functions in Queries"](#) for information about the `NVL` function
- *Oracle Database SQL Language Reference* for information about the `SQL` functions

9.4.6 Adding the Foreign Key Constraint

 **Note:**

You must be connected to Oracle Database as user `app_data`.

Now that the tables `departments` and `employees` contain data, add a foreign key constraint with the following `ALTER TABLE` statement. You can enter the statement either in `SQL*Plus` or in the Worksheet of `SQL Developer`. Alternatively, you can add the constraint with the `SQL Developer` tool `Add Foreign Key`.

```
ALTER TABLE departments#  
ADD CONSTRAINT dept_to_emp_fk  
FOREIGN KEY(manager_id) REFERENCES employees#;
```

If you add this foreign key constraint before `departments#` and `employees#` contain data, then you get this error when you try to load either of them with data:

```
ORA-02291: integrity constraint (APP_DATA.JOB_HIST_TO_DEPT_FK) violated - parent key not found
```

 **See Also:**

["Tutorial: Adding Constraints to Existing Tables"](#)

9.4.7 Granting Privileges on the Schema Objects to Users

Note:

You must be connected to Oracle Database as user app_data.

To grant privileges to users, use the SQL statement GRANT. You can enter the GRANT statements either in SQL*Plus or in the Worksheet of SQL Developer.

Grant to app_code *only* the privileges that it needs to create employees_pkg:

```
GRANT SELECT, INSERT, UPDATE, DELETE ON employees TO app_code;
GRANT SELECT ON departments TO app_code;
GRANT SELECT ON jobs TO app_code;
GRANT SELECT, INSERT on job_history TO app_code;
GRANT SELECT ON employees_sequence TO app_code;
```

Grant to app_admin *only* the privileges that it needs to create admin_pkg:

```
GRANT SELECT, INSERT, UPDATE, DELETE ON jobs TO app_admin;
GRANT SELECT, INSERT, UPDATE, DELETE ON departments TO app_admin;
GRANT SELECT ON employees_sequence TO app_admin;
GRANT SELECT ON departments_sequence TO app_admin;
```

See Also:

Oracle Database SQL Language Reference for information about the GRANT statement

9.5 Creating the employees_pkg Package

This section shows how to create the employees_pkg package, how its subprograms work, how to grant the execute privilege on the package to the users who need it, and how those users can invoke one of its subprograms.

To create the employees_pkg package:

1. Connect to Oracle Database as user app_code.

For instructions, see either "[Connecting to Oracle Database from SQL*Plus](#)" or "[Connecting to Oracle Database from SQL Developer](#)".

2. Create these synonyms:

```
CREATE OR REPLACE SYNONYM employees FOR app_data.employees;
CREATE OR REPLACE SYNONYM departments FOR app_data.departments;
CREATE OR REPLACE SYNONYM jobs FOR app_data.jobs;
CREATE OR REPLACE SYNONYM job_history FOR app_data.job_history;
```

You can enter the CREATE SYNONYM statements either in SQL*Plus or in the Worksheet of SQL Developer. Alternatively, you can create the synonyms with the SQL Developer tool Create Synonym.

3. Create the package specification.
 4. Create the package body.
- [Creating the Package Specification for employees_pkg](#)
 - [Creating the Package Body for employees_pkg](#)
 - [Tutorial: Showing How the employees_pkg Subprograms Work](#)
Using SQL*Plus, this tutorial shows how the subprograms of the employees_pkg package work. The tutorial also shows how the trigger employees_aufer and the CHECK constraint job_history_date_check work.
 - [Granting the Execute Privilege to app_user and app_admin_user](#)
 - [Tutorial: Invoking get_job_history as app_user or app_admin_user](#)
Using SQL*Plus, this tutorial shows how to invoke the subprogram app_code.employees_pkg.get_job_history as the user app_user (typically a manager) or app_admin_user (an application administrator).

 **See Also:**

- ["Creating Synonyms"](#)
- ["About Packages"](#)

9.5.1 Creating the Package Specification for employees_pkg

 **Note:**

You must be connected to Oracle Database as user app_code.

To create the package specification for employees_pkg, the API for managers, use the following CREATE PACKAGE statement. You can enter the statement either in SQL*Plus or in the Worksheet of SQL Developer. Alternatively, you can create the package with the SQL Developer tool Create Package.

```
CREATE OR REPLACE PACKAGE employees_pkg
AS
  PROCEDURE get_employees_in_dept
    ( p_deptno      IN      employees.department_id%TYPE,
      p_result_set  IN OUT SYS_REFCURSOR );

  PROCEDURE get_job_history
    ( p_employee_id IN      employees.department_id%TYPE,
      p_result_set  IN OUT SYS_REFCURSOR );

  PROCEDURE show_employee
    ( p_employee_id IN      employees.employee_id%TYPE,
      p_result_set  IN OUT SYS_REFCURSOR );
```

```

PROCEDURE update_salary
( p_employee_id IN employees.employee_id%TYPE,
  p_new_salary  IN employees.salary%TYPE );

PROCEDURE change_job
( p_employee_id IN employees.employee_id%TYPE,
  p_new_job     IN employees.job_id%TYPE,
  p_new_salary  IN employees.salary%TYPE := NULL,
  p_new_dept   IN employees.department_id%TYPE := NULL );

END employees_pkg;
/

```

- ["About the Application"](#)
- ["Creating and Managing Packages"](#)
- *Oracle Database PL/SQL Language Reference* for information about the CREATE PACKAGE statement

9.5.2 Creating the Package Body for employees_pkg

Note:

You must be connected to Oracle Database as user app_code.

To create the package body for employees_pkg, the API for managers, use the following CREATE PACKAGE BODY statement. You can enter the statement either in SQL*Plus or in the Worksheet of SQL Developer. Alternatively, you can create the package with the SQL Developer tool Create Body.

```

CREATE OR REPLACE PACKAGE BODY employees_pkg
AS
  PROCEDURE get_employees_in_dept
    ( p_deptno      IN      employees.department_id%TYPE,
      p_result_set  IN OUT SYS_REFCURSOR )
  IS
    l_cursor SYS_REFCURSOR;
  BEGIN
    OPEN p_result_set FOR
      SELECT e.employee_id,
             e.first_name || ' ' || e.last_name name,
             TO_CHAR( e.hire_date, 'Dy Mon ddth, yyyy' ) hire_date,
             j.job_title,
             m.first_name || ' ' || m.last_name manager,
             d.department_name
      FROM employees e INNER JOIN jobs j ON (e.job_id = j.job_id)
        LEFT OUTER JOIN employees m ON (e.manager_id = m.employee_id)
        INNER JOIN departments d ON (e.department_id = d.department_id)
     WHERE e.department_id = p_deptno ;

```

```
END get_employees_in_dept;

PROCEDURE get_job_history
( p_employee_id IN employees.department_id%TYPE,
  p_result_set IN OUT SYS_REFCURSOR )
IS
BEGIN
  OPEN p_result_set FOR
  SELECT e.First_name || ' ' || e.last_name name, j.job_title,
         e.job_start_date start_date,
         TO_DATE(NULL) end_date
  FROM employees e INNER JOIN jobs j ON (e.job_id = j.job_id)
  WHERE e.employee_id = p_employee_id
  UNION ALL
  SELECT e.First_name || ' ' || e.last_name name,
         j.job_title,
         jh.start_date,
         jh.end_date
  FROM employees e INNER JOIN job_history jh
  ON (e.employee_id = jh.employee_id)
  INNER JOIN jobs j ON (jh.job_id = j.job_id)
  WHERE e.employee_id = p_employee_id
  ORDER BY start_date DESC;
END get_job_history;

PROCEDURE show_employee
( p_employee_id IN employees.employee_id%TYPE,
  p_result_set IN OUT sys_refcursor )
IS
BEGIN
  OPEN p_result_set FOR
  SELECT *
  FROM (SELECT TO_CHAR(e.employee_id) employee_id,
              e.first_name || ' ' || e.last_name name,
              e.email_addr,
              TO_CHAR(e.hire_date, 'dd-mon-yyyy') hire_date,
              e.country_code,
              e.phone_number,
              j.job_title,
              TO_CHAR(e.job_start_date, 'dd-mon-yyyy') job_start_date,
              to_char(e.salary) salary,
              m.first_name || ' ' || m.last_name manager,
              d.department_name
  FROM employees e INNER JOIN jobs j on (e.job_id = j.job_id)
  RIGHT OUTER JOIN employees m ON (m.employee_id = e.manager_id)
  INNER JOIN departments d ON (e.department_id = d.department_id)
  WHERE e.employee_id = p_employee_id)
  UNPIVOT (VALUE FOR ATTRIBUTE IN (employee_id, name, email_addr, hire_date,
  country_code, phone_number, job_title, job_start_date, salary, manager,
  department_name) );
END show_employee;

PROCEDURE update_salary
( p_employee_id IN employees.employee_id%type,
  p_new_salary IN employees.salary%type )
IS
BEGIN
  UPDATE employees
  SET salary = p_new_salary
  WHERE employee_id = p_employee_id;
END update_salary;
```

```
PROCEDURE change_job
( p_employee_id IN employees.employee_id%TYPE,
  p_new_job      IN employees.job_id%TYPE,
  p_new_salary   IN employees.salary%TYPE := NULL,
  p_new_dept     IN employees.department_id%TYPE := NULL )
IS
BEGIN
  INSERT INTO job_history (employee_id, start_date, end_date, job_id,
    department_id)
  SELECT employee_id, job_start_date, TRUNC(SYSDATE), job_id, department_id
  FROM employees
  WHERE employee_id = p_employee_id;

  UPDATE employees
  SET job_id = p_new_job,
    department_id = NVL( p_new_dept, department_id ),
    salary = NVL( p_new_salary, salary ),
    job_start_date = TRUNC(SYSDATE)
  WHERE employee_id = p_employee_id;
END change_job;
END employees_pkg;
/
```

- ["Creating and Managing Packages"](#)
- *Oracle Database PL/SQL Language Reference* for information about the CREATE PACKAGE BODY statement

9.5.3 Tutorial: Showing How the employees_pkg Subprograms Work

Using SQL*Plus, this tutorial shows how the subprograms of the employees_pkg package work. The tutorial also shows how the trigger employees_auifer and the CHECK constraint job_history_date_check work.

 **Note:**

You must be connected to Oracle Database as user app_code from SQL*Plus.

To use SQL*Plus to show how the employees_pkg subprograms work:

1. Use formatting commands to improve the readability of the output. For example:

```
SET LINESIZE 80
SET RECSEP WRAPPED
SET RECSEPCHAR "="
COLUMN NAME FORMAT A15 WORD_WRAPPED
COLUMN HIRE_DATE FORMAT A20 WORD_WRAPPED
COLUMN DEPARTMENT_NAME FORMAT A10 WORD_WRAPPED
```

```
COLUMN JOB_TITLE FORMAT A29 WORD_WRAPPED
COLUMN MANAGER FORMAT A11 WORD_WRAPPED
```

2. Declare a bind variable for the value of the subprogram parameter p_result_set:

```
VARIABLE c REFCURSOR
```

3. Show the employees in department 90:

```
EXEC employees_pkg.get_employees_in_dept( 90, :c );
PRINT c
```

Result:

```
EMPLOYEE_ID NAME                HIRE_DATE                JOB_TITLE
-----
MANAGER      DEPARTMENT
-----
          100 Steven King      Tue Jun 17th, 2003    President
                Executive
=====
          102 Lex De Haan      Sat Jan 13th, 2001    Administration Vice President
Steven King Executive
=====
          101 Neena Kochhar     Wed Sep 21st, 2005    Administration Vice President
Steven King Executive
=====
```

4. Show the job history of employee 101:

```
EXEC employees_pkg.get_job_history( 101, :c );
PRINT c
```

Result:

```
NAME                JOB_TITLE                START_DAT END_DATE
-----
Neena Kochhar      Administration Vice President 16-MAR-05
Neena Kochhar      Accounting Manager        28-OCT-01 15-MAR-05
Neena Kochhar      Public Accountant         21-SEP-97 27-OCT-01
```

5. Show general information about employee 101:

```
EXEC employees_pkg.show_employee( 101, :c );
PRINT c
```

Result:

```
ATTRIBUTE          VALUE
-----
EMPLOYEE_ID        101
NAME                Neena Kochhar
EMAIL_ADDR          NKOCHHAR
HIRE_DATE           21-sep-2005
COUNTRY_CODE        +1
PHONE_NUMBER        515.123.4568
JOB_TITLE           Administration Vice President
JOB_START_DATE      16-mar-05
SALARY              17000
MANAGER             Steven King
DEPARTMENT_NAME     Executive
```

11 rows selected.

6. Show the information about the job Administration Vice President:

```
SELECT * FROM jobs WHERE job_title = 'Administration Vice President';
```

Result:

JOB_ID	JOB_TITLE	MIN_SALARY	MAX_SALARY
AD_VP	Administration Vice President	15000	30000

7. Try to give employee 101 a new salary outside the range for her job:

```
EXEC employees_pkg.update_salary( 101, 30001 );
```

Result:

```
SQL> EXEC employees_pkg.update_salary( 101, 30001 );
BEGIN employees_pkg.update_salary( 101, 30001 ); END;
```

```
*
ERROR at line 1:
ORA-20002: Salary modification invalid
ORA-06512: at "APP_DATA.EMPLOYEES_AIUFER", line 13
ORA-04088: error during execution of trigger 'APP_DATA.EMPLOYEES_AIUFER'
ORA-06512: at "APP_CODE.EMPLOYEES_PKG", line 77
ORA-06512: at line 1
```

8. Give employee 101 a new salary inside the range for her job and show general information about her again:

```
EXEC employees_pkg.update_salary( 101, 18000 );
EXEC employees_pkg.show_employee( 101, :c );
PRINT c
```

Result:

ATTRIBUTE	VALUE
EMPLOYEE_ID	101
NAME	Neena Kochhar
EMAIL_ADDR	NKOCHHAR
HIRE_DATE	21-sep-2005
COUNTRY_CODE	+1
PHONE_NUMBER	515.123.4568
JOB_TITLE	Administration Vice President
JOB_START_DATE	16-mar-05
SALARY	18000
MANAGER	Steven King
DEPARTMENT_NAME	Executive

11 rows selected.

9. Change the job of employee 101 to her current job with a lower salary:

```
EXEC employees_pkg.change_job( 101, 'AD_VP', 17500, 90 );
```

Result:

```
SQL> exec employees_pkg.change_job( 101, 'AD_VP', 17500, 90 );
BEGIN employees_pkg.change_job( 101, 'AD_VP', 17500, 80 ); END;
```

*

```

ERROR at line 1:
ORA-02290: check constraint (APP_DATA.JOB_HISTORY_DATE_CHECK) violated
ORA-06512: at "APP_CODE.EMPLOYEES_PKG", line 101
ORA-06512: at line 1

```

10. Show information about the employee. (Note that the salary was not changed by the statement in the preceding step; it is 18000, not 17500.)

```

exec employees_pkg.show_employee( 101, :c );
print c

```

Result:

ATTRIBUTE	VALUE
EMPLOYEE_ID	101
NAME	Neena Kochhar
EMAIL_ADDR	NKOCHHAR
HIRE_DATE	21-sep-2005
COUNTRY_CODE	+1
PHONE_NUMBER	515.123.4568
JOB_TITLE	Administration Vice President
JOB_START_DATE	10-mar-2015
SALARY	18000
MANAGER	Steven King
DEPARTMENT_NAME	Executive

11 rows selected.

 **See Also:**

9.5.4 Granting the Execute Privilege to app_user and app_admin_user

 **Note:**

You must be connected to Oracle Database as user app_code.

To grant the execute privilege on the package employees_pkg to app_user (typically a manager) and app_admin_user (an application administrator), use the following GRANT statements (in either order). You can enter the statements either in SQL*Plus or in the Worksheet of SQL Developer.

```

GRANT EXECUTE ON employees_pkg TO app_user;
GRANT EXECUTE ON employees_pkg TO app_admin_user;

```

 **See Also:**

- ["Schemas for the Application"](#)
- *Oracle Database SQL Language Reference* for information about the GRANT statement

9.5.5 Tutorial: Invoking get_job_history as app_user or app_admin_user

Using SQL*Plus, this tutorial shows how to invoke the subprogram `app_code.employees_pkg.get_job_history` as the user `app_user` (typically a manager) or `app_admin_user` (an application administrator).

To invoke `employees_pkg.get_job_history` as `app_user` or `app_admin_user`:

1. Connect to Oracle Database as user `app_user` or `app_admin_user` from SQL*Plus.

For instructions, see ["Connecting to Oracle Database from SQL*Plus"](#).

2. Create this synonym:

```
CREATE SYNONYM employees_pkg FOR app_code.employees_pkg;
```

3. Show the job history of employee 101:

```
EXEC employees_pkg.get_job_history( 101, :c );
PRINT c
```

Result:

NAME	JOB_TITLE	START_DAT	END_DATE
-----	-----	-----	-----
Neena Kochhar	Administration Vice President	16-MAR-05	15-MAY-12
Neena Kochhar	Accounting Manager	28-OCT-01	15-MAR-05
Neena Kochhar	Public Accountant	21-SEP-97	27-OCT-01

9.6 Creating the admin_pkg Package

This section shows how to create the `admin_pkg` package, how its subprograms work, how to grant the execute privilege on the package to the user who needs it, and how that user can invoke one of its subprograms.

To create the `admin_pkg` package:

1. Connect to Oracle Database as user `app_admin`.

For instructions, see either ["Connecting to Oracle Database from SQL*Plus"](#) or ["Connecting to Oracle Database from SQL Developer"](#).

2. Create these synonyms:

```
CREATE SYNONYM departments FOR app_data.departments;
CREATE SYNONYM jobs FOR app_data.jobs;
CREATE SYNONYM departments_sequence FOR app_data.departments_sequence;
```

You can enter the CREATE SYNONYM statements either in SQL*Plus or in the Worksheet of SQL Developer. Alternatively, you can create the tables with the SQL Developer tool Create Synonym.

3. Create the package specification.
 4. Create the package body.
- [Creating the Package Specification for admin_pkg](#)
 - [Creating the Package Body for admin_pkg](#)
 - [Tutorial: Showing How the admin_pkg Subprograms Work](#)
Using SQL*Plus, this tutorial shows how the subprograms of the admin_pkg package work. The tutorial also shows how the trigger jobs_aufer works.
 - [Granting the Execute Privilege to app_admin_user](#)
 - [Tutorial: Invoking add_department as app_admin_user](#)
Using SQL*Plus, this tutorial shows how to invoke the function app_admin.admin_pkg.add_department as the user app_admin_user (an application administrator) and then see the information about the new department.

- ["Creating and Managing Synonyms"](#)
- ["About Packages"](#)

9.6.1 Creating the Package Specification for admin_pkg

Note:

You must be connected to Oracle Database as user app_admin.

To create the package specification for admin_pkg, the API for application administrators, use the following CREATE PACKAGE statement. You can enter the statement either in SQL*Plus or in the Worksheet of SQL Developer. Alternatively, you can create the package with the SQL Developer tool Create Package.

```
CREATE OR REPLACE PACKAGE admin_pkg
AS
  PROCEDURE update_job
    ( p_job_id      IN jobs.job_id%TYPE,
      p_job_title  IN jobs.job_title%TYPE := NULL,
      p_min_salary IN jobs.min_salary%TYPE := NULL,
      p_max_salary IN jobs.max_salary%TYPE := NULL );

  PROCEDURE add_job
    ( p_job_id      IN jobs.job_id%TYPE,
      p_job_title  IN jobs.job_title%TYPE,
      p_min_salary IN jobs.min_salary%TYPE,
      p_max_salary IN jobs.max_salary%TYPE );
```

```

PROCEDURE update_department
( p_department_id      IN departments.department_id%TYPE,
  p_department_name    IN departments.department_name%TYPE := NULL,
  p_manager_id         IN departments.manager_id%TYPE := NULL,
  p_update_manager_id IN BOOLEAN := FALSE );

FUNCTION add_department
( p_department_name    IN departments.department_name%TYPE,
  p_manager_id         IN departments.manager_id%TYPE )
RETURN departments.department_id%TYPE;

END admin_pkg;
/

```

See Also:

- ["About the Application"](#)
- ["Creating and Managing Packages"](#)
- *Oracle Database PL/SQL Language Reference* for information about the CREATE PACKAGE statement

9.6.2 Creating the Package Body for admin_pkg

Note:

You must be connected to Oracle Database as user app_admin.

To create the package body for admin_pkg, the API for application administrators, use the following CREATE PACKAGE BODY statement. You can enter the statement either in SQL*Plus or in the Worksheet of SQL Developer. Alternatively, you can create the package with the SQL Developer tool Create Body.

```

CREATE OR REPLACE PACKAGE BODY admin_pkg
AS
  PROCEDURE update_job
  ( p_job_id      IN jobs.job_id%TYPE,
    p_job_title   IN jobs.job_title%TYPE := NULL,
    p_min_salary  IN jobs.min_salary%TYPE := NULL,
    p_max_salary  IN jobs.max_salary%TYPE := NULL )
  IS
  BEGIN
    UPDATE jobs
    SET job_title = NVL( p_job_title, job_title ),
        min_salary = NVL( p_min_salary, min_salary ),
        max_salary = NVL( p_max_salary, max_salary )
    WHERE job_id = p_job_id;
  END update_job;

  PROCEDURE add_job
  ( p_job_id      IN jobs.job_id%TYPE,
    p_job_title   IN jobs.job_title%TYPE,

```

```
        p_min_salary IN jobs.min_salary%TYPE,
        p_max_salary IN jobs.max_salary%TYPE )
IS
BEGIN
    INSERT INTO jobs ( job_id, job_title, min_salary, max_salary )
    VALUES ( p_job_id, p_job_title, p_min_salary, p_max_salary );
END add_job;

PROCEDURE update_department
( p_department_id    IN departments.department_id%TYPE,
  p_department_name  IN departments.department_name%TYPE := NULL,
  p_manager_id       IN departments.manager_id%TYPE := NULL,
  p_update_manager_id IN BOOLEAN := FALSE )
IS
BEGIN
    IF ( p_update_manager_id ) THEN
        UPDATE departments
        SET department_name = NVL( p_department_name, department_name ),
            manager_id = p_manager_id
        WHERE department_id = p_department_id;
    ELSE
        UPDATE departments
        SET department_name = NVL( p_department_name, department_name )
        WHERE department_id = p_department_id;
    END IF;
END update_department;

FUNCTION add_department
( p_department_name  IN departments.department_name%TYPE,
  p_manager_id       IN departments.manager_id%TYPE )
RETURN departments.department_id%TYPE
IS
    l_department_id departments.department_id%TYPE;
BEGIN
    INSERT INTO departments ( department_id, department_name, manager_id )
    VALUES ( departments_sequence.NEXTVAL, p_department_name, p_manager_id )
    RETURNING department_id INTO l_department_id;
    RETURN l_department_id;
END add_department;

END admin_pkg;
/
```

 **See Also:**

- ["About the Application"](#)
- ["Creating and Managing Packages"](#)
- *Oracle Database PL/SQL Language Reference* for information about the CREATE PACKAGE BODY statement

9.6.3 Tutorial: Showing How the admin_pkg Subprograms Work

Using SQL*Plus, this tutorial shows how the subprograms of the admin_pkg package work. The tutorial also shows how the trigger jobs_aufer works.

Note:

You must be connected to Oracle Database as user app_admin from SQL*Plus.

To show how the admin_pkg subprograms work:

1. Show the information about the job whose ID is AD_VP:

```
SELECT * FROM jobs WHERE job_id = 'AD_VP';
```

Result:

JOB_ID	JOB_TITLE	MIN_SALARY	MAX_SALARY
AD_VP	Administration Vice President	15000	30000

2. Increase the maximum salary for this job and show the information about it again:

```
EXEC admin_pkg.update_job( 'AD_VP', p_max_salary => 31000 );
SELECT * FROM jobs WHERE job_id = 'AD_VP';
```

Result:

JOB_ID	JOB_TITLE	MIN_SALARY	MAX_SALARY
AD_VP	Administration Vice President	15000	31000

3. Show the information about the job whose ID is IT_PROG:

```
SELECT * FROM jobs WHERE job_id = 'IT_PROG';
```

Result:

JOB_ID	JOB_TITLE	MIN_SALARY	MAX_SALARY
IT_PROG	Programmer	4000	10000

4. Try to increase the maximum salary for this job:

```
EXEC admin_pkg.update_job( 'IT_PROG', p_max_salary => 4001 );
```

Result (from SQL*Plus):

```
SQL> EXEC admin_pkg.update_job( 'IT_PROG', p_max_salary => 4001 );
BEGIN admin_pkg.update_job( 'IT_PROG', p_max_salary => 4001 ); END;
```

*

```
ERROR at line 1:
ORA-20001: Salary update would violate 5 existing employee records
ORA-06512: at "APP_DATA.JOBS_AUFER", line 12
ORA-04088: error during execution of trigger 'APP_DATA.JOBS_AUFER'
ORA-06512: at "APP_ADMIN.ADMIN_PKG", line 10
ORA-06512: at line 1
```

5. Add a new job and show the information about it:

```
EXEC admin_pkg.add_job( 'AD_CLERK', 'Administrative Clerk', 3000, 7000 );
SELECT * FROM jobs WHERE job_id = 'AD_CLERK';
```

Result:

JOB_ID	JOB_TITLE	MIN_SALARY	MAX_SALARY
AD_CLERK	Administrative Clerk	3000	7000

6. Show the information about department 100:

```
SELECT * FROM departments WHERE department_id = 100;
```

Result:

DEPARTMENT_ID	DEPARTMENT_NAME	MANAGER_ID
100	Finance	108

7. Change the name and manager of department 100 and show the information about it:

```
EXEC admin_pkg.update_department( 100, 'Financial Services' );
EXEC admin_pkg.update_department( 100, p_manager_id => 111,
  p_update_manager_id => true );
SELECT * FROM departments WHERE department_id = 100;
```

Result:

DEPARTMENT_ID	DEPARTMENT_NAME	MANAGER_ID
100	Financial Services	111

**See Also:**["Creating and Managing Packages"](#)

9.6.4 Granting the Execute Privilege to app_admin_user

**Note:**

You must be connected to Oracle Database as user app_admin.

To grant the execute privilege on the package admin_pkg to app_admin_user (an application administrator), use the following GRANT statement. You can enter the statement either in SQL*Plus or in the Worksheet of SQL Developer.

```
GRANT EXECUTE ON admin_pkg TO app_admin_user;
```

 **See Also:**

- ["Schemas for the Application"](#)
- *Oracle Database SQL Language Reference* for information about the GRANT statement

9.6.5 Tutorial: Invoking add_department as app_admin_user

Using SQL*Plus, this tutorial shows how to invoke the function `app_admin.admin_pkg.add_department` as the user `app_admin_user` (an application administrator) and then see the information about the new department.

To invoke `admin_pkg.add_department` as `app_admin_user`:

1. Connect to Oracle Database as user `app_admin_user` from SQL*Plus.
For instructions, see ["Connecting to Oracle Database from SQL*Plus"](#).

2. Create this synonym:

```
CREATE SYNONYM admin_pkg FOR app_admin.admin_pkg;
```

3. Declare a bind variable for the return value of the function:

```
VARIABLE n NUMBER
```

4. Add a new department without a manager:

```
EXEC :n := admin_pkg.add_department( 'New department', NULL );
```

5. Show the ID of the manager of the new department:

```
PRINT :n
```

Result:

```

          N
-----
        275
```

To see the information about the new department:

1. Connect to Oracle Database as user `app_admin`.
2. Show the information about the new department:

```
SELECT * FROM departments WHERE department_name LIKE 'New department%';
```

Result:

```

DEPARTMENT_ID DEPARTMENT_NAME          MANAGER_ID
-----
275 New department
```

10

Deploying an Oracle Database Application

After you develop your application, you can install it on other databases, called deployment environments, where other users can run it.

- [About Development and Deployment Environments](#)
The database on which you develop your application is called the **development environment**. After developing your application, you can install it on other databases, called **deployment environments**, where other users can run it.
- [About Installation Scripts](#)
An **installation script** can either have all the SQL statements needed to create the application or it can be a **master script** that runs other scripts.
- [Creating Installation Scripts](#)
You can create installation scripts in SQL Developer or a text editor.
- [Deploying the Sample Application](#)
You can deploy the sample application using installation scripts.
- [Checking the Validity of an Installation](#)
After installing your application in a deployment environment, you can check its validity using SQL Developer.
- [Archiving the Installation Scripts](#)
After you verify that the installation of your application is valid, Oracle recommends that you archive your installation scripts in a source code control system.

10.1 About Development and Deployment Environments

The database on which you develop your application is called the **development environment**. After developing your application, you can install it on other databases, called **deployment environments**, where other users can run it.

The first deployment environment is the **test environment**. In the test environment, you can thoroughly test the functionality of the application, determine whether it is structured correctly, and fix any problems before deploying it in the **production environment**.

You might also deploy your application to an **education environment**, either before or after deploying it to the production environment. An education environment provides a place for users to practice running the application without affecting other environments.

If the desired deployment environments do not exist in your organization, you can create them.

10.2 About Installation Scripts

An **installation script** can either have all the SQL statements needed to create the application or it can be a **master script** that runs other scripts.

A **script** is a series of SQL statements in a file whose name ends with `.sql` (for example, `create_app.sql`). When you run a script in a client program such as SQL*Plus or SQL Developer, the SQL statements run in the order in which they appear in the script. A script whose SQL statements create an application is called an **installation script**.

To deploy an application, you run one or more installation scripts in the deployment environment. For a new application, you must create the installation scripts. For an older application, the installation scripts might exist, but if they do not, you can create them.

- [About DDL Statements and Schema Object Dependencies](#)
An installation script contains DDL statements that create schema objects and, optionally, INSERT statements that load data into tables that DDL statements create. To create installation scripts correctly, and to run multiple installation scripts in the correct order, you must understand the dependencies between the schema objects of your application.
- [About INSERT Statements and Constraints](#)
When you run an installation script that contains INSERT statements, you must determine whether constraints could be violated when data from source tables (in the development environment) is inserted into new tables in the deployment environment.

10.2.1 About DDL Statements and Schema Object Dependencies

An installation script contains DDL statements that create schema objects and, optionally, INSERT statements that load data into tables that DDL statements create. To create installation scripts correctly, and to run multiple installation scripts in the correct order, you must understand the dependencies between the schema objects of your application.

If the definition of object A references object B, then A depends on B. Therefore, you must create B before you create A. Otherwise, the statement that creates B either fails or creates B in an invalid state, depending on the object type.

For a complex application, the order for creating the objects is rarely obvious. Usually, you must consult the database designer or a diagram of the design.

See Also:

- *Oracle Database Development Guide* for more information about schema object dependencies
- "[About Data Definition Language \(DDL\) Statements](#)"

10.2.2 About INSERT Statements and Constraints

When you run an installation script that contains INSERT statements, you must determine whether constraints could be violated when data from source tables (in the development environment) is inserted into new tables in the deployment environment.

For each source table in your application, you must determine whether any constraints could be violated when their data is inserted in the new table. If so, you must first

disable those constraints, then insert the data, and then try to re-enable the constraints. If a data item violates a constraint, then you cannot re-enable that constraint until you correct the data item.

If you are simply inserting lookup data in correct order (as in "[Loading the Data](#)"), then constraints are not violated. Therefore, you do not need to disable them first.

If you are inserting data from an outside source (such as a file, spreadsheet, or older application), or from many tables that have much dependent data, disable the constraints before inserting the data.

Some possible ways to disable and re-enable the constraints are:

- Using SQL Developer, disable and re-enable the constraints one at a time:
 1. In the Connections frame, select the appropriate table.
 2. In the pane labeled with table name, select the subtab **Constraints**.
 3. In the list of all constraints on the table, change `ENABLED` to `DISABLED` (or the reverse).
- Edit the installation script, adding SQL statements that disable and re-enable each constraint.
- Create a SQL script with SQL statements that disable and enable each constraint.
- Find the constraints in the Oracle Database data dictionary, and create a SQL script with the SQL statements to disable and enable each constraint.

For example, to find and enable the constraints used in the `EVALUATIONS`, `PERFORMANCE_PARTS`, and `SCORES` tables from "[Creating Tables](#)", enter these statements in the Worksheet:

```
SELECT 'ALTER TABLE ' || TABLE_NAME || ' DISABLE CONSTRAINT ' ||  
       CONSTRAINT_NAME || ';'   
FROM user_constraints  
WHERE table_name IN ('EVALUATIONS', 'PERFORMANCE_PARTS', 'SCORES');  
  
SELECT 'ALTER TABLE ' || TABLE_NAME || ' ENABLE CONSTRAINT ' ||  
       CONSTRAINT_NAME || ';'   
FROM user_constraints  
WHERE table_name IN ('EVALUATIONS', 'PERFORMANCE_PARTS', 'SCORES');
```

See Also:

- "[About the INSERT Statement](#)"
- "[Ensuring Data Integrity in Tables](#)"

10.3 Creating Installation Scripts

You can create installation scripts in SQL Developer or a text editor.

If an installation script needs only DDL and INSERT statements, then you can create it with either SQL Developer or any text editor. In SQL Developer, you can use either the Cart or the Database Export wizard. Oracle recommends the Cart for installation scripts that you expect to run in multiple deployment environments and the Database

Export wizard for installation scripts that you expect to run in only one deployment environment.

If an installation script needs SQL statements that are neither DDL nor INSERT statements, then you must create it with a text editor.

This section explains how to create installation scripts with the Cart and the Database Export wizard, when and how to edit installation scripts that create sequences and triggers, and how create installation scripts for the application in [Developing a Simple Oracle Database Application](#) ("the sample application").

- [Creating Installation Scripts with the Cart](#)
The SQL Developer Cart is a convenient tool for deploying Oracle Database objects from one or more database connections to a destination connection.
- [Creating an Installation Script with the Database Export Wizard](#)
To create an installation script in SQL Developer with the Database Export wizard, you specify the name of the installation script, the objects and data to export, and the desired options, and the wizard generates an installation script.
- [Editing Installation Scripts that Create Sequences](#)
If your application uses the sequence to generate unique keys, and you *will not* insert the data from the source tables into the corresponding new tables, then you might want to edit the START WITH value in the installation script.
- [Editing Installation Scripts that Create Triggers](#)
If your application has a BEFORE INSERT trigger on a source table, and you *will* insert data from that source table into the corresponding new table, you must decide if you want the trigger to fire before each INSERT statement in the installation script inserts data into the new table.
- [Creating Installation Scripts for the Sample Application](#)
You can create installation scripts for the sample application.

10.3.1 Creating Installation Scripts with the Cart

The SQL Developer Cart is a convenient tool for deploying Oracle Database objects from one or more database connections to a destination connection.

You drag and drop objects from the navigator frame into the Cart window, specify the desired options, and click the Export Cart icon to display the Export Objects dialog box. After you complete the information in that dialog box, SQL Developer creates a `.zip` file containing scripts (including a master script) to create the objects in the schema of a desired destination connection.

To create installation scripts with the Cart:

1. In the SQL Developer window, click the menu **View**.
2. From the View menu, select **Cart**.

The Cart window opens. The Export Cart icon is inactive (gray).

Tip:

In the Cart window, for information about Cart user preferences, press the key **F1**.

3. In the Connections frame, select the schema objects that you want the installation script to create and drag them into the Cart window.

In The Cart window, the Export Cart icon is now active (not gray).

4. For each Selected Object of type TABLE, if you want the installation script to export data, then select the option **Data**.
5. Click **Export Cart**.
6. In the Export Objects dialog box, enter the desired values in the fields.
For information about these fields, see *Oracle SQL Developer User's Guide*.
7. Click **Apply**.

SQL Developer creates a .zip file containing scripts (including a master script) to create the objects in the schema of a desired destination connection.

8. In the master script and the scripts that it runs, check that:
 - Referenced objects are created before their dependent objects.
 - Tables are created before data is inserted into them.

If the installation scripts create sequences, see "[Editing Installation Scripts that Create Sequences](#)".

If the installation scripts create triggers, see "[Editing Installation Scripts that Create Sequences](#)".

If necessary, edit the installation files in the Worksheet or any text editor.

See Also:

Oracle SQL Developer User's Guide for more information about the Cart

10.3.2 Creating an Installation Script with the Database Export Wizard

To create an installation script in SQL Developer with the Database Export wizard, you specify the name of the installation script, the objects and data to export, and the desired options, and the wizard generates an installation script.

Note:

In the following procedure, you might have to enlarge the SQL Developer windows to see all fields and options.

To create an installation script with the Database Export wizard:

1. If you have not done so, create a directory for the installation script, separate from the Oracle Database installation directory (for example, C:\my_exports).
2. In the SQL Developer window, click the menu **Tools**.
3. From the menu, select **Database Export**.
4. In the Export Wizard - Step 1 of 5 (Source/Destination) window:

- a. In the Connection field, select your connection to the development environment.
- b. Select the desired Export DDL options (and deselect any selected undesired options).

 **Note:**

Do not deselect Terminator, or the installation script will fail.

- c. If you do *not* want the installation script to export data, then deselect **Export Data**.
 - d. In the Save As field, accept the default `Single File` and type the full path name of the installation script (for example, `C:\my_exports\hr_export.sql`).
The file name must end with `.sql`.
 - e. Click **Next**.
5. In the Export Wizard - Step 2 of 5 (Types to Export) window:
 - a. Deselect the check boxes for the types that you do *not* want to export.
Selecting or deselecting **Toggle All** selects or deselects all check boxes.
 - b. Click **Next**.
 6. In the Export Wizard - Step 3 of 5 (Specify Objects) window:
 - a. Click **More**.
 - b. In the Schema field, select your schema from the menu.
 - c. In the Type field, select from the menu either `ALL OBJECTS` or a specific object type (for example, `TABLE`).
 - d. Click **Lookup**.
A list of objects appears in the left frame. If the value of the Type field is `ALL OBJECTS`, then the list contains all objects in the selected schema. If the value of the Type field is a specific object type, then the list contains all objects of that type in the selected schema.
 - e. Move the objects that you want to export from the left frame to the right frame:
To move all objects, click `>>`. (To move all objects back, click `<<`.)
To move selected objects, select them and then click `>`. (To move selected objects back, select them and click `<`.)
 - f. (Optional) Repeat steps 6.c through 6.e for other object types.
 - g. Click **Next**.
If you deselected `Export Data` in the Source/Destination window, then the Export Summary window appears—go to step 8.
If you did *not* deselect `Export Data` in the Source/Destination window, then the Export Wizard - Step 4 of 5 (Specify Data) window appears. The lower frame lists the objects that you specified in the Specify Objects window.
 7. In the Specify Data window:

- a. Move the objects whose data you *do not* want to export from the lower frame to the upper frame:

To move all objects, click the double upward arrow icon. (To move all objects back, click the double downward arrow icon.)

To move selected objects, select them and then click the single upward arrow icon.
 - b. Click **Next**.
8. In the Export Wizard - Step 5 of 5 (Export Summary) window, click **Finish**.

The Exporting window opens, showing that exporting is occurring. When exporting is complete, the Exporting window closes, and the Worksheet shows the contents of the installation script that you specified in the Source/Destination window.
 9. In the installation script, check that:
 - Referenced objects are created before their dependent objects.
 - Tables are created before data is inserted into them.If necessary, edit the file in the Worksheet or any text editor.

**See Also:**

Oracle SQL Developer User's Guide for more information about the Database Export wizard

10.3.3 Editing Installation Scripts that Create Sequences

If your application uses the sequence to generate unique keys, and you *will not* insert the data from the source tables into the corresponding new tables, then you might want to edit the START WITH value in the installation script.

For a sequence, SQL Developer generates a CREATE SEQUENCE statement whose START WITH value is relative to the current value of the sequence in the development environment.

If your application uses the sequence to generate unique keys, and you *will not* insert the data from the source tables into the corresponding new tables, then you might want to edit the START WITH value in the installation script.

You can edit the installation script in either the Worksheet or any text editor.

**See Also:**

"Tutorial: Creating a Sequence"

10.3.4 Editing Installation Scripts that Create Triggers

If your application has a BEFORE INSERT trigger on a source table, and you *will* insert data from that source table into the corresponding new table, you must decide if

you want the trigger to fire before each INSERT statement in the installation script inserts data into the new table.

For example, NEW_EVALUATION_TRIGGER (created in "[Tutorial: Creating a Trigger that Generates a Primary Key for a Row Before It Is Inserted](#)") fires before a row is inserted into the EVALUATIONS table. The trigger generates the unique number for the primary key of that row, using EVALUATIONS_SEQUENCE.

The source EVALUATIONS table is populated with primary keys. If you do not want the installation script to put new primary key values in the new EVALUATIONS table, then you must edit the CREATE TRIGGER statement in the installation script as shown in bold font:

```
CREATE OR REPLACE
TRIGGER NEW_EVALUATION_TRIGGER
BEFORE INSERT ON EVALUATIONS
FOR EACH ROW
BEGIN
  IF :NEW.evaluation_id IS NULL THEN
    :NEW.evaluation_id := evaluations_sequence.NEXTVAL
  END IF;
END;
```

Also, if the current value of the sequence is not greater than the maximum value in the primary key column, then you must make it greater.

You can edit the installation script in either the Worksheet or any text editor.

Two alternatives to editing the installation script are:

- Change the trigger definition in the source file and then re-create the installation script.
For information about changing triggers, see "[Changing Triggers](#)".
- Disable the trigger before running the data installation script, and then re-enable it afterward.
For information about disabling and enabling triggers, see "[Disabling and Enabling Triggers](#)".

See Also:

["Creating Triggers"](#)

10.3.5 Creating Installation Scripts for the Sample Application

You can create installation scripts for the sample application.

These scripts are for the application in [Developing a Simple Oracle Database Application](#):

- **schemas.sql**, which does in the deployment environment what you did in the development environment in "[Creating the Schemas for the Application](#)" and "[Granting Privileges to the Schemas](#)"
- **objects.sql**, which does in the deployment environment what you did in the development environment in "[Creating the Schema Objects and Loading the Data](#)"

- **employees.sql**, which does in the deployment environment what you did in the development environment in "[Creating the employees_pkg Package](#)"
- **admin.sql**, which does in the deployment environment what you did in the development environment in "[Creating the admin_pkg Package](#)"
- **create_app.sql**, a master script that runs the preceding scripts, thereby deploying the sample application in the deployment environment

You can create the scripts in any order. To create schemas.sql and create_app.sql, you must use a text editor. To create the other scripts, you can use either a text editor or SQL Developer.

- [Creating Installation Script schemas.sql](#)
- [Creating Installation Script objects.sql](#)
- [Creating Installation Script employees.sql](#)
- [Creating Installation Script admin.sql](#)
- [Creating Master Installation Script create_app.sql](#)

10.3.5.1 Creating Installation Script schemas.sql

The installation script schemas.sql does in the deployment environment what you did in the development environment in "[Creating the Schemas for the Application](#)" and "[Granting Privileges to the Schemas](#)".

To create schemas.sql, enter the following text in any text editor and save the file as schemas.sql.

 **Caution:**

Choose secure passwords. For guidelines for secure passwords, see *Oracle Database Security Guide*.

```
-----  
-- Create schemas  
-----  
  
DROP USER app_data CASCADE;  
  
CREATE USER app_data IDENTIFIED BY password  
DEFAULT TABLESPACE USERS  
QUOTA UNLIMITED ON USERS  
ENABLE EDITIONS;  
  
DROP USER app_code CASCADE;  
  
CREATE USER app_code IDENTIFIED BY password  
DEFAULT TABLESPACE USERS  
QUOTA UNLIMITED ON USERS  
ENABLE EDITIONS;  
  
DROP USER app_admin CASCADE;  
  
CREATE USER app_admin IDENTIFIED BY password
```

```
DEFAULT TABLESPACE USERS
QUOTA UNLIMITED ON USERS
ENABLE EDITIONS;

DROP USER app_user CASCADE;

CREATE USER app_user IDENTIFIED BY password
ENABLE EDITIONS;

DROP USER app_admin_user CASCADE;

CREATE USER app_admin_user IDENTIFIED BY password
ENABLE EDITIONS;

-----
-- Grant privileges to schemas
-----

GRANT CREATE SESSION TO app_data;
GRANT CREATE TABLE, CREATE VIEW, CREATE TRIGGER, CREATE SEQUENCE TO app_data;
GRANT SELECT ON HR.DEPARTMENTS TO app_data;
GRANT SELECT ON HR.EMPLOYEES TO app_data;
GRANT SELECT ON HR.JOB_HISTORY TO app_data;
GRANT SELECT ON HR.JOBS TO app_data;

GRANT CREATE SESSION, CREATE PROCEDURE, CREATE SYNONYM TO app_code;

GRANT CREATE SESSION, CREATE PROCEDURE, CREATE SYNONYM TO app_admin;

GRANT CREATE SESSION, CREATE SYNONYM TO app_user;

GRANT CREATE SESSION, CREATE SYNONYM TO app_admin_user;
```

**See Also:**

"[Schemas for the Application](#)" for descriptions of the schemas for the sample application

10.3.5.2 Creating Installation Script objects.sql

The installation script objects.sql does in the deployment environment what you did in the development environment in "[Creating the Schema Objects and Loading the Data](#)".

You can create objects.sql using either a text editor or SQL Developer.

To create objects.sql in any text editor, enter the following text and save the file as objects.sql. For password, use the password that schema.sql specifies when it creates the user app_data.

 **Note:**

The INSERT statements that load the data work only if the deployment environment has a standard HR schema. If it does not, then either use SQL Developer to create a script that loads the new tables (in the deployment environment) with data from the source tables (in the development environment) or modify the INSERT statements in the following script.

```
-----  
-- Create schema objects  
-----  
  
CONNECT app_data/password  
  
CREATE TABLE jobs#  
( job_id      VARCHAR2(10)  
  CONSTRAINT jobs_pk PRIMARY KEY,  
  job_title   VARCHAR2(35)  
  CONSTRAINT jobs_job_title_not_null NOT NULL,  
  min_salary  NUMBER(6)  
  CONSTRAINT jobs_min_salary_not_null NOT NULL,  
  max_salary  NUMBER(6)  
  CONSTRAINT jobs_max_salary_not_null NOT NULL  
)  
/  
  
CREATE TABLE departments#  
( department_id  NUMBER(4)  
  CONSTRAINT departments_pk PRIMARY KEY,  
  department_name VARCHAR2(30)  
  CONSTRAINT dept_department_name_not_null NOT NULL  
  CONSTRAINT dept_department_name_unique UNIQUE,  
  manager_id    NUMBER(6)  
)  
/  
  
CREATE TABLE employees#  
( employee_id    NUMBER(6)  
  CONSTRAINT employees_pk PRIMARY KEY,  
  first_name     VARCHAR2(20)

10.3.5.3 Creating Installation Script employees.sql

The installation script employees.sql does in the deployment environment what you did in the development environment in ["Creating the employees_pkg Package"](#).

You can create employees.sql using either a text editor or SQL Developer.

To create employees.sql in any text editor, enter the following text and save the file as employees.sql. For password, use the password that schema.sql specifies when it creates the user app_code.

```

-----
-- Create employees_pkg
-----

CONNECT app_code/password

CREATE SYNONYM employees FOR app_data.employees;
CREATE SYNONYM departments FOR app_data.departments;
CREATE SYNONYM jobs FOR app_data.jobs;
CREATE SYNONYM job_history FOR app_data.job_history;

```

```
CREATE OR REPLACE PACKAGE employees_pkg
AS
  PROCEDURE get_employees_in_dept
    ( p_deptno      IN      employees.department_id%TYPE,
      p_result_set  IN OUT SYS_REFCURSOR );

  PROCEDURE get_job_history
    ( p_employee_id IN      employees.department_id%TYPE,
      p_result_set  IN OUT SYS_REFCURSOR );

  PROCEDURE show_employee
    ( p_employee_id IN      employees.employee_id%TYPE,
      p_result_set  IN OUT SYS_REFCURSOR );

  PROCEDURE update_salary
    ( p_employee_id IN employees.employee_id%TYPE,
      p_new_salary  IN employees.salary%TYPE );

  PROCEDURE change_job
    ( p_employee_id IN employees.employee_id%TYPE,
      p_new_job     IN employees.job_id%TYPE,
      p_new_salary  IN employees.salary%TYPE := NULL,
      p_new_dept    IN employees.department_id%TYPE := NULL );
END employees_pkg;
/

CREATE OR REPLACE PACKAGE BODY employees_pkg
AS

10.3.5.4 Creating Installation Script admin.sql

The installation script admin.sql does in the deployment environment what you did in the development environment in ["Creating the admin_pkg Package"](#).

You can create admin.sql using either a text editor or SQL Developer.

To create admin.sql in any text editor, enter the following text and save the file as admin.sql. For password, use the password that schema.sql specifies when it creates the user app_admin.

```

-----
-- Create admin_pkg
-----

CONNECT app_admin/password

CREATE SYNONYM departments FOR app_data.departments;
CREATE SYNONYM jobs FOR app_data.jobs;
CREATE SYNONYM departments_sequence FOR app_data.departments_sequence;

CREATE OR REPLACE PACKAGE admin_pkg
AS
    PROCEDURE update_job
    ( p_job_id      IN jobs.job_id%TYPE,
      p_job_title  IN jobs.job_title%TYPE := NULL,
      p_min_salary IN jobs.min_salary%TYPE := NULL,
      p_max_salary IN jobs.max_salary%TYPE := NULL );

    PROCEDURE add_job

10.3.5.5 Creating Master Installation Script create_app.sql

The master installation script create_app.sql runs the other four installation scripts for the sample application in the correct order, thereby deploying the sample application in the deployment environment.

To create create_app.sql, enter the following text in any text editor and save the file as create_app.sql:

```

@schemas.sql
@objects.sql
@employees.sql
@admin.sql

```

10.4 Deploying the Sample Application

You can deploy the sample application using installation scripts.

Use the installation scripts that you created in ["Creating Installation Scripts for the Sample Application"](#).

Note:

For the following procedures, you need the name and password of a user who has the CREATE USER and DROP USER system privileges.

To deploy the sample application using SQL*Plus:

1. Copy the installation scripts that you created in "[Creating Installation Scripts for the Sample Application](#)" to the deployment environment.
2. In the deployment environment, connect to Oracle Database as a user with the CREATE USER and DROP USER system privileges.
3. At the SQL> prompt, run the master installation script:

```
@create_app.sql
```

The master installation script runs the other four installation scripts for the sample application in the correct order, thereby deploying the sample application in the deployment environment.

To deploy the sample application using SQL Developer:

1. If necessary, create a connection to the deployment environment.
For Connection Name, enter a name that is *not* the name of the connection to the development environment.
2. Copy the installation scripts that you created in "[Creating Installation Scripts for the Sample Application](#)" to the deployment environment.
3. Connect to Oracle Database as a user with the CREATE USER and DROP USER system privileges in the deployment environment.

A new pane appears. On its tab is the name of the connection to the deployment environment. The pane has two subpanes, Worksheet and Query Builder.

4. In the Worksheet pane, type the command for running the master installation script:

```
@create_app.sql
```

5. Click the icon **Run Script**.

The master installation script runs the other four installation scripts for the sample application in the correct order, thereby deploying the sample application in the deployment environment. The output appears in the Script Output pane, under the Worksheet pane.

In the Connections frame, if you expand the connection to the deployment environment, and then expand the type of each object that the sample application uses, you see the objects of the sample application.

See Also:

- *SQL*Plus User's Guide and Reference* for more information about using scripts in SQL*Plus
- *Oracle SQL Developer User's Guide* for more information about running scripts in SQL Developer

10.5 Checking the Validity of an Installation

After installing your application in a deployment environment, you can check its validity using SQL Developer.

- In the Connections frame:
 1. Expand the connection to the deployment environment.
 2. Examine the definitions of the new objects.
- In the Reports pane:
 1. Expand **Data Dictionary Reports**.
A list of data dictionary reports appears.
 2. Expand **All Objects**.
A list of objects reports appears.
 3. Select **All Objects**.
The Select Connection window appears.
 4. In the Connection field, select from the menu the connection to the deployment environment.
 5. Click **OK**.
 6. In the Enter Bind Values window, select either `Owner` or `Object Name`.
 7. Click **Apply**.
The message `Displaying Results` shows, followed by the results.
For each object, this report lists the Owner, Object Type, Object Name, Status (Valid or Invalid), Date Created, and Last DDL. Last DDL is the date of the last DDL operation that affected the object.
 8. In the Reports pane, select **Invalid Objects**.
 9. In the Enter Bind Values window, click **Apply**.
For each object whose Status is Invalid, this report lists the Owner, Object Type, and Object Name.

Oracle SQL Developer User's Guide for more information about SQL Developer reports

10.6 Archiving the Installation Scripts

After you verify that the installation of your application is valid, Oracle recommends that you archive your installation scripts in a source code control system.

Before doing so, add comments to each file, documenting its creation date and purpose. If you ever must deploy the same application to another environment, you can use these archived files.
