This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software, software documentation, data (as defined in the Federal Acquisition Regulation), or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs) and Oracle computer documentation or other Oracle data delivered to or accessed by U.S. Government end users are "commercial computer software," "commercial computer software documentation," or "limited rights data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, reproduction, duplication, release, display, disclosure, modification, preparation of derivative works, and/or adaptation of i) Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs), ii) Oracle computer documentation and/or iii) other Oracle data, is subject to the rights and limitations specified in the license contained in the applicable contract. The terms governing the U.S. Government's use of Oracle cloud services are defined by the applicable contract for such services. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle®, Java, MySQL, and NetSuite are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Inside are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Epyc, and the AMD logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

#### Preface

Audience	XXXV
Documentation Accessibility	XXXV
Related Documents	xxxvi
Conventions	xxxvi
Syntax Descriptions	xxxvii

#### 1 Changes in This Release for Oracle Database PL/SQL Language Reference

New Features in Release 23ai for Oracle Database PL/SQL Language Reference	1-1
SQL BOOLEAN Data Type	1-1
SQL VECTOR Data Type	1-3
IF [NOT] EXISTS Syntax Support	1-3
Extended CASE Controls	1-4
JSON Constructor and JSON_VALUE Support of PL/SQL Aggregate Types	1-5
SQL Transpiler	1-5
Oracle Database 23ai, Release Update 23.7	1-6
Jaccard Distance Metric	1-6
BINARY Vector Support	1-6
VECTOR Dimension-wise Arithmetic Support	1-6
Deprecated Features	1-7
Desupported Features	1-7

#### 2 Overview of PL/SQL

Advantages of PL/SOL	2-1
Advantages of PL/SQL	2-1
Tight Integration with SQL	2-1
High Performance	2-2
High Productivity	2-2
Portability	2-2
Scalability	2-3
Manageability	2-3
Support for Object-Oriented Programming	2-3

Main Features of PL/SQL	2-3
Error Handling	2-4
Blocks	2-4
Variables and Constants	2-5
Subprograms	2-5
Packages	2-5
Triggers	2-5
Input and Output	2-6
Data Abstraction	2-7
Cursors	2-7
Composite Variables	2-7
Using the %ROWTYPE Attribute	2-7
Using the %TYPE Attribute	2-8
Abstract Data Types	2-8
Control Statements	2-8
Conditional Compilation	2-9
Processing a Query Result Set One Row at a Time	2-9
Architecture of PL/SQL	2-10
PL/SQL Engine	2-10
PL/SQL Units and Compilation Parameters	2-11
Protecting Sensitive Information in PL/SQL	2-12

## 3 PL/SQL Language Fundamentals

Character Sets	3-1
Database Character Set	3-1
National Character Set	3-3
About Data-Bound Collation	3-3
Lexical Units	3-4
Delimiters	3-4
Identifiers	3-5
Reserved Words and Keywords	3-6
Predefined Identifiers	3-6
User-Defined Identifiers	3-6
Literals	3-10
Pragmas	3-12
Comments	3-12
Single-Line Comments	3-13
Multiline Comments	3-13
Whitespace Characters Between Lexical Units	3-14
Declarations	3-15
NOT NULL Constraint	3-15

	۰.	,
	14	r
	v	

Declaring Variables	3-16
Declaring Constants	3-16
Initial Values of Variables and Constants	3-17
Declaring Items using the %TYPE Attribute	3-18
References to Identifiers	3-19
Scope and Visibility of Identifiers	3-20
Assigning Values to Variables	3-24
Assigning Values to Variables with the Assignment Statement	3-25
Assigning Values to Variables with the SELECT INTO Statement	3-26
Assigning Values to Variables as Parameters of a Subprogram	3-26
Assigning Values to BOOLEAN Variables	3-27
Expressions	3-27
Concatenation Operator	3-28
Operator Precedence	3-29
Logical Operators	3-31
Short-Circuit Evaluation	3-36
Comparison Operators	3-36
IS [NOT] NULL Operator	3-37
Relational Operators	3-37
LIKE Operator	3-39
BETWEEN Operator	3-41
IN Operator	3-41
BOOLEAN Expressions	3-42
CASE Expressions	3-43
Simple CASE Expression	3-43
Searched CASE Expression	3-46
SQL Functions in PL/SQL Expressions	3-47
Static Expressions	3-48
PLS_INTEGER Static Expressions	3-51
BOOLEAN Static Expressions	3-51
VARCHAR2 Static Expressions	3-52
Static Constants	3-53
Error-Reporting Functions	3-54
Conditional Compilation	3-54
How Conditional Compilation Works	3-55
Preprocessor Control Tokens	3-55
Selection Directives	3-56
Error Directives	3-56
Inquiry Directives	3-57
DBMS_DB_VERSION Package	3-60
Conditional Compilation Examples	3-61
Retrieving and Printing Post-Processed Source Text	3-62

#### ORACLE

#### 4 PL/SQL Data Types

SQL Data Types	4-1
Different Maximum Sizes	4-2
Additional PL/SQL Constants for BINARY_FLOAT and BINARY_DOUBLE	4-2
Additional PL/SQL Subtypes of BINARY_FLOAT and BINARY_DOUBLE	4-3
BOOLEAN Data Type	4-3
JSON Data Type	4-5
PL/SQL and JSON Type Conversions	4-5
VECTOR Data Type	4-14
VECTOR Operations Supported by PL/SQL	4-16
VECTOR Data Type PL/SQL Code Examples	4-18
CHAR and VARCHAR2 Variables	4-21
Assigning or Inserting Too-Long Values	4-21
Declaring Variables for Multibyte Characters	4-22
Differences Between CHAR and VARCHAR2 Data Types	4-23
LONG and LONG RAW Variables	4-24
ROWID and UROWID Variables	4-25
PLS_INTEGER and BINARY_INTEGER Data Types	4-25
Preventing PLS_INTEGER Overflow	4-26
Predefined PLS_INTEGER Subtypes	4-27
SIMPLE_INTEGER Subtype of PLS_INTEGER	4-28
SIMPLE_INTEGER Overflow Semantics	4-28
Expressions with Both SIMPLE_INTEGER and Other Operands	4-29
Integer Literals in SIMPLE_INTEGER Range	4-29
User-Defined PL/SQL Subtypes	4-29
Unconstrained Subtypes	4-30
Constrained Subtypes	4-31
Subtypes with Base Types in Same Data Type Family	4-32

#### 5 PL/SQL Control Statements

Conditional Selection Statements	5-1
IF THEN Statement	5-1
IF THEN ELSE Statement	5-3
IF THEN ELSIF Statement	5-4
Simple CASE Statement	5-6
Searched CASE Statement	5-8
LOOP Statements	5-9
Basic LOOP Statement	5-10

FOR LOOP Statement Overview	5-10
FOR LOOP Iterand	5-12
Iterand Mutability	5-14
Multiple Iteration Controls	5-14
Stepped Range Iteration Controls	5-15
Single Expression Iteration Controls	5-17
Collection Iteration Controls	5-18
Cursor Iteration Controls	5-21
Using Dynamic SQL in Iteration Controls	5-21
Stopping and Skipping Predicate Clauses	5-22
WHILE LOOP Statement	5-23
Sequential Control Statements	5-24
GOTO Statement	5-24
NULL Statement	5-24

### 6 PI

### PL/SQL Collections and Records

Collection Types	6-2
Associative Arrays	6-4
Declaring Associative Array Constants	6-7
NLS Parameter Values Affect Associative Arrays Indexed by String	6-8
Changing NLS Parameter Values After Populating Associative Arrays	6-9
Indexes of Data Types Other Than VARCHAR2	6-9
Passing Associative Arrays to Remote Databases	6-9
Appropriate Uses for Associative Arrays	6-10
Varrays (Variable-Size Arrays)	6-10
Appropriate Uses for Varrays	6-12
Nested Tables	6-13
Important Differences Between Nested Tables and Arrays	6-16
Appropriate Uses for Nested Tables	6-16
Collection Constructors	6-16
Qualified Expressions Overview	6-18
Assigning Values to Collection Variables	6-23
Data Type Compatibility	6-24
Assigning Null Values to Varray or Nested Table Variables	6-24
Assigning Set Operation Results to Nested Table Variables	6-25
Multidimensional Collections	6-27
Collection Comparisons	6-29
Comparing Varray and Nested Table Variables to NULL	6-29
Comparing Nested Tables for Equality and Inequality	6-30
Comparing Nested Tables with SQL Multiset Conditions	6-31
Collection Methods	6-32

#### ORACLE

DELETE Collection Method	6-33
TRIM Collection Method	6-36
EXTEND Collection Method	6-38
EXISTS Collection Method	6-39
FIRST and LAST Collection Methods	6-39
FIRST and LAST Methods for Associative Array	6-40
FIRST and LAST Methods for Varray	6-41
FIRST and LAST Methods for Nested Table	6-42
COUNT Collection Method	6-44
COUNT Method for Varray	6-44
COUNT Method for Nested Table	6-44
LIMIT Collection Method	6-45
PRIOR and NEXT Collection Methods	6-46
Collection Types Defined in Package Specifications	6-49
Record Variables	6-50
Initial Values of Record Variables	6-51
Declaring Record Constants	6-51
RECORD Types	6-52
Declaring Items using the %ROWTYPE Attribute	6-56
Declaring a Record Variable that Always Represents Full Row	6-56
Declaring a Record Variable that Can Represent Partial Row	6-58
%ROWTYPE Attribute and Virtual Columns	6-59
%ROWTYPE Attribute and Invisible Columns	6-60
Assigning Values to Record Variables	6-62
Assigning Values to RECORD Type Variables Using Qualified Expressions	6-62
Assigning One Record Variable to Another	6-63
Assigning Full or Partial Rows to Record Variables	6-65
Using SELECT INTO to Assign a Row to a Record Variable	6-66
Using FETCH to Assign a Row to a Record Variable	6-66
Using SQL Statements to Return Rows in PL/SQL Record Variables	6-68
Assigning NULL to a Record Variable	6-68
Record Comparisons	6-69
Inserting Records into Tables	6-69
Updating Rows with Records	6-70
Restrictions on Record Inserts and Updates	6-71

### 7 PL/SQL Static SQL

Description of Static SQL	7-1
Statements	7-1
Pseudocolumns	7-3
CURRVAL and NEXTVAL in PL/SQL	7-3

Cursors Overview	7-5
Implicit Cursors	7-6
SQL%ISOPEN Attribute: Is the Cursor Open?	7-7
SQL%FOUND Attribute: Were Any Rows Affected?	7-7
SQL%NOTFOUND Attribute: Were No Rows Affected?	7-8
SQL%ROWCOUNT Attribute: How Many Rows Were Affected?	7-8
Explicit Cursors	7-9
Declaring and Defining Explicit Cursors	7-9
Opening and Closing Explicit Cursors	7-10
Fetching Data with Explicit Cursors	7-11
Variables in Explicit Cursor Queries	7-13
When Explicit Cursor Queries Need Column Aliases	7-15
Explicit Cursors that Accept Parameters	7-16
Explicit Cursor Attributes	7-20
Processing Query Result Sets	7-24
Processing Query Result Sets With SELECT INTO Statements	7-25
Handling Single-Row Result Sets	7-25
Handling Large Multiple-Row Result Sets	7-25
Processing Query Result Sets With Cursor FOR LOOP Statements	7-25
Processing Query Result Sets With Explicit Cursors, OPEN, FETCH, and CLOSE	7-28
Processing Query Result Sets with Subqueries	7-28
Cursor Variables	7-30
Creating Cursor Variables	7-31
Opening and Closing Cursor Variables	7-32
Fetching Data with Cursor Variables	7-33
Assigning Values to Cursor Variables	7-35
Variables in Cursor Variable Queries	7-35
Querying a Collection	7-37
Cursor Variable Attributes	7-38
Cursor Variables as Subprogram Parameters	7-38
Cursor Variables as Host Variables	7-41
CURSOR Expressions	7-42
Transaction Processing and Control	7-43
COMMIT Statement	7-44
ROLLBACK Statement	7-46
SAVEPOINT Statement	7-47
Implicit Rollbacks	7-49
SET TRANSACTION Statement	7-49
Overriding Default Locking	7-50
LOCK TABLE Statement	7-51
SELECT FOR UPDATE and FOR UPDATE Cursors	7-51
Simulating CURRENT OF Clause with ROWID Pseudocolumn	7-52

Autonomous Transactions	7-54
Advantages of Autonomous Transactions	7-55
Transaction Context	7-55
Transaction Visibility	7-55
Declaring Autonomous Routines	7-56
Controlling Autonomous Transactions	7-57
Entering and Exiting Autonomous Routines	7-57
Committing and Rolling Back Autonomous Transactions	7-58
Savepoints	7-58
Avoiding Errors with Autonomous Transactions	7-58
Autonomous Triggers	7-58
Invoking Autonomous Functions from SQL	7-61

## 8 PL/SQL Dynamic SQL

When You Need Dynamic SQL	8-1
Native Dynamic SQL	8-2
EXECUTE IMMEDIATE Statement	8-2
OPEN FOR, FETCH, and CLOSE Statements	8-8
Repeated Placeholder Names in Dynamic SQL Statements	8-10
Dynamic SQL Statement is Not Anonymous Block or CALL Statement	8-10
Dynamic SQL Statement is Anonymous Block or CALL Statement	8-10
DBMS_SQL Package	8-11
DBMS_SQL.RETURN_RESULT Procedure	8-12
DBMS_SQL.GET_NEXT_RESULT Procedure	8-14
DBMS_SQL.TO_REFCURSOR Function	8-15
DBMS_SQL.TO_CURSOR_NUMBER Function	8-17
SQL Injection	8-18
SQL Injection Techniques	8-18
Statement Modification	8-19
Statement Injection	8-20
Data Type Conversion	8-22
Guards Against SQL Injection	8-23
Bind Variables	8-24
Validation Checks	8-25
Explicit Format Models	8-27

### 9 PL/SQL Subprograms

Reasons to Use Subprograms	9-1
Nested, Package, and Standalone Subprograms	9-2
Subprogram Invocations	9-2

Subprogram Properties	9-3
Subprogram Parts	9-3
Additional Parts for Functions	9-5
RETURN Statement	9-6
RETURN Statement in Function	9-6
RETURN Statement in Procedure	9-8
RETURN Statement in Anonymous Block	9-8
Forward Declaration	9-9
Subprogram Parameters	9-9
Formal and Actual Subprogram Parameters	9-9
Formal Parameters of Constrained Subtypes	9-11
Subprogram Parameter Passing Methods	9-13
Subprogram Parameter Modes	9-14
Subprogram Parameter Aliasing	9-20
Subprogram Parameter Aliasing with Parameters Passed by Reference	9-20
Subprogram Parameter Aliasing with Cursor Variable Parameters	9-22
Default Values for IN Subprogram Parameters	9-23
Positional, Named, and Mixed Notation for Actual Parameters	9-25
Subprogram Invocation Resolution	9-27
Overloaded Subprograms	9-29
Formal Parameters that Differ Only in Numeric Data Type	9-30
Subprograms that You Cannot Overload	9-31
Subprogram Overload Errors	9-32
Recursive Subprograms	9-35
Subprogram Side Effects	9-37
PL/SQL Function Result Cache	9-37
Enabling Result-Caching for a Function	9-38
Developing Applications with Result-Cached Functions	9-40
Requirements for Result-Cached Functions	9-40
Examples of Result-Cached Functions	9-41
Result-Cached Application Configuration Parameters	9-41
Result-Cached Recursive Function	9-43
Advanced Result-Cached Function Topics	9-43
Rules for a Cache Hit	9-43
Result Cache Bypass	9-44
Making Result-Cached Functions Handle Session-Specific Settings	9-44
Making Result-Cached Functions Handle Session-Specific Application Contexts	9-45
Choosing Result-Caching Granularity	9-46
Result Caches in Oracle RAC Environment	9-48
Result Cache Management	9-49
Hot-Patching PL/SQL Units on Which Result-Cached Functions Depend	9-50
PL/SQL Functions that SQL Statements Can Invoke	9-51

Invoker's Rights and Definer's Rights (AUTHID Property)	9-52
Granting Roles to PL/SQL Packages and Standalone Subprograms	9-54
IR Units Need Template Objects	9-54
Connected User Database Links in DR Units	9-54
External Subprograms	9-55

### 10 PL/SQL Triggers

Overview of Triggers	10-1
Reasons to Use Triggers	10-2
DML Triggers	10-4
Conditional Predicates for Detecting Triggering DML Statement	10-5
INSTEAD OF DML Triggers	10-5
Compound DML Triggers	10-10
Compound DML Trigger Structure	10-10
Compound DML Trigger Restrictions	10-11
Performance Benefit of Compound DML Triggers	10-11
Using Compound DML Triggers with Bulk Insertion	10-12
Using Compound DML Triggers to Avoid Mutating-Table Error	10-15
Triggers for Ensuring Referential Integrity	10-15
Foreign Key Trigger for Child Table	10-17
UPDATE and DELETE RESTRICT Trigger for Parent Table	10-18
UPDATE and DELETE SET NULL Trigger for Parent Table	10-19
DELETE CASCADE Trigger for Parent Table	10-19
UPDATE CASCADE Trigger for Parent Table	10-20
Triggers for Complex Constraint Checking	10-21
Triggers for Complex Security Authorizations	10-22
Triggers for Transparent Event Logging	10-24
Triggers for Deriving Column Values	10-24
Triggers for Building Complex Updatable Views	10-24
Triggers for Fine-Grained Access Control	10-27
Correlation Names and Pseudorecords	10-28
OBJECT_VALUE Pseudocolumn	10-33
System Triggers	10-34
SCHEMA Triggers	10-35
DATABASE Triggers	10-35
INSTEAD OF CREATE Triggers	10-36
Subprograms Invoked by Triggers	10-36
Trigger Compilation, Invalidation, and Recompilation	10-37
Exception Handling in Triggers	10-38
Trigger Design Guidelines	10-39
Trigger Restrictions	10-41

Trigger Size Restriction	10-41
Trigger LONG and LONG RAW Data Type Restrictions	10-42
Mutating-Table Restriction	10-42
Order in Which Triggers Fire	10-46
Trigger Enabling and Disabling	10-47
Trigger Changing and Debugging	10-47
Triggers and Oracle Database Data Transfer Utilities	10-48
Triggers for Publishing Events	10-49
Event Attribute Functions	10-50
Event Attribute Functions for Database Event Triggers	10-54
Event Attribute Functions for Client Event Triggers	10-55
Views for Information About Triggers	10-60

### 11 PL/SQL Packages

What is a Package?	11-1
Reasons to Use Packages	11-2
Package Specification	11-3
Appropriate Public Items	11-3
Creating Package Specifications	11-4
Package Body	11-5
Package Instantiation and Initialization	11-7
Package State	11-7
SERIALLY_REUSABLE Packages	11-8
Creating SERIALLY_REUSABLE Packages	11-9
SERIALLY_REUSABLE Package Work Unit	11-9
Explicit Cursors in SERIALLY_REUSABLE Packages	11-10
Package Writing Guidelines	11-12
Package Example	11-14
How STANDARD Package Defines the PL/SQL Environment	11-18

### 12 PL/SQL Error Handling

Compile-Time Warnings	12-2
DBMS_WARNING Package	12-3
Overview of Exception Handling	12-5
Exception Categories	12-6
Advantages of Exception Handlers	12-7
Guidelines for Avoiding and Handling Exceptions	12-9
Internally Defined Exceptions	12-9
Predefined Exceptions	12-11
User-Defined Exceptions	12-13

Redeclared Predefined Exceptions	12-13
Raising Exceptions Explicitly	12-15
RAISE Statement	12-15
Raising User-Defined Exception with RAISE Statement	12-15
Raising Internally Defined Exception with RAISE Statement	12-16
Reraising Current Exception with RAISE Statement	12-17
RAISE_APPLICATION_ERROR Procedure	12-18
Exception Propagation	12-19
Propagation of Exceptions Raised in Declarations	12-22
Propagation of Exceptions Raised in Exception Handlers	12-23
Unhandled Exceptions	12-27
Retrieving Error Code and Error Message	12-27
Continuing Execution After Handling Exceptions	12-28
Retrying Transactions After Handling Exceptions	12-30
Handling Errors in Distributed Queries	12-31

### 13 PL/SQL Optimization and Tuning

PL/SQL Optimizer	13-1
Subprogram Inlining	13-2
Candidates for Tuning	13-4
Minimizing CPU Overhead	13-5
Tune SQL Statements	13-5
Tune Function Invocations in Queries	13-5
Tune Subprogram Invocations	13-7
Tune Loops	13-8
Tune Computation-Intensive PL/SQL Code	13-9
Use Data Types that Use Hardware Arithmetic	13-9
Avoid Constrained Subtypes in Performance-Critical Code	13-10
Minimize Implicit Data Type Conversion	13-10
Use SQL Character Functions	13-11
Put Least Expensive Conditional Tests First	13-11
Bulk SQL and Bulk Binding	13-11
FORALL Statement	13-12
Using FORALL Statements for Sparse Collections	13-15
Unhandled Exceptions in FORALL Statements	13-18
Handling FORALL Exceptions Immediately	13-19
Handling FORALL Exceptions After FORALL Statement Completes	13-20
Getting Number of Rows Affected by FORALL Statement	13-23
BULK COLLECT Clause	13-25
SELECT INTO Statement with BULK COLLECT Clause	13-26
FETCH Statement with BULK COLLECT Clause	13-33

RETURNING INTO Clause with BULK COLLECT Clause	13-38
Using FORALL Statement and BULK COLLECT Clause Together	13-39
Client Bulk-Binding of Host Arrays	13-41
Chaining Pipelined Table Functions for Multiple Transformations	13-42
Overview of Table Functions	13-42
Creating Pipelined Table Functions	13-43
Pipelined Table Functions as Transformation Functions	13-46
Chaining Pipelined Table Functions	13-47
Fetching from Results of Pipelined Table Functions	13-47
Passing CURSOR Expressions to Pipelined Table Functions	13-48
DML Statements on Pipelined Table Function Results	13-51
NO_DATA_NEEDED Exception	13-51
Overview of Polymorphic Table Functions	13-53
Polymorphic Table Function Definition	13-54
Polymorphic Table Function Implementation	13-54
Polymorphic Table Function Invocation	13-55
Variadic Pseudo-Operators	13-56
COLUMNS Pseudo-Operator	13-57
Polymorphic Table Function Compilation and Execution	13-57
Polymorphic Table Function Optimization	13-57
Skip_col Polymorphic Table Function Example	13-58
To_doc Polymorphic Table Function Example	13-61
Implicit_echo Polymorphic Table Function Example	13-65
Updating Large Tables in Parallel	13-67
Collecting Data About User-Defined Identifiers	13-68
Profiling and Tracing PL/SQL Programs	13-68
Compiling PL/SQL Units for Native Execution	13-70
Determining Whether to Use PL/SQL Native Compilation	13-70
How PL/SQL Native Compilation Works	13-71
Dependencies, Invalidation, and Revalidation	13-71
Setting Up a New Database for PL/SQL Native Compilation	13-71
Compiling the Entire Database for PL/SQL Native or Interpreted Compilation	13-72

### 14 PL/SQL Language Elements

ACCESSIBLE BY Clause	14-3
AGGREGATE Clause	14-8
Assignment Statement	14-9
AUTONOMOUS_TRANSACTION Pragma	14-12
Basic LOOP Statement	14-13
Block	14-15
Call Specification	14-24

CASE Statement	14-27
CLOSE Statement	14-30
Collection Method Invocation	14-31
Collection Variable Declaration	14-34
Comment	14-39
COMPILE Clause	14-40
Constant Declaration	14-43
CONTINUE Statement	14-44
COVERAGE Pragma	14-46
Cursor FOR LOOP Statement	14-49
Cursor Variable Declaration	14-51
Datatype Attribute	14-54
DEFAULT COLLATION Clause	14-55
DELETE Statement Extension	14-57
DEPRECATE Pragma	14-57
DETERMINISTIC Clause	14-67
Element Specification	14-68
EXCEPTION_INIT Pragma	14-74
Exception Declaration	14-76
Exception Handler	14-77
EXECUTE IMMEDIATE Statement	14-79
EXIT Statement	14-82
Explicit Cursor Declaration and Definition	14-84
Expression	14-88
FETCH Statement	14-98
FOR LOOP Statement	14-100
FORALL Statement	14-103
Formal Parameter Declaration	14-105
Function Declaration and Definition	14-108
GOTO Statement	14-110
IF Statement	14-113
Implicit Cursor Attribute	14-115
INLINE Pragma	14-117
Invoker's Rights and Definer's Rights Clause	14-118
INSERT Statement Extension	14-119
Iterator	14-121
Named Cursor Attribute	14-128
NULL Statement	14-130
OPEN Statement	14-130
OPEN FOR Statement	14-132
PARALLEL_ENABLE Clause	14-134
PIPE ROW Statement	14-137

PIPELINED Clause	14-138
Procedure Declaration and Definition	14-141
Qualified Expression	14-143
RAISE Statement	14-148
Record Variable Declaration	14-149
RESTRICT_REFERENCES Pragma	14-151
RETURN Statement	14-153
RETURNING INTO Clause	14-154
RESULT_CACHE Clause	14-157
%ROWTYPE Attribute	14-159
Scalar Variable Declaration	14-161
SELECT INTO Statement	14-162
SERIALLY_REUSABLE Pragma	14-164
SHARD_ENABLE Clause	14-165
SHARING Clause	14-167
SQL_MACRO Clause	14-169
SQLCODE Function	14-177
SQLERRM Function	14-178
SUPPRESSES_WARNING_6009 Pragma	14-180
%TYPE Attribute	14-186
UDF Pragma	14-188
UPDATE Statement Extensions	14-188
WHILE LOOP Statement	14-189

### 15 SQL Statements for Stored PL/SQL Units

ALTER FUNCTION Statement	15-2
ALTER LIBRARY Statement	15-4
ALTER PACKAGE Statement	15-6
ALTER PROCEDURE Statement	15-8
ALTER TRIGGER Statement	15-10
ALTER TYPE Statement	15-13
CREATE FUNCTION Statement	15-24
CREATE LIBRARY Statement	15-31
CREATE PACKAGE Statement	15-35
CREATE PACKAGE BODY Statement	15-39

#### A PL/SQL Source Text Wrapping

PL/SQL Source Text Wrapping Limitations	A-2
PL/SQL Source Text Wrapping Guidelines	A-2
Wrapping PL/SQL Source Text with PL/SQL Wrapper Utility	A-2
Wrapping PL/SQL Source Text with DBMS_DDL Subprograms	A-8

#### B PL/SQL Name Resolution

Qualified Names and Dot Notation	B-1
Column Name Precedence	B-3
Differences Between PL/SQL and SQL Name Resolution Rules	B-5
Resolution of Names in Static SQL Statements	B-6
What is Capture?	B-7
Outer Capture	B-7
Same-Scope Capture	B-7
Inner Capture	B-7
Avoiding Inner Capture in SELECT and DML Statements	B-8
Qualifying References to Attributes and Methods	B-9
Qualifying References to Row Expressions	B-10

#### C PL/SQL Program Limits

D PL/SQL Reserved Words and Keywords

#### E PL/SQL Predefined Data Types

#### Index

#### List of Examples

1-1	Calling a PL/SQL Function with BOOLEAN Argument from SQL	1-2
1-2	CREATE PROCEDURE with IF NOT EXISTS	1-4
2-1	PL/SQL Block Structure	2-4
2-2	Processing Query Result Rows One at a Time	2-9
3-1	Valid Case-Insensitive Reference to Quoted User-Defined Identifier	3-8
3-2	Invalid Case-Insensitive Reference to Quoted User-Defined Identifier	3-8
3-3	Reserved Word as Quoted User-Defined Identifier	3-9
3-4	Neglecting Double Quotation Marks	3-9
3-5	Neglecting Case-Sensitivity	3-10
3-6	Single-Line Comments	3-13
3-7	Multiline Comments	3-14
3-8	Whitespace Characters Improving Source Text Readability	3-14
3-9	Variable Declaration with NOT NULL Constraint	3-15
3-10	Variables Initialized to NULL Values	3-16
3-11	Scalar Variable Declarations	3-16
3-12	Constant Declarations	3-17
3-13	Variable and Constant Declarations with Initial Values	3-17
3-14	Variable Initialized to NULL by Default	3-17
3-15	Declaring Variable of Same Type as Column	3-19
3-16	Declaring Variable of Same Type as Another Variable	3-19
3-17	Scope and Visibility of Identifiers	3-20
3-18	Qualifying Redeclared Global Identifier with Block Label	3-21
3-19	Qualifying Identifier with Subprogram Name	3-22
3-20	Duplicate Identifiers in Same Scope	3-22
3-21	Declaring Same Identifier in Different Units	3-23
3-22	Label and Subprogram with Same Name in Same Scope	3-23
3-23	Block with Multiple and Duplicate Labels	3-24
3-24	Assigning Values to Variables with Assignment Statement	3-25
3-25	Assigning Value to Variable with SELECT INTO Statement	3-26
3-26	Assigning Value to Variable as IN OUT Subprogram Parameter	3-26
3-27	Assigning Value to BOOLEAN Variable	3-27
3-28	Concatenation Operator	3-28
3-29	Concatenation Operator with NULL Operands	3-28
3-30	Controlling Evaluation Order with Parentheses	3-29
3-31	Expression with Nested Parentheses	3-29
3-32	Improving Readability with Parentheses	3-30

3-33	Operator Precedence	3-30
3-34	Procedure Prints BOOLEAN Variable	3-31
3-35	AND Operator	3-32
3-36	OR Operator	3-33
3-37	NOT Operator	3-33
3-38	NULL Value in Unequal Comparison	3-34
3-39	NULL Value in Equal Comparison	3-34
3-40	NOT NULL Equals NULL	3-35
3-41	Changing Evaluation Order of Logical Operators	3-35
3-42	Short-Circuit Evaluation	3-36
3-43	Relational Operators in Expressions	3-38
3-44	LIKE Operator in Expression	3-40
3-45	Escape Character in Pattern	3-40
3-46	BETWEEN Operator in Expressions	3-41
3-47	IN Operator in Expressions	3-41
3-48	IN Operator with Sets with NULL Values	3-42
3-49	Equivalent BOOLEAN Expressions	3-43
3-50	Simple CASE Expression	3-44
3-51	Simple CASE Expression with WHEN NULL	3-44
3-52	Simple CASE Expression with List of selector_values	3-45
3-53	Simple CASE Expression with Dangling Predicates	3-45
3-54	Searched CASE Expression	3-46
3-55	Searched CASE Expression with WHEN IS NULL	3-47
3-56	Static Constants	3-54
3-57	Predefined Inquiry Directives	3-58
3-58	Displaying Values of PL/SQL Compilation Parameters	3-58
3-59	PLSQL_CCFLAGS Assigns Value to Itself	3-60
3-60	Code for Checking Database Version	3-61
3-61	Compiling Different Code for Different Database Versions	3-61
3-62	Displaying Post-Processed Source Textsource text	3-63
3-63	Using Conditional Compilation Directive in the Definition of a Package Specification	3-64
3-64	Using Conditional Compilation Directive in the Formal Parameter List of a Subprogram	3-64
4-1	Printing BOOLEAN Values	4-4
4-2	Convert a JSON Object to PL/SQL Records	4-7
4-3	Convert a PL/SQL Record to a JSON Object	4-8
4-4	Convert a JSON Object to an Index by PLS_INTEGER Collection	4-9
4-5	Convert a JSON Object to a Nested Table Collection	4-9

4-6	Convert an Index by PLS_INTEGER Collection to a JSON Object	4-10
4-7	Convert a Nested Table to a JSON Object	4-10
4-8	Convert a JSON Array to an Index by PLS_INTEGER Collection	4-11
4-9	Convert a JSON Array to a Varray	4-11
4-10	Convert a JSON Array to a Nested Table	4-12
4-11	Convert a Varray to a JSON Array	4-12
4-12	Convert a JSON Object to an Associative Array	4-13
4-13	Convert an Associative Array to a JSON Object	4-14
4-14	Use the VECTOR Data Type with PL/SQL	4-18
4-15	Use the VECTOR Data Type with a PL/SQL Trigger	4-19
4-16	Use Vector Distance Functions with PL/SQL	4-19
4-17	Use Shorthand Distance Operators	4-20
4-18	Perform Arithmetic Operations on Vectors	4-21
4-19	CHAR and VARCHAR2 Blank-Padding Difference	4-24
4-20	PLS_INTEGER Calculation Raises Overflow Exception	4-26
4-21	Preventing Overflow	4-26
4-22	Violating Constraint of SIMPLE_INTEGER Subtype	4-27
4-23	User-Defined Unconstrained Subtypes Show Intended Use	4-30
4-24	User-Defined Constrained Subtype Detects Out-of-Range Values	4-31
4-25	Implicit Conversion Between Constrained Subtypes with Same Base Type	4-32
4-26	Implicit Conversion Between Subtypes with Base Types in Same Family	4-32
5-1	IF THEN Statement	5-2
5-2	IF THEN ELSE Statement	5-3
5-3	Nested IF THEN ELSE Statements	5-4
5-4	IF THEN ELSIF Statement	5-5
5-5	IF THEN ELSIF Statement Simulates Simple CASE Statement	5-6
5-6	Simple CASE Statement	5-7
5-7	Simple CASE Statement with Dangling Predicates	5-7
5-8	Searched CASE Statement	5-8
5-9	EXCEPTION Instead of ELSE Clause in CASE Statement	5-9
5-10	FOR LOOP Statement Tries to Change Index Value	5-12
5-11	Outside Statement References FOR LOOP Statement Index	5-12
5-12	FOR LOOP Statement Index with Same Name as Variable	5-13
5-13	FOR LOOP Statement References Variable with Same Name as Index	5-13
5-14	Nested FOR LOOP Statements with Same Index Name	5-13
5-15	Using Multiple Iteration Controls	5-15
5-16	FOR LOOP Statements Range Iteration Control	5-16

5-17	Reverse FOR LOOP Statements Range Iteration Control	5-16
5-18	Stepped Range Iteration Controls	5-16
5-19	STEP Clause in FOR LOOP Statement	5-16
5-20	Simple Step Filter Using FOR LOOP Stepped Range Iterator	5-17
5-21	Single Expression Iteration Control	5-17
5-22	VALUES OF Iteration Control	5-19
5-23	INDICES OF Iteration Control	5-20
5-24	PAIRS OF Iteration Control	5-20
5-25	Cursor Iteration Controls	5-21
5-26	Using Dynamic SQL As An Iteration Control	5-22
5-27	Using Dynamic SQL As An Iteration Control In a Qualified Expression	5-22
5-28	Using FOR LOOP Stopping Predicate Clause	5-22
5-29	Using FOR LOOP Skipping Predicate Clause	5-23
5-30	NULL Statement Showing No Action	5-25
5-31	NULL Statement as Placeholder During Subprogram Creation	5-25
5-32	NULL Statement in ELSE Clause of Simple CASE Statement	5-25
6-1	Associative Array Indexed by String	6-5
6-2	Function Returns Associative Array Indexed by PLS_INTEGER	6-6
6-3	Declaring Associative Array Constant	6-7
6-4	Varray (Variable-Size Array)	6-11
6-5	Nested Table of Local Type	6-13
6-6	Nested Table of Standalone Type	6-15
6-7	Initializing Collection (Varray) Variable to Empty	6-17
6-8	Iterator Choice Association in Qualified Expressions	6-20
6-9	Index Iterator Choice Association in Qualified Expressions	6-21
6-10	Sequence Iterator Choice Association in Qualified Expressions	6-21
6-11	Assigning Values to Associative Array Type Variables Using Qualified Expressions	6-21
6-12	Assigning values to a RECORD Type Variables using Qualified Expressions	6-22
6-13	Assigning Values to a VARRAY Type using Qualified Expressions	6-23
6-14	Data Type Compatibility for Collection Assignment	6-24
6-15	Assigning Null Value to Nested Table Variable	6-25
6-16	Assigning Set Operation Results to Nested Table Variable	6-25
6-17	Two-Dimensional Varray (Varray of Varrays)	6-27
6-18	Nested Tables of Nested Tables and Varrays of Integers	6-27
6-19	Nested Tables of Associative Arrays and Varrays of Strings	6-28
6-20	Comparing Varray and Nested Table Variables to NULL	6-29
6-21	Comparing Nested Tables for Equality and Inequality	6-30

6-22	Comparing Nested Tables with SQL Multiset Conditions	6-31
6-23	DELETE Method with Nested Table	6-34
6-24	DELETE Method with Associative Array Indexed by String	6-35
6-25	TRIM Method with Nested Table	6-37
6-26	EXTEND Method with Nested Table	6-38
6-27	EXISTS Method with Nested Table	6-39
6-28	FIRST and LAST Values for Associative Array Indexed by PLS_INTEGER	6-40
6-29	FIRST and LAST Values for Associative Array Indexed by String	6-41
6-30	Printing Varray with FIRST and LAST in FOR LOOP	6-41
6-31	Printing Nested Table with FIRST and LAST in FOR LOOP	6-42
6-32	COUNT and LAST Values for Varray	6-44
6-33	COUNT and LAST Values for Nested Table	6-44
6-34	LIMIT and COUNT Values for Different Collection Types	6-45
6-35	PRIOR and NEXT Methods	6-47
6-36	Printing Elements of Sparse Nested Table	6-48
6-37	Identically Defined Package and Local Collection Types	6-49
6-38	Identically Defined Package and Standalone Collection Types	6-50
6-39	Declaring Record Constant	6-51
6-40	Declaring Record Constant	6-52
6-41	RECORD Type Definition and Variable Declaration	6-53
6-42	RECORD Type with RECORD Field (Nested Record)	6-53
6-43	RECORD Type with Varray Field	6-54
6-44	Identically Defined Package and Local RECORD Types	6-55
6-45	%ROWTYPE Variable Represents Full Database Table Row	6-56
6-46	%ROWTYPE Variable Does Not Inherit Initial Values or Constraints	6-57
6-47	%ROWTYPE Variable Represents Partial Database Table Row	6-58
6-48	%ROWTYPE Variable Represents Join Row	6-59
6-49	Inserting %ROWTYPE Record into Table (Wrong)	6-59
6-50	Inserting %ROWTYPE Record into Table (Right)	6-60
6-51	%ROWTYPE Affected by Making Invisible Column Visible	6-61
6-52	Assigning Values to RECORD Type Variables Using Qualified Expressions	6-62
6-53	Assigning Record to Another Record of Same RECORD Type	6-64
6-54	Assigning %ROWTYPE Record to RECORD Type Record	6-64
6-55	Assigning Nested Record to Another Record of Same RECORD Type	6-65
6-56	SELECT INTO Assigns Values to Record Variable	6-66
6-57	FETCH Assigns Values to Record that Function Returns	6-67
6-58	UPDATE Statement Assigns Values to Record Variable	6-68

6-59	Assigning NULL to Record Variable	6-68
6-60	Initializing Table by Inserting Record of Default Values	6-69
6-61	Updating Rows with Record	6-71
7-1	Static SQL Statements	7-2
7-2	CURRVAL and NEXTVAL Pseudocolumns	7-4
7-3	SQL%FOUND Implicit Cursor Attribute	7-7
7-4	SQL%ROWCOUNT Implicit Cursor Attribute	7-8
7-5	Explicit Cursor Declaration and Definition	7-10
7-6	FETCH Statements Inside LOOP Statements	7-11
7-7	Fetching Same Explicit Cursor into Different Variables	7-12
7-8	Variable in Explicit Cursor Query—No Result Set Change	7-13
7-9	Variable in Explicit Cursor Query—Result Set Change	7-14
7-10	Explicit Cursor with Virtual Column that Needs Alias	7-15
7-11	Explicit Cursor that Accepts Parameters	7-16
7-12	Cursor Parameters with Default Values	7-17
7-13	Adding Formal Parameter to Existing Cursor	7-19
7-14	%ISOPEN Explicit Cursor Attribute	7-21
7-15	%FOUND Explicit Cursor Attribute	7-21
7-16	%NOTFOUND Explicit Cursor Attribute	7-22
7-17	%ROWCOUNT Explicit Cursor Attribute	7-23
7-18	Implicit Cursor FOR LOOP Statement	7-26
7-19	Explicit Cursor FOR LOOP Statement	7-27
7-20	Passing Parameters to Explicit Cursor FOR LOOP Statement	7-27
7-21	Cursor FOR Loop References Virtual Columns	7-28
7-22	Subquery in FROM Clause of Parent Query	7-28
7-23	Correlated Subquery	7-29
7-24	Cursor Variable Declarations	7-31
7-25	Cursor Variable with User-Defined Return Type	7-32
7-26	Fetching Data with Cursor Variables	7-33
7-27	Fetching from Cursor Variable into Collections	7-34
7-28	Variable in Cursor Variable Query—No Result Set Change	7-35
7-29	Variable in Cursor Variable Query—Result Set Change	7-36
7-30	Querying a Collection with Static SQL	7-38
7-31	Procedure to Open Cursor Variable for One Query	7-39
7-32	Opening Cursor Variable for Chosen Query (Same Return Type)	7-40
7-33	Opening Cursor Variable for Chosen Query (Different Return Types)	7-40
7-34	Cursor Variable as Host Variable in Pro*C Client Program	7-42

7.05		7.40
7-35	CURSOR Expression	7-42
7-36	COMMIT Statement with COMMENT and WRITE Clauses	7-45
7-37	ROLLBACK Statement	7-46
7-38	SAVEPOINT and ROLLBACK Statements	7-48
7-39	Reusing SAVEPOINT with ROLLBACK	7-48
7-40	SET TRANSACTION Statement in Read-Only Transaction	7-50
7-41	FETCH with FOR UPDATE Cursor After COMMIT Statement	7-52
7-42	Simulating CURRENT OF Clause with ROWID Pseudocolumn	7-53
7-43	Declaring Autonomous Function in Package	7-56
7-44	Declaring Autonomous Standalone Procedure	7-56
7-45	Declaring Autonomous PL/SQL Block	7-57
7-46	Autonomous Trigger Logs INSERT Statements	7-59
7-47	Autonomous Trigger Uses Native Dynamic SQL for DDL	7-60
7-48	Invoking Autonomous Function	7-61
8-1	Invoking Subprogram from Dynamic PL/SQL Block	8-4
8-2	Dynamically Invoking Subprogram with BOOLEAN Formal Parameter	8-4
8-3	Dynamically Invoking Subprogram with RECORD Formal Parameter	8-5
8-4	Dynamically Invoking Subprogram with Assoc. Array Formal Parameter	8-6
8-5	Dynamically Invoking Subprogram with Nested Table Formal Parameter	8-7
8-6	Dynamically Invoking Subprogram with Varray Formal Parameter	8-7
8-7	Uninitialized Variable Represents NULL in USING Clause	8-8
8-8	Native Dynamic SQL with OPEN FOR, FETCH, and CLOSE Statements	8-9
8-9	Querying a Collection with Native Dynamic SQL	8-9
8-10	Repeated Placeholder Names in Dynamic PL/SQL Block	8-11
8-11	DBMS_SQL.RETURN_RESULT Procedure	8-13
8-12	DBMS_SQL.GET_NEXT_RESULT Procedure	8-14
8-13	Switching from DBMS_SQL Package to Native Dynamic SQL	8-16
8-14	Switching from Native Dynamic SQL to DBMS_SQL Package	8-17
8-15	Setup for SQL Injection Examples	8-18
8-16	Procedure Vulnerable to Statement Modification	8-19
8-17	Procedure Vulnerable to Statement Injection	8-20
8-18	Procedure Vulnerable to SQL Injection Through Data Type Conversion	8-22
8-19	Bind Variables Guarding Against SQL Injection	8-24
8-20	Validation Checks Guarding Against SQL Injection	8-26
8-21	Explicit Format Models Guarding Against SQL Injection	8-27
9-1	Declaring, Defining, and Invoking a Simple PL/SQL Procedure	9-4
9-2	Declaring, Defining, and Invoking a Simple PL/SQL Function	9-5

9-3	Execution Resumes After RETURN Statement in Function	9-7
9-4	Function Where Not Every Execution Path Leads to RETURN Statement	9-7
9-5	Function Where Every Execution Path Leads to RETURN Statement	9-7
9-6	Execution Resumes After RETURN Statement in Procedure	9-8
9-7	Execution Resumes After RETURN Statement in Anonymous Block	9-8
9-8	Nested Subprograms Invoke Each Other	9-9
9-9	Formal Parameters and Actual Parameters	9-11
9-10	Actual Parameter Inherits Only NOT NULL from Subtype	9-12
9-11	Actual Parameter and Return Value Inherit Only Range From Subtype	9-13
9-12	Function Implicitly Converts Formal Parameter to Constrained Subtype	9-13
9-13	Avoiding Implicit Conversion of Actual Parameters	9-14
9-14	Parameter Values Before, During, and After Procedure Invocation	9-16
9-15	OUT and IN OUT Parameter Values After Exception Handling	9-18
9-16	OUT Formal Parameter of Record Type with Non-NULL Default Value	9-19
9-17	Aliasing from Global Variable as Actual Parameter	9-21
9-18	Aliasing from Same Actual Parameter for Multiple Formal Parameters	9-21
9-19	Aliasing from Cursor Variable Subprogram Parameters	9-22
9-20	Procedure with Default Parameter Values	9-23
9-21	Function Provides Default Parameter Value	9-23
9-22	Adding Subprogram Parameter Without Changing Existing Invocations	9-24
9-23	Equivalent Invocations with Different Notations in Anonymous Block	9-26
9-24	Equivalent Invocations with Different Notations in SELECT Statements	9-27
9-25	Resolving PL/SQL Procedure Names	9-28
9-26	Overloaded Subprogram	9-30
9-27	Overload Error Causes Compile-Time Error	9-33
9-28	Overload Error Compiles Successfully	9-33
9-29	Invoking Subprogram in Causes Compile-Time Error	9-33
9-30	Correcting Overload Error in	9-33
9-31	Invoking Subprogram in	9-33
9-32	Package Specification Without Overload Errors	9-34
9-33	Improper Invocation of Properly Overloaded Subprogram	9-34
9-34	Implicit Conversion of Parameters Causes Overload Error	9-34
9-35	Implicit Conversion to Number Successful	9-34
9-36	Implicit Conversion to BOOLEAN or Number Causes Overload Error	9-35
9-37	Recursive Function Returns n Factorial (n!)	9-36
9-38	Recursive Function Returns nth Fibonacci Number	9-36
9-39	Declaring and Defining Result-Cached Function	9-39

9-40	Result-Cached Function Returns Configuration Parameter Setting	9-42
9-41	Result-Cached Function Handles Session-Specific Settings	9-45
9-42	Result-Cached Function Handles Session-Specific Application Context	9-46
9-43	Caching One Name at a Time (Finer Granularity)	9-47
9-44	Caching Translated Names One Language at a Time (Coarser Granularity)	9-47
9-45	Database Link in a DR Unit	9-55
9-46	PL/SQL Anonymous Block Invokes External Procedure	9-56
9-47	PL/SQL Standalone Procedure Invokes External Procedure	9-56
9-48	Implement JavaScript External Procedure	9-57
10-1	Trigger Uses Conditional Predicates to Detect Triggering Statement	10-5
10-2	INSTEAD OF Trigger	10-6
10-3	INSTEAD OF Trigger on Nested Table Column of View	10-8
10-4	Compound Trigger Logs Changes to One Table in Another Table	10-12
10-5	Compound Trigger Avoids Mutating-Table Error	10-15
10-6	Foreign Key Trigger for Child Table	10-17
10-7	UPDATE and DELETE RESTRICT Trigger for Parent Table	10-18

# Preface

*Oracle Database PL/SQL Language Reference* describes and explains how to use PL/SQL, the Oracle procedural extension of SQL.

#### **Topics**

- Audience
- Documentation Accessibility
- Related Documents
- Conventions
- Syntax Descriptions

### Audience

*Oracle Database PL/SQL Language Reference* is intended for anyone who is developing PL/ SQL-based applications for either an Oracle Database or an Oracle TimesTen In-Memory Database, including:

- Programmers
- Systems analysts
- Project managers
- Database administrators

To use this document effectively, you need a working knowledge of:

- Oracle Database
- Structured Query Language (SQL)
- Basic programming concepts such as IF-THEN statements, loops, procedures, and functions

### **Documentation Accessibility**

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

#### Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

### **Related Documents**

For more information, see these documents in the Oracle Database documentation set:

- Oracle Database SQL Language Reference
- Oracle Database PL/SQL Packages and Types Reference
- Oracle Database JSON Developer's Guide
- Oracle Database SODA for PL/SQL Developer's Guide
- Oracle Database Development Guide
- Oracle Database Administrator's Guide
- Oracle Database SecureFiles and Large Objects Developer's Guide
- Oracle Database Object-Relational Developer's Guide
- Oracle Database Concepts
- Oracle Database Performance Tuning Guide
- Oracle Database Sample Schemas

See Also:

### Conventions

This document uses these text conventions:

Convention	Meaning
boldface	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.
italic	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
monospace	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.
{A B C}	Choose either A, B, or C.

#### Also:

- \*\_view means all static data dictionary views whose names end with view. For example,
   \*\_ERRORS means ALL\_ERRORS, DBA\_ERRORS, and USER\_ERRORS. For more information about any static data dictionary view, or about static dictionary views in general, see Oracle Database Reference.
- Table names not qualified with schema names are in the sample schema HR. For information about the sample schemas, see *Oracle Database Sample Schemas*.

# Syntax Descriptions

Syntax descriptions are provided in this book for various SQL, PL/SQL, or other command-line constructs in graphic form or Backus Naur Form (BNF). See *Oracle Database SQL Language Reference* for information about how to interpret these descriptions.

# 1

# Changes in This Release for Oracle Database PL/SQL Language Reference

# New Features in Release 23ai for Oracle Database PL/SQL Language Reference

For Oracle Database 23ai, PL/SQL Language Reference documents these new features and enhancements.

### See Also:

*Oracle Database New Features* for the descriptions of all of the features that are new in Oracle Database Release 23ai

# SQL BOOLEAN Data Type

Although BOOLEAN support has already been available with PL/SQL prior to this release, the BOOLEAN data type is now supported by SQL as well. This expansion of support provides improved compatibility between PL/SQL and SQL.

PL/SQL stored functions with BOOLEAN parameter types are now invokable directly from SQL. While PL/SQL functions with BOOLEAN arguments were already callable from SQL (with arguments of BOOLEAN type binds), BOOLEAN expressions and BOOLEAN literals are now supported as well. Additionally, PL/SQL stored procedures and anonymous PL/SQL blocks with host binds that expect values of the BOOLEAN type are invokable from C via OCI and other interfaces such as dynamic SQL and DBMS\_SQL. It is also possible to call a C trusted or safe callout with formal parameters of BOOLEAN type.

BOOLEAN defines in the INTO and BULK COLLECT INTO clauses of a SELECT statement inside a PL/SQL block are supported.

Implicit conversions between BOOLEAN and number and character types are supported. It is possible to assign number and character variables and expressions to a BOOLEAN variable. The function to\_boolean has also been added to convert from number and character types to the BOOLEAN data type. The functions to\_number, to\_char, and to\_nchar now have BOOLEAN overloads to convert BOOLEAN values to number or character types. You can use the CAST operator to cast an expression to the BOOLEAN type as well.

To enable the support of implicit conversion, the initialization parameter PLSQL\_IMPLICIT\_CONVERSION\_BOOL must be set to TRUE. Explicit conversions such as CAST and to\_char do not depend on the parameter, so will work regardless of whether PLSQL\_IMPLICIT\_CONVERSION\_BOOL is set to TRUE or FALSE. For more information about using PLSQL\_IMPLICIT\_CONVERSION\_BOOL, see Oracle Database Reference.

All DML operations from PL/SQL take BOOLEAN variables in both IN and OUT binds, including array IN binds and array OUT binds. DML triggers support BOOLEAN binds (both IN and OUT binds) and BOOLEAN column references in the WHEN clause.

Pipelined table functions and polymorphic table functions (PTF) support returning columns of BOOLEAN data type.

It is possible to invoke Java and JavaScript stored procedures with parameters of BOOLEAN type from PL/SQL using call specifications with parameters of BOOLEAN type. PL/SQL procedures and anonymous blocks are also invokable from Java using JDBC in the server or client-server environment. Variables of BOOLEAN type passed using OCI, dynamic SQL, or DBMS\_SQL can be passed directly as BOOLEAN.

### Note:

BOOL can be used as an abbreviation of BOOLEAN.

### See Also:

- Oracle Database SQL Language Reference for more information about the SQL BOOLEAN data type
- Oracle Database SQL Language Reference for more information about data conversion rules

### Example 1-1 Calling a PL/SQL Function with BOOLEAN Argument from SQL

```
CREATE OR REPLACE FUNCTION useBool (p1 BOOLEAN) RETURN NUMBER AS
BEGIN
    IF p1 THEN RETURN 100;
    ELSE
        RETURN 200;
    END IF;
END;
/
SET SERVEROUTPUT ON;
DECLARE
    v1 NUMBER;
    v2 BOOLEAN := TRUE;
BEGIN
    SELECT useBool (v2) INTO v1 FROM dual; --boolean argument function called
from SELECT
    DBMS OUTPUT.PUT LINE(v1);
END;
/
```

### Result:

100

# SQL VECTOR Data Type

With Oracle Database Release 23ai, PL/SQL supports the VECTOR data type along with vector operations.

The VECTOR data type is introduced to support Artificial Intelligence workloads with Oracle AI Vector Search. Along with the new data type, vector operations including distance functions are provided to manage vectors in the database. In PL/SQL, the VECTOR data type is supported as its own distinct scalar family type and can be used in the same way as any other data type in PL/SQL.

For more information about vectors in PL/SQL, see VECTOR Data Type.

For information about Oracle AI Vector Search and general support for vectors in Oracle Database, see *Oracle Database AI Vector Search User's Guide*.

# IF [NOT] EXISTS Syntax Support

The clauses IF NOT EXISTS and IF EXISTS are supported by CREATE, ALTER, and DROP DDL statements. They are used to suppress potential errors otherwise raised by the existence or non-existence of a given object, allowing you to write idempotent DDL scripts.

The IF NOT EXISTS clause is supported by the CREATE DDL statement to prevent errors from being thrown if an object with the given name already exists. If the object does already exist, the command is ignored and the original object remains unchanged.

On the flip side, the IF EXISTS clause suppresses errors when used with ALTER and DROP DDL statements. In the case that no object by the given name exists, the command is ignored and no object is affected by ALTER or DROP.

The use or exclusion of the clause provides you more control depending on whether you need to know if an object exists before executing a DDL statement. With this flexibility, you can determine whether you would rather have the statement ignored or have an error raised in the event the object exists (or doesn't exist).

### Note:

IF NOT EXISTS cannot be used in combination with OR REPLACE in commands using the CREATE DDL statement.

### See Also:

- SQL Statements for Stored PL/SQL Units for information about the semantics used to implement IF [NOT] EXISTS with different object types
- Oracle Database Development Guide for more information about using the IF [NOT] EXISTS clause

### Example 1-2 CREATE PROCEDURE with IF NOT EXISTS

Executing this statement one time results in the creation of procedure hello, assuming a procedure by the same name does not already exist in your schema.

```
CREATE PROCEDURE IF NOT EXISTS hello AS
BEGIN
DBMS_OUTPUT.PUT_LINE('Hello there');
END;
/
```

Executing the statement additional times, even with an altered procedure body, results in no error. The original body remains unchanged.

```
CREATE PROCEDURE IF NOT EXISTS hello AS
BEGIN
DBMS_OUTPUT.PUT_LINE('Second hello');
END;
/
```

### Note:

The same output message will be displayed, in this case Procedure created, regardless of whether the command is ignored or executed. This ensures that you can write DDL scripts that are idempotent. The same holds true for ALTER, CREATE, and DROP statements.

The procedure text is the same before and after the second statement is executed.

SELECT TEXT FROM USER\_SOURCE WHERE NAME='HELLO';

```
TEXT

procedure hello

AS BEGIN

DBMS_OUTPUT.PUT_LINE('Hello there');

END;
```

# Extended CASE Controls

The simple CASE statement is extended in PL/SQL to support the use of dangling predicates and choice lists, allowing for simplified and less redundant code.

Dangling predicates are ordinary expressions with their left operands missing that can be used as a selector\_value either instead of or in combination with any number of literals or expressions. With dangling predicates, more complicated comparisons can be made without requiring a searched CASE statement.

### Note:

Currently, the dangling predicates IS JSON and IS OF are not supported.

Comma separated lists of choices are now supported in the WHEN clause(s) of a simple CASE statement. They can help streamline code by allowing for the consolidation of multiple selector value options that correspond to the same result.

### See Also:

- Simple CASE Expression for more information about using the extended case controls and for an example that uses a choice list
- Simple CASE Statement for more information about using the extended CASE controls and for an example that uses dangling predicates
- CASE Statement for information on the syntax and semantics of simple CASE statements, including the extended CASE controls

# JSON Constructor and JSON\_VALUE Support of PL/SQL Aggregate Types

The JSON constructor can now accept a PL/SQL aggregate type and return a JSON object or array populated with the aggregate type data. Conversely, the built-in function json\_value now supports PL/SQL aggregate types in the RETURNING clause, mapping from JSON to the specified aggregate type.

All PL/SQL record field and collection data element type constraints are honored by json value, including character max length, integer range checks, and not null constraints.

SQL objects and PL/SQL record type instances, including implicit records created by the %ROWTYPE attribute, are allowed as valid input to the JSON constructor. Expanded support for user defined types as input streamlines data interchange between PL/SQL applications and languages that support JSON.

### See Also:

- PL/SQL and JSON Type Conversions for more information about using json value and the JSON constructor with PL/SQL aggregate types
- Oracle Database JSON Developer's Guide for details about the JSON constructor
- Oracle Database JSON Developer's Guide for information about using json\_value to instantiate a user-defined object-type or collection-type instance

# SQL Transpiler

The SQL Transpiler automatically and wherever possible converts (transpiles) PL/SQL functions within SQL into SQL expressions, without user intervention.

The conversion operation is transparent to users and can improve performance by reducing overhead accrued from switching between the SQL and PL/SQL runtime.

See Also:

- SQL\_MACRO Clause for information about how standard PL/SQL functions can be used as an alternative to SCALAR macros due to the SQL Transpiler
- Oracle Database SQL Tuning Guide for details about the SQL Transpiler

# Oracle Database 23ai, Release Update 23.7

For Oracle Database 23ai, Release Update 23.7, PL/SQL Language Reference documents these new features and enhancements.

### Jaccard Distance Metric

With Oracle Database Release 23ai, Release Update 23.7, PL/SQL supports the Jaccard distance metric, used with vector similarity search.

The Jaccard similarity is used to determine the share of significant (non-zero) attributes common between two asymmetric BINARY vectors. The distance metric is applicable only to BINARY vectors.

For more information about using vectors in PL/SQL, see VECTOR Data Type.

For more information about the Jaccard similarity, see Oracle Database AI Vector Search User's Guide.

### **BINARY Vector Support**

With Oracle Database Release 23ai, Release Update 23.7, PL/SQL supports the BINARY vector format.

The BINARY format is now supported by the VECTOR data type in PL/SQL.

For more information about vectors in PL/SQL, see VECTOR Data Type.

For information about BINARY vectors, see Oracle Database Al Vector Search User's Guide.

### VECTOR Dimension-wise Arithmetic Support

With Oracle Database Release 23ai, Release Update 23.7, PL/SQL supports the VECTOR data type in arithmetic operations.

Dimension-wise addition, subtraction, and multiplication can be performed on variables and columns of the VECTOR data type.

For more information about vector arithmetic in PL/SQL, see VECTOR Operations Supported by PL/SQL.

For information about VECTOR arithmetic and aggregation, see Oracle Database AI Vector Search User's Guide.

# **Deprecated Features**

The following features are deprecated, and may be desupported in a future release.

The command ALTER TYPE ... INVALIDATE is deprecated. Use the CASCADE clause instead.

The REPLACE clause of ALTER TYPE is deprecated. Use the *alter\_method\_spec* clause instead. Alternatively, you can recreate the type using the CREATE OR REPLACE TYPE statement.

For the syntax and semantics, see ALTER TYPE Statement Starting with Oracle Database 12c release 1 (12.1), the compilation parameter PLSQL\_DEBUG is deprecated.

To compile PL/SQL units for debugging, specify PLSQL\_OPTIMIZE\_LEVEL=1.

For information about compilation parameters, see PL/SQL Units and Compilation Parameters.

# **Desupported Features**

No features in PL/SQL Language Reference have been desupported.

See Also:

Oracle Database Upgrade Guide for more information about desupported features in this release of Oracle Database

# 2 Overview of PL/SQL

PL/SQL, the Oracle procedural extension of SQL, is a portable, high-performance transactionprocessing language. This overview explains its advantages and briefly describes its main features and its architecture.

### Topics

- Advantages of PL/SQL
- Main Features of PL/SQL
- Architecture of PL/SQL

# Advantages of PL/SQL

PL/SQL offers several advantages over other programming languages.

PL/SQL has these advantages:

- Tight Integration with SQL
- High Performance
- High Productivity
- Portability
- Scalability
- Manageability
- Support for Object-Oriented Programming

# Tight Integration with SQL

PL/SQL is tightly integrated with SQL, the most widely used database manipulation language.

For example:

- PL/SQL lets you use all SQL data manipulation, cursor control, and transaction control statements, and all SQL functions, operators, and pseudocolumns.
- PL/SQL fully supports SQL data types.

You need not convert between PL/SQL and SQL data types. For example, if your PL/SQL program retrieves a value from a column of the SQL type VARCHAR2, it can store that value in a PL/SQL variable of the type VARCHAR2.

You can give a PL/SQL data item the data type of a column or row of a database table without explicitly specifying that data type (see "Using the %TYPE Attribute" and "Using the %ROWTYPE Attribute").

 PL/SQL lets you run a SQL query and process the rows of the result set one at a time (see "Processing a Query Result Set One Row at a Time").

- PL/SQL functions can be declared and defined in the WITH clauses of SQL SELECT statements (see Oracle Database SQL Language Reference).
- Where possible, PL/SQL functions called from a SQL statement are automatically converted to a semantically equivalent SQL expression by the Automatic SQL Transpiler (see "SQL\_MACRO Clause" and Oracle Database SQL Tuning Guide).

PL/SQL supports both static and dynamic SQL. **Static SQL** is SQL whose full text is known at compile time. **Dynamic SQL** is SQL whose full text is not known until run time. Dynamic SQL lets you make your applications more flexible and versatile. For more information, see PL/SQL Static SQL and PL/SQL Dynamic SQL.

# High Performance

PL/SQL lets you send a block of statements to the database, significantly reducing traffic between the application and the database.

### **Bind Variables**

When you embed a SQL INSERT, UPDATE, DELETE, MERGE, or SELECT statement directly in your PL/SQL code, the PL/SQL compiler turns the variables in the WHERE and VALUES clauses into bind variables (for details, see "Resolution of Names in Static SQL Statements"). Oracle Database can reuse these SQL statements each time the same code runs, which improves performance.

PL/SQL does not create bind variables automatically when you use dynamic SQL, but you can use them with dynamic SQL by specifying them explicitly (for details, see "EXECUTE IMMEDIATE Statement").

### Subprograms

PL/SQL subprograms are stored in executable form, which can be invoked repeatedly. Because stored subprograms run in the database server, a single invocation over the network can start a large job. This division of work reduces network traffic and improves response times. Stored subprograms are cached and shared among users, which lowers memory requirements and invocation overhead. For more information about subprograms, see "Subprograms".

### Optimizer

The PL/SQL compiler has an optimizer that can rearrange code for better performance. For more information about the optimizer, see "PL/SQL Optimizer".

# **High Productivity**

PL/SQL has many features that save designing and debugging time, and it is the same in all environments.

PL/SQL lets you write compact code for manipulating data. Just as a scripting language like PERL can read, transform, and write data in files, PL/SQL can query, transform, and update data in a database.

If you learn to use PL/SQL with one Oracle tool, you can transfer your knowledge to other Oracle tools. For an overview of PL/SQL features, see "Main Features of PL/SQL".

# Portability

PL/SQL is a portable and standard language for Oracle development.

You can run PL/SQL applications on any operating system and platform where Oracle Database runs.

# Scalability

PL/SQL stored subprograms increase scalability by centralizing application processing on the database server.

The shared memory facilities of the shared server let Oracle Database support thousands of concurrent users on a single node. For more information about subprograms, see "Subprograms"

For further scalability, you can use Oracle Connection Manager to multiplex network connections. For information about Oracle Connection Manager, see "Oracle Database Net Services Reference"

# Manageability

PL/SQL stored subprograms increase manageability because you can maintain only one copy of a subprogram, on the database server, rather than one copy on each client system.

Any number of applications can use the subprograms, and you can change the subprograms without affecting the applications that invoke them. For more information about subprograms, see "Subprograms".

# Support for Object-Oriented Programming

PL/SQL allows defining object types that can be used in object-oriented designs.

PL/SQL supports object-oriented programming with "Abstract Data Types".

# Main Features of PL/SQL

PL/SQL combines the data-manipulating power of SQL with the processing power of procedural languages.

When you can solve a problem with SQL, you can issue SQL statements from your PL/SQL program, without learning new APIs.

Like other procedural programming languages, PL/SQL lets you declare constants and variables, control program flow, define subprograms, and trap runtime errors.

You can break complex problems into easily understandable subprograms, which you can reuse in multiple applications.

### Topics

- Error Handling
- Blocks
- Variables and Constants
- Subprograms
- Packages
- Triggers
- Input and Output

- Data Abstraction
- Control Statements
- Conditional Compilation
- Processing a Query Result Set One Row at a Time

# Error Handling

PL/SQL makes it easy to detect and handle errors.

When an error occurs, PL/SQL raises an exception. Normal execution stops and control transfers to the exception-handling part of the PL/SQL block. You do not have to check every operation to ensure that it succeeded, as in a C program.

For more information, see PL/SQL Error Handling.

# Blocks

The basic unit of a PL/SQL source program is the **block**, which groups related declarations and statements.

A PL/SQL block is defined by the keywords DECLARE, BEGIN, EXCEPTION, and END. These keywords divide the block into a declarative part, an executable part, and an exception-handling part. Only the executable part is required. A block can have a label.

Declarations are local to the block and cease to exist when the block completes execution, helping to avoid cluttered namespaces for variables and subprograms.

Blocks can be nested: Because a block is an executable statement, it can appear in another block wherever an executable statement is allowed.

You can submit a block to an interactive tool (such as SQL\*Plus or Enterprise Manager) or embed it in an Oracle Precompiler or OCI program. The interactive tool or program runs the block one time. The block is not stored in the database, and for that reason, it is called an **anonymous block** (even if it has a label).

An anonymous block is compiled each time it is loaded into memory, and its compilation has three stages:

- 1. Syntax checking: PL/SQL syntax is checked, and a parse tree is generated.
- 2. Semantic checking: Type checking and further processing on the parse tree.
- 3. Code generation

### Note:

An anonymous block is a SQL statement.

For syntax details, see "Block".

### Example 2-1 PL/SQL Block Structure

This example shows the basic structure of a PL/SQL block.

```
<< label >> (optional)
DECLARE -- Declarative part (optional)
```

```
-- Declarations of local types, variables, & subprograms
BEGIN -- Executable part (required)
-- Statements (which can use items declared in declarative part)
[EXCEPTION -- Exception-handling part (optional)
-- Exception handlers for exceptions (errors) raised in executable part]
END;
```

# Variables and Constants

PL/SQL lets you declare variables and constants, and then use them wherever you can use an expression.

As the program runs, the values of variables can change, but the values of constants cannot.

For more information, see "Declarations" and "Assigning Values to Variables".

### Subprograms

A PL/SQL subprogram is a named PL/SQL block that can be invoked repeatedly.

If the subprogram has parameters, their values can differ for each invocation. PL/SQL has two types of subprograms, procedures and functions. A function returns a result.

For more information about PL/SQL subprograms, see PL/SQL Subprograms.

PL/SQL also lets you invoke external programs written in other languages.

For more information, see "External Subprograms".

# Packages

A **package** is a schema object that groups logically related PL/SQL types, variables, constants, subprograms, cursors, and exceptions.

A package is compiled and stored in the database, where many applications can share its contents. You can think of a package as an application.

You can write your own packages—for details, see PL/SQL Packages. You can also use the many product-specific packages that Oracle Database supplies. For information about these, see Oracle Database PL/SQL Packages and Types Reference.

# Triggers

A **trigger** is a named PL/SQL unit that is stored in the database and run in response to an event that occurs in the database.

You can specify the event, whether the trigger fires before or after the event, and whether the trigger runs for each event or for each row affected by the event. For example, you can create a trigger that runs every time an INSERT statement affects the EMPLOYEES table.

For more information about triggers, see PL/SQL Triggers.

# Input and Output

Most PL/SQL input and output (I/O) is done with SQL statements that store data in database tables or query those tables. All other PL/SQL I/O is done with PL/SQL packages that Oracle Database supplies.

Package	Description	More Information
DBMS_OUTPUT	Lets PL/SQL blocks, subprograms, packages, and triggers display output. Especially useful for displaying PL/SQL debugging information.	Oracle Database PL/SQL Packages and Types Reference
HTF	Has hypertext functions that generate HTML tags (for example, the HTF.ANCHOR function generates the HTML anchor tag <a>).</a>	Oracle Database PL/SQL Packages and Types Reference
HTP	Has hypertext procedures that generate HTML tags.	Oracle Database PL/SQL Packages and Types Reference
DBMS_PIPE	Lets two or more sessions in the same instance communicate.	Oracle Database PL/SQL Packages and Types Reference
UTL_FILE	Lets PL/SQL programs read and write operating system files.	Oracle Database PL/SQL Packages and Types Reference
UTL_HTTP	Lets PL/SQL programs make Hypertext Transfer Protocol (HTTP) callouts, and access data on the Internet over HTTP.	Oracle Database PL/SQL Packages and Types Reference
UTL_SMTP	Sends electronic mails (emails) over Simple Mail Transfer Protocol (SMTP) as specified by RFC821.	Oracle Database PL/SQL Packages and Types Reference

### Table 2-1 PL/SQL I/O-Processing Packages

To display output passed to DBMS\_OUTPUT, you need another program, such as SQL\*Plus. To see DBMS\_OUTPUT output with SQL\*Plus, you must first issue the SQL\*Plus command SET SERVEROUTPUT ON.

Some subprograms in the packages in Table 2-1 can both accept input and display output, but they cannot accept data directly from the keyboard. To accept data directly from the keyboard, use the SQL\*Plus commands PROMPT and ACCEPT.

### See Also:

- SQL\*Plus User's Guide and Reference for information about the SQL\*Plus command SET SERVEROUTPUT ON
- SQL\*Plus User's Guide and Reference for information about the SQL\*Plus command PROMPT
- SQL\*Plus User's Guide and Reference for information about the SQL\*Plus command ACCEPT
- Oracle Database SQL Language Reference for information about SQL statements

# Data Abstraction

Data abstraction lets you work with the essential properties of data without being too involved with details.

You can design a data structure first, and then design algorithms that manipulate it.

**Topics** 

- Cursors
- Composite Variables
- Using the %ROWTYPE Attribute
- Using the %TYPE Attribute
- Abstract Data Types

### Cursors

A **cursor** is a pointer to a private SQL area that stores information about processing a specific SQL statement or PL/SQL SELECT INTO statement.

You can use the cursor to retrieve the rows of the result set one at a time. You can use cursor attributes to get information about the state of the cursor—for example, how many rows the statement has affected so far.

For more information about cursors, see "Cursors Overview".

### **Composite Variables**

A composite variable has internal components, which you can access individually.

You can pass entire composite variables to subprograms as parameters. PL/SQL has two kinds of composite variables, collections and records.

In a **collection**, the internal components are always of the same data type, and are called **elements**. You access each element by its unique index. Lists and arrays are classic examples of collections.

In a **record**, the internal components can be of different data types, and are called **fields**. You access each field by its name. A record variable can hold a table row, or some columns from a table row.

For more information about composite variables, see PL/SQL Collections and Records.

### Using the %ROWTYPE Attribute

The **%ROWTYPE** attribute lets you declare a record that represents either a full or partial row of a database table or view.

For every column of the full or partial row, the record has a field with the same name and data type. If the structure of the row changes, then the structure of the record changes accordingly.

For more information about %ROWTYPE syntax and semantics, see "%ROWTYPE Attribute". For more details about its usage, see "Declaring Items using the %ROWTYPE Attribute".

### Using the %TYPE Attribute

The <code>%TYPE</code> attribute lets you declare a data item of the same data type as a previously declared variable or column (without knowing what that type is).

If the declaration of the referenced item changes, then the declaration of the referencing item changes accordingly. The <code>%TYPE</code> attribute is particularly useful when declaring variables to hold database values. For more information about <code>%TYPE</code> syntax and semantics, see "%TYPE Attribute". For more details about its usage, see "Declaring Items using the %TYPE Attribute".

### Abstract Data Types

An **Abstract Data Type (ADT)** consists of a data structure and subprograms that manipulate the data.

The variables that form the data structure are called **attributes**. The subprograms that manipulate the attributes are called **methods**.

ADTs are stored in the database. Instances of ADTs can be stored in tables and used as PL/SQL variables.

ADTs let you reduce complexity by separating a large system into logical components, which you can reuse.

In the static data dictionary view \*\_OBJECTS, the OBJECT\_TYPE of an ADT is TYPE. In the static data dictionary view \* TYPES, the TYPECODE of an ADT is OBJECT.

For more information about ADTs, see "CREATE TYPE Statement".

### Note:

ADTs are also called user-defined types and object types.

### See Also:

*Oracle Database Object-Relational Developer's Guide* for information about ADTs (which it calls *object types*)

# **Control Statements**

Control statements are the most important PL/SQL extension to SQL.

PL/SQL has three categories of control statements:

• **Conditional selection statements**, which let you run different statements for different data values.

For more information, see "Conditional Selection Statements".

 Loop statements, which let you repeat the same statements with a series of different data values.

For more information, see "LOOP Statements".

 Sequential control statements, which allow you to go to a specified, labeled statement, or to do nothing.

For more information, see "Sequential Control Statements".

# **Conditional Compilation**

Conditional compilation lets you customize the functionality in a PL/SQL application without removing source text.

For example, you can:

- Use new features with the latest database release, and disable them when running the application in an older database release.
- Activate debugging or tracing statements in the development environment, and hide them when running the application at a production site.

For more information, see "Conditional Compilation".

# Processing a Query Result Set One Row at a Time

PL/SQL lets you issue a SQL query and process the rows of the result set one at a time.

You can use a basic loop, or you can control the process precisely by using individual statements to run the query, retrieve the results, and finish processing.

### Example 2-2 Processing Query Result Rows One at a Time

This example uses a basic loop.

### Result:

```
First name = Steven, Last name = King
First name = Neena, Last name = Yang
First name = Lex, Last name = Garcia
First name = Alexander, Last name = James
First name = Bruce, Last name = Miller
First name = David, Last name = Williams
First name = Valli, Last name = Jackson
First name = Diana, Last name = Nguyen
First name = Nancy, Last name = Gruenberg
First name = Daniel, Last name = Faviet
First name = John, Last name = Chen
First name = Ismael, Last name = Sciarra
First name = Jose Manuel, Last name = Urman
First name = Luis, Last name = Popp
First name = Den, Last name = Li
First name = Alexander, Last name = Khoo
```

```
First name = Shelli, Last name = Baida
First name = Sigal, Last name = Tobias
First name = Guy, Last name = Himuro
First name = Karen, Last name = Colmenares
```

# Architecture of PL/SQL

Basic understanding of the PL/SQL architecture is beneficial to PL/SQL programmers.

Topics

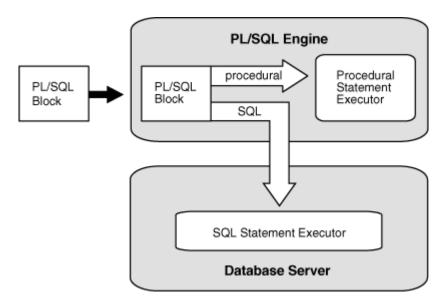

- PL/SQL Engine
- PL/SQL Units and Compilation Parameters

# PL/SQL Engine

The PL/SQL compilation and runtime system is an engine that compiles and runs PL/SQL units.

The engine can be installed in the database or in an application development tool, such as Oracle Forms.

In either environment, the PL/SQL engine accepts as input any valid PL/SQL unit. The engine runs procedural statements, but sends SQL statements to the SQL engine in the database, as shown in Figure 2-1.

### Figure 2-1 PL/SQL Engine

Typically, the database processes PL/SQL units.

When an application development tool processes PL/SQL units, it passes them to its local PL/SQL engine. If a PL/SQL unit contains no SQL statements, the local engine processes the entire PL/SQL unit. This is useful if the application development tool can benefit from conditional and iterative control.

For example, Oracle Forms applications frequently use SQL statements to test the values of field entries and do simple computations. By using PL/SQL instead of SQL, these applications can avoid calls to the database.

# PL/SQL Units and Compilation Parameters

PL/SQL units are affected by PL/SQL compilation parameters (a category of database initialization parameters). Different PL/SQL units-for example, a package specification and its body-can have different compilation parameter settings.

A PL/SQL unit is one of these:

- PL/SQL anonymous block
- FUNCTION
- LIBRARY
- PACKAGE
- PACKAGE BODY
- PROCEDURE
- TRIGGER
- TYPE
- TYPE BODY

Table 2-2 summarizes the PL/SQL compilation parameters. To display the values of these parameters for specified or all PL/SQL units, query the static data dictionary view ALL PLSQL OBJECT SETTINGS. For information about this view, see Oracle Database Reference.

Parameter	Description
PLSCOPE_SETTINGS	Controls the compile-time collection, cross-reference, and storage of PL/SQL source text identifier data. Used by the PL/Scope tool (see <i>Oracle Database Development Guide</i> ).
	For more information about PLSCOPE_SETTINGS, see Oracle Database Reference.
PLSQL_CCFLAGS	Lets you control conditional compilation of each PL/SQL unit independently.
	For more information about PLSQL_CCFLAGS, see "How Conditional Compilation Works" and Oracle Database Reference.
PLSQL_CODE_TYPE	Specifies the compilation mode for PL/SQL units—INTERPRETED (the default) or NATIVE. For information about which mode to use, see "Determining Whether to Use PL/SQL Native Compilation".

### Table 2-2 PL/SQL Compilation Parameters

If the optimization level (set by PLSQL OPTIMIZE LEVEL) is less than 2:

- The compiler generates interpreted code, regardless of PLSQL CODE TYPE.
- If you specify NATIVE, the compiler warns you that NATIVE was ignored.

For more information about PLSQL CODE TYPE, see Oracle Database Reference.

Parameter	Description
PLSQL_OPTIMIZE_LEVEL	Specifies the optimization level at which to compile PL/SQL units (the higher the level, the more optimizations the compiler tries to make).
	PLSQL_OPTIMIZE_LEVEL=1 instructs the PL/SQL compiler to generate and store code for use by the PL/SQL debugger.
	For more information about PLSQL_OPTIMIZE_LEVEL, see "PL/SQL Optimizer" and Oracle Database Reference.
PLSQL_WARNINGS	Enables or disables the reporting of warning messages by the PL/SQL compiler, and specifies which warning messages to show as errors. For more information about PLSQL_WARNINGS, see "Compile-Time Warnings" and Oracle Database Reference.
NLS_LENGTH_SEMANTICS	Lets you create CHAR and VARCHAR2 columns using either byte-length or character-length semantics.
	For more information about byte and character length semantics, see "CHAR and VARCHAR2 Variables".
	For more information about NLS_LENGTH_SEMANTICS, see Oracle Database Reference.
PERMIT_92_WRAP_FORMAT	Specifies whether the 12.1 PL/SQL compiler can use wrapped packages that were compiled with the 9.2 PL/SQL compiler. The default value is TRUE.
	For more information about wrapped packages, see PL/SQL Source Text Wrapping.
	For more information about <pre>PERMIT_92_WRAP_FORMAT</pre> , see Oracle Database Reference.

### Table 2-2 (Cont.) PL/SQL Compilation Parameters

### Note:

The compilation parameter PLSQL\_DEBUG, which specifies whether to compile PL/SQL units for debugging, is deprecated. To compile PL/SQL units for debugging, specify PLSQL OPTIMIZE LEVEL=1.

The compile-time values of the parameters in Table 2-2 are stored with the metadata of each stored PL/SQL unit, which means that you can reuse those values when you explicitly recompile the unit. (A **stored PL/SQL unit** is created with one of the "CREATE [ OR REPLACE ] Statements". An anonymous block is not a stored PL/SQL unit.)

To explicitly recompile a stored PL/SQL unit and reuse its parameter values, you must use an ALTER statement with both the COMPILE clause and the REUSE SETTINGS clause. All ALTER statements have this clause. For a list of ALTER statements, see "ALTER Statements".

# Protecting Sensitive Information in PL/SQL

Data security should be a top priority during any application development. There are several ways you can mitigate the risk of vulnerabilities while using PL/SQL.

Be aware that the content of a PL/SQL block may be written in its entirety in such places as audit logs and trace files. Similarly, stored procedure code can be accessed through dictionary

views, such as USER\_SOURCE. For this reason, it is strongly recommended that you never include any sensitive information in a literal seen in PL/SQL code.

Bind variables can be used to help protect against SQL injection attacks, however, bind values can be visible in places such as trace files, audit, and V\$SQL and related views. Access should be strictly managed to ensure that only those who require it have privileges to view this particularly sensitive information. For more information about using bind variables, see "Bind Variables".

# 3 PL/SQL Language Fundamentals

The PL/SQL language fundamental components are explained.

- Character Sets
- Lexical Units
- Declarations
- References to Identifiers
- Scope and Visibility of Identifiers
- Assigning Values to Variables
- Expressions
- Error-Reporting Functions
- Conditional Compilation

# **Character Sets**

Any character data to be processed by PL/SQL or stored in a database must be represented as a sequence of bytes. The byte representation of a single character is called a **character code**. A set of character codes is called a **character set**.

Every Oracle database supports a database character set and a national character set. PL/SQL also supports these character sets. This document explains how PL/SQL uses the database character set and national character set.

### Topics

- Database Character Set
- National Character Set
- About Data-Bound Collation

### See Also:

# Database Character Set

PL/SQL uses the database character set to represent:

- Stored source text of PL/SQL units
   For information about PL/SQL units, see "PL/SQL Units and Compilation Parameters".
- Character values of data types CHAR, VARCHAR2, CLOB, and LONG

For information about these data types, see "SQL Data Types".

The database character set can be either single-byte, mapping each supported character to one particular byte, or multibyte-varying-width, mapping each supported character to a sequence of one, two, three, or four bytes. The maximum number of bytes in a character code depends on the particular character set.

Every database character set includes these basic characters:

- Latin letters: A through Z and a through z
- Decimal digits: 0 through 9
- Punctuation characters in Table 3-1
- Whitespace characters: space, tab, new line, and carriage return

PL/SQL source text that uses only the basic characters can be stored and compiled in any database. PL/SQL source text that uses nonbasic characters can be stored and compiled only in databases whose database character sets support those nonbasic characters.

Symbol	Name
(	Left parenthesis
)	Right parenthesis
<	Left angle bracket
>	Right angle bracket
+	Plus sign
-	Hyphen <i>or</i> minus sign
*	Asterisk
/	Slash
=	Equal sign
,	Comma
;	Semicolon
:	Colon
	Period
!	Exclamation point
?	Question mark
'	Apostrophe or single quotation mark
"	Quotation mark or double quotation mark
Q	At sign
010	Percent sign
#	Number sign
\$	Dollar sign
_	Underscore
	Vertical bar

Table 3-1 Punctuation Characters in Every Database Character Set

# National Character Set

PL/SQL uses the national character set to represent character values of data types NCHAR, NVARCHAR2 and NCLOB.

See Also:

- "SQL Data Types" for information about these data types
- Oracle Database Globalization Support Guide for more information about the national character set

# About Data-Bound Collation

Collation (also called sort ordering) is a set of rules that determines if a character string equals, precedes, or follows another string when the two strings are compared and sorted.

Different collations correspond to rules of different spoken languages. Collation-sensitive operations are operations that compare text and need a collation to control the comparison rules. The equality operator and the built-in function INSTR are examples of collation-sensitive operations.

Starting with Oracle Database 12c release 2 (12.2), a new architecture provides control of the collation to be applied to operations on character data. In the new architecture, collation becomes an attribute of character data, analogous to a data type. You can now declare collation for a column and this collation is automatically applied by all collation-sensitive SQL operations referencing the column. The data-bound collation feature uses syntax and semantics compatible with the ISO/IEC SQL standard.

The PL/SQL language has limited support for the data-bound collation architecture. All data processed in PL/SQL expressions is assumed to have the compatibility collation USING\_NLS\_COMP. This pseudo-collation instructs collation-sensitive operators to behave in the same way as in previous Oracle Database releases. That is, the values of the session parameters NLS\_COMP and NLS\_SORT determine the collation to use. However, all SQL statements embedded or constructed dynamically in PL/SQL fully support the new architecture.

A new property called default collation has been added to tables, views, materialized views, packages, stored procedures, stored functions, triggers, and types. The default collation of a unit determines the collation for data containers, such as columns, variables, parameters, literals, and return values, that do not have their own explicit collation declaration in that unit. The default collation for packages, stored procedures, stored functions, triggers, and types must be USING NLS COMP.

For syntax and semantics, see the DEFAULT COLLATION Clause.

To facilitate the creation of PL/SQL units in a schema that has a schema default collation other than <code>USING\_NLS\_COMP</code>, the syntax and semantics for the following statements enable an explicit declaration of the object's default collation to be <code>USING\_NLS\_COMP</code>:

- CREATE FUNCTION Statement
- CREATE PACKAGE Statement
- CREATE PROCEDURE Statement
- CREATE TRIGGER Statement
- CREATE TYPE Statement

# Lexical Units

The **lexical units** of PL/SQL are its smallest individual components—delimiters, identifiers, literals, pragmas, and comments.

### **Topics**

- Delimiters
- Identifiers
- Literals
- Pragmas
- Comments
- Whitespace Characters Between Lexical Units

# Delimiters

A **delimiter** is a character, or character combination, that has a special meaning in PL/SQL. Do not embed any others characters (including whitespace characters) inside a delimiter. Table 3-2 summarizes the PL/SQL delimiters.

Table 3	3-2 PL	./SQL [	Delimiters
---------	--------	---------	------------

Delimiter	Meaning
+	Addition operator
:=	Assignment operator
=>	Association operator
00	Attribute indicator

Delimiter	Meaning
1	Character string delimiter
	Component indicator
	Concatenation operator
/	Division operator
* *	Exponentiation operator
(	Expression or list delimiter (begin)
)	Expression or list delimiter (end)
:	Host variable indicator
,	Item separator
<<	Label delimiter (begin)
>>	Label delimiter (end)
/*	Multiline comment delimiter (begin)
*/	Multiline comment delimiter (end)
*	Multiplication operator
"	Quoted identifier delimiter
	Range operator
=	Relational operator (equal)
<>	Relational operator (not equal)
! =	Relational operator (not equal)
~=	Relational operator (not equal)
^=	Relational operator (not equal)
<	Relational operator (less than)
>	Relational operator (greater than)
<=	Relational operator (less than or equal)
>=	Relational operator (greater than or equal)
Ø	Remote access indicator
	Single-line comment indicator
;	Statement terminator
-	Subtraction or negation operator

S
•

# Identifiers

Identifiers name PL/SQL elements, which include:

- Constants
- Cursors
- Exceptions
- Keywords

- Labels
- Packages
- Reserved words
- Subprograms
- Types
- Variables

Every character in an identifier, alphabetic or not, is significant. For example, the identifiers lastname and last name are different.

You must separate adjacent identifiers by one or more whitespace characters or a punctuation character.

Except as explained in "Quoted User-Defined Identifiers", PL/SQL is case-insensitive for identifiers. For example, the identifiers lastname, LastName, and LASTNAME are the same.

### **Topics**

- Reserved Words and Keywords
- Predefined Identifiers
- User-Defined Identifiers

### Reserved Words and Keywords

Reserved words and keywords are identifiers that have special meaning in PL/SQL.

You cannot use reserved words as ordinary user-defined identifiers. You can use them as quoted user-defined identifiers, but it is not recommended. For more information, see "Quoted User-Defined Identifiers".

You can use keywords as ordinary user-defined identifiers, but it is not recommended.

For lists of PL/SQL reserved words and keywords, see Table D-1 and Table D-2, respectively.

### **Predefined Identifiers**

Predefined identifiers are declared in the predefined package STANDARD.

An example of a predefined identifier is the exception INVALID NUMBER.

For a list of predefined identifiers, connect to Oracle Database as a user who has the DBA role and use this query:

SELECT TYPE NAME FROM ALL TYPES WHERE PREDEFINED='YES';

You can use predefined identifiers as user-defined identifiers, but it is not recommended. Your local declaration overrides the global declaration (see "Scope and Visibility of Identifiers").

### **User-Defined Identifiers**

### A user-defined identifier is:

- Composed of characters from the database character set
- Either ordinary or quoted

# **Tip:** Make user-defined identifiers meaningful. For example, the meaning of cost\_per\_thousand is obvious, but the meaning of cpt is not. **Tip:** Avoid using the same user-defined identifier for both a schema and a schema object. This decreases code readability and maintainability and can lead to coding mistakes. Note that local objects have name resolution precedence over schema qualification. For more information about database object naming rules, see *Oracle Database SQL Language Reference*. For more information about PL/SQL-specific name resolution rules, see "Differences Between PL/SQL and SQL Name Resolution Rules".

### Ordinary User-Defined Identifiers

An ordinary user-defined identifier:

- Begins with a letter
- Can include letters, digits, and these symbols:
  - Dollar sign (\$)
  - Number sign (#)
  - Underscore (\_)
- Is not a reserved word (listed in Table D-1).

The database character set defines which characters are classified as letters and digits. If COMPATIBLE is set to a value of 12.2 or higher, the representation of the identifier in the database character set cannot exceed 128 bytes. If COMPATIBLE is set to a value of 12.1 or lower, the limit is 30 bytes.

Examples of acceptable ordinary user-defined identifiers:

```
X
t2
phone#
credit_limit
LastName
oracle$number
money$$$tree
SN##
try_again_
```

Examples of unacceptable ordinary user-defined identifiers:

mine&yours debit-amount on/off user id

### **Quoted User-Defined Identifiers**

A quoted user-defined identifier is enclosed in double quotation marks.

Between the double quotation marks, any characters from the database character set are allowed except double quotation marks, new line characters, and null characters. For example, these identifiers are acceptable:

"X+Y" "last name" "on/off switch" "employee(s)" "\*\*\* header info \*\*\*"

If COMPATIBLE is set to a value of 12.2 or higher, the representation of the quoted identifier in the database character set cannot exceed 128 bytes (excluding the double quotation marks). If COMPATIBLE is set to a value of 12.1 or lower, the limit is 30 bytes.

A quoted user-defined identifier is case-sensitive, with one exception: If a quoted user-defined identifier, without its enclosing double quotation marks, is a valid *ordinary* user-defined identifier, then the double quotation marks are optional in references to the identifier, and if you omit them, then the identifier is case-insensitive.

It is not recommended, but you can use a reserved word as a quoted user-defined identifier. Because a reserved word is not a valid ordinary user-defined identifier, you must always enclose the identifier in double quotation marks, and it is always case-sensitive.

### Example 3-1 Valid Case-Insensitive Reference to Quoted User-Defined Identifier

In this example, the quoted user-defined identifier "HELLO", without its enclosing double quotation marks, is a valid ordinary user-defined identifier. Therefore, the reference Hello is valid.

```
DECLARE
   "HELLO" varchar2(10) := 'hello';
BEGIN
   DBMS_Output.Put_Line(Hello);
END;
/
```

### Result:

hello

### Example 3-2 Invalid Case-Insensitive Reference to Quoted User-Defined Identifier

In this example, the reference "Hello" is invalid, because the double quotation marks make the identifier case-sensitive.

```
DECLARE
   "HELLO" varchar2(10) := 'hello';
BEGIN
   DBMS_Output.Put_Line("Hello");
END;
/
```

### Result:

```
ORA-06550: line 4, column 25:
PLS-00201: identifier 'Hello' must be declared
ORA-06550: line 4, column 3:
PL/SQL: Statement ignored
```

### Example 3-3 Reserved Word as Quoted User-Defined Identifier

This example declares quoted user-defined identifiers "BEGIN", "Begin", and "begin". Although BEGIN, Begin, and begin represent the same reserved word, "BEGIN", "Begin", and "begin" represent different identifiers.

```
DECLARE
  "BEGIN" varchar2(15) := 'UPPERCASE';
  "Begin" varchar2(15) := 'Initial Capital';
  "begin" varchar2(15) := 'lowercase';
BEGIN
  DBMS_Output.Put_Line("BEGIN");
  DBMS_Output.Put_Line("Begin");
  DBMS_Output.Put_Line("begin");
END;
/
```

### Result:

UPPERCASE Initial Capital lowercase

PL/SQL procedure successfully completed.

### Example 3-4 Neglecting Double Quotation Marks

This example references a quoted user-defined identifier that is a reserved word, neglecting to enclose it in double quotation marks.

```
DECLARE
  "HELLO" varchar2(10) := 'hello'; -- HELLO is not a reserved word
  "BEGIN" varchar2(10) := 'begin'; -- BEGIN is a reserved word
BEGIN
  DBMS_Output.Put_Line(Hello); -- Double quotation marks are optional
  DBMS_Output.Put_Line(BEGIN); -- Double quotation marks are required
end;
/
```

### Result:

```
DBMS_Output.Put_Line(BEGIN); -- Double quotation marks are required

*
ERROR at line 6:

ORA-06550: line 6, column 24:

trailing forall merge year month day hour minute second

timezone_hour timezone_minute timezone_region timezone_abbr

time timestamp interval date

<a string literal with character set specificat
```

### Example 3-5 Neglecting Case-Sensitivity

This example references a quoted user-defined identifier that is a reserved word, neglecting its case-sensitivity.

```
DECLARE
  "HELLO" varchar2(10) := 'hello'; -- HELLO is not a reserved word
  "BEGIN" varchar2(10) := 'begin'; -- BEGIN is a reserved word
BEGIN
  DBMS_Output.Put_Line(Hello); -- Identifier is case-insensitive
  DBMS_Output.Put_Line("Begin"); -- Identifier is case-sensitive
END;
/
```

### Result:

```
DBMS_Output.Put_Line("Begin"); -- Identifier is case-sensitive

*

ERROR at line 6:

ORA-06550: line 6, column 25:

PLS-00201: identifier 'Begin' must be declared

ORA-06550: line 6, column 3:

PL/SQL: Statement ignored
```

# Literals

A literal is a value that is neither represented by an identifier nor calculated from other values.

For example, 123 is an integer literal and 'abc' is a character literal, but 1+2 is not a literal.

PL/SQL literals include all SQL literals (described in *Oracle Database SQL Language Reference*), including BOOLEAN literals. A BOOLEAN literal is the predefined logical value TRUE, FALSE, or NULL. NULL represents an unknown value.

```
    Note:
    Like Oracle Database SQL Language Reference, this document uses the terms character literal and string interchangeably.
    When using character literals in PL/SQL, remember:
```

Character literals are case-sensitive.

For example, 'Z' and 'z' are different.

• Whitespace characters are significant.

For example, these literals are different:

```
'abc'
'abc'
'abc'
'abc'
'a b c'
```

 PL/SQL has no line-continuation character that means "this string continues on the next source line." If you continue a string on the next source line, then the string includes a linebreak character.

For example, this PL/SQL code:

```
BEGIN
    DBMS_OUTPUT.PUT_LINE('This string breaks
here.');
END;
/
```

Prints this:

This string breaks here.

If your string does not fit on a source line and you do not want it to include a line-break character, then construct the string with the concatenation operator (||).

For example, this PL/SQL code:

Prints this:

This string contains no line-break character.

For more information about the concatenation operator, see "Concatenation Operator".

• '0' through '9' are not equivalent to the integer literals 0 through 9.

However, because PL/SQL converts them to integers, you can use them in arithmetic expressions.

- A character literal with zero characters has the value NULL and is called a **null string**. However, this NULL value is not the BOOLEAN value NULL.
- An ordinary character literal is composed of characters in the database character set.

For information about the database character set, see *Oracle Database Globalization Support Guide*.

• A national character literal is composed of characters in the national character set.

For information about the national character set, see *Oracle Database Globalization Support Guide*.

• You can use Q or q as part of the character literal syntax to indicate that an alternative quoting mechanism will be used. This mechanism allows a wide range of delimiters for a string as opposed to simply single quotation marks.

For more information about the alternative quoting mechanism, see *Oracle Database SQL Language Reference*.

### Live SQL:

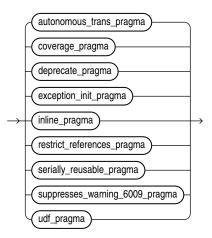

You can view and run examples of the Q mechanism at Alternative Quoting Mechanism ("Q") for String Literals

# Pragmas

A **pragma** is an instruction to the compiler that it processes at compile time.

A pragma begins with the reserved word PRAGMA followed by the name of the pragma. Some pragmas have arguments. A pragma may appear before a declaration or a statement. Additional restrictions may apply for specific pragmas. The extent of a pragma's effect depends on the pragma. A pragma whose name or argument is not recognized by the compiler has no effect.

pragma ::=

For information about pragmas syntax and semantics, see :

- "AUTONOMOUS\_TRANSACTION Pragma"
- "COVERAGE Pragma"
- "DEPRECATE Pragma"
- "EXCEPTION\_INIT Pragma"
- "INLINE Pragma"
- "RESTRICT\_REFERENCES Pragma"
- "SERIALLY\_REUSABLE Pragma"
- "SUPPRESSES\_WARNING\_6009 Pragma"
- "UDF Pragma"

# Comments

The PL/SQL compiler ignores comments. Their purpose is to help other application developers understand your source text.

Typically, you use comments to describe the purpose and use of each code segment. You can also disable obsolete or unfinished pieces of code by turning them into comments.

Topics

Single-Line Comments

Multiline Comments

### Single-Line Comments

A single-line comment begins with -- and extends to the end of the line.

Caution: Do not put a single-line comment in a PL/SQL block to be processed dynamically by an Oracle Precompiler program. The Oracle Precompiler program ignores end-of-line characters, which means that a single-line comment ends when the block ends.

While testing or debugging a program, you can disable a line of code by making it a comment. For example:

-- DELETE FROM employees WHERE comm\_pct IS NULL

### Example 3-6 Single-Line Comments

This example has three single-line comments.

```
DECLARE
howmany NUMBER;
num_tables NUMBER;
BEGIN
-- Begin processing
SELECT COUNT(*) INTO howmany
FROM USER_OBJECTS
WHERE OBJECT_TYPE = 'TABLE'; -- Check number of tables
num_tables := howmany; -- Compute another value
END;
/
```

# **Multiline Comments**

A multiline comment begins with /\*, ends with \*/, and can span multiple lines.

You can use multiline comment delimiters to "comment out" sections of code. When doing so, be careful not to cause nested multiline comments. One multiline comment cannot contain another multiline comment. However, a multiline comment can contain a single-line comment. For example, this causes a syntax error:

```
/*
    IF 2 + 2 = 4 THEN
        some_condition := TRUE;
    /* We expect this THEN to always be performed */
    END IF;
*/
```

This does not cause a syntax error:

```
/*
    IF 2 + 2 = 4 THEN
        some_condition := TRUE;
    -- We expect this THEN to always be performed
    END IF;
*/
```

### Example 3-7 Multiline Comments

This example has two multiline comments. (The SQL function TO\_CHAR returns the character equivalent of its argument. For more information about TO\_CHAR, see Oracle Database SQL Language Reference.)

```
DECLARE
 some condition BOOLEAN;
 pi
               NUMBER := 3.1415926;
               NUMBER := 15;
 radius
 area
                NUMBER;
BEGIN
 /* Perform some simple tests and assignments */
 IF 2 + 2 = 4 THEN
   some condition := TRUE;
  /* We expect this THEN to always be performed */
 END IF;
 /* This line computes the area of a circle using pi,
 which is the ratio between the circumference and diameter.
 After the area is computed, the result is displayed. */
 area := pi * radius**2;
 DBMS OUTPUT.PUT LINE('The area is: ' || TO CHAR(area));
END;
/
```

### Result:

The area is: 706.858335

# Whitespace Characters Between Lexical Units

You can put whitespace characters between lexical units, which often makes your source text easier to read.

### Example 3-8 Whitespace Characters Improving Source Text Readability

```
DECLARE
x NUMBER := 10;
y NUMBER := 5;
max NUMBER;
BEGIN
IF x>y THEN max:=x;ELSE max:=y;END IF; -- correct but hard to read
-- Easier to read:
IF x > y THEN
max:=x;
ELSE
max:=y;
END IF;
```

END; /

# Declarations

A declaration allocates storage space for a value of a specified data type, and names the storage location so that you can reference it.

You must declare objects before you can reference them. Declarations can appear in the declarative part of any block, subprogram, or package.

### Topics

- Declaring Variables
- Declaring Constants
- Initial Values of Variables and Constants
- NOT NULL Constraint
- Declaring Items using the %TYPE Attribute

For information about declaring objects other than variables and constants, see the syntax of *declare\_section* in "Block".

# NOT NULL Constraint

You can impose the NOT NULL constraint on a scalar variable or constant (or scalar component of a composite variable or constant).

The NOT NULL constraint prevents assigning a null value to the item. The item can acquire this constraint either implicitly (from its data type) or explicitly.

A scalar variable declaration that specifies NOT NULL, either implicitly or explicitly, must assign an initial value to the variable (because the default initial value for a scalar variable is NULL).

PL/SQL treats any zero-length string as a NULL value. This includes values returned by character functions and BOOLEAN expressions.

To test for a NULL value, use the "IS [NOT] NULL Operator".

### Examples

### Example 3-9 Variable Declaration with NOT NULL Constraint

In this example, the variable acct\_id acquires the NOT NULL constraint explicitly, and the variables a, b, and c acquire it from their data types.

```
DECLARE

acct_id INTEGER(4) NOT NULL := 9999;

a NATURALN := 9999;

b POSITIVEN := 9999;

c SIMPLE_INTEGER := 9999;

BEGIN

NULL;

END;

/
```

#### Example 3-10 Variables Initialized to NULL Values

In this example, all variables are initialized to NULL.

```
DECLARE
null_string VARCHAR2(80) := TO_CHAR('');
address VARCHAR2(80);
zip_code VARCHAR2(80) := SUBSTR(address, 25, 0);
name VARCHAR2(80);
valid BOOLEAN := (name != '');
BEGIN
NULL;
END;
/
```

# **Declaring Variables**

A variable declaration always specifies the name and data type of the variable.

For most data types, a variable declaration can also specify an initial value.

The variable name must be a valid user-defined identifier .

The data type can be any PL/SQL data type. The PL/SQL data types include the SQL data types. A data type is either scalar (without internal components) or composite (with internal components).

#### Example

#### Example 3-11 Scalar Variable Declarations

This example declares several variables with scalar data types.

```
DECLARE

part_number NUMBER(6);

part_name VARCHAR2(20);

in_stock BOOLEAN;

part_price NUMBER(6,2);

part_description VARCHAR2(50);

BEGIN

NULL;

END;

/
```

#### **Related Topics**

- "User-Defined Identifiers"
- "Scalar Variable Declaration" for scalar variable declaration syntax
- PL/SQL Data Types for information about scalar data types
- PL/SQL Collections and Records, for information about composite data types and variables

## Declaring Constants

A constant holds a value that does not change.

The information in "Declaring Variables" also applies to constant declarations, but a constant declaration has two more requirements: the keyword CONSTANT and the initial value of the constant. (The initial value of a constant is its permanent value.)

#### Example 3-12 Constant Declarations

This example declares three constants with scalar data types.

```
DECLARE
  credit_limit CONSTANT REAL := 5000.00;
  max_days_in_year CONSTANT INTEGER := 366;
  urban_legend CONSTANT BOOLEAN := FALSE;
BEGIN
  NULL;
END;
/
```

#### **Related Topic**

"Constant Declaration" for constant declaration syntax

# Initial Values of Variables and Constants

In a variable declaration, the initial value is optional unless you specify the NOT NULL constraint . In a constant declaration, the initial value is required.

If the declaration is in a block or subprogram, the initial value is assigned to the variable or constant every time control passes to the block or subprogram. If the declaration is in a package specification, the initial value is assigned to the variable or constant for each session (whether the variable or constant is public or private).

To specify the initial value, use either the assignment operator (:=) or the keyword DEFAULT, followed by an expression. The expression can include previously declared constants and previously initialized variables.

If you do not specify an initial value for a variable, assign a value to it before using it in any other context.

#### Examples

#### Example 3-13 Variable and Constant Declarations with Initial Values

This example assigns initial values to the constant and variables that it declares. The initial value of area depends on the previously declared constant pi and the previously initialized variable radius.

```
DECLARE
hours_worked INTEGER := 40;
employee_count INTEGER := 0;
pi CONSTANT REAL := 3.14159;
radius REAL := 1;
area REAL := (pi * radius**2);
BEGIN
NULL;
END;
/
```

#### Example 3-14 Variable Initialized to NULL by Default

In this example, the variable counter has the initial value NULL, by default. The example uses the "IS [NOT] NULL Operator" to show that NULL is different from zero.

DECLARE counter INTEGER; -- initial value is NULL by default

```
BEGIN
counter := counter + 1; -- NULL + 1 is still NULL
IF counter IS NULL THEN
DBMS_OUTPUT.PUT_LINE('counter is NULL.');
END IF;
END;
/
```

counter is NULL.

# Declaring Items using the %TYPE Attribute

The <code>%TYPE</code> attribute lets you declare a data item of the same data type as a previously declared variable or column (without knowing what that type is). If the declaration of the referenced item changes, then the declaration of the referencing item changes accordingly.

The syntax of the declaration is:

referencing item referenced item%TYPE;

For the kinds of items that can be referencing and referenced items, see "%TYPE Attribute".

The referencing item inherits the following from the referenced item:

- Data type and size
- Constraints (unless the referenced item is a column)

The referencing item does not inherit the initial value of the referenced item. Therefore, if the referencing item specifies or inherits the NOT NULL constraint, you must specify an initial value for it.

The <code>%TYPE</code> attribute is particularly useful when declaring variables to hold database values. The syntax for declaring a variable of the same type as a column is:

variable\_name table\_name.column\_name%TYPE;

#### See Also:

"Declaring Items using the %ROWTYPE Attribute", which lets you declare a record variable that represents either a full or partial row of a database table or view

#### Examples

#### Example 3-15 Declaring Variable of Same Type as Column

In this example, the variable surname inherits the data type and size of the column employees.last\_name, which has a NOT NULL constraint. Because surname does not inherit the NOT NULL constraint, its declaration does not need an initial value.

```
DECLARE
surname employees.last_name%TYPE;
BEGIN
DBMS_OUTPUT.PUT_LINE('surname=' || surname);
END;
/
```

#### Result:

surname=

#### Example 3-16 Declaring Variable of Same Type as Another Variable

In this example, the variable surname inherits the data type, size, and NOT NULL constraint of the variable name. Because surname does not inherit the initial value of name, its declaration needs an initial value (which cannot exceed 25 characters).

```
DECLARE
  name VARCHAR(25) NOT NULL := 'Smith';
  surname name%TYPE := 'Jones';
BEGIN
  DBMS_OUTPUT.PUT_LINE('name=' || name);
  DBMS_OUTPUT.PUT_LINE('surname=' || surname);
END;
/
```

#### Result:

name=Smith surname=Jones

# **References to Identifiers**

When referencing an identifier, you use a name that is either simple, qualified, remote, or both qualified and remote.

The simple name of an identifier is the name in its declaration. For example:

```
DECLARE
    a INTEGER; -- Declaration
BEGIN
    a := 1; -- Reference with simple name
END;
/
```

If an identifier is declared in a named PL/SQL unit, you can (and sometimes must) reference it with its **qualified name**. The syntax (called **dot notation**) is:

```
unit_name.simple_identifier_name
```

For example, if package p declares identifier a, you can reference the identifier with the qualified name p.a. The unit name also can (and sometimes must) be qualified. You *must* qualify an identifier when it is not visible (see "Scope and Visibility of Identifiers").

If the identifier names an object on a remote database, you must reference it with its **remote name**. The syntax is:

simple identifier name@link to remote database

If the identifier is declared in a PL/SQL unit on a remote database, you must reference it with its **qualified remote name**. The syntax is:

unit\_name.simple\_identifier\_name@link\_to\_remote\_database

You can create synonyms for remote schema objects, but you cannot create synonyms for objects declared in PL/SQL subprograms or packages. To create a synonym, use the SQL statement CREATE SYNONYM, explained in *Oracle Database SQL Language Reference*.

For information about how PL/SQL resolves ambiguous names, see PL/SQL Name Resolution.

## Note:

You can reference identifiers declared in the packages **STANDARD** and **DBMS\_STANDARD** without qualifying them with the package names, unless you have declared a local identifier with the same name (see "Scope and Visibility of Identifiers").

# Scope and Visibility of Identifiers

The **scope** of an identifier is the region of a PL/SQL unit from which you can reference the identifier. The **visibility** of an identifier is the region of a PL/SQL unit from which you can reference the identifier without qualifying it. An identifier is **local** to the PL/SQL unit that declares it. If that unit has subunits, the identifier is **global** to them.

If a subunit redeclares a global identifier, then inside the subunit, both identifiers are in scope, but only the local identifier is visible. To reference the global identifier, the subunit must qualify it with the name of the unit that declared it. If that unit has no name, then the subunit cannot reference the global identifier.

A PL/SQL unit cannot reference identifiers declared in other units at the same level, because those identifiers are neither local nor global to the block.

You cannot declare the same identifier twice in the same PL/SQL unit. If you do, an error occurs when you reference the duplicate identifier.

You can declare the same identifier in two different units. The two objects represented by the identifier are distinct. Changing one does not affect the other.

In the same scope, give labels and subprograms unique names to avoid confusion and unexpected results.

#### Examples

#### Example 3-17 Scope and Visibility of Identifiers

This example shows the scope and visibility of several identifiers. The first sub-block redeclares the global identifier a. To reference the global variable a, the first sub-block would

have to qualify it with the name of the outer block—but the outer block has no name. Therefore, the first sub-block cannot reference the global variable a; it can reference only its local variable a. Because the sub-blocks are at the same level, the first sub-block cannot reference d, and the second sub-block cannot reference c.

```
-- Outer block:
DECLARE
 a CHAR; -- Scope of a (CHAR) begins
          -- Scope of b begins
 b REAL;
BEGIN
 -- Visible: a (CHAR), b
 -- First sub-block:
 DECLARE
   a INTEGER; -- Scope of a (INTEGER) begins
   c REAL; -- Scope of c begins
 BEGIN
   -- Visible: a (INTEGER), b, c
   NULL;
 END;
              -- Scopes of a (INTEGER) and c end
 -- Second sub-block:
 DECLARE
   d REAL;
            -- Scope of d begins
 BEGIN
   -- Visible: a (CHAR), b, d
   NULL;
 END;
              -- Scope of d ends
-- Visible: a (CHAR), b
END;
              -- Scopes of a (CHAR) and b end
```

#### Example 3-18 Qualifying Redeclared Global Identifier with Block Label

This example labels the outer block with the name outer. Therefore, after the sub-block redeclares the global variable birthdate, it can reference that global variable by qualifying its name with the block label. The sub-block can also reference its local variable birthdate, by its simple name.

```
<<pre><<outer>> -- label
DECLARE
birthdate DATE := TO_DATE('09-AUG-70', 'DD-MON-YY');
BEGIN
DECLARE
birthdate DATE := TO_DATE('29-SEP-70', 'DD-MON-YY');
BEGIN
IF birthdate = outer.birthdate THEN
DBMS_OUTPUT.PUT_LINE ('Same Birthday');
ELSE
DBMS_OUTPUT.PUT_LINE ('Different Birthday');
END IF;
END;
END;
//
```

#### Result:

Different Birthday

#### Example 3-19 Qualifying Identifier with Subprogram Name

In this example, the procedure check\_credit declares a variable, rating, and a function, check\_rating. The function redeclares the variable. Then the function references the global variable by qualifying it with the procedure name.

```
CREATE OR REPLACE PROCEDURE check credit (credit limit NUMBER) AS
  rating NUMBER := 3;
 FUNCTION check_rating RETURN BOOLEAN IS
   rating NUMBER := 1;
   over limit BOOLEAN;
 BEGIN
   IF check credit.rating <= credit limit THEN -- reference global variable
     over limit := FALSE;
    ELSE
     over limit := TRUE;
     rating := credit limit;
                                                 -- reference local variable
   END IF;
   RETURN over limit;
 END check rating;
BEGIN
 IF check rating THEN
    DBMS OUTPUT.PUT LINE
      ('Credit rating over limit (' || TO CHAR(credit limit) || '). '
      || 'Rating: ' || TO CHAR(rating));
 ELSE
    DBMS OUTPUT.PUT LINE
      ('Credit rating OK. ' || 'Rating: ' || TO CHAR(rating));
 END IF;
END;
/
BEGIN
  check_credit(1);
END;
/
```

#### Result:

Credit rating over limit (1). Rating: 3

#### Example 3-20 Duplicate Identifiers in Same Scope

You cannot declare the same identifier twice in the same PL/SQL unit. If you do, an error occurs when you reference the duplicate identifier, as this example shows.

```
DECLARE
   id BOOLEAN;
   id VARCHAR2(5); -- duplicate identifier
BEGIN
   id := FALSE;
END;
/
```

#### Result:

id := FALSE;
 \*
ERROR at line 5:
ORA-06550: line 5, column 3:

```
PLS-00371: at most one declaration for 'ID' is permitted ORA-06550: line 5, column 3: PL/SQL: Statement ignored
```

#### Example 3-21 Declaring Same Identifier in Different Units

You can declare the same identifier in two different units. The two objects represented by the identifier are distinct. Changing one does not affect the other, as this example shows. In the same scope, give labels and subprograms unique names to avoid confusion and unexpected results.

```
DECLARE
 PROCEDURE p
 ΤS
   x VARCHAR2(1);
 BEGIN
   x := 'a'; -- Assign the value 'a' to x
   DBMS OUTPUT.PUT LINE ('In procedure p, x = ' || x);
 END;
 PROCEDURE q
 IS
   x VARCHAR2(1);
 BEGIN
   x := 'b'; -- Assign the value 'b' to x
   DBMS OUTPUT.PUT LINE ('In procedure q, x = ' || x);
 END;
BEGIN
 p;
 q;
END;
/
```

#### Result:

In procedure p, x = aIn procedure q, x = b

#### Example 3-22 Label and Subprogram with Same Name in Same Scope

In this example, echo is the name of both a block and a subprogram. Both the block and the subprogram declare a variable named x. In the subprogram, echo.x refers to the local variable x, not to the global variable x.

```
<<pre><<echo>>
DECLARE
    x NUMBER := 5;

PROCEDURE echo AS
    x NUMBER := 0;
BEGIN
    DBMS_OUTPUT.PUT_LINE('x = ' || x);
    DBMS_OUTPUT.PUT_LINE('echo.x = ' || echo.x);
END;
BEGIN
    echo;
END;
/
```

x = 0echo.x = 0

#### Example 3-23 Block with Multiple and Duplicate Labels

This example has two labels for the outer block, <code>compute\_ratio</code> and <code>another\_label</code>. The second label appears again in the inner block. In the inner block, <code>another\_label.denominator</code> refers to the local variable <code>denominator</code>, not to the global variable <code>denominator</code>, which results in the error <code>ZERO DIVIDE</code>.

```
<<compute ratio>>
<<another label>>
DECLARE
 numerator NUMBER := 22;
 denominator NUMBER := 7;
BEGIN
 <<another label>>
 DECLARE
    denominator NUMBER := 0;
 BEGIN
    DBMS OUTPUT.PUT LINE('Ratio with compute ratio.denominator = ');
    DBMS OUTPUT.PUT LINE (numerator/compute ratio.denominator);
    DBMS OUTPUT.PUT LINE('Ratio with another_label.denominator = ');
    DBMS OUTPUT.PUT LINE (numerator/another label.denominator);
 EXCEPTION
   WHEN ZERO DIVIDE THEN
     DBMS OUTPUT.PUT_LINE('Divide-by-zero error: can''t divide '
       || numerator || ' by ' || denominator);
   WHEN OTHERS THEN
     DBMS OUTPUT.PUT LINE ('Unexpected error.');
 END another label;
END compute ratio;
```

#### Result:

```
Ratio with compute_ratio.denominator =
3.14285714285714285714285714285714285714285714
Ratio with another_label.denominator =
Divide-by-zero error: cannot divide 22 by 0
```

# Assigning Values to Variables

After declaring a variable, you can assign a value to it in these ways:

- Use the assignment statement to assign it the value of an expression.
- Use the SELECT INTO or FETCH statement to assign it a value from a table.
- Pass it to a subprogram as an OUT or IN OUT parameter, and then assign the value inside the subprogram.

The variable and the value must have compatible data types. One data type is **compatible** with another data type if it can be implicitly converted to that type. For information about implicit data conversion, see *Oracle Database SQL Language Reference*.

#### Topics

- Assigning Values to Variables with the Assignment Statement
- Assigning Values to Variables with the SELECT INTO Statement
- Assigning Values to Variables as Parameters of a Subprogram
- Assigning Values to BOOLEAN Variables

#### See Also:

- "Assigning Values to Collection Variables"
- "Assigning Values to Record Variables"
- "FETCH Statement"

## Assigning Values to Variables with the Assignment Statement

To assign the value of an expression to a variable, use this form of the assignment statement:

variable\_name := expression;

For the complete syntax of the assignment statement, see "Assignment Statement".

For the syntax of an expression, see "Expression".

#### Example 3-24 Assigning Values to Variables with Assignment Statement

This example declares several variables (specifying initial values for some) and then uses assignment statements to assign the values of expressions to them.

```
DECLARE -- You can assign initial values here
  wages NUMBER;
  hours_worked NUMBER := 40;
  hourly_salary NUMBER := 22.50;
 nourly_salary NUMBER := 22.50;
bonus NUMBER := 150;
country VARCHAR2(128);
counter NUMBER := 0;
done BOOLEAN;
valid_id BOOLEAN;
emp_rec1 employees%ROWTYPE;
emp_rec2 employees%ROWTYPE;
  TYPE commissions IS TABLE OF NUMBER INDEX BY PLS INTEGER;
  comm tab commissions;
BEGIN -- You can assign values here too
  wages := (hours worked * hourly salary) + bonus;
  country := 'France';
  country := UPPER('Canada');
  done := (counter > 100);
  valid id := TRUE;
  emp rec1.first name := 'Antonio';
  emp rec1.last name := 'Ortiz';
  emp rec1 := emp rec2;
  comm tab(5) := 20000 * 0.15;
END;
```

# Assigning Values to Variables with the SELECT INTO Statement

A simple form of the SELECT INTO statement is:

```
SELECT select_item [, select_item ]...
INTO variable_name [, variable_name ]...
FROM table name;
```

For each select item, there must be a corresponding, type-compatible variable name.

For the complete syntax of the SELECT INTO statement, see "SELECT INTO Statement".

#### Example 3-25 Assigning Value to Variable with SELECT INTO Statement

This example uses a SELECT INTO statement to assign to the variable bonus the value that is 10% of the salary of the employee whose employee\_id is 100.

```
DECLARE
bonus NUMBER(8,2);
BEGIN
SELECT salary * 0.10 INTO bonus
FROM employees
WHERE employee_id = 100;
DBMS_OUTPUT.PUT_LINE('bonus = ' || TO_CHAR(bonus));
END;
/
Result:
```

bonus = 2400

# Assigning Values to Variables as Parameters of a Subprogram

If you pass a variable to a subprogram as an OUT or IN OUT parameter, and the subprogram assigns a value to the parameter, the variable retains that value after the subprogram finishes running. For more information, see "Subprogram Parameters".

#### Example 3-26 Assigning Value to Variable as IN OUT Subprogram Parameter

This example passes the variable <code>new\_sal</code> to the procedure <code>adjust\_salary</code>. The procedure assigns a value to the corresponding formal parameter, <code>sal</code>. Because <code>sal</code> is an <code>IN OUT</code> parameter, the variable <code>new\_sal</code> retains the assigned value after the procedure finishes running.

```
DECLARE
emp_salary NUMBER(8,2);
PROCEDURE adjust_salary (
   emp NUMBER,
   sal IN OUT NUMBER,
   adjustment NUMBER
) IS
BEGIN
   sal := sal + adjustment;
END;
BEGIN
SELECT salary INTO emp salary
```

```
FROM employees
WHERE employee_id = 100;
DBMS_OUTPUT.PUT_LINE
  ('Before invoking procedure, emp_salary: ' || emp_salary);
adjust_salary (100, emp_salary, 1000);
DBMS_OUTPUT.PUT_LINE
  ('After invoking procedure, emp_salary: ' || emp_salary);
END;
/
```

```
Before invoking procedure, emp_salary: 24000
After invoking procedure, emp_salary: 25000
```

# Assigning Values to BOOLEAN Variables

The only values that you can assign to a BOOLEAN variable are TRUE, FALSE, and NULL.

For more information about the BOOLEAN data type, see "BOOLEAN Data Type".

#### Example 3-27 Assigning Value to BOOLEAN Variable

This example initializes the BOOLEAN variable done to NULL by default, assigns it the literal value FALSE, compares it to the literal value TRUE, and assigns it the value of a BOOLEAN expression.

```
DECLARE

done BOOLEAN; -- Initial value is NULL by default

counter NUMBER := 0;

BEGIN

done := FALSE; -- Assign literal value

WHILE done != TRUE -- Compare to literal value

LOOP

counter := counter + 1;

done := (counter > 500); -- Assign value of BOOLEAN expression

END LOOP;

END;

/
```

# **Expressions**

An expression is a combination of one or more values, operators, and SQL functions that evaluates to a value.

An expression always returns a single value. The simplest expressions, in order of increasing complexity, are:

- 1. A single constant or variable (for example, a)
- 2. A unary operator and its single operand (for example, -a)
- 3. A binary operator and its two operands (for example, a+b)

An **operand** can be a variable, constant, literal, operator, function invocation, or placeholder or another expression. Therefore, expressions can be arbitrarily complex. For expression syntax, see Expression.

The data types of the operands determine the data type of the expression. Every time the expression is evaluated, a single value of that data type results. The data type of that result is the data type of the expression.

#### Topics

- Concatenation Operator
- Operator Precedence
- Logical Operators
- Short-Circuit Evaluation
- Comparison Operators
- BOOLEAN Expressions
- CASE Expressions
- SQL Functions in PL/SQL Expressions

## Concatenation Operator

The concatenation operator (||) appends one string operand to another.

The concatenation operator ignores null operands.

For more information about the syntax of the concatenation operator, see "*character\_expression* ::=".

```
Example 3-28 Concatenation Operator
```

```
DECLARE
    x VARCHAR2(4) := 'suit';
    y VARCHAR2(4) := 'case';
BEGIN
    DBMS_OUTPUT.PUT_LINE (x || y);
END;
/
```

#### Result:

suitcase

#### Example 3-29 Concatenation Operator with NULL Operands

The concatenation operator ignores null operands, as this example shows.

```
BEGIN
   DBMS_OUTPUT.PUT_LINE ('apple' || NULL || NULL || 'sauce');
END;
/
```

#### Result:

applesauce

# **Operator Precedence**

An **operation** is either a unary operator and its single operand or a binary operator and its two operands. The operations in an expression are evaluated in order of operator precedence.

Table 3-3 shows operator precedence from highest to lowest. Operators with equal precedence are evaluated in no particular order.

Table 3-3 Operator Precedence	Table 3-3	<b>Operator Precedence</b>
-------------------------------	-----------	----------------------------

Operator	Operation
**	exponentiation
+, -	identity, negation
*, /	multiplication, division
+, -,	addition, subtraction, concatenation
=, <, >, <=, >=, <>, !=, ~=, ^=, IS NULL, LIKE, BETWEEN, IN	comparison
NOT	negation
AND	conjunction
OR	inclusion

To control the order of evaluation, enclose operations in parentheses, as in Example 3-30.

When parentheses are nested, the most deeply nested operations are evaluated first.

You can also use parentheses to improve readability where the parentheses do not affect evaluation order.

#### Example 3-30 Controlling Evaluation Order with Parentheses

```
DECLARE
    a INTEGER := 1+2**2;
    b INTEGER := (1+2)**2;
BEGIN
    DBMS_OUTPUT.PUT_LINE('a = ' || TO_CHAR(a));
    DBMS_OUTPUT.PUT_LINE('b = ' || TO_CHAR(b));
END;
/
```

Result:

```
a = 5
b = 9
```

#### Example 3-31 Expression with Nested Parentheses

In this example, the operations (1+2) and (3+4) are evaluated first, producing the values 3 and 7, respectively. Next, the operation 3\*7 is evaluated, producing the result 21. Finally, the operation 21/7 is evaluated, producing the final value 3.

```
DECLARE
  a INTEGER := ((1+2)*(3+4))/7;
BEGIN
  DBMS OUTPUT.PUT LINE('a = ' || TO CHAR(a));
```

```
END;
/
```

a = 3

#### Example 3-32 Improving Readability with Parentheses

In this example, the parentheses do not affect the evaluation order. They only improve readability.

```
DECLARE
    a INTEGER := 2**2*3**2;
    b INTEGER := (2**2)*(3**2);
BEGIN
    DBMS_OUTPUT.PUT_LINE('a = ' || TO_CHAR(a));
    DBMS_OUTPUT.PUT_LINE('b = ' || TO_CHAR(b));
END;
/
```

#### Result:

#### a = 36 b = 36

#### Example 3-33 Operator Precedence

This example shows the effect of operator precedence and parentheses in several more complex expressions.

```
DECLARE
            NUMBER := 60000;
 salary
 commission NUMBER := 0.10;
BEGIN
  -- Division has higher precedence than addition:
 DBMS OUTPUT.PUT LINE ('5 + 12 / 4 = ' || TO CHAR (5 + 12 / 4));
  DBMS OUTPUT.PUT LINE('12 / 4 + 5 = ' || TO CHAR(12 / 4 + 5));
 -- Parentheses override default operator precedence:
 DBMS OUTPUT.PUT LINE('8 + 6 / 2 = ' || TO CHAR(8 + 6 / 2));
 DBMS OUTPUT.PUT LINE('(8 + 6) / 2 = ' || TO CHAR((8 + 6) / 2));
  -- Most deeply nested operation is evaluated first:
  DBMS OUTPUT.PUT LINE('100 + (20 / 5 + (7 - 3)) = '
                      || TO CHAR (100 + (20 / 5 + (7 - 3)));
  -- Parentheses, even when unnecessary, improve readability:
 DBMS_OUTPUT.PUT_LINE('(salary * 0.05) + (commission * 0.25) = '
   || TO_CHAR((salary * 0.05) + (commission * 0.25))
 );
 DBMS_OUTPUT.PUT_LINE('salary * 0.05 + commission * 0.25 = '
   || TO CHAR(salary * 0.05 + commission * 0.25)
 );
END;
/
```

```
5 + 12 / 4 = 8

12 / 4 + 5 = 8

8 + 6 / 2 = 11

(8 + 6) / 2 = 7

100 + (20 / 5 + (7 - 3)) = 108

(salary * 0.05) + (commission * 0.25) = 3000.025

salary * 0.05 + commission * 0.25 = 3000.025
```

## Logical Operators

The logical operators AND, OR, and NOT follow a tri-state logic.

AND and OR are binary operators; NOT is a unary operator.

x	У	x AND y	x OR y	NOT x
TRUE	TRUE	TRUE	TRUE	FALSE
TRUE	FALSE	FALSE	TRUE	FALSE
TRUE	NULL	NULL	TRUE	FALSE
FALSE	TRUE	FALSE	TRUE	TRUE
FALSE	FALSE	FALSE	FALSE	TRUE
FALSE	NULL	FALSE	NULL	TRUE
NULL	TRUE	NULL	TRUE	NULL
NULL	FALSE	FALSE	NULL	NULL
NULL	NULL	NULL	NULL	NULL

Table 3-4 Logical Truth Table

AND returns TRUE if and only if both operands are TRUE.

OR returns TRUE if either operand is TRUE.

NOT returns the opposite of its operand, unless the operand is NULL. NOTNULL returns NULL, because NULL is an indeterminate value.

#### Example 3-34 Procedure Prints BOOLEAN Variable

This example creates a procedure, print\_boolean, that prints the value of a BOOLEAN variable. The procedure uses the "IS [NOT] NULL Operator". Several examples in this chapter invoke print boolean.

```
CREATE OR REPLACE PROCEDURE print_boolean (
    b_name VARCHAR2,
    b_value BOOLEAN
) AUTHID DEFINER IS
BEGIN
    IF b_value IS NULL THEN
        DBMS_OUTPUT.PUT_LINE (b_name || ' = NULL');
    ELSIF b_value = TRUE THEN
        DBMS_OUTPUT.PUT_LINE (b_name || ' = TRUE');
    ELSE
        DBMS_OUTPUT.PUT_LINE (b_name || ' = FALSE');
    END IF;
END;
```

#### Example 3-35 AND Operator

/

As Table 3-4 and this example show, AND returns TRUE if and only if both operands are TRUE.

```
DECLARE
 PROCEDURE print_x_and_y (
   x BOOLEAN,
   y BOOLEAN
 ) IS
 BEGIN
  print boolean ('x', x);
  print boolean ('y', y);
  print boolean ('x AND y', x AND y);
END print x and y;
BEGIN
print_x_and_y (FALSE, FALSE);
print_x_and_y (TRUE, FALSE);
print_x_and_y (FALSE, TRUE);
print_x_and_y (TRUE, TRUE);
print_x_and_y (TRUE, NULL);
print_x_and_y (FALSE, NULL);
print x and y (NULL, TRUE);
print x and y (NULL, FALSE);
END;
/
```

#### Result:

```
x = FALSE
y = FALSE
x AND y = FALSE
x = TRUE
y = FALSE
x AND y = FALSE
x = FALSE
y = TRUE
x AND y = FALSE
\mathbf{x} = \mathbf{TRUE}
y = TRUE
x AND y = TRUE
x = TRUE
y = NULL
x AND y = NULL
x = FALSE
y = NULL
x AND y = FALSE
x = NULL
y = TRUE
x AND y = NULL
x = NULL
y = FALSE
x AND y = FALSE
```

#### Example 3-36 OR Operator

As Table 3-4 and this example show, OR returns TRUE if either operand is TRUE. (This example invokes the print boolean procedure from Example 3-34.)

```
DECLARE
  PROCEDURE print_x_or_y (
   x BOOLEAN,
   y BOOLEAN
  ) IS
  BEGIN
   print boolean ('x', x);
   print boolean ('y', y);
   print_boolean ('x OR y', x OR y);
  END print x or y;
BEGIN
  print x or y (FALSE, FALSE);
 print x or y (TRUE, FALSE);
  print x or y (FALSE, TRUE);
  print x or y (TRUE, TRUE);
  print x or y (TRUE, NULL);
  print x or y (FALSE, NULL);
 print x or y (NULL, TRUE);
  print x or y (NULL, FALSE);
END;
/
```

Result:

```
x = FALSE
y = FALSE
x OR y = FALSE
\mathbf{x} = \mathbf{TRUE}
y = FALSE
x \text{ OR } y = \text{TRUE}
\mathbf{x} = FALSE
y = TRUE
x \text{ OR } y = \text{TRUE}
\mathbf{x} = \mathbf{TRUE}
y = TRUE
x OR y = TRUE
\mathbf{x} = \mathbf{TRUE}
y = NULL
x OR y = TRUE
x = FALSE
y = NULL
x OR y = NULL
x = NULL
y = TRUE
x \text{ OR } y = \text{TRUE}
x = NULL
y = FALSE
x OR y = NULL
```

#### Example 3-37 NOT Operator

As Table 3-4 and this example show, NOT returns the opposite of its operand, unless the operand is NULL. NOT NULL returns NULL, because NULL is an indeterminate value. (This example invokes the print boolean procedure from Example 3-34.)

```
DECLARE
PROCEDURE print_not_x (
    x BOOLEAN
) IS
BEGIN
    print_boolean ('x', x);
    print_boolean ('NOT x', NOT x);
END print_not_x;
BEGIN
    print_not_x (TRUE);
    print_not_x (FALSE);
    print_not_x (NULL);
END;
/
```

```
x = TRUE
NOT x = FALSE
x = FALSE
NOT x = TRUE
x = NULL
NOT x = NULL
```

#### Example 3-38 NULL Value in Unequal Comparison

In this example, you might expect the sequence of statements to run because x and y seem unequal. But, NULL values are indeterminate. Whether x equals y is unknown. Therefore, the IF condition yields NULL and the sequence of statements is bypassed.

```
DECLARE
   x NUMBER := 5;
   y NUMBER := NULL;
BEGIN
   IF x != y THEN -- yields NULL, not TRUE
    DBMS_OUTPUT.PUT_LINE('x != y'); -- not run
   ELSIF x = y THEN -- also yields NULL
   DBMS_OUTPUT.PUT_LINE('x = y');
   ELSE
    DBMS_OUTPUT.PUT_LINE
    ('Can''t tell if x and y are equal or not.');
   END IF;
END;
/
```

#### Result:

Can't tell if x and y are equal or not.

#### Example 3-39 NULL Value in Equal Comparison

In this example, you might expect the sequence of statements to run because a and b seem equal. But, again, that is unknown, so the IF condition yields NULL and the sequence of statements is bypassed.

```
DECLARE

a NUMBER := NULL;

b NUMBER := NULL;

BEGIN
```

```
IF a = b THEN -- yields NULL, not TRUE
   DBMS_OUTPUT.PUT_LINE('a = b'); -- not run
ELSIF a != b THEN -- yields NULL, not TRUE
   DBMS_OUTPUT.PUT_LINE('a != b'); -- not run
ELSE
   DBMS_OUTPUT.PUT_LINE('Can''t tell if two NULLs are equal');
END IF;
END;
/
```

Can't tell if two NULLs are equal

#### Example 3-40 NOT NULL Equals NULL

In this example, the two IF statements appear to be equivalent. However, if either x or y is NULL, then the first IF statement assigns the value of y to high and the second IF statement assigns the value of x to high.

```
DECLARE
 x INTEGER := 2;
 Y INTEGER := 5;
 high INTEGER;
BEGIN
 IF (x > y)
             -- If x or y is NULL, then (x > y) is NULL
   THEN high := x; -- run if (x > y) is TRUE
   ELSE high := y; -- run if (x > y) is FALSE or NULL
 END IF;
  IF NOT (x > y) -- If x or y is NULL, then NOT (x > y) is NULL
   THEN high := y; -- run if NOT (x > y) is TRUE
   ELSE high := x; -- run if NOT (x > y) is FALSE or NULL
 END IF;
END;
/
```

#### Example 3-41 Changing Evaluation Order of Logical Operators

This example invokes the print\_boolean procedure from Example 3-34 three times. The third and first invocation are logically equivalent—the parentheses in the third invocation only improve readability. The parentheses in the second invocation change the order of operation.

```
DECLARE
  x BOOLEAN := FALSE;
  y BOOLEAN := FALSE;
BEGIN
  print_boolean ('NOT x AND y', NOT x AND y);
  print_boolean ('NOT (x AND y)', NOT (x AND y));
  print_boolean ('(NOT x) AND y', (NOT x) AND y);
END;
/
```

#### Result:

NOT x AND y = FALSENOT (x AND y) = TRUE (NOT x) AND y = FALSE

# Short-Circuit Evaluation

When evaluating a logical expression, PL/SQL uses **short-circuit evaluation**. That is, PL/SQL stops evaluating the expression as soon as it can determine the result.

Therefore, you can write expressions that might otherwise cause errors.

In Example 3-42, short-circuit evaluation prevents the OR expression from causing a divide-byzero error. When the value of on\_hand is zero, the value of the left operand is TRUE, so PL/SQL does not evaluate the right operand. If PL/SQL evaluated both operands before applying the OR operator, the right operand would cause a division by zero error.

#### Example 3-42 Short-Circuit Evaluation

```
DECLARE
on_hand INTEGER := 0;
on_order INTEGER := 100;
BEGIN
-- Does not cause divide-by-zero error;
-- evaluation stops after first expression
IF (on_hand = 0) OR ((on_order / on_hand) < 5) THEN
DBMS_OUTPUT.PUT_LINE('On hand quantity is zero.');
END IF;
END;
/
```

#### Result:

On hand quantity is zero.

# **Comparison Operators**

Comparison operators compare one expression to another. The result is always either TRUE, FALSE, or NULL.

If the value of one expression is NULL, then the result of the comparison is also NULL.

The comparison operators are:

- IS [NOT] NULL Operator
- Relational Operators
- LIKE Operator
- BETWEEN Operator
- IN Operator

## Note:

Character comparisons are affected by NLS parameter settings, which can change at runtime. Therefore, character comparisons are evaluated at runtime, and the same character comparison can have different values at different times. For information about NLS parameters that affect character comparisons, see *Oracle Database Globalization Support Guide*.

## Note:

Using CLOB values with comparison operators can create temporary LOB values. Ensure that your temporary tablespace is large enough to handle them.

## IS [NOT] NULL Operator

The IS NULL operator returns the BOOLEAN value TRUE if its operand is NULL or FALSE if it is not NULL. The IS NOT NULL operator does the opposite.

Comparisons involving NULL values always yield NULL.

To test whether a value is NULL, use IF value IS NULL, as in these examples:

- Example 3-14, "Variable Initialized to NULL by Default"
- Example 3-34, "Procedure Prints BOOLEAN Variable"
- Example 3-55, "Searched CASE Expression with WHEN ... IS NULL"

## **Relational Operators**

This table summarizes the relational operators.

Table 3-5 Relational Operators

Operator	Meaning	
=	equal to	
<>, !=, ~=, ^=	not equal to	
<	less than	
>	greater than	
<=	less than or equal to	
>=	greater than or equal to	

#### Topics

- Arithmetic Comparisons
- BOOLEAN Comparisons
- Character Comparisons
- Date Comparisons

## Arithmetic Comparisons

One number is greater than another if it represents a larger quantity.

Real numbers are stored as approximate values, so Oracle recommends comparing them for equality or inequality.

#### Example 3-43 Relational Operators in Expressions

This example invokes the print\_boolean procedure from Example 3-35 to print the values of expressions that use relational operators to compare arithmetic values.

```
BEGIN
print_boolean ('(2 + 2 = 4)', 2 + 2 = 4);
print_boolean ('(2 + 2 <> 4)', 2 + 2 <> 4);
print_boolean ('(2 + 2 != 4)', 2 + 2 <> 4);
print_boolean ('(2 + 2 ~= 4)', 2 + 2 ~= 4);
print_boolean ('(2 + 2 ~= 4)', 2 + 2 ~= 4);
print_boolean ('(1 < 2)', 1 < 2);
print_boolean ('(1 > 2)', 1 > 2);
print_boolean ('(1 >= 2)', 1 <= 2);
print_boolean ('(1 >= 1)', 1 >= 1);
END;
/
```

#### Result:

```
(2 + 2 = 4) = TRUE

(2 + 2 <> 4) = FALSE

(2 + 2 != 4) = FALSE

(2 + 2 ~= 4) = FALSE

(2 + 2 ~= 4) = FALSE

(1 < 2) = TRUE

(1 > 2) = FALSE

(1 <= 2) = TRUE

(1 >= 1) = TRUE
```

## **BOOLEAN Comparisons**

By definition, TRUE is greater than FALSE. Any comparison with NULL returns NULL.

## **Character Comparisons**

By default, one character is greater than another if its binary value is larger.

For example, this expression is true:

'y' > 'r'

Strings are compared character by character. For example, this expression is true:

```
'Kathy' > 'Kathryn'
```

If you set the initialization parameter NLS\_COMP=ANSI, string comparisons use the collating sequence identified by the NLS\_SORT initialization parameter.

A **collating sequence** is an internal ordering of the character set in which a range of numeric codes represents the individual characters. One character value is greater than another if its internal numeric value is larger. Each language might have different rules about where such characters occur in the collating sequence. For example, an accented letter might be sorted differently depending on the database character set, even though the binary value is the same in each case.

By changing the value of the NLS\_SORT parameter, you can perform comparisons that are caseinsensitive and accent-insensitive.

A **case-insensitive comparison** treats corresponding uppercase and lowercase letters as the same letter. For example, these expressions are true:

```
'a' = 'A'
'Alpha' = 'ALPHA'
```

To make comparisons case-insensitive, append \_CI to the value of the NLS\_SORT parameter (for example, BINARY CI or XGERMAN CI).

An **accent-insensitive comparison** is case-insensitive, and also treats letters that differ only in accents or punctuation characters as the same letter. For example, these expressions are true:

```
'Cooperate' = 'Co-Operate'
'Co-Operate' = 'coöperate'
```

To make comparisons both case-insensitive and accent-insensitive, append \_AI to the value of the NLS SORT parameter (for example, BINARY AI or FRENCH M AI).

Semantic differences between the CHAR and VARCHAR2 data types affect character comparisons.

For more information, see "Value Comparisons".

## **Date Comparisons**

One date is greater than another if it is more recent.

For example, this expression is true:

```
'01-JAN-91' > '31-DEC-90'
```

## LIKE Operator

The LIKE operator compares a character, string, or CLOB value to a pattern and returns TRUE if the value matches the pattern and FALSE if it does not.

Case is significant.

The pattern can include the two wildcard characters underscore () and percent sign (%).

Underscore matches exactly one character.

Percent sign (%) matches zero or more characters.

To search for the percent sign or underscore, define an escape character and put it before the percent sign or underscore.

# See Also: Oracle Database SQL Language Reference for more information about LIKE Oracle Database SQL Language Reference for information about REGEXP\_LIKE, which is similar to LIKE

#### Example 3-44 LIKE Operator in Expression

The string 'Johnson' matches the pattern 'J%s\_n' but not 'J%S\_N', as this example shows.

```
DECLARE
 PROCEDURE compare (
   value VARCHAR2,
   pattern VARCHAR2
 ) IS
 BEGIN
   IF value LIKE pattern THEN
     DBMS_OUTPUT.PUT_LINE ('TRUE');
   ELSE
     DBMS_OUTPUT.PUT_LINE ('FALSE');
   END IF;
 END;
BEGIN
 compare('Johnson', 'J%s_n');
 compare('Johnson', 'J%S N');
END;
/
```

#### Result:

TRUE FALSE

#### Example 3-45 Escape Character in Pattern

This example uses the backslash as the escape character, so that the percent sign in the string does not act as a wildcard.

```
DECLARE
PROCEDURE half_off (sale_sign VARCHAR2) IS
BEGIN

IF sale_sign LIKE '50\% off!' ESCAPE '\' THEN
DBMS_OUTPUT.PUT_LINE ('TRUE');
ELSE
DBMS_OUTPUT.PUT_LINE ('FALSE');
END IF;
END;
BEGIN
half_off('Going out of business!');
half_off('50% off!');
END;
/
```

Result:

FALSE TRUE

## **BETWEEN** Operator

The BETWEEN operator tests whether a value lies in a specified range.

The value of the expression x BETWEEN a AND b is defined to be the same as the value of the expression (x>=a) AND (x<=b). The expression x will only be evaluated once.

```
See Also:
Oracle Database SQL Language Reference for more information about BETWEEN
```

#### Example 3-46 BETWEEN Operator in Expressions

This example invokes the print\_boolean procedure from Example 3-34 to print the values of expressions that include the BETWEEN operator.

```
BEGIN
    print_boolean ('2 BETWEEN 1 AND 3', 2 BETWEEN 1 AND 3);
    print_boolean ('2 BETWEEN 2 AND 3', 2 BETWEEN 2 AND 3);
    print_boolean ('2 BETWEEN 1 AND 2', 2 BETWEEN 1 AND 2);
    print_boolean ('2 BETWEEN 3 AND 4', 2 BETWEEN 3 AND 4);
END;
/
```

#### Result:

2 BETWEEN 1 AND 3 = TRUE 2 BETWEEN 2 AND 3 = TRUE 2 BETWEEN 1 AND 2 = TRUE 2 BETWEEN 3 AND 4 = FALSE

## **IN Operator**

The IN operator tests set membership.

x IN (set) returns TRUE only if x equals a member of set.

#### 💉 See Also:

Oracle Database SQL Language Reference for more information about IN

#### Example 3-47 IN Operator in Expressions

This example invokes the print\_boolean procedure from Example 3-34 to print the values of expressions that include the IN operator.

```
DECLARE
  letter VARCHAR2(1) := 'm';
BEGIN
  print_boolean (
```

```
'letter IN (''a'', ''b'', ''c'')',
    letter IN ('a', 'b', 'c')
);
print_boolean (
    'letter IN (''z'', ''m'', ''y'', ''p'')',
    letter IN ('z', 'm', 'y', 'p')
);
END;
/
```

letter IN ('a', 'b', 'c') = FALSE
letter IN ('z', 'm', 'y', 'p') = TRUE

#### Example 3-48 IN Operator with Sets with NULL Values

This example shows what happens when *set* includes a NULL value. This invokes the print boolean procedure from Example 3-34.

```
DECLARE
    a INTEGER; -- Initialized to NULL by default
    b INTEGER := 10;
    c INTEGER := 100;
BEGIN
    print_boolean ('100 IN (a, b, c)', 100 IN (a, b, c));
    print_boolean ('100 NOT IN (a, b, c)', 100 NOT IN (a, b, c));
    print_boolean ('100 IN (a, b)', 100 IN (a, b));
    print_boolean ('100 NOT IN (a, b)', 100 NOT IN (a, b));
    print_boolean ('a IN (a, b)', a IN (a, b));
    print_boolean ('a NOT IN (a, b)', a NOT IN (a, b));
END;
/
```

#### Result:

```
100 IN (a, b, c) = TRUE
100 NOT IN (a, b, c) = FALSE
100 IN (a, b) = NULL
100 NOT IN (a, b) = NULL
a IN (a, b) = NULL
a NOT IN (a, b) = NULL
```

# **BOOLEAN Expressions**

A BOOLEAN expression is an expression that returns a BOOLEAN value—TRUE, FALSE, or NULL.

The simplest BOOLEAN expression is a BOOLEAN literal, constant, or variable. The following are also BOOLEAN expressions:

```
NOT boolean_expression
boolean_expression relational_operator boolean_expression
boolean expression { AND | OR } boolean expression
```

For a list of relational operators, see Table 3-5. For the complete syntax of a BOOLEAN expression, see "*boolean\_expression* ::=".

Typically, you use BOOLEAN expressions as conditions in control statements (explained in PL/SQL Control Statements) and in WHERE clauses of DML statements.

You can use a BOOLEAN variable itself as a condition; you need not compare it to the value TRUE or FALSE.

#### Example 3-49 Equivalent BOOLEAN Expressions

In this example, the conditions in the loops are equivalent.

```
DECLARE
 done BOOLEAN;
BEGIN
 -- These WHILE loops are equivalent
 done := FALSE;
 WHILE done = FALSE
   LOOP
     done := TRUE;
   END LOOP;
 done := FALSE;
 WHILE NOT (done = TRUE)
   LOOP
     done := TRUE;
   END LOOP;
 done := FALSE;
 WHILE NOT done
   LOOP
     done := TRUE;
   END LOOP;
END;
```

# **CASE** Expressions

#### Topics

- Simple CASE Expression
- Searched CASE Expression

## Simple CASE Expression

For this explanation, assume that a simple CASE expression has this syntax:

```
CASE selector
WHEN { selector_value_1a | dangling_predicate_1a }
  [, ..., { selector_value_1n | dangling_predicate_1n } ] THEN result_1
WHEN { selector_value_2a | dangling_predicate_2a }
  [, ..., { selector_value_2n | dangling_predicate_2n } ] THEN result_2
...
WHEN { selector_value_na | dangling_predicate_na }
  [, ..., { selector_value_nn | dangling_predicate_nn }] THEN result_n
  [ELSE
   else_result ]
END;
```

The selector is an expression (typically a single variable). Each selector\_value and each result can be either a literal or an expression. A *dangling\_predicate* can also be used either instead of or in combination with one or multiple selector\_values. At least one result must not be the literal NULL.

A *dangling\_predicate* is an ordinary expression with its left operand missing, for example < 2. Using a *dangling\_predicate* allows for more complicated comparisons that would otherwise require a searched CASE statement.

The simple CASE expression returns the first <code>result</code> for which the <code>selector\_value</code> or <code>dangling\_predicate</code> matches <code>selector</code>. Remaining expressions are not evaluated. If no <code>selector\_value</code> or <code>dangling\_predicate</code> matches <code>selector</code>, the CASE expression returns <code>else result</code> if it exists and <code>NULL</code> otherwise.

A list of comma-separated selector\_values and or dangling\_predicates can be used with each WHEN clause if multiple choices map to a single result. As with selector\_values and dangling\_predicates listed in separate WHEN clauses, only the first selector\_value or dangling predicate to match the selector is evaluated.

#### See Also:

"*simple\_case\_expression* ::=" for the complete syntax

#### Example 3-50 Simple CASE Expression

This example assigns the value of a simple CASE expression to the variable appraisal. The *selector* is grade.

```
DECLARE
grade CHAR(1) := 'B';
appraisal VARCHAR2(20);
BEGIN
appraisal :=
CASE grade
    WHEN 'A' THEN 'Excellent'
    WHEN 'B' THEN 'Very Good'
    WHEN 'B' THEN 'Very Good'
    WHEN 'C' THEN 'Good'
    WHEN 'C' THEN 'Good'
    WHEN 'D' THEN 'Fair'
    WHEN 'F' THEN 'Poor'
    ELSE 'No such grade'
END;
DBMS_OUTPUT.PUT_LINE ('Grade ' || grade || ' is ' || appraisal);
END;
/
```

#### Result:

Grade B is Very Good

#### Example 3-51 Simple CASE Expression with WHEN NULL

If selector has the value NULL, it cannot be matched by WHEN NULL, as this example shows.

Instead, use a searched CASE expression with WHEN boolean\_expression IS NULL, as in Example 3-55.

```
DECLARE
 grade CHAR(1); -- NULL by default
 appraisal VARCHAR2(20);
BEGIN
  appraisal :=
 CASE grade
   WHEN NULL THEN 'No grade assigned'
   WHEN 'A' THEN 'Excellent'
   WHEN 'B' THEN 'Very Good'
   WHEN 'C' THEN 'Good'
   WHEN 'D' THEN 'Fair'
   WHEN 'F' THEN 'Poor'
   ELSE 'No such grade'
 END;
 DBMS_OUTPUT.PUT_LINE ('Grade ' || grade || ' is ' || appraisal);
END;
/
```

Grade is No such grade

#### Example 3-52 Simple CASE Expression with List of selector\_values

```
DECLARE
   salary NUMBER := 7000;
   salary_level VARCHAR2(20);
BEGIN
   salary_level :=
   CASE salary
     WHEN 1000, 2000 THEN 'low'
     WHEN 3000, 4000, 5000 THEN 'normal'
     WHEN 6000, 7000, 8000 THEN 'high'
     ELSE 'executive pay'
   END;
   DBMS_OUTPUT.PUT_LINE('Salary level is: ' || salary_level);
END;
//
```

#### Result:

Salary level is: high

#### Example 3-53 Simple CASE Expression with Dangling Predicates

The value of data\_val/2 is used as the left operand during evaluation of the dangling\_predicates. Using a simple CASE expression as opposed to a searched CASE expression in this situation avoids repeated computation of the selector expression. You can use a list of conditions with any combination of selector values and dangling predicates.

```
DECLARE
    data_val NUMBER := 30;
    status VARCHAR2(20);
BEGIN
    status :=
    CASE data_val/2
    WHEN < 0, > 50 THEN 'outlier'
```

```
WHEN BETWEEN 10 AND 30 THEN 'good'
ELSE 'bad'
END;
DBMS_OUTPUT.PUT_LINE('The data status is: ' || status);
END;
/
```

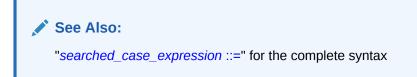

The data status is: good

## Searched CASE Expression

For this explanation, assume that a searched CASE expression has this syntax:

```
CASE
WHEN boolean_expression_1 THEN result_1
WHEN boolean_expression_2 THEN result_2
...
WHEN boolean_expression_n THEN result_n
[ ELSE
    else_result ]
END]
```

The searched CASE expression returns the first result for which boolean\_expression is TRUE. Remaining expressions are not evaluated. If no boolean\_expression is TRUE, the CASE expression returns else result if it exists and NULL otherwise.

#### Example 3-54 Searched CASE Expression

This example assigns the value of a searched CASE expression to the variable appraisal.

```
DECLARE
 grade CHAR(1) := 'B';
 appraisal VARCHAR2(120);
 id NUMBER := 8429862;
 attendance NUMBER := 150;
 min days CONSTANT NUMBER := 200;
 FUNCTION attends this school (id NUMBER)
   RETURN BOOLEAN IS
 BEGIN
   RETURN TRUE;
 END;
BEGIN
 appraisal :=
 CASE
   WHEN attends_this_school(id) = FALSE
     THEN 'Student not enrolled'
   WHEN grade = 'F' OR attendance < min_days
     THEN 'Poor (poor performance or bad attendance)'
   WHEN grade = 'A' THEN 'Excellent'
```

```
WHEN grade = 'B' THEN 'Very Good'
WHEN grade = 'C' THEN 'Good'
WHEN grade = 'D' THEN 'Fair'
ELSE 'No such grade'
END;
DBMS_OUTPUT.PUT_LINE
('Result for student ' || id || ' is ' || appraisal);
END;
/
```

Result for student 8429862 is Poor (poor performance or bad attendance)

#### Example 3-55 Searched CASE Expression with WHEN ... IS NULL

This example uses a searched CASE expression to solve the problem in Example 3-51.

```
DECLARE
 grade CHAR(1); -- NULL by default
 appraisal VARCHAR2(20);
BEGIN
 appraisal :=
   CASE
     WHEN grade IS NULL THEN 'No grade assigned'
     WHEN grade = 'A' THEN 'Excellent'
     WHEN grade = 'B' THEN 'Very Good'
     WHEN grade = 'C' THEN 'Good'
     WHEN grade = 'D' THEN 'Fair'
     WHEN grade = 'F' THEN 'Poor'
     ELSE 'No such grade'
   END;
   DBMS OUTPUT.PUT LINE ('Grade ' || grade || ' is ' || appraisal);
END;
```

#### Result:

Grade is No grade assigned

# SQL Functions in PL/SQL Expressions

In PL/SQL expressions, you can use all SQL functions except:

- Aggregate functions (such as AVG and COUNT)
- Aggregate function JSON ARRAYAGG
- Aggregate function JSON DATAGUIDE
- Aggregate function JSON MERGEPATCH
- Aggregate function JSON OBJECTAGG
- JSON TABLE
- JSON TRANSFORM
- JSON condition JSON\_TEXTCONTAINS
- Analytic functions (such as LAG and RATIO\_TO\_REPORT)

- Conversion function BIN\_TO\_NUM
- Data mining functions (such as CLUSTER\_ID and FEATURE\_VALUE)
- Encoding and decoding functions (such as DECODE and DUMP)
- Model functions (such as ITERATION NUMBER and PREVIOUS)
- Object reference functions (such as REF and VALUE)
- XML functions
- These collation SQL operators and functions:
  - COLLATE operator
  - COLLATION function
  - NLS\_COLLATION\_ID function
  - NLS COLLATION NAME function
- These miscellaneous functions:
  - CUBE\_TABLE
  - DATAOBJ\_TO\_PARTITION
  - LNNVL
  - SYS\_CONNECT\_BY\_PATH
  - SYS\_TYPEID
  - WIDTH\_BUCKET

PL/SQL supports an overload of BITAND for which the arguments and result are BINARY INTEGER.

When used in a PL/SQL expression, the RAWTOHEX function accepts an argument of data type RAW and returns a VARCHAR2 value with the hexadecimal representation of bytes that comprise the value of the argument. Arguments of types other than RAW can be specified only if they can be implicitly converted to RAW. This conversion is possible for CHAR, VARCHAR2, and LONG values that are valid arguments of the HEXTORAW function, and for LONG RAW and BLOB values of up to 16380 bytes.

# Static Expressions

A **static expression** is an expression whose value can be determined at compile time—that is, it does not include character comparisons, variables, or function invocations. Static expressions are the only expressions that can appear in conditional compilation directives.

#### **Definition of Static Expression**

- An expression is static if it is the NULL literal.
- An expression is static if it is a character, numeric, or boolean literal.
- An expression is static if it is a reference to a static constant.
- An expression is static if it is a reference to a conditional compilation variable begun with \$\$ .
- An expression is static if it is an operator is allowed in static expressions, if all of its operands are static, and if the operator does not raise an exception when it is evaluated on those operands.

#### Table 3-6 Operators Allowed in Static Expressions

Operators	Operators Category
	1 07
0	Expression delimiter
**	exponentiation
*, /,+, -	Arithmetic operators for multiplication, division, addition or positive, subtraction or negative
=, !=, <, <=, >=, > IS [NOT] NULL	Comparison operators
NOT	Logical operator
[NOT] LIKE, [NOT] LIKE2, [NOT] LIKE4, [NOT] LIKEC	Pattern matching operators
XOR	Binary operator

This list shows functions allowed in static expressions.

- ABS
- ACOS
- ASCII
- ASCIISTR
- ASIN
- ATAN
- ATAN2
- BITAND
- CEIL
- CHR
- COMPOSE
- CONVERT
- COS
- COSH
- DECOMPOSE
- EXP
- FLOOR
- HEXTORAW
- INSTR
- INSTRB
- INSTRC
- INSTR2
- INSTR4
- IS [NOT] INFINITE
- IS [NOT] NAN

- LENGTH
- LENGTH2
- LENGTH4
- LENGTHB
- LENGTHC
- LN
- LOG
- LOWER
- LPAD
- LTRIM
- MOD
- NVL
- POWER
- RAWTOHEX
- REM
- REMAINDER
- REPLACE
- ROUND
- RPAD
- RTRIM
- SIGN
- SIN
- SINH
- SQRT
- SUBSTR
- SUBSTR2
- SUBSTR4
- SUBSTRB
- SUBSTRC
- TAN
- TANH
- TO\_BINARY\_DOUBLE
- TO\_BINARY\_FLOAT
- TO\_BOOLEAN
- TO\_CHAR
- TO\_NUMBER
- TRIM
- TRUNC

• UPPER

Static expressions can be used in the following subtype declarations:

- Length of string types (VARCHAR2, NCHAR, CHAR, NVARCHAR2, RAW, and the ANSI equivalents)
- Scale and precision of NUMBER types and subtypes such as FLOAT
- Interval type precision (year, month ,second)
- Time and Timestamp precision
- VARRAY **bounds**
- Bounds of ranges in type declarations

In each case, the resulting type of the static expression must be the same as the declared item subtype and must be in the correct range for the context.

#### Topics

- PLS\_INTEGER Static Expressions
- BOOLEAN Static Expressions
- VARCHAR2 Static Expressions
- Static Constants

See Also:

"Expressions" for general information about expressions

# PLS\_INTEGER Static Expressions

PLS INTEGER static expressions are:

PLS\_INTEGER literals

For information about literals, see "Literals".

PLS\_INTEGER static constants

For information about static constants, see "Static Constants".

• NULL

#### 🖍 See Also:

"PLS\_INTEGER and BINARY\_INTEGER Data Types" for information about the PLS\_INTEGER data type

## **BOOLEAN Static Expressions**

BOOLEAN static expressions are:

• BOOLEAN literals (TRUE, FALSE, Or NULL)

BOOLEAN static constants

For information about static constants, see "Static Constants".

- Where *x* and *y* are PLS INTEGER static expressions:
  - x > y
  - x < y
  - $x \ge y$
  - $x \le y$
  - x = y
  - $x \leftrightarrow y$

For information about PLS\_INTEGER static expressions, see "PLS\_INTEGER Static Expressions".

- Where *x* and *y* are BOOLEAN expressions:
  - NOT y
  - x AND y
  - x OR y
  - x > y
  - $x \ge y$
  - x = y
  - x <= y
  - x <> y

For information about BOOLEAN expressions, see "BOOLEAN Expressions".

- Where x is a static expression:
  - x IS NULL
  - x IS NOT NULL

For information about static expressions, see "Static Expressions".

#### See Also:

"BOOLEAN Data Type" for information about the BOOLEAN data type

# VARCHAR2 Static Expressions

VARCHAR2 static expressions are:

- String literal with maximum size of 32,767 bytes For information about literals, see "Literals".
- NULL
- TO\_CHAR(x), where x is a PLS\_INTEGER static expression

For information about the TO\_CHAR function, see Oracle Database SQL Language Reference.

TO\_CHAR(x, f, n) where x is a PLS\_INTEGER static expression and f and n are VARCHAR2 static expressions

For information about the TO\_CHAR function, see Oracle Database SQL Language Reference.

• x || y where x and y are VARCHAR2 or PLS INTEGER static expressions

For information about PLS\_INTEGER static expressions, see "PLS\_INTEGER Static Expressions".

See Also:

"CHAR and VARCHAR2 Variables" for information about the VARCHAR2 data type

### Static Constants

A static constant is declared in a package specification with this syntax:

constant\_name CONSTANT data\_type := static\_expression;

The type of *static\_expression* must be the same as *data\_type* (either BOOLEAN or PLS INTEGER).

The static constant must always be referenced as *package\_name.constant\_name*, even in the body of the *package\_name* package.

If you use *constant\_name* in the BOOLEAN expression in a conditional compilation directive in a PL/SQL unit, then the PL/SQL unit depends on the package *package\_name*. If you alter the package specification, the dependent PL/SQL unit might become invalid and need recompilation (for information about the invalidation of dependent objects, see *Oracle Database Development Guide*).

If you use a package with static constants to control conditional compilation in multiple PL/SQL units, Oracle recommends that you create only the package specification, and dedicate it exclusively to controlling conditional compilation. This practice minimizes invalidations caused by altering the package specification.

To control conditional compilation in a single PL/SQL unit, you can set flags in the PLSQL\_CCFLAGS compilation parameter. For information about this parameter, see "Assigning Values to Inquiry Directives" and Oracle Database Reference.

#### See Also:

- "Declaring Constants" for general information about declaring constants
- PL/SQL Packages for more information about packages
- Oracle Database Development Guide for more information about schema object dependencies

#### Example 3-56 Static Constants

In this example, the package <code>my\_debug</code> defines the static constants <code>debug</code> and <code>trace</code> to control debugging and tracing in multiple PL/SQL units. The procedure <code>my\_proc1</code> uses only <code>debug</code>, and the procedure <code>my\_proc2</code> uses only <code>trace</code>, but both procedures depend on the package. However, the recompiled code might not be different. For example, if you only change the value of <code>debug</code> to <code>FALSE</code> and then recompile the two procedures, the compiled code for <code>my\_proc1</code> changes, but the compiled code for <code>my\_proc2</code> does not.

```
CREATE PACKAGE my debug IS
 debug CONSTANT BOOLEAN := TRUE;
 trace CONSTANT BOOLEAN := TRUE;
END my debug;
CREATE PROCEDURE my_proc1 AUTHID DEFINER IS
BEGIN
 $IF my debug.debug $THEN
   DBMS OUTPUT.put line('Debugging ON');
 SELSE
   DBMS OUTPUT.put line('Debugging OFF');
 $END
END my proc1;
CREATE PROCEDURE my proc2 AUTHID DEFINER IS
BEGIN
 $IF my_debug.trace $THEN
   DBMS OUTPUT.put_line('Tracing ON');
 SELSE
   DBMS OUTPUT.put_line('Tracing OFF');
 SEND
END my proc2;
```

# **Error-Reporting Functions**

PL/SQL has two error-reporting functions, SQLCODE and SQLERRM, for use in PL/SQL exceptionhandling code.

For their descriptions, see "SQLCODE Function" and "SQLERRM Function".

You cannot use the SQLCODE and SQLERRM functions in SQL statements.

# **Conditional Compilation**

Conditional compilation lets you customize the functionality of a PL/SQL application without removing source text.

For example, you can:

- Use new features with the latest database release and disable them when running the application in an older database release.
- Activate debugging or tracing statements in the development environment and hide them when running the application at a production site.

#### Topics

- How Conditional Compilation Works
- Conditional Compilation Examples
- Retrieving and Printing Post-Processed Source Text
- Conditional Compilation Directive Restrictions

# How Conditional Compilation Works

Conditional compilation uses selection directives, which are similar to IF statements, to select source text for compilation.

The condition in a selection directive usually includes an inquiry directive. Error directives raise user-defined errors. All conditional compilation directives are built from preprocessor control tokens and PL/SQL text.

#### Topics

- Preprocessor Control Tokens
- Selection Directives
- Error Directives
- Inquiry Directives
- DBMS\_DB\_VERSION Package

See Also: "Static Expressions"

## **Preprocessor Control Tokens**

A preprocessor control token identifies code that is processed before the PL/SQL unit is compiled.

#### **Syntax**

\$plsql\_identifier

There cannot be space between \$ and plsql\_identifier.

The character \$ can also appear inside *plsql\_identifier*, but it has no special meaning there.

These preprocessor control tokens are reserved:

- \$IF
- \$THEN
- \$ELSE
- \$ELSIF
- \$ERROR

For information about plsql identifier, see "Identifiers".

# Selection Directives

A selection directive selects source text to compile.

#### Syntax

```
$IF boolean_static_expression $THEN
    text
[ $ELSIF boolean_static_expression $THEN
    text
]...
[ $ELSE
    text
$END
]
```

For the syntax of *boolean\_static\_expression*, see "BOOLEAN Static Expressions". The *text* can be anything, but typically, it is either a statement (see "*statement* ::=") or an error directive (explained in "Error Directives").

The selection directive evaluates the BOOLEAN static expressions in the order that they appear until either one expression has the value TRUE or the list of expressions is exhausted. If one expression has the value TRUE, its text is compiled, the remaining expressions are not evaluated, and their text is not analyzed. If no expression has the value TRUE, then if \$ELSE is present, its text is compiled; otherwise, no text is compiled.

For examples of selection directives, see "Conditional Compilation Examples".

#### See Also:

"Conditional Selection Statements" for information about the IF statement, which has the same logic as the selection directive

# **Error Directives**

An **error directive** produces a user-defined error message during compilation.

#### Syntax

\$ERROR varchar2\_static\_expression \$END

It produces this compile-time error message, where *string* is the value of *varchar2 static expression*:

PLS-00179: \$ERROR: string

For the syntax of varchar2 static expression, see "VARCHAR2 Static Expressions".

For an example of an error directive, see Example 3-60.

# **Inquiry Directives**

An inquiry directive provides information about the compilation environment.

Syntax

\$\$name

For information about name, which is an unquoted PL/SQL identifier, see "Identifiers".

An inquiry directive typically appears in the *boolean\_static\_expression* of a selection directive, but it can appear anywhere that a variable or literal of its type can appear. Moreover, it can appear where regular PL/SQL allows only a literal (not a variable)—for example, to specify the size of a VARCHAR2 variable.

#### Topics

- Predefined Inquiry Directives
- Assigning Values to Inquiry Directives
- Unresolvable Inquiry Directives

#### **Predefined Inquiry Directives**

The predefined inquiry directives are:

• \$\$PLSQL LINE

A PLS\_INTEGER literal whose value is the number of the source line on which the directive appears in the current PL/SQL unit. An example of <code>\$\$PLSQL\_LINE</code> in a selection directive is:

\$IF \$\$PLSQL\_LINE = 32 \$THEN ...

• \$\$PLSQL\_UNIT

A VARCHAR2 literal that contains the name of the current PL/SQL unit. If the current PL/SQL unit is an anonymous block, then *\$\$PLSQL UNIT* contains a NULL value.

• \$\$PLSQL\_UNIT\_OWNER

A VARCHAR2 literal that contains the name of the owner of the current PL/SQL unit. If the current PL/SQL unit is an anonymous block, then <code>\$\$PLSQL\_UNIT\_OWNER</code> contains a <code>NULL</code> value.

• \$\$PLSQL\_UNIT\_TYPE

A VARCHAR2 literal that contains the type of the current PL/SQL unit—ANONYMOUS BLOCK, FUNCTION, PACKAGE, PACKAGE BODY, PROCEDURE, TRIGGER, TYPE, or TYPE BODY. Inside an anonymous block or non-DML trigger, \$\$PLSQL\_UNIT\_TYPE has the value ANONYMOUS BLOCK.

• \$\$plsql\_compilation\_parameter

The name *plsql\_compilation\_parameter* is a PL/SQL compilation parameter (for example, *PLSCOPE SETTINGS*). For descriptions of these parameters, see Table 2-2.

Because a selection directive needs a BOOLEAN static expression, you cannot use splsgl\_unit, splsgl\_unit\_owner, or splsgl\_unit\_type in a varchar2 comparison such as:

```
$IF $$PLSQL_UNIT = 'AWARD_BONUS' $THEN ...
$IF $$PLSQL_UNIT_OWNER IS HR $THEN ...
$IF $$PLSQL_UNIT_TYPE IS FUNCTION $THEN ...
```

However, you can compare the preceding directives to NULL. For example:

```
$IF $$PLSQL_UNIT IS NULL $THEN ...
$IF $$PLSQL_UNIT_OWNER IS NOT NULL $THEN ...
$IF $$PLSQL_UNIT_TYPE IS NULL $THEN ...
```

#### Example 3-57 Predefined Inquiry Directives

In this example, a SQL\*Plus script, uses several predefined inquiry directives as PLS\_INTEGER and VARCHAR2 literals to show how their values are assigned.

```
SOL> CREATE OR REPLACE PROCEDURE p
 2 AUTHID DEFINER IS
 3
    i PLS_INTEGER;
 4 BEGIN
 5
     DBMS OUTPUT.PUT LINE('Inside p');
 6 i := $$PLSQL LINE;
 7
    DBMS OUTPUT.PUT LINE('i = ' || i);
 8
     DBMS OUTPUT.PUT LINE ('$$PLSQL LINE = ' || $$PLSQL_LINE);
      DBMS OUTPUT.PUT LINE ('$$PLSQL UNIT = ' || $$PLSQL UNIT);
 9
10
      DBMS OUTPUT.PUT LINE ('$$PLSQL UNIT OWNER = ' || $$PLSQL UNIT OWNER);
11 DBMS OUTPUT.PUT LINE('$$PLSQL UNIT TYPE = ' || $$PLSQL_UNIT_TYPE);
12 END;
13 /
```

Procedure created.

```
SQL> BEGIN
```

```
2 p;
3 DBMS_OUTPUT.PUT_LINE('Outside p');
4 DBMS_OUTPUT.PUT_LINE('$$PLSQL_LINE = ' || $$PLSQL_LINE);
5 DBMS_OUTPUT.PUT_LINE('$$PLSQL_UNIT = ' || $$PLSQL_UNIT);
6 DBMS_OUTPUT.PUT_LINE('$$PLSQL_UNIT_OWNER = ' || $$PLSQL_UNIT_OWNER);
7 DBMS_OUTPUT.PUT_LINE('$$PLSQL_UNIT_TYPE = ' || $$PLSQL_UNIT_TYPE);
8 END;
9 /
```

#### Result:

```
Inside p
i = 6
$$PLSQL_LINE = 8
$$PLSQL_UNIT = P
$$PLSQL_UNIT_OWNER = HR
$$PLSQL_UNIT_TYPE = PROCEDURE
Outside p
$$PLSQL_LINE = 4
$$PLSQL_UNIT =
$$PLSQL_UNIT =
$$PLSQL_UNIT_OWNER =
$$PLSQL_UNIT_TYPE = ANONYMOUS BLOCK
```

```
PL/SQL procedure successfully completed.
```

#### Example 3-58 Displaying Values of PL/SQL Compilation Parameters

This example displays the current values of PL/SQL the compilation parameters.

#### Note:

In the SQL\*Plus environment, you can display the current values of initialization parameters, including the PL/SQL compilation parameters, with the command SHOW PARAMETERS. For more information about the SHOW command and its PARAMETERS option, see SQL\*Plus User's Guide and Reference.

```
BEGIN
```

```
DBMS_OUTPUT.PUT_LINE('$$PLSCOPE_SETTINGS = ' || $$PLSCOPE_SETTINGS);

DBMS_OUTPUT.PUT_LINE('$$PLSQL_CCFLAGS = ' || $$PLSQL_CCFLAGS);

DBMS_OUTPUT.PUT_LINE('$$PLSQL_CODE_TYPE = ' || $$PLSQL_CODE_TYPE);

DBMS_OUTPUT.PUT_LINE('$$PLSQL_OPTIMIZE_LEVEL = ' || $$PLSQL_OPTIMIZE_LEVEL);

DBMS_OUTPUT.PUT_LINE('$$PLSQL_WARNINGS = ' || $$PLSQL_WARNINGS);

DBMS_OUTPUT.PUT_LINE('$$NLS_LENGTH_SEMANTICS = ' || $$NLS_LENGTH_SEMANTICS);

END;
```

#### Result:

```
$$PLSCOPE_SETTINGS = IDENTIFIERS:NONE
$$PLSQL_CCFLAGS =
$$PLSQL_CODE_TYPE = INTERPRETED
$$PLSQL_OPTIMIZE_LEVEL = 2
$$PLSQL_WARNINGS = ENABLE:ALL
$$NLS_LENGTH_SEMANTICS = BYTE
```

#### Assigning Values to Inquiry Directives

You can assign values to inquiry directives with the PLSQL CCFLAGS compilation parameter.

#### For example:

```
ALTER SESSION SET PLSQL_CCFLAGS =
    'name1:value1, name2:value2, ... namen:valuen'
```

Each *value* must be either a BOOLEAN literal (TRUE, FALSE, or NULL) or PLS\_INTEGER literal. The data type of *value* determines the data type of *name*.

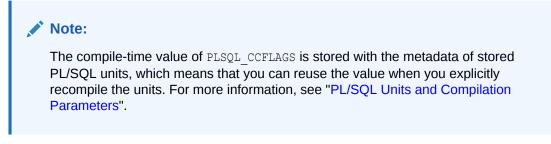

The same name can appear multiple times, with values of the same or different data types. Later assignments override earlier assignments. For example, this command sets the value of \$\$flag to 5 and its data type to PLS INTEGER:

ALTER SESSION SET PLSQL CCFLAGS = 'flag:TRUE, flag:5'

Oracle recommends against using PLSQL\_CCFLAGS to assign values to predefined inquiry directives, including compilation parameters. To assign values to compilation parameters, Oracle recommends using the ALTER SESSION statement.

For more information about the ALTER SESSION statement, see Oracle Database SQL Language Reference.

For more information about PLSQL\_CCFLAGS, see Oracle Database Reference.

#### Example 3-59 PLSQL\_CCFLAGS Assigns Value to Itself

This example uses PLSQL\_CCFLAGS to assign a value to the user-defined inquiry directive \$\$Some\_Flag and (though not recommended) to itself. Because later assignments override earlier assignments, the resulting value of \$\$Some\_Flag is 2 and the resulting value of PLSQL\_CCFLAGS is the value that it assigns to itself (99), not the value that the ALTER SESSION statement assigns to it ('Some\_Flag:1, Some\_Flag:2, PLSQL\_CCFLags:99').

```
ALTER SESSION SET
PLSQL_CCFlags = 'Some_Flag:1, Some_Flag:2, PLSQL_CCFlags:99'
/
BEGIN
DBMS_OUTPUT.PUT_LINE($$Some_Flag);
DBMS_OUTPUT.PUT_LINE($$PLSQL_CCFlags);
END;
/
Result:
```

```
2
99
```

#### Unresolvable Inquiry Directives

If the source text is not wrapped, PL/SQL issues a warning if the value of an inquiry directive cannot be determined.

If an inquiry directive (\$\$name) cannot be resolved, and the source text is not wrapped, then PL/SQL issues the warning PLW-6003 and substitutes NULL for the value of the unresolved inquiry directive. If the source text is wrapped, the warning message is disabled, so that the unresolved inquiry directive is not revealed.

For information about wrapping PL/SQL source text, see PL/SQL Source Text Wrapping.

#### DBMS\_DB\_VERSION Package

The DBMS\_DB\_VERSION package specifies the Oracle version numbers and other information useful for simple conditional compilation selections based on Oracle versions.

The DBMS\_DB\_VERSION package provides these static constants:

- The PLS INTEGER constant VERSION identifies the current Oracle Database version.
- The PLS INTEGER constant RELEASE identifies the current Oracle Database release number.
- Each BOOLEAN constant of the form VER\_LE\_v has the value TRUE if the database version is less than or equal to v; otherwise, it has the value FALSE.

• Each BOOLEAN constant of the form VER\_LE\_v\_r has the value TRUE if the database version is less than or equal to v and release is less than or equal to r; otherwise, it has the value FALSE.

For more information about the DBMS\_DB\_VERSION package, see Oracle Database PL/SQL Packages and Types Reference.

# **Conditional Compilation Examples**

Examples of conditional compilation using selection and user-defined inquiry directives.

#### Example 3-60 Code for Checking Database Version

This example generates an error message if the database version and release is less than Oracle Database 10g release 2; otherwise, it displays a message saying that the version and release are supported and uses a COMMIT statement that became available at Oracle Database 10g release 2.

```
BEGIN
$IF DBMS_DB_VERSION.VER_LE_10_1 $THEN -- selection directive begins
$ERROR 'unsupported database release' $END -- error directive
$ELSE
DBMS_OUTPUT.PUT_LINE (
    'Release ' || DBMS_DB_VERSION.VERSION || '.' ||
DBMS_DB_VERSION.RELEASE || ' is supported.'
);
-- This COMMIT syntax is newly supported in 10.2:
COMMIT WRITE IMMEDIATE NOWAIT;
$END -- selection directive ends
END;
/
```

#### Result:

Release 12.1 is supported.

#### Example 3-61 Compiling Different Code for Different Database Versions

This example sets the values of the user-defined inquiry directives <code>\$\$my\_debug</code> and <code>\$\$my\_tracing</code> and then uses conditional compilation:

- In the specification of package my\_pkg, to determine the base type of the subtype my\_real (BINARY DOUBLE is available only for Oracle Database versions 10g and later.)
- In the body of package my\_pkg, to compute the values of my\_pi and my\_e differently for different database versions
- In the procedure circle\_area, to compile some code only if the inquiry directive \$\$my debug has the value TRUE.

```
ALTER SESSION SET PLSQL_CCFLAGS = 'my_debug:FALSE, my_tracing:FALSE';
```

```
CREATE OR REPLACE PACKAGE my_pkg AUTHID DEFINER AS
SUBTYPE my_real IS
$IF DBMS_DB_VERSION.VERSION < 10 $THEN
NUMBER;
$ELSE
BINARY_DOUBLE;
$END</pre>
```

my\_pi my\_real;

```
my e my real;
END my_pkg;
CREATE OR REPLACE PACKAGE BODY my_pkg AS
BEGIN
  $IF DBMS_DB_VERSION.VERSION < 10 $THEN
   my pi := 3.14159265358979323846264338327950288420;
   my_e := 2.71828182845904523536028747135266249775;
  $ELSE
   my_pi := 3.14159265358979323846264338327950288420d;
   my_e := 2.71828182845904523536028747135266249775d;
  $END
END my_pkg;
/
CREATE OR REPLACE PROCEDURE circle_area(radius my_pkg.my_real) AUTHID DEFINER IS
 my_area my_pkg.my_real;
 my data type VARCHAR2(30);
BEGIN
 my area := my pkg.my pi * (radius**2);
 DBMS OUTPUT.PUT LINE
    ('Radius: ' || TO CHAR(radius) || ' Area: ' || TO CHAR(my area));
  $IF $$my debug $THEN
    SELECT DATA TYPE INTO my data type
    FROM USER ARGUMENTS
    WHERE OBJECT NAME = 'CIRCLE AREA'
   AND ARGUMENT_NAME = 'RADIUS';
    DBMS OUTPUT.PUT LINE
      ('Data type of the RADIUS argument is: ' || my_data_type);
  $END
END;
/
CALL DBMS PREPROCESSOR.PRINT POST PROCESSED SOURCE
 ('PACKAGE', 'HR', 'MY PKG');
Result:
PACKAGE my pkg AUTHID DEFINER AS
```

```
SUBTYPE my_real IS
BINARY_DOUBLE;
my_pi my_real;
my_e my_real;
END my_pkg;
```

Call completed.

# Retrieving and Printing Post-Processed Source Text

The DBMS\_PREPROCESSOR package provides subprograms that retrieve and print the source text of a PL/SQL unit in its post-processed form.

For information about the DBMS\_PREPROCESSOR package, see Oracle Database PL/SQL Packages and Types Reference.

#### Example 3-62 Displaying Post-Processed Source Textsource text

This example invokes the procedure DBMS\_PREPROCESSOR.PRINT\_POST\_PROCESSED\_SOURCE to print the post-processed form of my\_pkg (from "Example 3-61"). Lines of code in "Example 3-61" that are not included in the post-processed text appear as blank lines.

```
CALL DBMS_PREPROCESSOR.PRINT_POST_PROCESSED_SOURCE (
    'PACKAGE', 'HR', 'MY_PKG'
);
```

#### Result:

```
PACKAGE my_pkg AUTHID DEFINERs AS
SUBTYPE my_real IS
BINARY_DOUBLE;
my_pi my_real;
my_e my_real;
END my pkg;
```

# Conditional Compilation Directive Restrictions

Conditional compilation directives are subject to these semantic restrictions.

A conditional compilation directive cannot appear in the specification of a schema-level userdefined type (created with the "CREATE TYPE Statement"). This type specification specifies the attribute structure of the type, which determines the attribute structure of dependent types and the column structure of dependent tables.

#### **Caution**:

Using a conditional compilation directive to change the attribute structure of a type can cause dependent objects to "go out of sync" or dependent tables to become inaccessible. Oracle recommends that you change the attribute structure of a type only with the "ALTER TYPE Statement". The ALTER TYPE statement propagates changes to dependent objects.

If a conditional compilation directive is used in a schema-level type specification, the compiler raises the error PLS-00180: preprocessor directives are not supported in this context.

As all conditional compiler constructs are processed by the PL/SQL preprocessor, the SQL Parser imposes the following restrictions on the location of the first conditional compilation directive in a stored PL/SQL unit or anonymous block:

 In a package specification, a package body, a type body, a schema-level function and in a schema-level procedure, at least one nonwhitespace PL/SQL token must appear after the identifier of the unit name before a conditional compilation directive is valid.

Note:
The PL/SQL comments, "--" or "/\*", are counted as whitespace tokens.
If the token is invalid in PL/SQL, then a PLS-00103 error is issued. But if a conditional compilation directive is used in violation of this rule, then an ORA error is produced.

Example 3-63 and Example 3-64, show that the first conditional compilation directive appears after the first PL/SQL token that follows the identifier of the unit being defined.

 In a trigger or an anonymous block, the first conditional compilation directive cannot appear before the keyword DECLARE or BEGIN, whichever comes first.

The SQL parser also imposes this restriction: If an anonymous block uses a placeholder, the placeholder cannot appear in a conditional compilation directive. For example:

```
BEGIN
  :n := 1; -- valid use of placeholder
  $IF ... $THEN
      :n := 1; -- invalid use of placeholder
  $END
```

# Example 3-63 Using Conditional Compilation Directive in the Definition of a Package Specification

This example shows the placement of the first conditional compilation directive after an AUTHID clause, but before the keyword IS, in the definition of the package specification.

#### Result:

Package created.

# Example 3-64 Using Conditional Compilation Directive in the Formal Parameter List of a Subprogram

This example shows the placement of the first conditional compilation directive after the left parenthesis, in the formal parameter list of a PL/SQL procedure definition.

```
CREATE OR REPLACE PROCEDURE my_proc (
    $IF $$xxx $THEN i IN PLS_INTEGER $ELSE i IN INTEGER $END
) IS
BEGIN
    NULL;
END my proc;
```

#### Result:

Procedure created.

# 4 PL/SQL Data Types

Every PL/SQL constant, variable, parameter, and function return value has a **data type** that determines its storage format and its valid values and operations.

This chapter explains scalar data types, which store values with no internal components.

A scalar data type can have subtypes. A **subtype** is a data type that is a subset of another data type, which is its **base type**. A subtype has the same valid operations as its base type. A data type and its subtypes comprise a **data type family**.

PL/SQL predefines many types and subtypes in the package STANDARD and lets you define your own subtypes.

The PL/SQL scalar data types are:

- The SQL data types
- PLS\_INTEGER
- BINARY\_INTEGER
- REF CURSOR
- User-defined subtypes

#### Topics

- SQL Data Types
- PLS\_INTEGER and BINARY\_INTEGER Data Types
- SIMPLE\_INTEGER Subtype of PLS\_INTEGER
- User-Defined PL/SQL Subtypes

#### 💉 See Also:

- "PL/SQL Collections and Records" for information about composite data types
- "Cursor Variables" for information about REF CURSOR
- "CREATE TYPE Statement" for information about creating schema-level userdefined data types
- "PL/SQL Predefined Data Types" for the predefined PL/SQL data types and subtypes, grouped by data type family

# SQL Data Types

The PL/SQL data types include the SQL data types.

For information about the SQL data types, see *Oracle Database SQL Language Reference* all information there about data types and subtypes, data type comparison rules, data

conversion, literals, and format models applies to both SQL and PL/SQL, except as noted here:

- Different Maximum Sizes
- Additional PL/SQL Constants for BINARY\_FLOAT and BINARY\_DOUBLE
- Additional PL/SQL Subtypes of BINARY\_FLOAT and BINARY\_DOUBLE

Unlike SQL, PL/SQL lets you declare variables, to which the following topics apply:

- BOOLEAN Data Type
- JSON Data Type
- VECTOR Data Type
- CHAR and VARCHAR2 Variables
- LONG and LONG RAW Variables
- ROWID and UROWID Variables

# **Different Maximum Sizes**

The SQL data types listed in Table 4-1 have different maximum sizes in PL/SQL and SQL.

Data Type	Maximum Size in PL/SQL	Maximum Size in SQL
CHAR <sup>1</sup>	32,767 bytes	2,000 bytes
NCHAR <sup>1</sup>	32,767 bytes	2,000 bytes
RAW <sup>1</sup>	32,767 bytes	2,000 bytes <sup>2</sup>
VARCHAR2 <sup>1</sup>	32,767 bytes	4,000 bytes <sup>2</sup>
NVARCHAR2 <sup>1</sup>	32,767 bytes	4,000 bytes <sup>2</sup>
LONG <sup>3</sup>	32,760 bytes	2 gigabytes (GB) - 1
LONG RAW <sup>3</sup>	32,760 bytes	2 GB
BLOB	128 terabytes (TB)	(4 GB - 1) * database_block_size
CLOB	128 TB	(4 GB - 1) * database_block_size
NCLOB	128 TB	(4 GB - 1) * database_block_size

 Table 4-1
 Data Types with Different Maximum Sizes in PL/SQL and SQL

<sup>1</sup> When specifying the maximum size of a value of this data type in PL/SQL, use an integer literal (not a constant or variable) whose value is in the range from 1 through 32,767.

<sup>2</sup> To eliminate this size difference, follow the instructions in Oracle Database SQL Language Reference.

<sup>3</sup> Supported only for backward compatibility with existing applications.

# Additional PL/SQL Constants for BINARY\_FLOAT and BINARY\_DOUBLE

The SQL data types BINARY\_FLOAT and BINARY\_DOUBLE represent single-precision and double-precision IEEE 754-format floating-point numbers, respectively.

BINARY\_FLOAT and BINARY\_DOUBLE computations do not raise exceptions, so you must check the values that they produce for conditions such as overflow and underflow by comparing them to predefined constants (for examples, see *Oracle Database SQL Language Reference*). PL/SQL has more of these constants than SQL does.

Table 4-2 lists and describes the predefined PL/SQL constants for BINARY\_FLOAT and BINARY DOUBLE, and identifies those that SQL also defines.

Constant	Description
BINARY_FLOAT_NAN (*)	BINARY_FLOAT value for which the condition IS NAN (not a number) is true
BINARY_FLOAT_INFINITY (*)	Single-precision positive infinity
BINARY_FLOAT_MAX_NORMAL	Maximum normal BINARY_FLOAT value
BINARY_FLOAT_MIN_NORMAL	Minimum normal BINARY_FLOAT value
BINARY_FLOAT_MAX_SUBNORMAL	Maximum subnormal BINARY_FLOAT value
BINARY_FLOAT_MIN_SUBNORMAL	Minimum subnormal BINARY_FLOAT value
BINARY_DOUBLE_NAN (*)	BINARY_DOUBLE value for which the condition IS NAN (not a number) is true
BINARY_DOUBLE_INFINITY (*)	Double-precision positive infinity
BINARY_DOUBLE_MAX_NORMAL	Maximum normal BINARY_DOUBLE value
BINARY_DOUBLE_MIN_NORMAL	Minimum normal BINARY_DOUBLE value
BINARY_DOUBLE_MAX_SUBNORMAL	Maximum subnormal BINARY_DOUBLE value
BINARY_DOUBLE_MIN_SUBNORMAL	Minimum subnormal BINARY_DOUBLE value

Table 4-2 Predefined PL/SQL BINARY_FLOAT and BINARY_DOUBLE Constants	Table 4-2	Predefined PL/SOL	BINARY F	LOAT and BINARY	<b>DOUBLE Constants</b>
--	-----------	-------------------	----------	-----------------	-------------------------

(\*) SQL also predefines this constant.

# Additional PL/SQL Subtypes of BINARY\_FLOAT and BINARY\_DOUBLE

PL/SQL predefines these subtypes:

- SIMPLE\_FLOAT, a subtype of SQL data type BINARY\_FLOAT
- SIMPLE DOUBLE, a subtype of SQL data type BINARY DOUBLE

Each subtype has the same range as its base type and has a NOT NULL constraint (explained in "NOT NULL Constraint").

If you know that a variable will never have the value NULL, declare it as SIMPLE\_FLOAT or SIMPLE\_DOUBLE, rather than BINARY\_FLOAT or BINARY\_DOUBLE. Without the overhead of checking for nullness, the subtypes provide significantly better performance than their base types. The performance improvement is greater with PLSQL\_CODE\_TYPE='NATIVE' than with PLSQL\_CODE\_TYPE='INTERPRETED' (for more information, see "Use Data Types that Use Hardware Arithmetic").

# BOOLEAN Data Type

The data type BOOLEAN stores logical values, which are the boolean values TRUE and FALSE and the value NULL. NULL represents an unknown value.

The syntax for declaring a BOOLEAN variable is:

variable\_name BOOLEAN

By default, you cannot pass a BOOLEAN value to any NUMBER or VARCHAR2 parameters for any procedures or functions, such as the DBMS\_OUTPUT.PUT or DBMS\_OUTPUT.PUT\_LINE subprograms.

In order to pass a BOOLEAN value to these procedures, set the initialization parameter PLSQL\_IMPLICIT\_CONVERSION\_BOOL to TRUE. Setting the parameter to TRUE also allows implicit conversions in the assignment of variables, for example, if you want to assign a NUMBER or VARCHAR2 value to a BOOLEAN variable. Additionally, a TRUE value makes it possible to use string literals in the assignment of BOOLEAN variables. The parameter has no effect on explicit conversions such as CAST or the functions TO NUMBER, TO CHAR, or TO BOOLEAN.

If a subprogram is overloaded with BOOLEAN and numeric or character types, setting PLSQL\_IMPLICIT\_CONVERSION\_BOOL to TRUE can cause compile-time errors. For more information about potential overload errors with the use of this parameter, see "Subprogram Overload Errors".

The PLSQL\_IMPLICIT\_CONVERSION\_BOOL parameter is persistable, meaning any PL/SQL unit created with the parameter set uses the value specified at the time of unit creation when the unit is compiled with the REUSE SETTINGS clause.

It is also possible to assign a BOOLEAN expression to a BOOLEAN variable (regardless of the PLSQL\_IMPLICIT\_CONVERSION\_BOOL parameter's value). For details about BOOLEAN expressions, see "BOOLEAN Expressions".

#### 💉 See Also:

- Oracle Database Reference for more information about the PLSQL IMPLICIT CONVERSION BOOL parameter
- Oracle Database SQL Language Reference for information about the SQL BOOLEAN data type and for a list of available string literals used to represent TRUE and FALSE

#### Example 4-1 Printing BOOLEAN Values

In this example, BOOLEAN values are printed by passing the values directly to the procedure DBMS\_OUTPUT.PUT\_LINE. Executing this code successfully depends on the initialization parameter PLSQL IMPLICIT CONVERSION BOOL being set to TRUE.

```
DECLARE
  t_b boolean := TRUE;
  f_b boolean := FALSE;
BEGIN
  DBMS_OUTPUT.PUT_LINE('My bool is: ' || t_b);
  DBMS_OUTPUT.PUT_LINE('My bool is: ' || f_b);
END;
```

#### Result:

My bool is: TRUE My bool is: FALSE

# JSON Data Type

You can use JSON data type instances with PL/SQL subprograms. The PL/SQL JSON data type is stored in the database in a binary form for faster access to nested JSON values.

You can use JSON data type and its instances in most places where a SQL data type is allowed, including:

- As the column type for table or view DDL.
- As a parameter type for a PL/SQL subprogram.
- As an element or field type in records, PL/SQL collections, and **%ROWTYPE** attributes.
- In expressions wherever a SQL/JSON function or condition is allowed.

The JSON data type is not currently supported in SQL collections or objects.

#### Topics

• PL/SQL and JSON Type Conversions

#### See Also:

- json-schema.org for information about JSON Schema
- Oracle Database JSON Developer's Guide for details about using PL/SQL with JSON data
- Oracle Database JSON Developer's Guide for more information about PL/SQL object types for JSON

# PL/SQL and JSON Type Conversions

The built-in function json\_value supports scalar data type mappings as well as mappings from JSON objects to user-defined PL/SQL types. Given an instance of a user-defined PL/SQL or SQL aggregate type, the PL/SQL JSON constructor returns a corresponding JSON object or JSON array type instance.

The use of PL/SQL user-defined subtypes as the returning aggregate data type is supported by json\_value. This includes support for any constraints or initializers employed by subtypes used as field or element data types in a returning aggregate data type.

All PL/SQL record field and collection data element data type constraints are honored by PL/SQL json\_value. Constraints include character max length, number scale and precision, time/time stamp/interval constraints, integer range checks, and not null constraints.

These types can be declared in any program scope visible to the json\_value call site, including top-level SQL (for SQL objects and collections), package level PL/SQL, or locally in a PL/SQL function, procedure, or anonymous call block.

PL/SQL specific user-defined aggregate types include:

- Records
- INDEX BY PLS\_INTEGER collections
- Associative arrays

- Nested tables
- Varrays
- Objects

PL/SQL aggregate types can be used as the IN and RETURN data types of PL/SQL built-in functions. All PL/SQL %ROWTYPEs are supported in the RETURNING clause of json value.

The ON MISMATCH clause can be used with json\_value to handle type matching exceptions. It is used to specify the desired behavior when a targeted JSON value cannot be converted to the specified return type. Note that PL/SQL records, index by PLS\_INTEGER collections, and index by VARCHAR2 collections cannot be atomically null. Therefore, the NULL ON MISMATCH clause raises a compile time error when one of these types is specified as the return type. For more information about the ON MISMATCH clause, see Oracle Database JSON Developer's Guide.

#### **Type Name Resolution and Scoping**

A type name used in json\_value is resolved using standard PL/SQL name resolution rules. PL/SQL begins looking for a name in the inner-most scope of the PL/SQL code where the name is referenced and expands the search to the outer scopes until the name is resolved.

The PL/SQL built-in function json\_value resolves up to three part names, which include the following formats:

- <schema name>.<package name>.<type name>
- <package name>.<type name>
- <schema name>.<type name>
- <type name>

Note that this differs from the SQL json\_value built-in function, which only resolves one or two part type names.

Synonyms may be used where appropriate in the full type name string and those synonyms are resolved during type name resolution.

#### **Topics**

- JSON Objects and PL/SQL Records
- JSON Objects and Index by PLS\_INTEGER and Nested Table Collections
- JSON Arrays and Nested Tables, Index by PLS\_INTEGER, and Varray Collections
- JSON Objects and Associative Arrays

#### See Also:

• Oracle Database JSON Developer's Guide for more information about the json\_value built-in function

#### JSON Objects and PL/SQL Records

PL/SQL records hold data using name/value pairs and can be mapped to and from JSON objects via the JSON constructor and the built-in function json\_value, respectively.

#### Topics

- JSON Objects to PL/SQL Records
- PL/SQL Records to JSON Objects

#### JSON Objects to PL/SQL Records

When a PL/SQL record name is specified in the RETURNING clause, json\_value maps the input JSON object to the PL/SQL record and returns an instance of the PL/SQL record. If the input JSON is not a JSON object, the ON MISMATCH clause applies.

To accomplish the mapping, each JSON key name must map to a unique attribute in the PL/SQL record using a default case-insensitive comparison that disregards any double quotes surrounding the name, as well as the placement of the key or attribute name in either of the types being mapped.

Case sensitive mapping is supported using the case-sensitive mapping syntax, as shown below:

```
DECLARE
   TYPE personrecord IS RECORD(first VARCHAR2(10), last VARCHAR2(10));
   p personrecord;
BEGIN
   p := JSON_VALUE(JSON('{"FIRST":"Jane", "LAST":"Cooper"}'), '$'
   RETURNING personrecord USING CASE_SENSITIVE MAPPING);
   DBMS_OUTPUT.PUT_LINE(p.first ||' '|| p.last);
END;
/
```

Once the key name is mapped, the JSON value for the key name is copied into the PL/SQL record attribute. The JSON value must be convertible to the PL/SQL data type of the mapped field. If the value types are not convertible, a MISMATCH error is raised.

Record types that contain JSON fields are supported in calls to json\_value, with the JSON fields mapped to any JSON type, including JSON objects and JSON arrays. In other words, if a JSON attribute name is mapped to a record field name and the record field is a JSON type, PL/SQL copies the JSON value of the JSON attribute into the record field JSON type.

The JSON value must be valid JSON. If the JSON document is textual, the JSON value is parsed when it is copied into the JSON field to verify that it is valid JSON. Once the copy is complete, no further recursive mapping takes place for the attribute.

#### Example 4-2 Convert a JSON Object to PL/SQL Records

This example demonstrates how the same JSON object can be mapped to two different PL/SQL records.

```
DECLARE

TYPE theRec1 IS RECORD (field1 NUMBER, field2 VARCHAR2(10));

TYPE theRec2 IS RECORD ("field2" VARCHAR2(20), "FielD1" NUMBER);
```

```
Rec1 theRec1;
Rec2 theRec2;
BEGIN
Rec1 := JSON_VALUE(JSON('{"FIELD1":10, "field2":"hello"}'), '$' RETURNING
theRec1);
Rec2 := JSON_VALUE(JSON('{"FIELD1":10, "field2":"hello"}'), '$' RETURNING
theRec2);
END;
/
```

Running the PL/SQL block results in Rec1 and Rec2 containing the following values, respectively:

```
theRec1(field1=>10, field2=>'hello')
theRec2("fIeLd2"=>'hello', "FielD1"=>10)
```

#### PL/SQL Records to JSON Objects

SQL objects and PL/SQL record type instances, including implicit records created by the %ROWTYPE attribute, are allowed as valid inputs to the JSON constructor.

The PL/SQL object attribute name becomes the JSON key name. Double quoted attribute names become case sensitive JSON key names while non-double quoted attribute names become uppercase JSON key names. In PL/SQL object attribute values are mapped to the closest JSON value type.

#### Example 4-3 Convert a PL/SQL Record to a JSON Object

```
DECLARE
   TYPE theRec IS RECORD(field1 NUMBER, "Field2" NUMBER);
   myRec theRec := theRec(10, 20);
   myJson JSON;
BEGIN
   myJson := JSON(myRec);
   DBMS_OUTPUT.PUT_LINE(JSON_SERIALIZE(myJson));
END;
/
```

#### Result:

{"FIELD1":10, "Field2":20}

#### JSON Objects and Index by PLS\_INTEGER and Nested Table Collections

Index by PLS\_INTEGER collections and nested table collections can be converted to and from JSON objects using the built-in json\_value function and the JSON constructor, respectively.

#### **Topics**

- JSON Objects to Index by PLS\_INTEGER and Nested Table Collections
- Index by PLS\_INTEGER Collections and Nested Types to JSON Objects

#### JSON Objects to Index by PLS\_INTEGER and Nested Table Collections

Index by PLS\_INTEGER and nested table collections can both be sparse collection types that depend on integer indexed elements. These types map to JSON objects, where the string key attribute of the object is a string representation of the collection's integer index.

When converting from a JSON object to either collection type, an error is raised if the JSON object string key attribute does not cleanly convert into an integer value. With nested table collections, the key attribute must be a positive integer, otherwise an error is raised. Additionally, the maximum key value cannot exceed the number of elements in the JSON object. If a larger key value is required, an index by PLS INTEGER collection can be used.

If there are any gaps between index values in the object, those gaps are recreated in both collection types. That is, if elements are missing between the lowest and highest number index in the JSON object, those elements will also be missing in the collection. Keep in mind that missing elements are not the same as NULL elements.

The JSON object index key attributes do not need to be in sorted order. They are sorted when they are inserted into the collection.

#### Example 4-4 Convert a JSON Object to an Index by PLS\_INTEGER Collection

This example demonstrates the conversion of a JSON object to an Index by PLS\_INTEGER collection using the built-in function json value.

```
DECLARE
   TYPE theIBPLS IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
   myIBPLS theIBPLS;
BEGIN
   myIBPLS := JSON_VALUE(JSON('{"-10":10, "-1":1, "100":-100}'), '$'
RETURNING theIBPLS);
END;
/
```

Running the PL/SQL block results in the creation of an Index by PLS\_INTEGER collection with the following element values:

theIBPLS(-10=>10, -1=>1, 100=>-100)

#### Example 4-5 Convert a JSON Object to a Nested Table Collection

This example demonstrates the conversion of a JSON object to a nested table collection using the built-in function <code>json value</code>.

```
DECLARE
   TYPE theNSTTAB IS TABLE OF NUMBER;
   myNSTTAB theNSTTAB;
BEGIN
   myNSTTAB := JSON_VALUE(JSON('{"1":10, "2":20, "3":30, "4":40}'), '$'
RETURNING theNSTTAB);
END;
/
```

Running the PL/SQL block results in the creation of a nested table collection with the following values:

```
theNSTTAB(1=>10, 2=>20, 3=>30, 4=>40)
```

#### Index by PLS\_INTEGER Collections and Nested Types to JSON Objects

Index by PLS\_INTEGER collections are converted to a JSON object with index values preserved when passed to a JSON constructor. When represented as a JSON object, the collection's index appears as a JSON string representation of the index integer value.

In order to preserve sparseness on a round trip from PL/SQL to JSON and back to PL/SQL, a nested table collection is converted to a JSON object when it is passed to a JSON constructor. When represented as a JSON object, nested table indices appear as a JSON string representation of the index integer value.

#### Example 4-6 Convert an Index by PLS\_INTEGER Collection to a JSON Object

This example demonstrates the conversion of an index by PLS\_INTEGER collection to a JSON object using the JSON constructor.

```
DECLARE
   TYPE theIBPLS IS TABLE OF NUMBER INDEX BY PLS_INTEGER;
   myIBPLS theIBPLS := theIBPLS(-1=>1, 2=>2, -3=>3);
   myJSON JSON;
BEGIN
   myJSON := JSON(myIBPLS);
   DBMS_OUTPUT.PUT_LINE(JSON_SERIALIZE(myJSON));
END;
/
```

Result:

{ "-3":3, "-1":1, "2":2 }

#### Example 4-7 Convert a Nested Table to a JSON Object

This example demonstrates the conversion of a sparse nested table into a JSON object using the JSON constructor.

```
DECLARE
   TYPE theNSTTAB IS TABLE OF NUMBER;
   myNSTTAB theNSTTAB := theNSTTAB(1=>1, 2=>2, 3=>3);
   myJSON JSON;
BEGIN
   myNSTTAB.delete(2); --myNSTTAB becomes sparse when elements are deleted
   myJSON := JSON(myNSTTAB);
   DBMS_OUTPUT.PUT_LINE(JSON_SERIALIZE(myJSON));
END;
/
```

#### Result:

{ "1":1, "3":3 }

#### JSON Arrays and Nested Tables, Index by PLS\_INTEGER, and Varray Collections

JSON arrays are converted to nested tables, Index by PLS\_INTEGER, or Varray collections using the built-in json\_value function. Varrays are converted to JSON arrays when passed through the JSON constructor while Index by PLS\_INTEGER collections and nested tables are converted to JSON objects.

#### Topics

- JSON Arrays to Nested Tables, Index by PLS\_INTEGER, and Varray Collections
- Varrays to JSON Arrays

#### JSON Arrays to Nested Tables, Index by PLS\_INTEGER, and Varray Collections

When a nested table, index by PLS\_INTEGER, or varray collection is specified in the RETURNING clause, json\_value converts the input JSON array to the PL/SQL collection type and returns an instance of the PL/SQL collection. If the input JSON is not a JSON array, a MISMATCH error is raised.

To convert a JSON array into a PL/SQL collection, the JSON array elements are inserted one by one into the collection. Insertion begins with the first element in the JSON array inserted at index 1 of the PL/SQL collection and ends when the last JSON array element is inserted into the collection. The collection index is incremented by 1 for each inserted element.

- A JSON null element results in a PL/SQL NULL element being inserted into the collection.
- If the number of elements in a JSON array exceeds the size of its corresponding varray, a MISMATCH error is raised.
- If the JSON element types are not convertible to the PL/SQL collection element type, a MISMATCH error is raised.

#### Example 4-8 Convert a JSON Array to an Index by PLS\_INTEGER Collection

This example converts a JSON array to an index by PLS\_INTEGER collection using the built-in function json value.

```
DECLARE
    TYPE theIBPLS IS TABLE OF NUMBER INDEX BY PLS_INTEGER;
    myIBPLS theIBPLS;
BEGIN
    myIBPLS := JSON_VALUE(JSON('[1, 2, 3, 4, 5]'), '$' RETURNING theIBPLS);
END;
/
```

Running this PL/SQL block results in myIBPLS having the following value:

theIBPLS(1=>1, 2=>2, 3=>3, 4=>4, 5=>5)

#### Example 4-9 Convert a JSON Array to a Varray

This example converts a JSON array to a varray using the built-in function json\_value.

```
DECLARE
TYPE theVARRAY IS VARRAY(5) OF NUMBER;
myVARRAY theVARRAY;
```

```
BEGIN
  myVARRAY := JSON_VALUE(JSON('[1, 2, 3, 4, 5]'), '$' RETURNING theVARRAY);
END;
/
```

Running this PL/SQL block results in myVARRAY having the following value:

```
theVARRAY(1=>1, 2=>2, 3=>3, 4=>4, 5=>5)
```

#### Example 4-10 Convert a JSON Array to a Nested Table

This example converts a JSON array to a nested table using the built-in function json value.

```
DECLARE
   TYPE theNESTEDTABLE IS TABLE OF NUMBER;
   myNESTEDTABLE theNESTEDTABLE;
BEGIN
   myNESTEDTABLE := JSON_VALUE(JSON('[1, 2, 3, 4, 5]'), '$' RETURNING
   theNESTEDTABLE);
END;
/
```

Running this PL/SQL block results in myNESTEDTABLE having the following value:

```
theNESTEDTABLE(1=>1, 2=>2, 3=>3, 4=>4, 5=>5)
```

#### Varrays to JSON Arrays

Varrays are converted to JSON arrays when they are passed to a JSON constructor.

When varrays are converted to JSON arrays, each element of the collection is inserted into the JSON array beginning with the element at the smallest collection index and ending with the element at the largest collection index. The indices are not transferred into the JSON array, only the element value.

When passed to the JSON constructor, Index by PLS\_INTEGER collections and nested types are converted to JSON objects rather than JSON arrays.

#### Example 4-11 Convert a Varray to a JSON Array

```
DECLARE
   TYPE theVarray IS VARRAY(4) OF NUMBER;
   myVarray theVarray := theVarray(1, 2, 3, null);
   myJSON JSON;
BEGIN
   myJSON := JSON(myVarray);
   DBMS_OUTPUT.PUT_LINE(JSON_SERIALIZE(myJSON));
END;
/
```

#### Result:

[1, 2, 3, null]

#### JSON Objects and Associative Arrays

Associative arrays can be converted to and from JSON objects using the JSON constructor and the built-in function json\_value, respectively.

#### **Topics**

- JSON Objects to Associative Arrays
- Associative Arrays to JSON Objects

#### **JSON Objects to Associative Arrays**

When JSON objects are mapped into associative arrays, each JSON key name and value pair is inserted into the associative array based on the ordering and or collection of the associative array.

Associative array key names are case sensitive and the insert preserves the case of the JSON key name. The JSON value for the key is converted as necessary to the associative array element type and the key name/value pair is then inserted into the associative array.

Similar to SQL objects and PL/SQL records, a JSON value can be a nested object or an array and must be convertible to the associative array element type. If the value types are not convertible, a MISMATCH error is raised.

#### Example 4-12 Convert a JSON Object to an Associative Array

This example converts a JSON object to an associative array using the built-in function json value.

```
DECLARE
    TYPE theASCARRAY IS TABLE OF NUMBER INDEX BY VARCHAR2(10);
    myAscArray theASCARRAY;
BEGIN
    myAscArray := JSON_VALUE(JSON('{"Key1":10, "Key2":20}'), '$' RETURNING
theASCARRAY);
END;
/
```

Running this PL/SQL block will result in an associative with two elements:

```
theASCARRAY('Key1'=>10, 'Key2'=>20)
```

#### Associative Arrays to JSON Objects

The process of converting an associative array to a JSON object consists of inserting every associative array key and value into the JSON object as a name/value pair. The ordering of insertions may not matter because all key names in PL/SQL associative arrays are unique and the ordering of JSON attributes is not specified in the JSON standards. However, the key values will likely be inserted based on the internal sorted order or collation of the associative array.

Because associative arrays have varchar2 keys, the key type inserted into the JSON object is a JSON string. The case of the key in the associative array is preserved in the copy to the JSON object.

The value of the associative array element is copied into the JSON object following the key. If the element type of the associative array is a nested aggregate type, a JSON object or array matching the aggregate type is created as the JSON value.

#### Example 4-13 Convert an Associative Array to a JSON Object

This example converts an associative array to a JSON object using the JSON constructor.

```
DECLARE
   TYPE AsscArray IS TABLE OF VARCHAR2(10) INDEX BY VARCHAR2(10);
   myAsscArray AsscArray := AsscArray('FIRST_NAME' => 'Bob', 'LAST_NAME' =>
'Jones');
   myJson JSON;
BEGIN
   myJson := JSON(myAsscArray);
   DBMS_OUTPUT.PUT_LINE(JSON_SERIALIZE(myJson));
END;
/
```

Running this PL/SQL block will result in a JSON object with the following values:

{"FIRST NAME":"Bob", "LAST NAME":"Jones"}

# VECTOR Data Type

A vector value is an array of non-null numeric values, all of which are of the same numeric type. A vector in PL/SQL has two storage attributes; the number of values constituting the vector is its dimension and the numeric type of the values is its format.

A vector variable in PL/SQL holds a vector value and can be flexible, partially flexible, or fully inflexible in terms of dimension and storage format. Assignment of a vector value to a flexible PL/SQL vector variable always succeeds and no conversion occurs. An error occurs during assignment if the value and the variable differ in the inflexible attribute(s). In all cases, the elements stored in the vector must be of the same numeric type.

If specified, the format of a vector must be one of the following: FLOAT64, FLOAT32, INT8, or BINARY. The dimension of a BINARY vector must be a multiple of 8. For more information about using BINARY vectors, see Oracle Database AI Vector Search User's Guide.

#### Note:

Checks of the dimension and format are completed at runtime.

The PL/SQL VECTOR data type appears as its own distinct scalar type family and can be used with PL/SQL operators, passed to PL/SQL procedures and functions, set to NULL, and otherwise used in the same way as any other data type in PL/SQL. Note that although a vector variable can hold a NULL vector, the value(s) in the vector cannot be NULL.

Assignment semantics and handling of implicit conversion in PL/SQL differ from SQL. While SQL requires an exact match only for dimension, PL/SQL requires both format and dimension to match for a successful assignment. Additionally, SQL allows for implicit conversion between VECTOR and string types while PL/SQL does not support implicit conversion between vectors and any other type. Neither SQL nor PL/SQL support equality comparisons of vectors.

If a variable is declared using <code>%TYPE</code> on a vector variable or a vector column, the declared variable will be a vector that inherits the storage attributes of the referenced vector variable or column. The following example demonstrates this concept:

```
CREATE TABLE PLS VEC TAB (
   v1 vector,
   v2 vector(100),
   v3 vector(*, INT8),
   v4 vector(100, INT8),
   v5 vector(1024, BINARY)
);
DECLARE
                               -- dimension and format are flexible
   vec0 vector;
   vec1 PLS VEC TAB.v1%TYPE; -- dimension and format are flexible
   vec2 PLS VEC TAB.v2%TYPE; -- dimension is 100, format is flexible
   vec3 PLS VEC TAB.v3%TYPE; -- dimension is flexible, format is INT8
   vec4 PLS_VEC_TAB.v4%TYPE; -- dimension is 100, format is INT8
   vec5 PLS VEC TAB.v5%TYPE; -- dimension is 1024, format is BINARY
   vec 0 vec0%TYPE; -- dimension and format are flexible
   vec_1 vec1%TYPE; -- dimension and format are flexible
   vec 2 vec2%TYPE; -- dimension is 100, format is flexible
   vec 3 vec3%TYPE; -- dimension is flexible, format is INT8
   vec 4 vec4%TYPE; -- dimension is 100, format is INT8
   vec 5 vec5%TYPE; -- dimension is 1024, format is BINARY
BEGIN
   NULL;
END;
/
```

You can use the VECTOR data type and its instances in most places where a SQL data type is allowed, including:

- As an element or field type in records, PL/SQL collections, and %ROWTYPE attributes. Note that a %ROWTYPE attribute inherits both the dimension and format of an underlying vector column.
- In PL/SQL triggers, including with the pseudorecords OLD and NEW and in the WHEN clause of a conditional trigger.
- The USING clause supports vectors in all three bind directions; IN, IN OUT, and OUT.
- In the FORALL clause, the RETURNING INTO clause, and the BULK COLLECT INTO clause.
- As the arguments to an addition, subtraction, or multiplication operation.

The VECTOR data type is not currently supported in SQL collections or objects.

A variable of type VECTOR can come in the form of static SQL, dynamic SQL, or using DBMS\_SQL. In all of these cases, a vector can appear as the column type, the bind type, or both. If the column and bind type are not both VECTOR, the remaining side must be a string type. Note that PL/SQL functions that use formal arguments of the VECTOR data type are not currently supported in the WITH clause of a SQL SELECT statement.

PL/SQL will use the definition of the identifier VECTOR in the innermost scope in which it appears. If a user-defined type is created with the name VECTOR and then is referenced without a name prefix, PL/SQL interprets the variable using the local definition. If no local definition

exists, PL/SQL expands its search to outer scopes until the name is resolved, eventually to the Package STANDARD definition.

#### **Topics**

# VECTOR Operations Supported by PL/SQL

PL/SQL natively supports the following base operations for use with the VECTOR data type:

- VECTOR
- TO\_VECTOR
- FROM\_VECTOR (and VECTOR\_SERIALIZE)<sup>1</sup>
- TO\_CHAR
- TO\_CLOB
- VECTOR\_DIMENSION\_COUNT (and VECTOR\_DIMS)
- VECTOR DIMENSION FORMAT
- VECTOR NORM
- VECTOR\_DISTANCE is supported with the following metric options (cosine distance is the default if no metric is specified):
  - COSINE
  - MANHATTAN
  - EUCLIDEAN
  - EUCLIDEAN\_SQUARED
  - DOT
  - HAMMING
  - JACCARD
- The following vector distance functions are also natively supported as standalone functions in PL/SQL:
  - COSINE\_DISTANCE
  - L1 DISTANCE (Manhattan distance)

<sup>&</sup>lt;sup>1</sup> The optional RETURNING clause is not supported with TO\_VECTOR and VECTOR\_SERIALIZE.

- L2 DISTANCE (Euclidean distance)
- INNER PRODUCT
- Additionally, the following shorthand distance operators are available for the corresponding vector distances:
  - Cosine distance: <=>
  - Euclidean distance: <->
  - Dot product: <#>

Note that the corresponding vector distance metrics, standalone functions, and shorthand distance operators will have equivalent results. For example, VECTOR\_DISTANCE (v1, v2, COSINE) is equal to COSINE DISTANCE (v1, v2) is equal to v1 <=> v2.

To construct a vector in PL/SQL, use VECTOR or TO\_VECTOR. For example, see the following variable assignments:

```
v VECTOR := VECTOR('[1, 2, 3]');
v VECTOR := TO VECTOR('[1, 2, 3]');
```

The ON CONVERSION ERROR clause used by SQL in explicit conversions to determine a default value if conversion fails is not supported by PL/SQL. Instead, a default value can be set using a code block in the exception handler.

You can use the <code>VECTOR\_DISTANCE</code> function with metric keyword natively in PL/SQL, use the previously listed distance functions, or call <code>VECTOR\_DISTANCE</code> from static SQL. The distance is returned as a <code>BINARY\_DOUBLE</code>. Consider the following valid assignments:

```
dist := COSINE_DISTANCE(v1, v2);
dist := VECTOR_DISTANCE(v1, v2, COSINE);
dist := v1 <=> v2;
SELECT VECTOR_DISTANCE(v1, v2, COSINE) INTO dist;
SELECT v1 <=> v2 INTO dist;
```

Arithmetic operators for addition, subtraction, and multiplication can be applied to vectors dimension-wise. Both sides of the operation must evaluate to vectors with matching dimensions and must not be BINARY or SPARSE vectors. The resulting vector has the same number of dimensions as the operands and the format is determined based on the formats of the inputs. If one side of the operation is not a vector, an attempt is made automatically to convert the value to a vector. If the conversion fails, an error is raised.

The format used for the result is ranked in the following order: flexible, FLOAT64, FLOAT32, then INT8. As in, if either side of the operation has a flexible format, the result will be flexible, otherwise, if either side has the format FLOAT64, the result will be FLOAT64, and so on.

The syntax for arithmetic operators is as follows:

- Addition: expr1 + expr2
- Subtraction: expr1 expr2
- Multiplication: expr1 \* expr2

If either side of the arithmetic operation is NULL, the result is NULL. In the case of dimension overflow, an error is raised. For example, adding VECTOR('[1, 127]', 2, INT8) to

VECTOR ('[1, 1]', 2, INT8) results in an error because 127+1=128, which overflows the INT8 format.

# See Also: Oracle Database SQL Language Reference for syntax and semantic information about vector SQL functions Oracle Database Al Vector Search User's Guide for more information about performing arithmetic operations with vectors

# VECTOR Data Type PL/SQL Code Examples

The PL/SQL code examples provided here show how to use the VECTOR data type.

#### Example 4-14 Use the VECTOR Data Type with PL/SQL

The first part of this example demonstrates how to select a vector into a PL/SQL vector variable, in this case using <code>%TYPE</code> on a vector column.

```
DROP TABLE theVectorTable;
CREATE TABLE theVectorTable (embedding VECTOR(3, float32), id NUMBER);
INSERT INTO theVectorTable VALUES ('[1.11, 2.22, 3.33]', 1);
INSERT INTO theVectorTable VALUES ('[4.44, 5.55, 6.66]', 2);
INSERT INTO theVectorTable VALUES ('[7.77, 8.88, 9.99]', 3);
SET SERVEROUTPUT ON;
DECLARE
  v_embedding theVectorTable.embedding%TYPE;
BEGIN
  SELECT embedding INTO v_embedding FROM theVectorTable WHERE id=3;
  DBMS_OUTPUT.PUT_LINE('Embedding is ' || FROM_VECTOR(v_embedding));
END;
/
```

#### Result:

```
Embedding is [7.76999998E+000,8.88000011E+000,9.98999977E+000]
```

The following anonymous block uses a cursor with bulk fetch to capture theVectorTable's vector and id data into a table%ROWTYPE index table.

```
DECLARE

TYPE vecTabT IS TABLE OF theVectorTable%ROWTYPE INDEX BY BINARY_INTEGER;

v_vecTabT vecTabT;

CURSOR c IS SELECT * FROM theVectorTable;

BEGIN

OPEN c;

FETCH c BULK COLLECT INTO v_vecTabT;

CLOSE c;
```

```
-- display the contents of the vector index table

FOR i IN 1..v_vecTabT.LAST LOOP

DBMS_OUTPUT.PUT_LINE('Embedding ID ' || v_vecTabT(i).id || ': ' ||

FROM_VECTOR(v_vecTabT(i).embedding));

END LOOP;

END;

/
```

```
Embedding ID 1: [1.11000001E+000,2.22000003E+000,3.32999992E+000]
Embedding ID 2: [4.44000006E+000,5.55000019E+000,6.65999985E+000]
Embedding ID 3: [7.76999998E+000,8.88000011E+000,9.98999977E+000]
```

#### Example 4-15 Use the VECTOR Data Type with a PL/SQL Trigger

This example creates a BEFORE UPDATE trigger on theVectorTable that inserts vector values into vecLogTable:

UPDATE theVectorTable SET embedding='[2.22, 4.44, 6.66]' WHERE id=2; SELECT \* FROM vecLogTable ORDER BY seq;

#### Result:

```
        EMBEDDING
        DESCRIBE
        SEQ

        [4.44000006E+000,5.55000019E+000,6.65999985E+000]
        OLD.VECTRG
        1

        [2.22000003E+000,4.44000006E+000,6.65999985E+000]
        NEW.VECTRG
        2
```

#### Example 4-16 Use Vector Distance Functions with PL/SQL

This example demonstrates PL/SQL support for vector distance functions.

```
DECLARE
v1 VECTOR := TO_VECTOR('[1, 2, 3]');
```

```
v2 VECTOR := TO VECTOR('[4, 5, 6]');
 v3 VECTOR := TO VECTOR('[1, 2, 0, 6]', *, BINARY);
 v4 VECTOR := TO VECTOR('[0, 6, 0, 3]', *, BINARY);
 man dist NUMBER;
  euc dist NUMBER;
  cos dist NUMBER;
  inn dist NUMBER;
 ham dist NUMBER;
  dot dist NUMBER;
  jac dist NUMBER;
BEGIN
 man dist := L1_DISTANCE(v1, v2); --Manhattan Distance
  euc_dist := L2_DISTANCE(v1, v2); --Euclidean Distance
  cos dist := COSINE DISTANCE(v1, v2); --Cosine Distance
  inn dist := INNER PRODUCT(v1, v2); --Inner Product
  --The Hamming Distance has no standalone function in PL/SQL
  ham dist := VECTOR DISTANCE (v1, v2, HAMMING);
  --The Negative Inner (Dot) Product has no standalone function in PL/SQL
  dot dist := VECTOR DISTANCE(v1, v2, DOT);
  --The Jaccard Distance has no standalone function in PL/SQL
  jac dist := VECTOR DISTANCE (v3, v4, JACCARD);
  DBMS_OUTPUT.PUT_LINE('The Manhattan distance is: ' || man_dist);
  DBMS OUTPUT.PUT LINE ('The Euclidean distance is: ' || euc dist);
  DBMS OUTPUT.PUT LINE('The Cosine distance is: ' || cos dist);
  DBMS OUTPUT.PUT LINE ('The Inner Product is: ' || inn dist);
  DBMS OUTPUT.PUT LINE ('The Hamming distance is: ' || ham dist);
  DBMS_OUTPUT.PUT_LINE('The Dot Product is: ' || dot_dist);
  DBMS OUTPUT.PUT LINE('The Jaccard Distance between the BINARY vectors v3
and v4 is: ' || jac dist);
END;
/
```

```
The Manhattan distance is: 9

The Euclidean distance is: 5.1961524227066329

The Cosine distance is: .025368153802923787

The Inner Product is: 32

The Hamming distance is: 3

The Dot Product is: -32

The Jaccard Distance between the BINARY vectors v3 and v4

is: .666666666666666674
```

#### Example 4-17 Use Shorthand Distance Operators

Note that because PL/SQL does not support implicit conversion with vectors, you must construct the vectors before the variable assignment or in the same line. This is the same behavior as the other distance functions in PL/SQL.

```
DECLARE
   v1 VECTOR := VECTOR('[1, 2, 3]');
```

```
v2 VECTOR := VECTOR('[4, 5, 6]');
cos_dist BINARY_DOUBLE;
euc_dist BINARY_DOUBLE;
dot_dist BINARY_DOUBLE;
BEGIN
cos_dist := v1 <=> v2;
euc_dist := v1 <=> v2;
dot_dist := v2; dot_
```

```
2.5368153802923787E-002
5.1961524227066329E+000
-3.2E+001
```

#### Example 4-18 Perform Arithmetic Operations on Vectors

```
DECLARE
v1 VECTOR := VECTOR('[10, 20, 30]', 3, INT8);
v2 VECTOR := VECTOR('[6, 4, 2]', 3, INT8);
BEGIN
DBMS_OUTPUT.PUT_LINE(TO_CHAR(v1 + v2));
DBMS_OUTPUT.PUT_LINE(TO_CHAR(v1 - v2));
DBMS_OUTPUT.PUT_LINE(TO_CHAR(v1 * v2));
END;
/
```

#### Result:

```

# CHAR and VARCHAR2 Variables

#### Topics

- Assigning or Inserting Too-Long Values
- Declaring Variables for Multibyte Characters
- Differences Between CHAR and VARCHAR2 Data Types

# Assigning or Inserting Too-Long Values

If the value that you assign to a character variable is longer than the maximum size of the variable, an error occurs. For example:

```
DECLARE
    c VARCHAR2(3 CHAR);
BEGIN
    c := 'abc ';
END;
/
```

```
DECLARE
*
ERROR at line 1:
ORA-06502: PL/SQL: value or conversion error: character string buffer too small
ORA-06512: at line 4
```

Similarly, if you insert a character variable into a column, and the value of the variable is longer than the defined width of the column, an error occurs. For example:

```
DROP TABLE t;
CREATE TABLE t (c CHAR(3 CHAR));
DECLARE
s VARCHAR2(5 CHAR) := 'abc ';
BEGIN
INSERT INTO t(c) VALUES(s);
END;
/
```

#### Result:

```
BEGIN
*
ERROR at line 1:
ORA-12899: value too large for column "HR"."T"."C" (actual: 5, maximum: 3)
ORA-06512: at line 4
```

To strip trailing blanks from a character value before assigning it to a variable or inserting it into a column, use the RTRIM function, explained in *Oracle Database SQL Language Reference*. For example:

```
DECLARE
  c VARCHAR2(3 CHAR);
BEGIN
  c := RTRIM('abc ');
INSERT INTO t(c) VALUES(RTRIM('abc '));
END;
/
```

#### Result:

PL/SQL procedure successfully completed.

# Declaring Variables for Multibyte Characters

The maximum size of a CHAR or VARCHAR2 variable is 32,767 bytes, whether you specify the maximum size in characters or bytes. The maximum *number of characters* in the variable depends on the character set type and sometimes on the characters themselves:

Character Set Type	Maximum Number of Characters
Single-byte character set	32,767

Character Set Type	Maximum Number of Characters
<i>n</i> -byte fixed-width multibyte character set (for example, AL16UTF16)	FLOOR (32,767/n)
<i>n</i> -byte variable-width multibyte character set with character widths between 1 and <i>n</i> bytes (for example, JA16SJIS or AL32UTF8)	Depends on characters themselves—can be anything from 32,767 (for a string containing only 1-byte characters) through FLOOR (32,767/ $n$ ) (for a string containing only <i>n</i> -byte characters).

When declaring a CHAR or VARCHAR2 variable, to ensure that it can always hold *n* characters in any multibyte character set, declare its length in characters—that is, CHAR (*n* CHAR) or VARCHAR2 (*n* CHAR), where *n* does not exceed FLOOR (32767/4) = 8191.

#### See Also:

*Oracle Database Globalization Support Guide* for information about Oracle Database character set support

# Differences Between CHAR and VARCHAR2 Data Types

CHAR and VARCHAR2 data types differ in:

- Predefined Subtypes
- How Blank-Padding Works
- Value Comparisons

#### **Predefined Subtypes**

The CHAR data type has one predefined subtype in both PL/SQL and SQL—CHARACTER.

The VARCHAR2 data type has one predefined subtype in both PL/SQL and SQL, VARCHAR, and an additional predefined subtype in PL/SQL, STRING.

Each subtype has the same range of values as its base type.

#### Note:

In a future PL/SQL release, to accommodate emerging SQL standards, VARCHAR might become a separate data type, no longer synonymous with VARCHAR2.

#### How Blank-Padding Works

This explains the differences and considerations of using blank-padding with CHAR and VARCHAR2.

Consider these situations:

- The value that you assign to a variable is shorter than the maximum size of the variable.
- The value that you insert into a column is shorter than the defined width of the column.

 The value that you retrieve from a column into a variable is shorter than the maximum size of the variable.

If the data type of the receiver is CHAR, PL/SQL blank-pads the value to the maximum size. Information about trailing blanks in the original value is lost.

If the data type of the receiver is VARCHAR2, PL/SQL neither blank-pads the value nor strips trailing blanks. Character values are assigned intact, and no information is lost.

### Example 4-19 CHAR and VARCHAR2 Blank-Padding Difference

In this example, both the CHAR variable and the VARCHAR2 variable have the maximum size of 10 characters. Each variable receives a five-character value with one trailing blank. The value assigned to the CHAR variable is blank-padded to 10 characters, and you cannot tell that one of the six trailing blanks in the resulting value was in the original value. The value assigned to the VARCHAR2 variable is not changed, and you can see that it has one trailing blank.

```
DECLARE
first_name CHAR(10 CHAR);
last_name VARCHAR2(10 CHAR);
BEGIN
first_name := 'John ';
last_name := 'Chen ';
DBMS_OUTPUT.PUT_LINE('*' || first_name || '*');
DBMS_OUTPUT.PUT_LINE('*' || last_name || '*');
END;
/
```

#### Result:

\*John \*Chen \*

### Value Comparisons

The SQL rules for comparing character values apply to PL/SQL character variables.

Whenever one or both values in the comparison have the data type VARCHAR2 or NVARCHAR2, nonpadded comparison semantics apply; otherwise, blank-padded semantics apply. For more information, see *Oracle Database SQL Language Reference*.

### LONG and LONG RAW Variables

### Note:

Oracle supports the LONG and LONG RAW data types only for backward compatibility with existing applications. For new applications:

- Instead of LONG, use VARCHAR2 (32760), BLOB, CLOB or NCLOB.
- Instead of LONG RAW, use RAW (32760) or BLOB.

For information about how to migrate columns from LONG data types to LOB data types, see Oracle Database SecureFiles and Large Objects Developer's Guide.

You can insert any LONG value into a LONG column. You can insert any LONG RAW value into a LONG RAW column. You cannot retrieve a value longer than 32,760 bytes from a LONG or LONG RAW column into a LONG or LONG RAW variable.

You can insert any CHAR or VARCHAR2 value into a LONG column. You cannot retrieve a value longer than 32,767 bytes from a LONG column into a CHAR or VARCHAR2 variable.

You can insert any RAW value into a LONG RAW column. You cannot retrieve a value longer than 32,767 bytes from a LONG RAW column into a RAW variable.

### See Also:

"Trigger LONG and LONG RAW Data Type Restrictions" for restrictions on LONG and LONG RAW data types in triggers

### **ROWID and UROWID Variables**

When you retrieve a rowid into a ROWID variable, use the ROWIDTOCHAR function to convert the binary value to a character value. For information about this function, see *Oracle Database SQL Language Reference*.

To convert the value of a ROWID variable to a rowid, use the CHARTOROWID function, explained in *Oracle Database SQL Language Reference*. If the value does not represent a valid rowid, PL/SQL raises the predefined exception SYS INVALID ROWID.

To retrieve a rowid into a UROWID variable, or to convert the value of a UROWID variable to a rowid, use an assignment statement; conversion is implicit.

### Note:

- UROWID is a more versatile data type than ROWID, because it is compatible with both logical and physical rowids.
- When you update a row in a table compressed with Hybrid Columnar Compression (HCC), the ROWID of the row changes. HCC, a feature of certain Oracle storage systems, is described in *Oracle Database Concepts*.

### See Also:

Oracle Database PL/SQL Packages and Types Reference for information about the DBMS\_ROWID package, whose subprograms let you create and return information about ROWID values (but not UROWID values)

# PLS\_INTEGER and BINARY\_INTEGER Data Types

The PL/SQL data types PLS\_INTEGER and BINARY\_INTEGER are identical.

For simplicity, this document uses PLS\_INTEGER to mean both PLS\_INTEGER and BINARY INTEGER.

The PLS\_INTEGER data type stores signed integers in the range -2,147,483,648 through 2,147,483,647, represented in 32 bits.

The PLS\_INTEGER data type has these advantages over the NUMBER data type and NUMBER subtypes:

- PLS INTEGER values require less storage.
- PLS\_INTEGER operations use hardware arithmetic, so they are faster than NUMBER operations, which use library arithmetic.

For efficiency, use PLS INTEGER values for all calculations in its range.

#### Topics

- Preventing PLS\_INTEGER Overflow
- Predefined PLS\_INTEGER Subtypes
- SIMPLE\_INTEGER Subtype of PLS\_INTEGER

### Preventing PLS\_INTEGER Overflow

A calculation with two PLS\_INTEGER values that overflows the PLS\_INTEGER range raises an overflow exception.

For calculations outside the PLS\_INTEGER range, use INTEGER, a predefined subtype of the NUMBER data type.

### Example 4-20 PLS\_INTEGER Calculation Raises Overflow Exception

This example shows that a calculation with two PLS\_INTEGER values that overflows the PLS\_INTEGER range raises an overflow exception, even if you assign the result to a NUMBER data type.

```
DECLARE
    p1 PLS_INTEGER := 2147483647;
    p2 PLS_INTEGER := 1;
    n NUMBER;
BEGIN
    n := p1 + p2;
END;
/
```

#### Result:

```
DECLARE
*
ERROR at line 1:
ORA-01426: numeric overflow
ORA-06512: at line 6
```

#### Example 4-21 Preventing Example 4-20 Overflow

This example shows the correct use of the INTEGER predefined subtype for calculations outside the PLS INTEGER range.

DECLARE
p1 PLS\_INTEGER := 2147483647;

```
p2 INTEGER := 1;
n NUMBER;
BEGIN
n := p1 + p2;
END;
/
```

PL/SQL procedure successfully completed.

# Predefined PLS\_INTEGER Subtypes

This summary lists the predefined subtypes of the  ${\tt PLS\_INTEGER}$  data type and describes the data they store.

### Table 4-3 Predefined Subtypes of PLS\_INTEGER Data Type

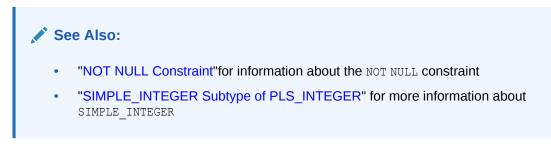

Data Type	Data Description
NATURAL	Nonnegative PLS_INTEGER value
NATURALN	Nonnegative PLS_INTEGER value with NOT NULL constraint
POSITIVE	Positive PLS_INTEGER value
POSITIVEN	Positive PLS_INTEGER value with NOT NULL constraint
SIGNTYPE	PLS_INTEGER value -1, 0, or 1 (useful for programming tri-state logic)
SIMPLE_INTEGER	PLS_INTEGER value with NOT NULL constraint.

PLS\_INTEGER and its subtypes can be implicitly converted to these data types:

- CHAR
- VARCHAR2
- NUMBER
- LONG

All of the preceding data types except LONG, and all PLS\_INTEGER subtypes, can be implicitly converted to PLS INTEGER.

A PLS\_INTEGER value can be implicitly converted to a PLS\_INTEGER subtype only if the value does not violate a constraint of the subtype.

### Example 4-22 Violating Constraint of SIMPLE\_INTEGER Subtype

This example shows that casting the PLS\_INTEGER value NULL to the SIMPLE\_INTEGER subtype raises an exception.

```
DECLARE
    a SIMPLE_INTEGER := 1;
    b PLS_INTEGER := NULL;
BEGIN
    a := b;
END;
/
```

```
DECLARE
*
ERROR at line 1:
ORA-06502: PL/SQL: value or conversion error
ORA-06512: at line 5
```

# SIMPLE\_INTEGER Subtype of PLS\_INTEGER

SIMPLE INTEGER is a predefined subtype of the PLS INTEGER data type.

SIMPLE\_INTEGER has the same range as PLS\_INTEGER and has a NOT NULL constraint. It differs significantly from PLS\_INTEGER in its overflow semantics.

If you know that a variable will never have the value <code>NULL</code> or need overflow checking, declare it as <code>SIMPLE\_INTEGER</code> rather than <code>PLS\_INTEGER</code>. Without the overhead of checking for nullness and overflow, <code>SIMPLE\_INTEGER</code> performs significantly better than <code>PLS\_INTEGER</code>.

### Topics

- SIMPLE\_INTEGER Overflow Semantics
- Expressions with Both SIMPLE\_INTEGER and Other Operands
- Integer Literals in SIMPLE\_INTEGER Range

### SIMPLE\_INTEGER Overflow Semantics

If and only if all operands in an expression have the data type SIMPLE\_INTEGER, PL/SQL uses two's complement arithmetic and ignores overflows.

Because overflows are ignored, values can wrap from positive to negative or from negative to positive; for example:

 $2^{30} + 2^{30} = 0x40000000 + 0x40000000 = 0x80000000 = -2^{31}$ 

 $-2^{31} + -2^{31} = 0x8000000 + 0x8000000 = 0x0000000 = 0$ 

For example, this block runs without errors:

```
DECLARE
n SIMPLE_INTEGER := 2147483645;
BEGIN
FOR j IN 1..4 LOOP
n := n + 1;
DBMS_OUTPUT_PUT_LINE(TO_CHAR(n, 'S9999999999'));
```

```
END LOOP;

FOR j IN 1..4 LOOP

n := n - 1;

DBMS_OUTPUT.PUT_LINE(TO_CHAR(n, 'S9999999999'));

END LOOP;

END;

/

Result:

+2147483646

+2147483647

-2147483648

-2147483648

+2147483647
```

PL/SQL procedure successfully completed.

### Expressions with Both SIMPLE\_INTEGER and Other Operands

If an expression has both SIMPLE\_INTEGER and other operands, PL/SQL implicitly converts the SIMPLE INTEGER values to PLS INTEGER NOT NULL.

The PL/SQL compiler issues a warning when SIMPLE\_INTEGER and other values are mixed in a way that might negatively impact performance by inhibiting some optimizations.

### Integer Literals in SIMPLE\_INTEGER Range

+2147483646 +2147483645

Integer literals in the SIMPLE INTEGER range have the data type SIMPLE INTEGER.

However, to ensure backward compatibility, when all operands in an arithmetic expression are integer literals, PL/SQL treats the integer literals as if they were cast to PLS\_INTEGER.

# User-Defined PL/SQL Subtypes

PL/SQL lets you define your own subtypes.

The base type can be any scalar or user-defined PL/SQL data type specifier such as CHAR, DATE, or RECORD (including a previously defined user-defined subtype).

### Note:

The information in this topic applies to both user-defined subtypes and the predefined subtypes listed in PL/SQL Predefined Data Types.

Subtypes can:

- Provide compatibility with ANSI/ISO data types
- Show the intended use of data items of that type
- Detect out-of-range values

### Topics

- Unconstrained Subtypes
- Constrained Subtypes
- Subtypes with Base Types in Same Data Type Family

### Unconstrained Subtypes

An **unconstrained subtype** has the same set of values as its base type, so it is only another name for the base type.

Therefore, unconstrained subtypes of the same base type are interchangeable with each other and with the base type. No data type conversion occurs.

To define an unconstrained subtype, use this syntax:

SUBTYPE subtype\_name IS base\_type

For information about subtype name and base type, see subtype.

An example of an unconstrained subtype, which PL/SQL predefines for compatibility with ANSI, is:

SUBTYPE "DOUBLE PRECISION" IS FLOAT

### Example 4-23 User-Defined Unconstrained Subtypes Show Intended Use

In this example, the unconstrained subtypes Balance and Counter show the intended uses of data items of their types.

#### DECLARE SUBTYPE Balance IS NUMBER;

checking\_account Balance(6,2); savings\_account Balance(8,2); certificate\_of\_deposit Balance(8,2); max insured CONSTANT Balance(8,2) := 250000.00;

#### SUBTYPE Counter IS NATURAL;

```
accounts Counter := 1;
deposits Counter := 0;
withdrawals Counter := 0;
overdrafts Counter := 0;
PROCEDURE deposit (
    account IN OUT Balance,
    amount IN Balance
) IS
BEGIN
    account := account + amount;
    deposits := deposits + 1;
END;
BEGIN
NULL;
END;
/
```

### **Constrained Subtypes**

A constrained subtype has only a subset of the values of its base type.

If the base type lets you specify size, precision and scale, or a range of values, then you can specify them for its subtypes. The subtype definition syntax is:

SUBTYPE subtype\_name IS base\_type
{ precision [, scale ] | RANGE low\_value .. high\_value } [ NOT NULL ]

Otherwise, the only constraint that you can put on its subtypes is NOT NULL:

SUBTYPE subtype\_name IS base\_type [ NOT NULL ]

### Note:

The only base types for which you can specify a range of values are PLS\_INTEGER and its subtypes (both predefined and user-defined).

A constrained subtype can be implicitly converted to its base type, but the base type can be implicitly converted to the constrained subtype only if the value does not violate a constraint of the subtype.

A constrained subtype can be implicitly converted to another constrained subtype with the same base type only if the source value does not violate a constraint of the target subtype.

### See Also:

- "subtype\_definition ::=" syntax diagram
- "subtype" semantic description
- "Example 4-22", "Violating Constraint of SIMPLE\_INTEGER Subtype"
- "Formal Parameters of Constrained Subtypes"
- "NOT NULL Constraint"

#### Example 4-24 User-Defined Constrained Subtype Detects Out-of-Range Values

In this example, the constrained subtype Balance detects out-of-range values.

```
DECLARE
SUBTYPE Balance IS NUMBER(8,2);
checking_account Balance;
savings_account Balance;
BEGIN
checking_account := 2000.00;
savings_account := 1000000.00;
END;
/
```

```
DECLARE
*
ERROR at line 1:
ORA-06502: PL/SQL: value or conversion error: number precision too large
ORA-06512: at line 9
```

# Example 4-25 Implicit Conversion Between Constrained Subtypes with Same Base Type

In this example, the three constrained subtypes have the same base type. The first two subtypes can be implicitly converted to the third subtype, but not to each other.

```
DECLARE

SUBTYPE Digit IS PLS_INTEGER RANGE 0..9;

SUBTYPE Double_digit IS PLS_INTEGER RANGE 10..99;

SUBTYPE Under_100 IS PLS_INTEGER RANGE 0..99;

d Digit := 4;

dd Double_digit := 35;

u Under_100;

BEGIN

u := d; -- Succeeds; Under_100 range includes Digit range

u := dd; -- Succeeds; Under_100 range includes Double_digit range

dd := d; -- Raises error; Double_digit range does not include Digit range

END;

/
```

#### Result:

```
DECLARE
*
ERROR at line 1:
ORA-06502: PL/SQL: value or conversion error
ORA-06512: at line 12
```

### Subtypes with Base Types in Same Data Type Family

If two subtypes have different base types in the same data type family, then one subtype can be implicitly converted to the other only if the source value does not violate a constraint of the target subtype.

For the predefined PL/SQL data types and subtypes, grouped by data type family, see PL/SQL Predefined Data Types.

### Example 4-26 Implicit Conversion Between Subtypes with Base Types in Same Family

In this example, the subtypes Word and Text have different base types in the same data type family. The first assignment statement implicitly converts a Word value to Text. The second assignment statement implicitly converts a Text value to Word. The third assignment statement cannot implicitly convert the Text value to Word, because the value is too long.

```
DECLARE
SUBTYPE Word IS CHAR(6);
SUBTYPE Text IS VARCHAR2(15);
verb Word := 'run';
sentence1 Text;
sentence2 Text := 'Hurry!';
sentence3 Text := 'See Tom run.';
```

```
BEGIN
sentence1 := verb; -- 3-character value, 15-character limit
verb := sentence2; -- 6-character value, 6-character limit
verb := sentence3; -- 12-character value, 6-character limit
END;
/
```

#### DECLARE

```
*
ERROR at line 1:
ORA-06502: PL/SQL: value or conversion error: character string buffer too small
ORA-06512: at line 13
```

# 5 PL/SQL Control Statements

PL/SQL has three categories of control statements: conditional selection statements, loop statements and sequential control statements.

PL/SQL categories of control statements are:

• **Conditional selection statements**, which run different statements for different data values.

The conditional selection statements are IF and CASE.

• Loop statements, which run the same statements with a series of different data values.

The loop statements are the basic LOOP, FOR LOOP, and WHILE LOOP.

The EXIT statement transfers control to the end of a loop. The CONTINUE statement exits the current iteration of a loop and transfers control to the next iteration. Both EXIT and CONTINUE have an optional WHEN clause, where you can specify a condition.

Sequential control statements, which are not crucial to PL/SQL programming.

The sequential control statements are GOTO, which goes to a specified statement, and NULL, which does nothing.

# **Conditional Selection Statements**

The conditional selection statements, IF and CASE, run different statements for different data values.

The IF statement either runs or skips a sequence of one or more statements, depending on a condition. The IF statement has these forms:

- IF THEN
- IF THEN ELSE
- IF THEN ELSIF

The CASE statement chooses from a sequence of conditions, and runs the corresponding statement. The CASE statement has these forms:

- Simple CASE statement, which evaluates a single expression and compares it to several potential values.
- Searched CASE statement, which evaluates multiple conditions and chooses the first one that is true.

The CASE statement is appropriate when a different action is to be taken for each alternative.

### **IF THEN Statement**

The IF THEN statement either runs or skips a sequence of one or more statements, depending on a condition.

The IF THEN statement has this structure:

```
IF condition THEN
   statements
END IF;
```

If the condition is true, the statements run; otherwise, the IF statement does nothing.

For complete syntax, see "IF Statement".

```
\bigcirc
   Tip:
   Avoid clumsy IF statements such as:
   IF new balance < minimum balance THEN
     overdrawn := TRUE;
   ELSE
     overdrawn := FALSE;
   END IF;
   Instead, assign the value of the BOOLEAN expression directly to a BOOLEAN variable:
   overdrawn := new balance < minimum balance;</pre>
   A BOOLEAN variable is either TRUE, FALSE, or NULL. Do not write:
   IF overdrawn = TRUE THEN
     RAISE insufficient funds;
   END IF;
   Instead, write:
   IF overdrawn THEN
     RAISE insufficient funds;
   END IF;
```

### Example 5-1 IF THEN Statement

In this example, the statements between THEN and END IF run if and only if the value of sales is greater than quota+200.

```
DECLARE
 PROCEDURE p (
   sales NUMBER,
   quota NUMBER,
   emp id NUMBER
 )
 IS
   bonus
            NUMBER := 0;
   updated VARCHAR2(3) := 'No';
 BEGIN
   IF sales > (quota + 200) THEN
     bonus := (sales - quota)/4;
     UPDATE employees
     SET salary = salary + bonus
     WHERE employee id = emp id;
     updated := 'Yes';
   END IF;
```

```
DBMS_OUTPUT.PUT_LINE (
    'Table updated? ' || updated || ', ' ||
    'bonus = ' || bonus || '.'
);
END p;
BEGIN
    p(10100, 10000, 120);
    p(10500, 10000, 121);
END;
/
```

```
Table updated? No, bonus = 0.
Table updated? Yes, bonus = 125.
```

# IF THEN ELSE Statement

The IF THEN ELSE statement has this structure:

```
IF condition THEN
statements
ELSE
else_statements
END IF;
```

If the value of condition is true, the statements run; otherwise, the else statements run.

IF statements can be nested, as in Example 5-3.

For complete syntax, see "IF Statement".

### Example 5-2 IF THEN ELSE Statement

In this example, the statement between THEN and ELSE runs if and only if the value of sales is greater than quota+200; otherwise, the statement between ELSE and END IF runs.

```
DECLARE
 PROCEDURE p (
   sales NUMBER,
   quota NUMBER,
   emp id NUMBER
 )
 IS
   bonus NUMBER := 0;
 BEGIN
   IF sales > (quota + 200) THEN
     bonus := (sales - quota)/4;
   ELSE
     bonus := 50;
   END IF;
   DBMS OUTPUT.PUT LINE ('bonus = ' || bonus);
   UPDATE employees
   SET salary = salary + bonus
   WHERE employee id = emp id;
 END p;
BEGIN
 p(10100, 10000, 120);
 p(10500, 10000, 121);
```

```
END;
/
```

bonus = 50 bonus = 125

### Example 5-3 Nested IF THEN ELSE Statements

```
DECLARE
  PROCEDURE p (
   sales NUMBER,
    quota NUMBER,
    emp_id NUMBER
  )
  IS
    bonus NUMBER := 0;
  BEGIN
    IF sales > (quota + 200) THEN
     bonus := (sales - quota)/4;
    ELSE
      IF sales > quota THEN
       bonus := 50;
     ELSE
       bonus := 0;
     END IF;
    END IF;
    DBMS OUTPUT.PUT LINE ('bonus = ' || bonus);
    UPDATE employees
    SET salary = salary + bonus
    WHERE employee id = emp id;
  END p;
BEGIN
  p(10100, 10000, 120);
  p(10500, 10000, 121);
  p(9500, 10000, 122);
END;
/
```

### Result:

bonus = 50bonus = 125bonus = 0

### IF THEN ELSIF Statement

The IF THEN ELSIF statement has this structure:

```
IF condition_1 THEN
  statements_1
ELSIF condition_2 THEN
  statements_2
[ ELSIF condition_3 THEN
    statements_3
]...
[ ELSE
    else statements
```

```
]
END IF;
```

The IF THEN ELSIF statement runs the first *statements* for which *condition* is true. Remaining conditions are not evaluated. If no *condition* is true, the *else\_statements* run, if they exist; otherwise, the IF THEN ELSIF statement does nothing.

A single IF THEN ELSIF statement is easier to understand than a logically equivalent nested IF THEN ELSE statement:

```
-- IF THEN ELSIF statement
```

```
IF condition_1 THEN statements_1;
ELSIF condition_2 THEN statements_2;
ELSIF condition_3 THEN statement_3;
END IF;
```

-- Logically equivalent nested IF THEN ELSE statements

```
IF condition_1 THEN
  statements_1;
ELSE
  IF condition_2 THEN
    statements_2;
  ELSE
    IF condition_3 THEN
       statements_3;
    END IF;
  END IF;
END IF;
```

For complete syntax, see "IF Statement".

### Example 5-4 IF THEN ELSIF Statement

In this example, when the value of sales is larger than 50000, both the first and second conditions are true. However, because the first condition is true, bonus is assigned the value 1500, and the second condition is never tested. After bonus is assigned the value 1500, control passes to the DBMS OUTPUT.PUT LINE invocation.

```
DECLARE
 PROCEDURE p (sales NUMBER)
 ΤS
   bonus NUMBER := 0;
 BEGIN
   IF sales > 50000 THEN
     bonus := 1500;
   ELSIF sales > 35000 THEN
     bonus := 500;
   ELSE
     bonus := 100;
   END IF;
    DBMS OUTPUT.PUT_LINE (
      'Sales = ' || sales || ', bonus = ' || bonus || '.'
   );
 END p;
BEGIN
 p(55000);
 p(40000);
 p(30000);
```

```
END;
/
```

```
Sales = 55000, bonus = 1500.
Sales = 40000, bonus = 500.
Sales = 30000, bonus = 100.
```

### Example 5-5 IF THEN ELSIF Statement Simulates Simple CASE Statement

This example uses an IF THEN ELSIF statement with many ELSIF clauses to compare a single value to many possible values. For this purpose, a simple CASE statement is clearer—see Example 5-6.

```
DECLARE
 grade CHAR(1);
BEGIN
 grade := 'B';
 IF grade = 'A' THEN
   DBMS OUTPUT.PUT LINE ('Excellent');
 ELSIF grade = 'B' THEN
   DBMS OUTPUT.PUT LINE('Very Good');
 ELSIF grade = 'C' THEN
   DBMS OUTPUT.PUT LINE ('Good');
 ELSIF grade = 'D' THEN
   DBMS_OUTPUT. PUT_LINE('Fair');
 ELSIF grade = 'F' THEN
    DBMS_OUTPUT.PUT_LINE('Poor');
 ELSE
   DBMS OUTPUT.PUT LINE('No such grade');
 END IF;
END;
/
```

### Result:

Very Good

### Simple CASE Statement

The simple CASE statement has this structure:

```
CASE selector
WHEN { selector_value_1a | dangling_predicate_1a }
    [, ..., { selector_value_1n | dangling_predicate_1n }] THEN statements_1
WHEN { selector_value_2a | dangling_predicate_2a }
        [, ..., { selector_value_2n | dangling_predicate_2n }] THEN statements_2
...
WHEN { selector_value_na | dangling_predicate_na }
        [, ..., { selector_value_nn | dangling_predicate_nn }] THEN statements_n
[ ELSE
        else_statements ]
END CASE;
```

The *selector* is an expression (typically a single variable). Each *selector\_value* can be either a literal or an expression. A *dangling predicate* can also be used either instead of or in

combination with one or multiple *selector\_values*. (For complete syntax, see "CASE Statement".)

A *dangling\_predicate* is an ordinary expression with its left operand missing, for example, < 2. Using a *dangling\_predicate* allows for more complicated comparisons that would otherwise require a searched CASE statement.

The simple CASE statement runs the first statements for which selector\_value equals selector or dangling\_predicate is true. Remaining conditions are not evaluated. If no selector\_value equals selector and no dangling\_predicate is true, the CASE statement runs else\_statements if they exist and raises the predefined exception CASE\_NOT\_FOUND otherwise.

Example 5-6 uses a simple CASE statement to compare a single value to many possible values. The CASE statement in Example 5-6 is logically equivalent to the IF THEN ELSIF statement in Example 5-5.

### Note:

As in a simple CASE expression, if the selector in a simple CASE statement has the value NULL, it cannot be matched by WHEN NULL (see Example 3-51). Instead, use a searched CASE statement with WHEN condition IS NULL (see Example 3-55).

### Example 5-6 Simple CASE Statement

```
DECLARE
grade CHAR(1);
BEGIN
grade := 'B';

CASE grade
    WHEN 'A' THEN DBMS_OUTPUT.PUT_LINE('Excellent');
    WHEN 'B' THEN DBMS_OUTPUT.PUT_LINE('Very Good');
    WHEN 'C' THEN DBMS_OUTPUT.PUT_LINE('Good');
    WHEN 'D' THEN DBMS_OUTPUT.PUT_LINE('Fair');
    WHEN 'F' THEN DBMS_OUTPUT.PUT_LINE('Poor');
    ELSE DBMS_OUTPUT.PUT_LINE('No such grade');
    END;
//
```

### Result:

Very Good

#### Example 5-7 Simple CASE Statement with Dangling Predicates

```
DECLARE
grade NUMBER;
BEGIN
grade := '85';

CASE grade
  WHEN < 0, > 100 THEN DBMS_OUTPUT.PUT_LINE('No such grade');
  WHEN > 89 THEN DBMS_OUTPUT.PUT_LINE('A');
  WHEN > 79 THEN DBMS_OUTPUT.PUT_LINE('B');
  WHEN > 69 THEN DBMS_OUTPUT.PUT_LINE('C');
```

```
when > 59 THEN DBMS_OUTPUT.PUT_LINE('D');
else dbms_output.put_line('F');
end case;
END;
/
Result:
B
```

## Searched CASE Statement

The searched CASE statement has this structure:

```
CASE
WHEN condition_1 THEN statements_1
WHEN condition_2 THEN statements_2
...
WHEN condition_n THEN statements_n
[ ELSE
else_statements ]
END CASE;
```

The searched CASE statement runs the first *statements* for which *condition* is true. Remaining conditions are not evaluated. If no *condition* is true, the CASE statement runs *else\_statements* if they exist and raises the predefined exception CASE\_NOT\_FOUND otherwise. (For complete syntax, see "CASE Statement".)

The searched CASE statement in Example 5-8 is logically equivalent to the simple CASE statement in Example 5-6.

In both Example 5-8 and Example 5-6, the ELSE clause can be replaced by an EXCEPTION part. Example 5-9 is logically equivalent to Example 5-8.

### Example 5-8 Searched CASE Statement

```
DECLARE
grade CHAR(1);
BEGIN
grade := 'B';

CASE
WHEN grade = 'A' THEN DBMS_OUTPUT.PUT_LINE('Excellent');
WHEN grade = 'B' THEN DBMS_OUTPUT.PUT_LINE('Very Good');
WHEN grade = 'C' THEN DBMS_OUTPUT.PUT_LINE('Good');
WHEN grade = 'D' THEN DBMS_OUTPUT.PUT_LINE('Fair');
WHEN grade = 'F' THEN DBMS_OUTPUT.PUT_LINE('Poor');
ELSE DBMS_OUTPUT.PUT_LINE('No such grade');
END CASE;
END;
//
```

### Result:

Very Good

```
Example 5-9 EXCEPTION Instead of ELSE Clause in CASE Statement
```

```
DECLARE
  grade CHAR(1);
BEGIN
  grade := 'B';
  CASE
    WHEN grade = 'A' THEN DBMS OUTPUT.PUT LINE('Excellent');
    WHEN grade = 'B' THEN DBMS OUTPUT.PUT LINE('Very Good');
    WHEN grade = 'C' THEN DBMS OUTPUT.PUT LINE('Good');
    WHEN grade = 'D' THEN DBMS OUTPUT.PUT LINE('Fair');
    WHEN grade = 'F' THEN DBMS OUTPUT.PUT LINE('Poor');
  END CASE;
EXCEPTION
  WHEN CASE NOT FOUND THEN
    DBMS OUTPUT.PUT LINE('No such grade');
END;
/
Result:
```

Very Good

# LOOP Statements

Loop statements run the same statements iteratively with a series of different values.

A LOOP statement has three parts:

- An iterand, also known as a loop variable, to pass values from the loop header to the loop body
- 2. Iteration controls to generate values for the loop
- 3. A loop body run once for each value

#### The loop statements are:

- Basic LOOP
- FOR LOOP
- Cursor FOR LOOP
- WHILE LOOP

The statements that exit a loop are:

- EXIT
- EXIT WHEN

The statements that exit the current iteration of a loop are:

- CONTINUE
- CONTINUE WHEN

EXIT, EXIT WHEN, CONTINUE, and CONTINUE WHEN can appear anywhere inside a loop, but not outside a loop. Oracle recommends using these statements instead of the GOTO statement, which can exit a loop or the current iteration of a loop by transferring control to a statement outside the loop.

A raised exception also exits a loop.

LOOP statements can be labeled, and LOOP statements can be nested. Labels are recommended for nested loops to improve readability. You must ensure that the label in the END LOOP statement matches the label at the beginning of the same loop statement (the compiler does not check).

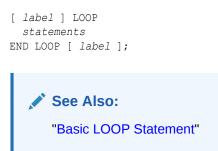

### See Also:

- GOTO Statement
- CONTINUE Statement
- "EXIT Statement"
- "Overview of Exception Handling" for information about exceptions
- "Processing Query Result Sets With Cursor FOR LOOP Statements" for information about the cursor FOR LOOP

### **Basic LOOP Statement**

The basic LOOP statement has this structure.

With each iteration of the loop, the *statements* run and control returns to the top of the loop. To prevent an infinite loop, a statement or raised exception must exit the loop.

### FOR LOOP Statement Overview

The FOR LOOP statement runs one or more statements for each value of the loop index.

A FOR LOOP header specifies the iterator. The iterator specifies an iterand and the iteration controls. The iteration control provides a sequence of values to the iterand for access in the loop body. The loop body has the statements that are processed once for each value of the iterand.

The iteration controls available are :

**Stepped Range** An iteration control that generates a sequence of stepped numeric values. When step is not specified, the counting control is a stepped range of type pls integer with a step of one.

**Single Expression** An iteration control that evaluates a single expression.

Repeated Expression An iteration control that repeatedly evaluates a single expression.

Values Of An iteration control that generates all the values from a collection in sequence. The collection can be a vector valued expression, cursor, cursor variable, or dynamic SQL.

**Indices Of** An iteration control that generates all the indices from a collection in sequence. While all the collection types listed for values of are allowed, indices of is most useful when the collection is a vector variable.

**Pairs Of** An iteration control that generates all the index and value pairs from a collection. All of the collection types allowed for values of are allowed for pairs of. Pairs of iteration controls require two iterands.

**Cursor** An iteration control that generates all the records from a cursor, cursor variable, or dynamic SQL.

The FOR LOOP statement has this structure:

```
[ label ] for loop header
 statements
END LOOP [ label ];
for loop header ::= FOR iterator LOOP
iterator ::= iterand decl [, iterand decl] IN iteration ctl seq
iterand decl ::= pls identifier [ MUTABLE | IMMUTABLE ] [ constrained type ]
iteration ctl seq ::= qual iteration ctl [,]...
qual iteration ctl ::= [ REVERSE ] iteration control pred clause seq
iteration_control ::= stepped_control
                      | single expression control
                      | values of control
                      | indices of control
                      | pairs of control
                      | cursor control
pred clause seq ::= [ stopping pred ] [ skipping pred ]
stopping pred ::= WHILE boolean expression
skipping pred ::= WHEN boolean expression
stepped control ::= lower bound .. upper bound [ BY step ]
single expression control ::= [ REPEAT ] expr
```

See Also: "FOR LOOP Statement" for more information about syntax and semantics

### FOR LOOP Iterand

The index or iterand of a FOR LOOP statement is implicitly or explicitly declared as a variable that is local to the loop.

The statements in the loop can read the value of the iterand, but cannot change it. Statements outside the loop cannot reference the iterand. After the FOR LOOP statement runs, the iterand is undefined. A loop iterand is sometimes called a loop counter.

### Example 5-10 FOR LOOP Statement Tries to Change Index Value

In this example, the FOR LOOP statement tries to change the value of its index, causing an error.

```
BEGIN
FOR i IN 1..3 LOOP
IF i < 3 THEN
DBMS_OUTPUT.PUT_LINE (TO_CHAR(i));
ELSE
i := 2;
END IF;
END LOOP;
END;
/</pre>
```

### Result:

```
i := 2;
*
PLS-00363: expression 'I' cannot be used as an assignment target
ORA-06550: line 6, column 8:
PL/SQL: Statement ignored
```

### Example 5-11 Outside Statement References FOR LOOP Statement Index

In this example, a statement outside the FOR LOOP statement references the loop index, causing an error.

```
BEGIN
FOR i IN 1..3 LOOP
DBMS_OUTPUT.PUT_LINE ('Inside loop, i is ' || TO_CHAR(i));
END LOOP;
DBMS_OUTPUT.PUT_LINE ('Outside loop, i is ' || TO_CHAR(i));
END;
/
```

### Result:

```
DBMS_OUTPUT.PUT_LINE ('Outside loop, i is ' || TO_CHAR(i));

*
PLS-00201: identifier 'I' must be declared
ORA-06550: line 6, column 3:
PL/SQL: Statement ignored
```

### Example 5-12 FOR LOOP Statement Index with Same Name as Variable

If the index of a FOR LOOP statement has the same name as a variable declared in an enclosing block, the local implicit declaration hides the other declaration, as this example shows.

```
DECLARE
i NUMBER := 5;
BEGIN
FOR i IN 1..3 LOOP
DBMS_OUTPUT.PUT_LINE ('Inside loop, i is ' || TO_CHAR(i));
END LOOP;
DBMS_OUTPUT.PUT_LINE ('Outside loop, i is ' || TO_CHAR(i));
END;
/
```

### Result:

Inside loop, i is 1 Inside loop, i is 2 Inside loop, i is 3 Outside loop, i is 5

### Example 5-13 FOR LOOP Statement References Variable with Same Name as Index

This example shows how to change Example 5-12 to allow the statement inside the loop to reference the variable declared in the enclosing block.

```
<<main>> -- Label block.
DECLARE
    i NUMBER := 5;
BEGIN
    FOR i IN 1..3 LOOP
    DBMS_OUTPUT.PUT_LINE (
        'local: ' || TO_CHAR(i) || ', global: ' ||
        TO_CHAR(main.i) -- Qualify reference with block label.
    );
    END LOOP;
END main;
/
```

### Result:

local: 1, global: 5
local: 2, global: 5
local: 3, global: 5

### Example 5-14 Nested FOR LOOP Statements with Same Index Name

In this example, the indexes of the nested FOR LOOP statements have the same name. The inner loop references the index of the outer loop by qualifying the reference with the label of the outer loop. For clarity only, the inner loop also qualifies the reference to its own index with its own label.

```
BEGIN

<<outer_loop>>
FOR i IN 1..3 LOOP

<<inner_loop>>
FOR i IN 1..3 LOOP

IF outer_loop.i = 2 THEN

DBMS_OUTPUT.PUT_LINE

('outer: ' || TO_CHAR(outer_loop.i) || ' inner: '

|| TO_CHAR(inner_loop.i));
```

```
END IF;
END LOOP inner_loop;
END LOOP outer_loop;
END;
/
```

```
outer: 2 inner: 1
outer: 2 inner: 2
outer: 2 inner: 3
```

### **Iterand Mutability**

The mutability property of an iterand determines whether or not it can be assigned in the loop body.

If all iteration controls specified in an iterator are cursor controls, the iterand is mutable by default. Otherwise, the iterand is immutable. The default mutability property of an iterand can be changed in the iterand declaration by specifying the MUTABLE or IMMUTABLE keyword after the iterand variable.

Considerations when declaring an iterand mutable:

- Any modification to the iterand for values of iteration control or the values iterand for a
  pairs of iteration control will not affect the sequence of values produced by that iteration
  control.
- Any modification to the iterand for stepped range iteration control or repeated single expression iteration control will likely affect the behaviour of that control and the sequence of values it produces.
- When the PL/SQL compiler can determine that making an iterand mutable may adversely
  affect runtime performance, it may report a warning.

### Multiple Iteration Controls

Multiple iteration controls may be chained together by separating them with commas.

Each iteration control has a set of controlling expressions (some controls have none) that are evaluated once when the control starts. Evaluation of these expressions or conversion of the evaluated values to the iterand type may raise exceptions. In such cases, the loop is abandoned and normal exception handling occurs. The iterand is accessible in the list of iteration controls. It is initially set to the default value for its type. If that type has a not null constraint, any reference to the iterand in the controlling expressions for the first iteration control will produce a semantic error because the iterand cannot be implicitly initialized. When an iteration control is exhausted, the iterand contains the final value assigned to it while processing that iteration control and execution advances to the next iteration control. If no values are assigned to the iterand by an iteration control, it retains the value it had prior to the start of that iteration control. If the final value of a mutable iterand is modified in the loop body, that modified value will be visible when evaluating the control expressions from the following iteration control.

### Expanding Multiple Iteration Controls Into PL/SQL

The first iteration control is initialized. The loop for the first iteration control is evaluated. The controlling expressions from the next iteration control is evaluated. The loop for the second iteration control is evaluated. Each iteration control and loop is evaluated in turn until there are no more iteration controls.

### Example 5-15 Using Multiple Iteration Controls

This example shows the loop variable *i* taking the value three iteration controls in succession. The value of the iterator is printed for demonstration purpose. It shows that when a loop control is exhausted, the next iteration control begins. When the last iteration control is exhausted, the loop is complete.

```
DECLARE
  i PLS INTEGER;
BEGIN
   FOR i IN 1..3, REVERSE i+1..i+10, 51..55 LOOP
      DBMS OUTPUT.PUT_LINE(i);
   END LOOP;
END;
/
1
2
3
13
12
11
10
9
8
7
6
5
4
51
52
53
54
55
```

### Stepped Range Iteration Controls

Stepped range iteration controls generate a sequence of numeric values.

Controlling expressions are the lower bound, upper bound, and step.

```
stepped_control ::= [ REVERSE ] lower_bound..upper_bound [ BY step ]
lower_bound ::= numeric_expression
upper_bound ::= numeric_expression
step ::= numeric_expression
```

### Expanding Stepped Range Iteration Controls Into PL/SQL

When the iteration control is initialized, each controlling expression is evaluated and converted to the type of the iterand. Step must have a strictly positive numeric value. If any exception occurs while evaluating the controlling expressions, the loop is abandoned and normal exception handling occurs. When no step is specified, its value is one. The values generated by a stepped range iteration control go from lower bound to upper bound by step. When REVERSE is specified the values are decremented from the upper bound to lower bound by step. If the iterand has a floating point type, some combinations of loop control values may create an infinite loop because of rounding errors. No semantic or dynamic analysis will report this. When the iterand is mutable and is modified in the loop body, the modified value is used for the increment and loop exhaustion test in the next iterand update. This may change the sequence of values processed by the loop.

### Example 5-16 FOR LOOP Statements Range Iteration Control

In this example, the iterand i has a *lower\_bound* of 1 and an upper\_bound of 3. The loop prints the numbers from 1 to 3.

```
BEGIN
  FOR i IN 1..3 LOOP
        DBMS_OUTPUT.PUT_LINE (i);
   END LOOP;
END;
/
```

Result:

```
1
2
3
```

### Example 5-17 Reverse FOR LOOP Statements Range Iteration Control

The FOR LOOP statement in this example prints the numbers from 3 to 1. The loop variable *i* is implicitly declared as a PLS INTEGER (the default for counting and indexing loops).

```
BEGIN
    FOR i IN REVERSE 1..3 LOOP
        DBMS_OUTPUT.PUT_LINE (i);
    END LOOP;
END;
/
```

Result:

```
3
2
1
```

### Example 5-18 Stepped Range Iteration Controls

This example shows a loop variable *n* declared explicitly as a NUMBER(5,1). The increment for the counter is 0.5.

```
BEGIN
   FOR n NUMBER(5,1) IN 1.0 .. 3.0 BY 0.5 LOOP
        DBMS_OUTPUT_PUT_LINE(n);
   END LOOP;
END;
/
Result:
```

Result

1 1.5 2 2.5 3

### Example 5-19 STEP Clause in FOR LOOP Statement

In this example, the FOR LOOP effectively increments the index by five.

```
BEGIN
FOR i IN 5..15 BY 5 LOOP
DBMS_OUTPUT.PUT_LINE (i);
END LOOP;
END;
Result:
```

5

10 15

### Example 5-20 Simple Step Filter Using FOR LOOP Stepped Range Iterator

This example illustrates a simple step filter. This filter is used in signal processing and other reduction applications. The predicate specifies that every Kth element of the original collection is passed to the collection being created.

```
FOR i IN start..finish LOOP
    IF (i - start) MOD k = 0 THEN
        newcol(i) := col(i)
    END IF;
END LOOP;
```

You can implement the step filter using a stepped range iterator.

```
FOR i IN start..finish BY k LOOP
  newcol(i) := col(i)
END LOOP;
```

You can implement the same filter by creating a new collection using a stepped iteration control embedded in a qualified expression.

newcol := col\_t(FOR I IN start..finish BY k => col(i));

### Single Expression Iteration Controls

A single expression iteration control generates a single value.

single\_expression\_control ::= [ REPEAT ] expr

A single expression iteration control has no controlling expressions.

When the iterand is mutable, changes made to it in the loop body will be seen when reevaluating the expression in the repeat form.

### Expanding Single Expression Iteration Controls Into PL/SQL

The expression is evaluated, converted to the iterand type to create the next value. Any stopping predicate is evaluated. If it fails to evaluate to TRUE, the iteration control is exhausted. Any skipping predicate is evaluated. If it fails to evaluate to TRUE, skip the next step. Evaluate the loop body. If REPEAT is specified, evaluate the expression again. Otherwise, the iteration control is exhausted.

### Example 5-21 Single Expression Iteration Control

This example shows the loop body being processed once.

ORACLE

```
BEGIN
    FOR i IN 1 LOOP
        DBMS_OUTPUT.PUT_LINE(i);
    END LOOP;
END;
/
```

1

This example shows the iterand starting with 1, then i\*2 is evaluated repeatedly until the stopping predicate evaluates to true.

```
BEGIN
   FOR i IN 1, REPEAT i*2 WHILE i < 100 LOOP
        DBMS_OUTPUT.PUT_LINE(i);
   END LOOP;
END;
/
Result:
1</pre>
```

### **Collection Iteration Controls**

VALUES OF, INDICES OF, and PAIRS OF iteration controls generate sequences of values for an iterand derived from a collection.

```
collection iteration control ::= values of control
                                 | indices of control
                                  | pairs of control
values_of_control ::= VALUES OF expr
                      | VALUES OF (cursor_object)
                      | VALUES OF (sql_statement)
                      | VALUES OF cursor_variable
                      | VALUES OF (dynamic sql)
indices_of_control ::= INDICES OF expr
                      | INDICES OF (cursor object)
                      | INDICES OF (sql statement)
                      | INDICES OF cursor variable
                      | INDICES OF (dynamic sql)
pairs_of_control ::= PAIRS OF expr
                      | PAIRS OF (cursor object)
                      | PAIRS OF (sql statement)
                      | PAIRS OF cursor variable
                      | PAIRS OF (dynamic sql)
```

The collection itself is the controlling expression. The collection can be a vector value expression, a cursor object, cursor variable, or dynamic SQL. If a collection is null, it is treated as if it were defined and empty.

A *cursor\_object* is an explicit PL/SQL cursor object. A *sql\_statement* is an implicit PL/SQL cursor object created for a SQL statement specified directly in the iteration control. A *cursor\_variable* is a PL/SQL REF\_CURSOR object.

When the iterand for a values of iteration control or the value iterand for a VALUES OF iteration control is modified in the loop body, those changes have no effect on the next value generated by the iteration control.

If the collection is modified in the loop body, behavior is unspecified. If a cursor variable is accessed other than through the iterand during execution of the loop body, the behavior is unspecified. Most INDICES OF iteration controls produce a numeric sequence unless the collection is a vector variable.

### Expanding VALUES OF Iteration Controls into PL/SQL

The collection is evaluated and assigned to a vector. If the collection is empty, the iteration control is exhausted. A temporary hidden index is initialized with the index of the first element (or last element if REVERSE is specified). A value is fetched from the collection based on the temporary index to create the next value for the iterand. Any stopping predicate is evaluated. If it fails to evaluate to TRUE, the iteration control is exhausted. Any skipping predicate is evaluated. If it fails to evaluate to TRUE, skip the next step. Evaluate the loop body. Advance the index temporary to the index of the next element in the vector (previous element for REVERSE). Determine the next value and reiterate with each iterand value until the iteration control is exhausted.

### Example 5-22 VALUES OF Iteration Control

This example prints the values from the collection vec: [11, 10, 34]. The iterand values of the iteration control variable *i* is the value of the first element in the vector, then the next element, and the last one.

```
DECLARE
  TYPE intvec_t IS TABLE OF PLS_INTEGER INDEX BY PLS_INTEGER;
  vec intvec_t := intvec_t(3 => 10, 1 => 11, 100 => 34);
BEGIN
  FOR i IN VALUES OF vec LOOP
     DBMS_OUTPUT.PUT_LINE(i);
  END LOOP;
END;
/
```

### Result:

11 10 34

### Expanding INDICES OF Iteration Controls into PL/SQL

The collection is evaluated and assigned to a vector. If the collection is empty, the iteration control is exhausted. The next value for the iterand is determined (index of the first element or last element if REVERSE is specified). The next value is assigned to the iterand. Any stopping predicate is evaluated. If it fails to evaluate to TRUE, the iteration control is exhausted. Any skipping predicate is evaluated. If it fails to evaluate to TRUE, skip the next step. The loop body

is evaluated. Advance the iterand to the next value which is the index of the next element in the vector (previous element for REVERSE). Reiterate with each iterand value (assigned the index of the next or previous element) until the iteration control is exhausted.

### Example 5-23 INDICES OF Iteration Control

This example prints the indices of the collection vec : [1, 3, 100]. The iterand values of the iteration control variable *i* is the index of the first element in the vector, then the next element, and the last one.

```
DECLARE
   TYPE intvec_t IS TABLE OF PLS_INTEGER INDEX BY PLS_INTEGER;
   vec intvec_t := intvec_t(3 => 10, 1 => 11, 100 => 34);
BEGIN
   FOR i IN INDICES OF vec LOOP
        DBMS_OUTPUT.PUT_LINE(i);
   END LOOP;
END;
/
```

#### Result:

1 3 100

### Expanding PAIRS OF Iteration Controls into PL/SQL

The collection is evaluated and assigned to a vector. If the collection is empty, the iteration control is exhausted. The next index value for the iterand is determined (index of the first element or last element if REVERSE is specified). The next value of the element indexed by the next value is assigned to the iterand. Any stopping predicate is evaluated. If it fails to evaluate to TRUE, the iteration control is exhausted. Any skipping predicate is evaluated. If it fails to evaluate to TRUE, skip the next step. The loop body is evaluated. Advance the iterand to the next index value which is the index of the next element in the vector (previous element for REVERSE). Reiterate with each iterand value until the iteration control is exhausted.

### Example 5-24 PAIRS OF Iteration Control

This example inverts a collection vec into a collection result and prints the resulting index value pairs ( $10 \Rightarrow 3$ ,  $11 \Rightarrow 1$ ,  $34 \Rightarrow 100$ ).

```
DECLARE
   TYPE intvec_t IS TABLE OF PLS_INTEGER INDEX BY PLS_INTEGER;
   vec intvec_t := intvec_t(3 => 10, 1 => 11, 100 => 34);
   result intvec_t;
BEGIN
   result := intvec_t(FOR i,j IN PAIRS OF vec INDEX j => i);
   FOR i,j IN PAIRS OF result LOOP
        DBMS_OUTPUT.PUT_LINE(i || '=>'|| j);
   END LOOP;
END;
/
```

### Result:

10=>3 11=>1 34=>100

### **Cursor Iteration Controls**

Cursor iteration controls generate the sequence of records returned by an explicit or implicit cursor.

The cursor definition is the controlling expression. You cannot use REVERSE with a cursor iteration control.

A *cursor\_object* is an explicit PL/SQL cursor object. A *sql\_statement* is an implicit PL/SQL cursor object created for a SQL statement specified directly in the iteration control. A *cursor\_variable* is a PL/SQL REF CURSOR object. A cursor iteration control is equivalent to a VALUES OF iteration control whose collection is a cursor. When the iteration control. When the loop body, it has no effect on the next value generated by the iteration control. When the collection is a cursor variable, it must be open when the iteration control is encountered or an exception will be raised. It remains open when the iteration control is exhausted. If the cursor variable is accessed other than through the iteration during execution of the loop body, the behavior is unspecified.

### Expanding Cursor Iteration Controls Into PL/SQL

The cursor is evaluated to create a vector of iterands. If the vector is empty, the iteration control is exhausted. A value is fetched in the vector to create the next value for the iterand. Any stopping predicate is evaluated. If it fails to evaluate to TRUE, the iteration control is exhausted. Any skipping predicate is evaluated. If it fails to evaluate to TRUE, skip the next step. Evaluate the loop body. Reiterate the same with each iterand value fetched until the iteration control is exhausted.

### Example 5-25 Cursor Iteration Controls

This example creates an associative array mapping of id to data from table t.

```
OPEN c FOR SELECT id, data FROM T;
FOR r rec_t IN c LOOP
    result(r.id) := r.data;
END LOOP;
CLOSE c;
```

Using Dynamic SQL in Iteration Controls

```
dynamic_sql ::= EXECUTE IMMEDIATE dynamic_sql_stmt [ using_clause ]
using_clause ::= USING [ [ IN ] (bind_argument [,])+ ]
```

Dynamic SQL may be used in a cursor or collection iteration control. Such a construct cannot provide a default type; if it is used as the first iteration control, an explicit type must be specified for the iterand (or for the value iterand for a pairs of control). The *using\_clause* is the only clause allowed. No INTO or dynamic returning clauses may be used. If the specified SQL statement is a kind that cannot return any rows, a runtime error will be reported similar to that

reported if a bulk collect into or into clause were specified on an ordinary EXECUTE IMMEDIATE statement.

### Example 5-26 Using Dynamic SQL As An Iteration Control

This example shows the iteration control generates all the records from a dynamic SQL. It prints the last\_name and employee\_id of all employees having an employee\_id less than 103. It executes the loop body when the stopping predicate is TRUE.

Result:

```
Garcia, 102
King, 100
Yang, 101
```

Example 5-27 Using Dynamic SQL As An Iteration Control In a Qualified Expression

v := vec rec t( FOR r rec t IN (EXECUTE IMMEDIATE query var) SEQUENCE => r);

### Stopping and Skipping Predicate Clauses

A stopping predicate clause can cause the iteration control to be exhausted while a skipping predicate clause can cause the loop body to be skipped for some values.

The expressions in these predicate clauses are not controlling expressions.

A stopping predicate clause can cause the iteration control to be exhausted. The *boolean\_expression* is evaluated at the beginning of each iteration of the loop. If it fails to evaluate to TRUE, the iteration control is exhausted.

A skipping predicate clause can cause the loop body to be skipped for some values. The *boolean\_expression* is evaluated. If it fails to evaluate to TRUE, the iteration control skips to the next value.

```
pred_clause_seq ::= [stopping_pred] [skipping_pred]
stopping_pred ::= WHILE boolean_expression
skipping_pred ::= WHEN boolean_expression
```

### Example 5-28 Using FOR LOOP Stopping Predicate Clause

This example shows an iteration control with a WHILE stopping predicate clause The iteration control is exhausted if the stopping predicate does not evaluate to TRUE.

```
BEGIN
FOR power IN 1, REPEAT power*2 WHILE power <= 64 LOOP
DBMS_OUTPUT.PUT_LINE(power);
END LOOP;
END;
/
Result:
1
2
4
8
16</pre>
```

### Example 5-29 Using FOR LOOP Skipping Predicate Clause

This example shows an iteration control with a WHEN skipping predicate clause. If the skipping predicate does not evaluate to TRUE, the iteration control skips to the next value.

```
BEGIN
FOR power IN 2, REPEAT power*2 WHILE power <= 64 WHEN MOD(power, 32) = 0 LOOP
DBMS_OUTPUT.PUT_LINE(power);
END LOOP;
END;
/
Result:</pre>
```

2 32 64

32 64

### WHILE LOOP Statement

The WHILE LOOP statement runs one or more statements while a condition is true.

It has this structure:

```
[ label ] WHILE condition LOOP
  statements
END LOOP [ label ];
```

If the *condition* is true, the *statements* run and control returns to the top of the loop, where *condition* is evaluated again. If the *condition* is not true, control transfers to the statement after the WHILE LOOP statement. To prevent an infinite loop, a statement inside the loop must make the condition false or null. For complete syntax, see "WHILE LOOP Statement".

An EXIT, EXIT WHEN, CONTINUE, or CONTINUE WHEN in the *statements* can cause the loop or the current iteration of the loop to end early.

Some languages have a LOOP UNTIL or REPEAT UNTIL structure, which tests a condition at the bottom of the loop instead of at the top, so that the statements run at least once. To simulate this structure in PL/SQL, use a basic LOOP statement with an EXIT WHEN statement:

```
LOOP
statements
EXIT WHEN condition;
END LOOP;
```

# **Sequential Control Statements**

Unlike the IF and LOOP statements, the sequential control statements GOTO and NULL are not crucial to PL/SQL programming.

The GOTO statement, which goes to a specified statement, is seldom needed. Occasionally, it simplifies logic enough to warrant its use.

The NULL statement, which does nothing, can improve readability by making the meaning and action of conditional statements clear.

### Topics

- GOTO Statement
- NULL Statement

### **GOTO** Statement

The GOTO statement transfers control to a label unconditionally. The label must be unique in its scope and must precede an executable statement or a PL/SQL block. When run, the GOTO statement transfers control to the labeled statement or block.

For GOTO statement restrictions, see "GOTO Statement".

Use GOTO statements sparingly—overusing them results in code that is hard to understand and maintain. Do not use a GOTO statement to transfer control from a deeply nested structure to an exception handler. Instead, raise an exception. For information about the PL/SQL exception-handling mechanism, see PL/SQL Error Handling.

The GOTO statement transfers control to the first enclosing block in which the referenced label appears.

### NULL Statement

The NULL statement only passes control to the next statement. Some languages refer to such an instruction as a no-op (no operation).

Some uses for the NULL statement are:

- To provide a target for a GOTO statement
- To improve readability by making the meaning and action of conditional statements clear
- To create placeholders and stub subprograms
- To show that you are aware of a possibility, but that no action is necessary

### Note:

Using the NULL statement might raise an unreachable code warning if warnings are enabled. For information about warnings, see "Compile-Time Warnings".

### Example 5-30 NULL Statement Showing No Action

The NULL statement emphasizes that only salespersons receive commissions.

```
DECLARE
v_job_id VARCHAR2(10);
v_emp_id NUMBER(6) := 110;
BEGIN
SELECT job_id INTO v_job_id
FROM employees
WHERE employee_id = v_emp_id;
IF v_job_id = 'SA_REP' THEN
UPDATE employees
SET commission_pct = commission_pct * 1.2;
ELSE
NULL; -- Employee is not a sales rep
END IF;
END;
/
```

### Example 5-31 NULL Statement as Placeholder During Subprogram Creation

The NULL statement lets you compile this subprogram and fill in the real body later.

```
CREATE OR REPLACE PROCEDURE award_bonus (
  emp_id NUMBER,
  bonus NUMBER
) AUTHID DEFINER AS
BEGIN -- Executable part starts here
  NULL; -- Placeholder
  -- (raises "unreachable code" if warnings enabled)
END award_bonus;
/
```

### Example 5-32 NULL Statement in ELSE Clause of Simple CASE Statement

The NULL statement shows that you have chosen to take no action for grades other than A, B, C, D, and F.

```
CREATE OR REPLACE PROCEDURE print grade (
  grade CHAR
) AUTHID DEFINER AS
BEGIN
  CASE grade
    WHEN 'A' THEN DBMS OUTPUT.PUT LINE('Excellent');
    WHEN 'B' THEN DBMS OUTPUT.PUT LINE('Very Good');
    WHEN 'C' THEN DBMS OUTPUT.PUT LINE('Good');
    WHEN 'D' THEN DBMS_OUTPUT.PUT_LINE('Fair');
    WHEN 'F' THEN DBMS_OUTPUT.PUT_LINE('Poor');
   ELSE NULL;
  END CASE;
END;
/
BEGIN
  print grade('A');
  print grade('S');
END;
/
```

#### Result:

Excellent

# 6 PL/SQL Collections and Records

PL/SQL lets you define two kinds of composite data types: collection and record.

A **composite data type** stores values that have internal components. You can pass entire composite variables to subprograms as parameters, and you can access internal components of composite variables individually. Internal components can be either scalar or composite. You can use scalar components wherever you can use scalar variables. You can use composite components wherever you can use composite variables of the same type.

### Note:

If you pass a composite variable as a parameter to a remote subprogram, then you must create a redundant loop-back DATABASE LINK, so that when the remote subprogram compiles, the type checker that verifies the source uses the same definition of the user-defined composite variable type as the invoker uses.

In a **collection**, the internal components always have the same data type, and are called **elements**. You can access each element of a collection variable by its unique index, with this syntax: *variable\_name(index)*. To create a collection variable, you either define a collection type and then create a variable of that type or use <code>%TYPE</code>.

In a **record**, the internal components can have different data types, and are called **fields**. You can access each field of a record variable by its name, with this syntax: variable\_name.field\_name. To create a record variable, you either define a RECORD type and then create a variable of that type or use %ROWTYPE or %TYPE.

You can create a collection of records, and a record that contains collections.

### **Collection Topics**

- Collection Types
- Associative Arrays
- Varrays (Variable-Size Arrays)
- Nested Tables
- Collection Constructors
- Qualified Expressions Overview
- Assigning Values to Collection Variables
- Multidimensional Collections
- Collection Comparisons
- Collection Methods
- Collection Types Defined in Package Specifications

### See Also:

- Oracle Database SQL Language Reference for information about the CREATE
   DATABASE LINK statement
- "Querying a Collection"
- "BULK COLLECT Clause" for information about retrieving query results into a collection
- "Collection Variable Declaration" for syntax and semantics of collection type definition and collection variable declaration

#### **Record Topics**

- Record Variables
- Assigning Values to Record Variables
- Record Comparisons
- Inserting Records into Tables
- Updating Rows with Records
- Restrictions on Record Inserts and Updates

### Note:

The components of an explicitly listed composite data structure (such as a collection constructor or record initializer) can be evaluated in any order. If a program determines order of evaluation, then at the point where the program does so, its behavior is undefined.

# **Collection Types**

PL/SQL has three collection types—associative array, VARRAY (variable-size array), and nested table.

Table 6-1 summarizes their similarities and differences.

Collection Type	Number of Elements	Index Type	Dense or Sparse	Uninitialized Status	Where Defined	Can Be ADT Attribute Data Type
Associative array (or index-by table)	Unspecified	String or PLS_INTEG ER	Either	Empty	In PL/SQL block or package	No
VARRAY (variable-size array)	Specified	Integer	Always dense	Null	In PL/SQL block or package or at schema level	Only if defined at schema level

#### Table 6-1 PL/SQL Collection Types

Collection Type	Number of Elements	Index Type	Dense or Sparse	Uninitialized Status	Where Defined	Can Be ADT Attribute Data Type
Nested table	Unspecified	Integer	Starts dense, can become sparse	Null	In PL/SQL block or package or at schema level	Only if defined at schema level

#### Table 6-1 (Cont.) PL/SQL Collection Types

#### Number of Elements

If the number of elements is specified, it is the maximum number of elements in the collection. If the number of elements is unspecified, the maximum number of elements in the collection is the upper limit of the index type.

#### **Dense or Sparse**

A **dense collection** has no gaps between elements—every element between the first and last element is defined and has a value (the value can be NULL unless the element has a NOT NULL constraint). A **sparse collection** has gaps between elements.

#### **Uninitialized Status**

An **empty collection** exists but has no elements. To add elements to an empty collection, invoke the EXTEND method (described in "EXTEND Collection Method").

A **null collection** (also called an **atomically null collection**) does not exist. To change a null collection to an existing collection, you must initialize it, either by making it empty or by assigning a non-NULL value to it (for details, see "Collection Constructors" and "Assigning Values to Collection Variables"). You cannot use the EXTEND method to initialize a null collection.

#### Where Defined

A collection type defined in a PL/SQL block is a **local type**. It is available only in the block, and is stored in the database only if the block is in a standalone or package subprogram. (Standalone and package subprograms are explained in "Nested, Package, and Standalone Subprograms".)

A collection type defined in a package specification is a **public item**. You can reference it from outside the package by qualifying it with the package name (*package\_name.type\_name*). It is stored in the database until you drop the package. (Packages are explained in PL/SQL Packages.)

A collection type defined at schema level is a **standalone type**. You create it with the "CREATE TYPE Statement". It is stored in the database until you drop it with the "DROP TYPE Statement".

### Note:

A collection type defined in a package specification is incompatible with an identically defined local or standalone collection type (see Example 6-37 and Example 6-38).

#### Can Be ADT Attribute Data Type

To be an ADT attribute data type, a collection type must be a standalone collection type. For other restrictions, see **Restrictions on** *datatype*.

#### Translating Non-PL/SQL Composite Types to PL/SQL Composite Types

If you have code or business logic that uses another language, you can usually translate the array and set types of that language directly to PL/SQL collection types. For example:

Non-PL/SQL Composite Type	Equivalent PL/SQL Composite Type
Hash table	Associative array
Unordered table	Associative array
Set	Nested table
Bag	Nested table
Array	VARRAY

### See Also:

*Oracle Database SQL Language Reference* for information about the CAST function, which converts one SQL data type or collection-typed value into another SQL data type or collection-typed value.

# Associative Arrays

An **associative array** (formerly called **PL/SQL table** or **index-by table**) is a set of key-value pairs. Each key is a unique index, used to locate the associated value with the syntax *variable name(index)*.

The data type of *index* can be either a string type (VARCHAR2, VARCHAR, STRING, or LONG) or PLS\_INTEGER. Indexes are stored in sort order, not creation order. For string types, sort order is determined by the initialization parameters NLS SORT and NLS COMP.

Like a database table, an associative array:

- Is empty (but not null) until you populate it
- Can hold an unspecified number of elements, which you can access without knowing their positions

Unlike a database table, an associative array:

- Does not need disk space or network operations
- Cannot be manipulated with DML statements

#### Topics

- Declaring Associative Array Constants
- NLS Parameter Values Affect Associative Arrays Indexed by String
- Appropriate Uses for Associative Arrays

See Also:
Table 6-1 for a summary of associative array characteristics
"assoc\_array\_type\_def ::=" for the syntax of an associative array type definition

#### Example 6-1 Associative Array Indexed by String

This example defines a type of associative array indexed by string, declares a variable of that type, populates the variable with three elements, changes the value of one element, and prints the values (in sort order, not creation order). (FIRST and NEXT are collection methods, described in "Collection Methods".)

```
Live SQL:
```

You can view and run this example on Oracle Live SQL at Associative Array Indexed by String

```
DECLARE
```

```
-- Associative array indexed by string:
```

```
TYPE population IS TABLE OF NUMBER -- Associative array type
INDEX BY VARCHAR2(64); -- indexed by string
```

```
city_population population; -- Associative array variable
i VARCHAR2(64); -- Scalar variable
```

BEGIN

END; /

-- Add elements (key-value pairs) to associative array:

```
city_population('Smallville') := 2000;
city_population('Midland') := 750000;
city_population('Megalopolis') := 1000000;
```

-- Change value associated with key 'Smallville':

```
city_population('Smallville') := 2001;
```

```
-- Print associative array:
```

i := city\_population.FIRST; -- Get first element of array
WHILE i IS NOT NULL LOOP

```
DBMS_Output.PUT_LINE
```

```
('Population of ' || i || ' is ' || city_population(i));
i := city_population.NEXT(i); -- Get next element of array
END LOOP;
```

#### Result:

```
Population of Megalopolis is 1000000
Population of Midland is 750000
Population of Smallville is 2001
```

#### Example 6-2 Function Returns Associative Array Indexed by PLS\_INTEGER

This example defines a type of associative array indexed by PLS\_INTEGER and a function that returns an associative array of that type.

#### Live SQL:

You can view and run this example on Oracle Live SQL at Function Returns Associative Array Indexed by PLS\_INTEGER

```
DECLARE
```

```
TYPE sum multiples IS TABLE OF PLS INTEGER INDEX BY PLS INTEGER;
 n PLS INTEGER := 5; -- number of multiples to sum for display
 sn PLS INTEGER := 10; -- number of multiples to sum
 m PLS INTEGER := 3; -- multiple
 FUNCTION get_sum_multiples (
   multiple IN PLS INTEGER,
        IN PLS INTEGER
   num
 ) RETURN sum multiples
 IS
   s sum multiples;
 BEGIN
   FOR i IN 1..num LOOP
     s(i) := multiple * ((i * (i + 1)) / 2); -- sum of multiples
   END LOOP;
   RETURN s;
 END get sum multiples;
BEGIN
 DBMS OUTPUT.PUT LINE (
   'Sum of the first ' || TO CHAR(n) || ' multiples of ' ||
   TO CHAR(m) || ' is ' || TO CHAR(get sum multiples (m, sn)(n))
 );
END;
/
```

### Result:

Sum of the first 5 multiples of 3 is 45

# **Declaring Associative Array Constants**

When declaring an associative array constant, you can use qualified expressions to initialize the associative array with its initial values in a compact form.

For information about constructors, see "Collection Constructors".

#### Example 6-3 Declaring Associative Array Constant

You can use a qualified expression indexed association aggregate to initialize a constant associative array index expression and value expression.

```
DECLARE

TYPE My_AA IS TABLE OF VARCHAR2(20) INDEX BY PLS_INTEGER;

v CONSTANT My_AA := My_AA(-10=>'-ten', 0=>'zero', 1=>'one', 2=>'two', 3 =>

'three', 4 => 'four', 9 => 'nine');

BEGIN

DECLARE

Idx PLS_INTEGER := v.FIRST();

BEGIN

WHILE Idx IS NOT NULL LOOP

DBMS_OUTPUT.PUT_LINE(TO_CHAR(Idx, '999')||LPAD(v(Idx), 7));

Idx := v.NEXT(Idx);

END LOOP;

END;

END;

END;
```

Prior to Oracle Database Release 18c, to achieve the same result, you had to create the function for the associative array constructor. You can observe by comparing both examples that qualified expressions improve program clarity and developer productivity by being more compact.

### 💉 Live SQL:

You can view and run this example on Oracle Live SQL at Declaring Associative Array Constant

```
CREATE OR REPLACE PACKAGE My_Types AUTHID CURRENT_USER IS
TYPE My_AA IS TABLE OF VARCHAR2(20) INDEX BY PLS_INTEGER;
FUNCTION Init_My_AA RETURN My_AA;
END My_Types;
/
CREATE OR REPLACE PACKAGE BODY My_Types IS
FUNCTION Init_My_AA RETURN My_AA IS
Ret My_AA;
BEGIN
Ret(-10) := '-ten';
Ret(0) := 'zero';
Ret(1) := 'one';
Ret(2) := 'two';
Ret(3) := 'three';
```

```
Ret(4) := 'four';
    Ret(9) := 'nine';
    RETURN Ret;
  END Init_My_AA;
END My_Types;
/
DECLARE
  v CONSTANT My_Types.My_AA := My_Types.Init_My_AA();
BEGIN
  DECLARE
    Idx PLS INTEGER := v.FIRST();
  BEGIN
    WHILE Idx IS NOT NULL LOOP
      DBMS OUTPUT.PUT LINE (TO CHAR(Idx, '999') | |LPAD(v(Idx), 7));
     Idx := v.NEXT(Idx);
    END LOOP;
  END;
END;
/
```

### Result:

-10 -ten 0 zero 1 one 2 two 3 three 4 four 9 nine

# NLS Parameter Values Affect Associative Arrays Indexed by String

National Language Support (NLS) parameters such as NLS\_SORT, NLS\_COMP, and NLS\_DATE\_FORMAT affect associative arrays indexed by string.

#### Topics

- Changing NLS Parameter Values After Populating Associative Arrays
- Indexes of Data Types Other Than VARCHAR2
- Passing Associative Arrays to Remote Databases

### 🖋 See Also:

*Oracle Database Globalization Support Guide* for information about linguistic sort parameters

## Changing NLS Parameter Values After Populating Associative Arrays

The initialization parameters NLS\_SORT and NLS\_COMP determine the storage order of string indexes of an associative array.

If you change the value of either parameter after populating an associative array indexed by string, then the collection methods FIRST, LAST, NEXT, and PRIOR might return unexpected values or raise exceptions. If you must change these parameter values during your session, restore their original values before operating on associative arrays indexed by string.

## See Also:

Collection Methods for more information about FIRST, LAST, NEXT, and PRIOR

## Indexes of Data Types Other Than VARCHAR2

In the declaration of an associative array indexed by string, the string type must be VARCHAR2 or one of its subtypes.

However, you can populate the associative array with indexes of any data type that the TO CHAR function can convert to VARCHAR2.

If your indexes have data types other than VARCHAR2 and its subtypes, ensure that these indexes remain consistent and unique if the values of initialization parameters change. For example:

• Do not use TO CHAR (SYSDATE) as an index.

If the value of NLS\_DATE\_FORMAT changes, then the value of (TO\_CHAR(SYSDATE)) might also change.

- Do not use different NVARCHAR2 indexes that might be converted to the same VARCHAR2 value.
- Do not use CHAR or VARCHAR2 indexes that differ only in case, accented characters, or punctuation characters.

If the value of NLS\_SORT ends in \_CI (case-insensitive comparisons) or \_AI (accent- and case-insensitive comparisons), then indexes that differ only in case, accented characters, or punctuation characters might be converted to the same value.

## 💉 See Also:

Oracle Database SQL Language Reference for more information about TO\_CHAR

## Passing Associative Arrays to Remote Databases

If you pass an associative array as a parameter to a remote database, and the local and the remote databases have different NLS\_SORT or NLS\_COMP values, then:

 The collection method FIRST, LAST, NEXT or PRIOR (described in "Collection Methods") might return unexpected values or raise exceptions.

 Indexes that are unique on the local database might not be unique on the remote database, raising the predefined exception VALUE ERROR.

# Appropriate Uses for Associative Arrays

An associative array is appropriate for:

- A relatively small lookup table, which can be constructed in memory each time you invoke the subprogram or initialize the package that declares it
- Passing collections to and from the database server

Declare formal subprogram parameters of associative array types. With Oracle Call Interface (OCI) or an Oracle precompiler, bind the host arrays to the corresponding actual parameters. PL/SQL automatically converts between host arrays and associative arrays indexed by PLS INTEGER.

## Note:

You cannot bind an associative array indexed by VARCHAR.

## Note:

You cannot declare an associative array type at schema level. Therefore, to pass an associative array variable as a parameter to a standalone subprogram, you must declare the type of that variable in a package specification. Doing so makes the type available to both the invoked subprogram (which declares a formal parameter of that type) and the invoking subprogram or anonymous block (which declares and passes the variable of that type). See Example 11-2.

## 🛛 Tip:

The most efficient way to pass collections to and from the database server is to use associative arrays with the FORALL statement or BULK COLLECT clause. For details, see "FORALL Statement" and "BULK COLLECT Clause".

An associative array is intended for temporary data storage. To make an associative array persistent for the life of a database session, declare it in a package specification and populate it in the package body.

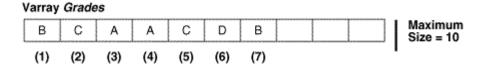

# Varrays (Variable-Size Arrays)

A **varray (variable-size array)** is an array whose number of elements can vary from zero (empty) to the declared maximum size.

To access an element of a varray variable, use the syntax <code>variable\_name(index)</code>. The lower bound of <code>index</code> is 1; the upper bound is the current number of elements. The upper bound changes as you add or delete elements, but it cannot exceed the maximum size. When you store and retrieve a varray from the database, its indexes and element order remain stable.

Figure 6-1 shows a varray variable named Grades, which has maximum size 10 and contains seven elements. Grades(*n*) references the *n*th element of Grades. The upper bound of Grades is 7, and it cannot exceed 10.

#### Figure 6-1 Varray of Maximum Size 10 with 7 Elements

The database stores a varray variable as a single object. If a varray variable is less than 4 KB, it resides inside the table of which it is a column; otherwise, it resides outside the table but in the same tablespace.

An uninitialized varray variable is a null collection. You must initialize it, either by making it empty or by assigning a non-NULL value to it. For details, see "Collection Constructors" and "Assigning Values to Collection Variables".

#### Topics

Appropriate Uses for Varrays

#### See Also:

- Table 6-1 for a summary of varray characteristics
- "varray\_type\_def ::=" for the syntax of a VARRAY type definition
- "CREATE TYPE Statement" for information about creating standalone VARRAY types
- Oracle Database SQL Language Reference for more information about varrays

#### Example 6-4 Varray (Variable-Size Array)

This example defines a local VARRAY type, declares a variable of that type (initializing it with a constructor), and defines a procedure that prints the varray. The example invokes the procedure three times: After initializing the variable, after changing the values of two elements individually, and after using a constructor to the change the values of all elements. (For an example of a procedure that prints a varray that might be null or empty, see Example 6-30.)

### Live SQL:

You can view and run this example on Oracle Live SQL at Varray (Variable-Size Array)

```
DECLARE
TYPE Foursome IS VARRAY(4) OF VARCHAR2(15); -- VARRAY type
-- varray variable initialized with constructor:
```

```
team Foursome := Foursome('John', 'Mary', 'Alberto', 'Juanita');
  PROCEDURE print_team (heading VARCHAR2) IS
  BEGIN
   DBMS OUTPUT.PUT LINE (heading);
    FOR i IN 1..4 LOOP
     DBMS_OUTPUT.PUT_LINE(i || '.' || team(i));
    END LOOP;
    DBMS OUTPUT.PUT LINE('---');
  END;
BEGIN
  print_team('2001 Team:');
  team(3) := 'Pierre'; -- Change values of two elements
  team(4) := 'Yvonne';
  print_team('2005 Team:');
  -- Invoke constructor to assign new values to varray variable:
  team := Foursome('Arun', 'Amitha', 'Allan', 'Mae');
  print team('2009 Team:');
END;
/
```

#### Result:

2001 Team: 1.John 2.Mary 3.Alberto 4.Juanita \_\_\_ 2005 Team: 1.John 2.Mary 3.Pierre 4.Yvonne \_\_\_ 2009 Team: 1.Arun 2.Amitha 3.Allan 4.Mae \_\_\_

# Appropriate Uses for Varrays

A varray is appropriate when:

• You know the maximum number of elements.

• You usually access the elements sequentially.

Because you must store or retrieve all elements at the same time, a varray might be impractical for large numbers of elements.

# **Nested Tables**

In the database, a **nested table** is a column type that stores an unspecified number of rows in no particular order.

When you retrieve a nested table value from the database into a PL/SQL nested table variable, PL/SQL gives the rows consecutive indexes, starting at 1. Using these indexes, you can access the individual rows of the nested table variable. The syntax is *variable\_name(index)*. The indexes and row order of a nested table might not remain stable as you store and retrieve the nested table from the database.

The amount of memory that a nested table variable occupies can increase or decrease dynamically, as you add or delete elements.

An uninitialized nested table variable is a null collection. You must initialize it, either by making it empty or by assigning a non-NULL value to it. For details, see "Collection Constructors" and "Assigning Values to Collection Variables".

#### Note:

Example 6-23, Example 6-25, and Example 6-26 reuse nt\_type and print\_nt.

#### Topics

- Important Differences Between Nested Tables and Arrays
- Appropriate Uses for Nested Tables

#### See Also:

- Table 6-1 for a summary of nested table characteristics
- "nested\_table\_type\_def ::=" for the syntax of a nested table type definition
- "CREATE TYPE Statement" for information about creating standalone nested table types
- "INSTEAD OF DML Triggers" for information about triggers that update nested table columns of views
- Oracle Database SQL Language Reference for more information about nested tables

#### Example 6-5 Nested Table of Local Type

This example defines a local nested table type, declares a variable of that type (initializing it with a constructor), and defines a procedure that prints the nested table. (The procedure uses the collection methods FIRST and LAST, described in "Collection Methods".) The example invokes the procedure three times: After initializing the variable, after changing the value of

one element, and after using a constructor to the change the values of all elements. After the second constructor invocation, the nested table has only two elements. Referencing element 3 would raise error ORA-06533.

### 💉 Live SQL:

You can view and run this example on Oracle Live SQL at Nested Table of Local Type

```
DECLARE
```

```
TYPE Roster IS TABLE OF VARCHAR2(15); -- nested table type
  -- nested table variable initialized with constructor:
  names Roster := Roster('D Caruso', 'J Hamil', 'D Piro', 'R Singh');
  PROCEDURE print_names (heading VARCHAR2) IS
  BEGIN
    DBMS OUTPUT.PUT LINE (heading);
    FOR i IN names.FIRST .. names.LAST LOOP -- For first to last element
      DBMS OUTPUT.PUT LINE(names(i));
    END LOOP;
    DBMS OUTPUT.PUT LINE('---');
  END;
BEGIN
  print names('Initial Values:');
  names(3) := 'P Perez'; -- Change value of one element
  print names('Current Values:');
  names := Roster('A Jansen', 'B Gupta'); -- Change entire table
  print names('Current Values:');
END;
/
```

#### Result:

Initial Values: D Caruso J Hamil D Piro R Singh ----Current Values: D Caruso J Hamil P Perez R Singh

Current Values: A Jansen B Gupta

#### Example 6-6 Nested Table of Standalone Type

This example defines a standalone nested table type, nt\_type, and a standalone procedure to print a variable of that type, print\_nt. An anonymous block declares a variable of type nt\_type, initializing it to empty with a constructor, and invokes print\_nt twice: After initializing the variable and after using a constructor to the change the values of all elements.

### 🖍 Live SQL:

You can view and run this example on Oracle Live SQL at Nested Table of Standalone Type

```
CREATE OR REPLACE TYPE nt_type IS TABLE OF NUMBER;
/
CREATE OR REPLACE PROCEDURE print nt (nt nt type) AUTHID DEFINER IS
  i NUMBER;
BEGIN
 i := nt.FIRST;
  IF i IS NULL THEN
   DBMS OUTPUT.PUT_LINE('nt is empty');
  ELSE
    WHILE i IS NOT NULL LOOP
     DBMS_OUTPUT.PUT('nt.(' || i || ') = ');
     DBMS OUTPUT.PUT LINE(NVL(TO CHAR(nt(i)), 'NULL'));
     i := nt.NEXT(i);
   END LOOP;
 END IF;
  DBMS OUTPUT.PUT LINE('---');
END print nt;
/
DECLARE
 nt nt type := nt type(); -- nested table variable initialized to empty
BEGIN
 print nt(nt);
 nt := nt type(90, 9, 29, 58);
 print nt(nt);
END;
/
```

#### Result:

nt is empty --nt.(1) = 90 nt.(2) = 9 nt.(3) = 29

# Important Differences Between Nested Tables and Arrays

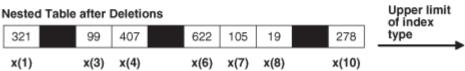

Conceptually, a nested table is like a one-dimensional array with an arbitrary number of elements. However, a nested table differs from an array in these important ways:

- An array has a declared number of elements, but a nested table does not. The size of a nested table can increase dynamically.
- An array is always dense. A nested array is dense initially, but it can become sparse, because you can delete elements from it.

Figure 6-2 shows the important differences between a nested table and an array.

#### Figure 6-2 Array and Nested Table

Array of Integers 407 83 622 105 19 321 17 99 67 x(1) x(2) x(3) x(4) x(5) x(6) x(7) x(8) x(9)

# Appropriate Uses for Nested Tables

A nested table is appropriate when:

- The number of elements is not set.
- Index values are not consecutive.
- You must delete or update some elements, but not all elements simultaneously.

Nested table data is stored in a separate store table, a system-generated database table. When you access a nested table, the database joins the nested table with its store table. This makes nested tables suitable for queries and updates that affect only some elements of the collection.

 You would create a separate lookup table, with multiple entries for each row of the main table, and access it through join queries.

# **Collection Constructors**

A **collection constructor (constructor)** is a system-defined function with the same name as a collection type, which returns a collection of that type.

### Note:

This topic applies only to varrays and nested tables. In this topic, *collection* means *varray or nested table*. Associative arrays use qualified expressions and aggregates (see Qualified Expressions Overview).

The syntax of a constructor invocation is:

```
collection_type ( [ value [, value ]... ] )
```

If the parameter list is empty, the constructor returns an empty collection. Otherwise, the constructor returns a collection that contains the specified values. For semantic details, see "*collection\_constructor*".

You can assign the returned collection to a collection variable (of the same type) in the variable declaration and in the executable part of a block.

#### Example 6-7 Initializing Collection (Varray) Variable to Empty

This example invokes a constructor twice: to initialize the varray variable team to empty in its declaration, and to give it new values in the executable part of the block. The procedure print\_team shows the initial and final values of team. To determine when team is empty, print\_team uses the collection method COUNT, described in "Collection Methods". (For an example of a procedure that prints a varray that might be null, see Example 6-30.)

### Live SQL:

You can view and run this example on Oracle Live SQL at Initializing Collection (Varray) Variable to Empty

```
DECLARE
 TYPE Foursome IS VARRAY(4) OF VARCHAR2(15);
  team Foursome := Foursome(); -- initialize to empty
  PROCEDURE print team (heading VARCHAR2)
  IS
  BEGIN
    DBMS OUTPUT.PUT LINE (heading);
    IF team.COUNT = 0 THEN
     DBMS OUTPUT.PUT LINE ('Empty');
    ELSE
      FOR i IN 1..4 LOOP
       DBMS OUTPUT.PUT LINE(i || '.' || team(i));
     END LOOP;
   END IF;
    DBMS OUTPUT.PUT_LINE('---');
  END;
BEGIN
 print team('Team:');
```

```
team := Foursome('John', 'Mary', 'Alberto', 'Juanita');
print_team('Team:');
END;
/
Result:
Team:
Empty
---
Team:
1.John
2.Mary
3.Alberto
4.Juanita
---
```

# **Qualified Expressions Overview**

Qualified expressions improve program clarity and developer productivity by providing the ability to declare and define a complex value in a compact form where the value is needed.

A qualified expression combines expression elements to create values of almost any type. They are most useful for records, associative arrays, nested tables, and variable arrays.

Qualified expressions use an explicit type indication to provide the type of the qualified item. This explicit indication is known as a typemark.

Qualified expressions have this structure:

```
qualified expression ::= empty qualified expression
                      | simple qualified expression
                      | aggregate qualified expression
typemark ::= type name
type_name ::= identifier
             | type name . identifier
empty qualified expression ::= typemark ( )
simple_qualified_expression ::= typemark ( expr )
aggregate qualified expression ::= typemark ( aggregate )
aggregate ::= [ positional choice list ] [ explicit choice list ] [ others choice ]
positional choice list ::= ( expr )+
                          | sequence iterator choice
sequence_iterator_choice ::= FOR iterator SEQUENCE => expr
explicit_choice_list ::= named_choice_list
                      | indexed choice list
                       | iterator choice
                       | index iterator choice
named choice list ::= identifier => expr [,]+
indexed choice list ::= expr => expr [,] +
iterator choice ::= FOR iterator => expr
```

index\_iterator\_choice ::= FOR iterator INDEX expr => expr
others\_choice ::= OTHERS => expr

See "qualified\_expression ::=" for more information about the syntax and semantics.

#### **Empty Qualified Expressions**

An empty qualified expression has the form *typemark ()*. For example, the expression T () where T is a typemark, provides a new value as defined by the declaration of type T. In PL/SQL, all types define an initialization for their values, sometimes, it is simply <code>NULL</code>. When the typemark includes constraints, the value of the qualified expression is required to honor those constraints, or an exception is raised.

#### Simple Qualified Expressions

A simple qualified expression has the form *typemark (expr)* where *expr* is an expression that produces a single value, not necessarily a scalar value.

#### **Aggregate Qualified Expressions**

An aggregate qualified expression has the form *typemark ( aggregate)*. For example, given T is a typemark of a compound type, it looks like T(C1, C2, ..., Cn) where each of the C's is a choice that describes some elements of type T.

A positional choice contains only an initializing expression *expr*. If an aggregate contains positional choices, they must appear before any other choices. Positional choices may only be used with structured types and lower bounded vector types.

A named choice has the form N1 | N2 | ... | Nn => expr where there may be only one name and where the names Ni are field names from the structured type T. Named choices may only be used with structured types.

An indexed choice has the form  $I \Rightarrow expr$  where index I is a numeric or varchar2 expression. Indexed choices may only be used with vector types.

An iterator choice has the form F.L =>expr where there where F and L are each numeric expressions. The bounds follow the same rules as used for the bounds of a for loop. Iterator choices may only be used with vector types and they may not be used with unbounded vector types that have a varchar2 index type.

Indexed and iterator choices may be intermixed freely, including by alternation as in I1 | F2..L2 | .. | In => expr.

An others choice has the form OTHERS => *expr* and must appear last if it appears at all.. An others choice may only be used with structured types and bounded vector types.

Positional choices must precede explicit choices which must precede the others choice if it appears.

An alternation index or iterator choice has the form I1 | F2..L2 | ... | In => expr and has the same effect as the collection of single index and iterator choices I1 => expr, F2..L2 => expr, ..., In => expr.

This example shows different methods to assign values to a record with the same results.

DECLARE

```
TYPE t_rec IS RECORD (
   id NUMBER,
   val1 VARCHAR2(10),
    val2 VARCHAR2(10),
    val3 VARCHAR2(10) );
  l rec t rec;
BEGIN
  -- Method 1: Direct assignment to record fields (not using aggregate).
  l rec.id := 1;
  l rec.val1 := 'ONE';
  l rec.val2 := 'TWO';
  l rec.val3 := 'THREE';
  -- Method 2 : Using aggregate qualified expression positional association
  l rec := t rec(1, 'ONE', 'TWO', 'THREE');
  -- Method 3 : Using aggregate qualified expression named association
  l rec := t rec(id => 1, val1 => 'ONE', val2 => 'TWO', val3 => 'THREE');
END;
/
```

#### **Iterator Choice Association**

The iterator choice association uses the iterand as an index.

For each iterand value, the expression is evaluated and added to the collection using the iterand value as the index.

For each value of iterand generated by the iteration controls:

- 1. Evaluate the expression producing an expression value.
- 2. If appropriate for the collection type, extend the collection to the index specified by the iterand.
- 3. Add the expression value to the collection at the index specified by the iterand value.

#### Example 6-8 Iterator Choice Association in Qualified Expressions

This example creates a vector of the first N fibonacci numbers.

result := vec t (FOR i IN 1..n => fib(i));

This example creates a vector of the first N even numbers.

result := vec t (FOR i IN 1..n => 2\*i);

#### Index Iterator Choice Association

The index iterator choice association provides an index expression along with the value expression.

For each iterand value, the index expression and value expression are evaluated. Then the expanded value is added to the collection using the expanded index.

For each value of iterand generated by the iteration controls:

- **1**. Evaluate the expression producing an expression value.
- 2. Evaluate the index expression producing an index value.
- If appropriate for the collection type, extend the collection to the index specified by the index value.
- 4. Add the expression value to the collection at the index specified by the index value.

#### Example 6-9 Index Iterator Choice Association in Qualified Expressions

This example creates a copy of vec with values incremented by N.

result := vec t (FOR I, j IN PAIRS OF vec INDEX I => j+n);

This example creates a vector of the first N even numbers.

result := vec t (FOR i IN 2...n BY 2 INDEX i/2 => i);

#### Sequence Iterator Choice Association

The sequence iterator choice association allows a sequence of values to be added to the end of a collection. In each case, the expressions specified may reference the iterands.

For each iterand value, the value expression is evaluated and added to the end of the collection.

For each value of iterand generated by the iteration controls:

- 1. Evaluate the expression producing an expression value.
- 2. If appropriate for the collection type, extend the collection by one.
- 3. Add the expression value to the collection at its end.

#### Example 6-10 Sequence Iterator Choice Association in Qualified Expressions

This example concatenates vectors v1 and reversed v2 together.

This example creates a vector of the prime numbers less than or equal to N.

# Example 6-11 Assigning Values to Associative Array Type Variables Using Qualified Expressions

This example uses a function to display the values of a table of BOOLEAN.

## Live SQL:

You can view and run this example on Oracle Live SQL at "18c Assigning Values to Associative Array Type Variables Using Qualified Expressions"

```
CREATE FUNCTION print bool (v IN BOOLEAN)
  RETURN VARCHAR2
IS
  v rtn VARCHAR2(10);
BEGIN
  CASE v
  WHEN TRUE THEN
   v rtn := 'TRUE';
  WHEN FALSE THEN
   v rtn := 'FALSE';
  ELSE
   v rtn := 'NULL';
 END CASE;
 RETURN v rtn;
END print bool;
/
```

The variable v\_aa1 is initialized using index key-value pairs.

#### Result:

FALSE TRUE NULL

# Example 6-12 Assigning values to a RECORD Type Variables using Qualified Expressions

This example shows a record of values assigned using a qualified expression. The value for rec.a is assigned using the position notation, the value for rec.c uses the named association

and rec.b is assigned a value of 2 since it is not defined by the position and named association, it falls in the other notation.

```
DECLARE
  TYPE r IS RECORD(a PLS_INTEGER, b PLS_INTEGER, c NUMBER);
  rec r;
BEGIN
  rec := r(1, c => 3.0, OTHERS => 2);
-- rec contains [ 1, 2, 3.0 ]
END;
/
```

### Example 6-13 Assigning Values to a VARRAY Type using Qualified Expressions

In this example, the variable array vec contains [1, 3, 2, 3].

```
DECLARE
  TYPE v IS VARRAY(4) OF NUMBER;
  vec v;
BEGIN
  vec := v(1, 3 => 2, OTHERS => 3);
END;
/
```

# Assigning Values to Collection Variables

You can assign a value to a collection variable in these ways:

- Invoke a constructor to create a collection and assign it to the collection variable.
- Use the assignment statement to assign it the value of another existing collection variable.
- Pass it to a subprogram as an OUT or IN OUT parameter, and then assign the value inside the subprogram.
- Use a qualified expression to assign values to an associative array (see Example 6-11).

To assign a value to a scalar element of a collection variable, reference the element as *collection variable name(index)* and assign it a value.

#### **Topics**

- Data Type Compatibility
- Assigning Null Values to Varray or Nested Table Variables
- Assigning Set Operation Results to Nested Table Variables

#### See Also:

- "Collection Constructors"
- "Assignment Statement" syntax diagram
- "Assigning Values to Variables" for instructions on how to assign a value to a scalar element of a collection variable
- "BULK COLLECT Clause"

# Data Type Compatibility

You can assign a collection to a collection variable only if they have the same data type. Having the same element type is not enough.

#### Example 6-14 Data Type Compatibility for Collection Assignment

In this example, VARRAY types triplet and trio have the same element type, VARCHAR(15). Collection variables group1 and group2 have the same data type, triplet, but collection variable group3 has the data type trio. The assignment of group1 to group2 succeeds, but the assignment of group1 to group3 fails.

#### Live SQL:

You can view and run this example on Oracle Live SQL at Data Type Compatibility for Collection Assignment

```
DECLARE
TYPE triplet IS VARRAY(3) OF VARCHAR2(15);
TYPE trio IS VARRAY(3) OF VARCHAR2(15);
group1 triplet := triplet('Jones', 'Wong', 'Marceau');
group2 triplet;
group3 trio;
BEGIN
group3 trio;
EEGIN
group2 := group1; -- succeeds
group3 := group1; -- fails
END;
/
```

#### Result:

ORA-06550: line 10, column 13: PLS-00382: expression is of wrong type

## Assigning Null Values to Varray or Nested Table Variables

To a varray or nested table variable, you can assign the value NULL or a null collection of the same data type. Either assignment makes the variable null.

Example 6-15 initializes the nested table variable dept\_names to a non-null value; assigns a null collection to it, making it null; and re-initializes it to a different non-null value.

#### Example 6-15 Assigning Null Value to Nested Table Variable

# Live SQL: You can view and run this example on Oracle Live SQL at Assigning Null Value to Nested Table Variable

```
DECLARE
 TYPE dnames tab IS TABLE OF VARCHAR2(30);
  dept_names dnames_tab := dnames_tab(
    'Shipping', 'Sales', 'Finance', 'Payroll'); -- Initialized to non-null value
  empty set dnames tab; -- Not initialized, therefore null
  PROCEDURE print dept names status IS
 BEGIN
   IF dept names IS NULL THEN
      DBMS OUTPUT.PUT LINE ('dept names is null.');
   ELSE
     DBMS_OUTPUT.PUT_LINE('dept_names is not null.');
   END IF;
 END print dept names status;
BEGIN
 print dept names status;
 dept names := empty set; -- Assign null collection to dept names.
 print dept names status;
 dept names := dnames tab (
    'Shipping', 'Sales', 'Finance', 'Payroll'); -- Re-initialize dept names
 print dept names status;
END;
/
```

#### Result:

dept\_names is not null.
dept\_names is null.
dept names is not null.

# Assigning Set Operation Results to Nested Table Variables

To a nested table variable, you can assign the result of a SQL MULTISET operation or SQL SET function invocation.

The SQL MULTISET operators combine two nested tables into a single nested table. The elements of the two nested tables must have comparable data types. For information about the MULTISET operators, see *Oracle Database SQL Language Reference*.

The SQL SET function takes a nested table argument and returns a nested table of the same data type whose elements are distinct (the function eliminates duplicate elements). For information about the SET function, see *Oracle Database SQL Language Reference*.

#### Example 6-16 Assigning Set Operation Results to Nested Table Variable

This example assigns the results of several MULTISET operations and one SET function invocation of the nested table variable answer, using the procedure print nested table to

print answer after each assignment. The procedure uses the collection methods FIRST and LAST, described in "Collection Methods".

### Live SQL:

You can view and run this example on Oracle Live SQL at Assigning Set Operation Results to Nested Table Variable

```
DECLARE
 TYPE nested typ IS TABLE OF NUMBER;
 nt1
         nested typ := nested typ(1,2,3);
 nt2
        nested typ := nested typ(3,2,1);
 nt3
        nested typ := nested typ(2,3,1,3);
 nt4
        nested typ := nested typ(1,2,4);
 answer nested typ;
 PROCEDURE print nested table (nt nested typ) IS
   output VARCHAR2(128);
 BEGIN
   IF nt IS NULL THEN
     DBMS OUTPUT.PUT LINE('Result: null set');
   ELSIF \overline{nt}.COUNT = \overline{0} THEN
      DBMS OUTPUT.PUT LINE('Result: empty set');
   ELSE
      FOR i IN nt.FIRST .. nt.LAST LOOP -- For first to last element
       output := output || nt(i) || ' ';
     END LOOP;
     DBMS_OUTPUT.PUT_LINE('Result: ' || output);
   END IF;
 END print_nested_table;
BEGIN
 answer := nt1 MULTISET UNION nt4;
 print nested table(answer);
 answer := nt1 MULTISET UNION nt3;
 print nested table(answer);
 answer := nt1 MULTISET UNION DISTINCT nt3;
 print nested table(answer);
 answer := nt2 MULTISET INTERSECT nt3;
 print nested table(answer);
 answer := nt2 MULTISET INTERSECT DISTINCT nt3;
 print nested table(answer);
 answer := SET(nt3);
 print nested table(answer);
 answer := nt3 MULTISET EXCEPT nt2;
 print nested table(answer);
 answer := nt3 MULTISET EXCEPT DISTINCT nt2;
 print nested table(answer);
END;
```

#### /

#### Result:

Result: 1 2 3 1 2 4 Result: 1 2 3 2 3 1 3 Result: 1 2 3 Result: 3 2 1 Result: 3 2 1

```
Result: 2 3 1
Result: 3
Result: empty set
```

# **Multidimensional Collections**

Although a collection has only one dimension, you can model a multidimensional collection with a collection whose elements are collections.

#### Example 6-17 Two-Dimensional Varray (Varray of Varrays)

In this example, nva is a two-dimensional varray—a varray of varrays of integers.

# Live SQL: You can view and run this example on Oracle Live SQL at Two-Dimensional Varray (Varray of Varrays)

```
DECLARE
 TYPE t1 IS VARRAY(10) OF INTEGER; -- varray of integer
```

va t1 := t1(2,3,5);

```
TYPE nt1 IS VARRAY(10) OF t1; -- varray of varray of integer
nva nt1 := nt1(va, t1(55,6,73), t1(2,4), va);
```

```
i INTEGER;
  val t1;
BEGIN
```

```
i := nva(2)(3);
DBMS OUTPUT.PUT LINE('i = ' || i);
```

```
nva.EXTEND;
 nva(5) := t1(56, 32); -- replace inner varray elements
 nva(4) := t1(45,43,67,43345); -- replace an inner integer element
 nva(4)(4) := 1;
                               -- replace 43345 with 1
 nva(4).EXTEND; -- add element to 4th varray element
 nva(4)(5) := 89; -- store integer 89 there
END;
```

#### Result:

/

i = 73

#### Example 6-18 Nested Tables of Nested Tables and Varrays of Integers

In this example, ntb1 is a nested table of nested tables of strings, and ntb2 is a nested table of varrays of integers.

### Live SQL:

You can view and run this example on Oracle Live SQL at Nested Tables of Nested Tables and Varrays of Integers

```
DECLARE
  TYPE tb1 IS TABLE OF VARCHAR2(20); -- nested table of strings
  vtb1 tb1 := tb1('one', 'three');
  TYPE ntb1 IS TABLE OF tb1; -- nested table of nested tables of strings
  vntb1 ntb1 := ntb1(vtb1);
  TYPE tv1 IS VARRAY(10) OF INTEGER; -- varray of integers
  TYPE ntb2 IS TABLE OF tv1;
                                     -- nested table of varrays of integers
  vntb2 ntb2 := ntb2(tv1(3,5), tv1(5,7,3));
BEGIN
  vntb1.EXTEND;
 vntb1(2) := vntb1(1);
 vntb1.DELETE(1); -- delete first element of vntb1
 vntb1(2).DELETE(1); -- delete first string from second table in nested table
END;
/
```

#### Example 6-19 Nested Tables of Associative Arrays and Varrays of Strings

In this example, aal is an associative array of associative arrays, and ntb2 is a nested table of varrays of strings.

## 💉 Live SQL:

You can view and run this example on Oracle Live SQL at Nested Tables of Associative Arrays and Varrays of Strings

```
DECLARE
  TYPE tb1 IS TABLE OF INTEGER INDEX BY PLS INTEGER; -- associative arrays
 v4 tb1;
  v5 tb1;
  TYPE aa1 IS TABLE OF tb1 INDEX BY PLS INTEGER; -- associative array of
  v2 aal;
                                                 -- associative arrays
  TYPE val IS VARRAY(10) OF VARCHAR2(20); -- varray of strings
  v1 va1 := va1('hello', 'world');
  TYPE ntb2 IS TABLE OF val INDEX BY PLS INTEGER; -- associative array of varrays
  v3 ntb2;
BEGIN
  v4(1) := 34;
                   -- populate associative array
  v4(2) := 46456;
  v4(456) := 343;
  v2(23) := v4; -- populate associative array of associative arrays
  v3(34) := va1(33, 456, 656, 343); -- populate associative array varrays
  v2(35) := v5;
                   -- assign empty associative array to v2(35)
  v2(35)(2) := 78;
END;
/
```

# **Collection Comparisons**

To determine if one collection variable is less than another (for example), you must define what less than means in that context and write a function that returns TRUE or FALSE.

You cannot compare associative array variables to the value NULL or to each other.

Except for Comparing Nested Tables for Equality and Inequality, you cannot natively compare two collection variables with relational operators. This restriction also applies to implicit comparisons. For example, a collection variable cannot appear in a DISTINCT, GROUP BY, or ORDER BY clause.

#### Topics

- Comparing Varray and Nested Table Variables to NULL
- Comparing Nested Tables for Equality and Inequality
- Comparing Nested Tables with SQL Multiset Conditions

### See Also:

- Table 3-5
- PL/SQL Subprograms for information about writing functions

# Comparing Varray and Nested Table Variables to NULL

Use the IS[NOT] NULL operator when comparing to the NULL value.

You can compare varray and nested table variables to the value NULL with the "IS [NOT] NULL Operator", but not with the relational operators equal (=) and not equal (<>, !=, ~=, or ^=).

#### Example 6-20 Comparing Varray and Nested Table Variables to NULL

This example compares a varray variable and a nested table variable to NULL correctly.

## Live SQL:

You can view and run this example on Oracle Live SQL at Comparing Varray and Nested Table Variables to NULL

```
DECLARE

TYPE Foursome IS VARRAY(4) OF VARCHAR2(15); -- VARRAY type

team Foursome; -- varray variable

TYPE Roster IS TABLE OF VARCHAR2(15); -- nested table type

names Roster := Roster('Adams', 'Patel'); -- nested table variable

BEGIN

IF team IS NULL THEN
```

```
DBMS_OUTPUT.PUT_LINE('team IS NULL');
```

```
ELSE
	DBMS_OUTPUT.PUT_LINE('team IS NOT NULL');
END IF;
	IF names IS NOT NULL THEN
	DBMS_OUTPUT.PUT_LINE('names IS NOT NULL');
ELSE
	DBMS_OUTPUT.PUT_LINE('names IS NULL');
END IF;
END;
/
```

#### Result:

team IS NULL names IS NOT NULL

# Comparing Nested Tables for Equality and Inequality

Two nested table variables are equal if and only if they have the same set of elements (in any order).

If two nested table variables have the same nested table type, and that nested table type does not have elements of a record type, then you can compare the two variables for equality or inequality with the relational operators equal (=) and not equal (<>, !=,  $\sim=$ ,  $^{>}=$ ).

See Also: "Record Comparisons"

#### Example 6-21 Comparing Nested Tables for Equality and Inequality

This example compares nested table variables for equality and inequality with relational operators.

# Live SQL: You can view and run this example on Oracle Live SQL at Comparing Nested Tables for Equality and Inequality

```
DECLARE
TYPE dnames_tab IS TABLE OF VARCHAR2(30); -- element type is not record type
dept_names1 dnames_tab :=
    dnames_tab('Shipping', 'Sales', 'Finance', 'Payroll');
dept_names2 dnames_tab :=
    dnames_tab('Sales', 'Finance', 'Shipping', 'Payroll');
dept_names3 dnames_tab :=
    dnames_tab('Sales', 'Finance', 'Payroll');
BEGIN
IF dept_names1 = dept_names2 THEN
```

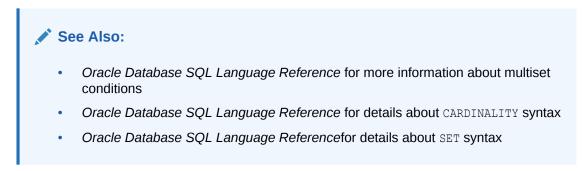

```
DBMS_OUTPUT.PUT_LINE('dept_names1 = dept_names2');
END IF;
IF dept_names2 != dept_names3 THEN
DBMS_OUTPUT.PUT_LINE('dept_names2 != dept_names3');
END IF;
END;
/
Result:
dept_names1 = dept_names2
```

# dept\_names2 != dept\_names3

# Comparing Nested Tables with SQL Multiset Conditions

You can compare nested table variables, and test some of their properties, with SQL multiset conditions.

### Example 6-22 Comparing Nested Tables with SQL Multiset Conditions

This example uses the SQL multiset conditions and two SQL functions that take nested table variable arguments, CARDINALITY and SET .

## Live SQL:

You can view and run this example on Oracle Live SQL at Comparing Nested Tables with SQL Multiset Conditions

```
DECLARE

TYPE nested_typ IS TABLE OF NUMBER;

nt1 nested_typ := nested_typ(1,2,3);

nt2 nested_typ := nested_typ(3,2,1);

nt3 nested_typ := nested_typ(2,3,1,3);

nt4 nested_typ := nested_typ(1,2,4);

PROCEDURE testify (

   truth BOOLEAN := NULL,

   quantity NUMBER := NULL

) IS

BEGIN

IF truth IS NOT NULL THEN

   DBMS_OUTPUT.PUT_LINE (

   CASE truth

   WHEN TRUE THEN 'True'
```

```
WHEN FALSE THEN 'False'
      END
    );
   END IF;
   IF quantity IS NOT NULL THEN
      DBMS OUTPUT.PUT LINE (quantity);
   END IF;
 END;
BEGIN
 testify(truth => (nt1 IN (nt2,nt3,nt4)));
                                             -- condition
 -- condition
 testify(truth => (nt1 NOT SUBMULTISET OF nt4)); -- condition
 testify(truth => (4 MEMBER OF nt1));
                                             -- condition
 testify(truth => (nt3 IS A SET));
                                             -- condition
 testify(truth => (nt3 IS NOT A SET));
                                            -- condition
 testify(truth => (nt1 IS EMPTY));
                                            -- condition
 testify(quantity => (CARDINALITY(nt3))); -- function
 testify(quantity => (CARDINALITY(SET(nt3)))); -- 2 functions
END;
/
```

#### Result:

True True False False True False 4 3

# **Collection Methods**

A collection method is a PL/SQL subprogram—either a function that returns information about a collection or a procedure that operates on a collection. Collection methods make collections easier to use and your applications easier to maintain.

Table 6-2 summarizes the collection methods.

### Note:

With a null collection, EXISTS is the only collection method that does not raise the predefined exception COLLECTION IS NULL.

Table 6-2 Collection Metho	ds
----------------------------	----

Method	Туре	Description
DELETE	Procedure	Deletes elements from collection.
TRIM	Procedure	Deletes elements from end of varray or nested table.
EXTEND	Procedure	Adds elements to end of varray or nested table.
EXISTS	Function	Returns TRUE if and only if specified element of varray or nested table exists.

Method	Туре	Description
FIRST	Function	Returns first index in collection.
LAST	Function	Returns last index in collection.
COUNT	Function	Returns number of elements in collection.
LIMIT	Function	Returns maximum number of elements that collection can have.
PRIOR	Function	Returns index that precedes specified index.
NEXT	Function	Returns index that succeeds specified index.

Table 6-2	(Cont.)	Collection	Methods
-----------	---------	------------	---------

The basic syntax of a collection method invocation is:

collection\_name.method

For detailed syntax, see "Collection Method Invocation".

A collection method invocation can appear anywhere that an invocation of a PL/SQL subprogram of its type (function or procedure) can appear, except in a SQL statement. (For general information about PL/SQL subprograms, see PL/SQL Subprograms.)

In a subprogram, a collection parameter assumes the properties of the argument bound to it. You can apply collection methods to such parameters. For varray parameters, the value of LIMIT is always derived from the parameter type definition, regardless of the parameter mode.

#### Topics

- DELETE Collection Method

- LIMIT Collection Method
- PRIOR and NEXT Collection Methods

# **DELETE Collection Method**

DELETE is a procedure that deletes elements from a collection.

This method has these forms:

• DELETE deletes all elements from a collection of any type.

This operation immediately frees the memory allocated to the deleted elements.

- From an associative array or nested table (but not a varray):
  - DELETE (n) deletes the element whose index is n, if that element exists; otherwise, it does nothing.
  - DELETE (m, n) deletes all elements whose indexes are in the range m..n, if both m and n exist and m <= n; otherwise, it does nothing.</li>

For these two forms of DELETE, PL/SQL keeps placeholders for the deleted elements. Therefore, the deleted elements are included in the internal size of the collection, and you can restore a deleted element by assigning a valid value to it.

#### Example 6-23 DELETE Method with Nested Table

This example declares a nested table variable, initializing it with six elements; deletes and then restores the second element; deletes a range of elements and then restores one of them; and then deletes all elements. The restored elements occupy the same memory as the corresponding deleted elements. The procedure print\_nt prints the nested table variable after initialization and after each DELETE operation. The type nt\_type and procedure print\_nt are defined in Example 6-6.

```
DECLARE
 nt nt type := nt type(11, 22, 33, 44, 55, 66);
BEGIN
 print_nt(nt);
 nt.DELETE(2);
                   -- Delete second element
 print nt(nt);
 nt(2) := 2222;
                    -- Restore second element
 print nt(nt);
 nt.DELETE(2, 4); -- Delete range of elements
 print_nt(nt);
 nt(3) := 3333;
                   -- Restore third element
 print_nt(nt);
                   -- Delete all elements
 nt.DELETE;
 print_nt(nt);
END;
/
```

#### Result:

nt.(1) = 11nt.(2) = 22nt.(3) = 33nt.(4) = 44nt.(5) = 55nt.(6) = 66\_\_\_ nt.(1) = 11nt.(3) = 33nt.(4) = 44nt.(5) = 55nt.(6) = 66\_\_\_ nt.(1) = 11nt.(2) = 2222nt.(3) = 33nt.(4) = 44nt.(5) = 55nt.(6) = 66--nt.(1) = 11nt.(5) = 55nt.(6) = 66\_\_\_ nt.(1) = 11

```
nt.(3) = 3333
nt.(5) = 55
nt.(6) = 66
----
nt is empty
```

### Example 6-24 DELETE Method with Associative Array Indexed by String

This example populates an associative array indexed by string and deletes all elements, which frees the memory allocated to them. Next, the example replaces the deleted elements—that is, adds new elements that have the same indexes as the deleted elements. The new replacement elements do not occupy the same memory as the corresponding deleted elements. Finally, the example deletes one element and then a range of elements. The procedure print aa str shows the effects of the operations.

```
DECLARE
 TYPE aa type str IS TABLE OF INTEGER INDEX BY VARCHAR2(10);
 aa str aa type str;
 PROCEDURE print_aa_str IS
   i VARCHAR2(10);
 BEGIN
   i := aa str.FIRST;
   IF i IS NULL THEN
     DBMS_OUTPUT.PUT_LINE('aa_str is empty');
   ELSE
     WHILE i IS NOT NULL LOOP
       DBMS OUTPUT.PUT('aa str.(' || i || ') = ');
       DBMS_OUTPUT.PUT_LINE(NVL(TO_CHAR(aa_str(i)), 'NULL'));
       i := aa str.NEXT(i);
     END LOOP;
   END IF;
   DBMS OUTPUT.PUT LINE('---');
 END print aa str;
BEGIN
 aa str('M') := 13;
 aa str('Z') := 26;
 aa str('C') := 3;
 print aa str;
 aa_str.DELETE; -- Delete all elements
 print aa str;
 aa str('M') := 13; -- Replace deleted element with same value
 aa str('Z') := 260; -- Replace deleted element with new value
 aa str('C') := 30; -- Replace deleted element with new value
 aa str('W') := 23; -- Add new element
 aa str('J') := 10; -- Add new element
 aa_str('N') := 14; -- Add new element
 aa str('P') := 16; -- Add new element
 aa str('W') := 23; -- Add new element
 aa_str('J') := 10; -- Add new element
 print aa str;
 aa str.DELETE('C');
                          -- Delete one element
 print aa str;
 aa_str.DELETE('N','W'); -- Delete range of elements
```

```
print_aa_str;
    aa_str.DELETE('Z','M'); -- Does nothing
    print_aa_str;
END;
/
```

#### Result:

```
aa str.(C) = 3
aa str.(M) = 13
aa str.(Z) = 26
_ _ _ _
aa str is empty
_ _ _ _
aa str.(C) = 30
aa str.(J) = 10
aa str.(M) = 13
aa_str.(N) = 14
aa_str.(P) = 16
aa_str.(W) = 23
aa str.(Z) = 260
aa str.(J) = 10
aa str.(M) = 13
aa str.(N) = 14
aa str.(P) = 16
aa str.(W) = 23
aa_str.(Z) = 260
___
aa_str.(J) = 10
aa_str.(M) = 13
aa str.(Z) = 260
___
aa str.(J) = 10
aa str.(M) = 13
aa str.(Z) = 260
```

# **TRIM Collection Method**

TRIM is a procedure that deletes elements from the end of a varray or nested table.

This method has these forms:

- TRIM removes one element from the end of the collection, if the collection has at least one element; otherwise, it raises the predefined exception SUBSCRIPT BEYOND COUNT.
- TRIM(*n*) removes *n* elements from the end of the collection, if there are at least *n* elements at the end; otherwise, it raises the predefined exception SUBSCRIPT BEYOND COUNT.

TRIM operates on the internal size of a collection. That is, if DELETE deletes an element but keeps a placeholder for it, then TRIM considers the element to exist. Therefore, TRIM can delete a deleted element.

PL/SQL does not keep placeholders for trimmed elements. Therefore, trimmed elements are not included in the internal size of the collection, and you cannot restore a trimmed element by assigning a valid value to it.

### **Caution**:

Do not depend on interaction between TRIM and DELETE. Treat nested tables like either fixed-size arrays (and use only DELETE) or stacks (and use only TRIM and EXTEND).

#### Example 6-25 TRIM Method with Nested Table

This example declares a nested table variable, initializing it with six elements; trims the last element; deletes the fourth element; and then trims the last two elements—one of which is the deleted fourth element. The procedure print\_nt prints the nested table variable after initialization and after the TRIM and DELETE operations. The type nt\_type and procedure print\_nt are defined in Example 6-6.

```
DECLARE
nt nt_type := nt_type(11, 22, 33, 44, 55, 66);
BEGIN
print_nt(nt);
nt.TRIM; -- Trim last element
print_nt(nt);
nt.DELETE(4); -- Delete fourth element
print_nt(nt);
nt.TRIM(2); -- Trim last two elements
print_nt(nt);
END;
/
```

#### Result:

nt.(1) = 11nt.(2) = 22nt.(3) = 33nt.(4) = 44nt.(5) = 55nt.(6) = 66\_\_\_\_ nt.(1) = 11nt.(2) = 22nt.(3) = 33nt.(4) = 44nt.(5) = 55\_\_\_ nt.(1) = 11nt.(2) = 22nt.(3) = 33nt.(5) = 55\_\_\_\_ nt.(1) = 11 nt.(2) = 22nt.(3) = 33\_\_\_

# **EXTEND** Collection Method

EXTEND is a procedure that adds elements to the end of a varray or nested table.

The collection can be empty, but not null. (To make a collection empty or add elements to a null collection, use a constructor. For more information, see "Collection Constructors".)

The EXTEND method has these forms:

- EXTEND appends one null element to the collection.
- EXTEND(*n*) appends *n* null elements to the collection.
- EXTEND (*n*,*i*) appends *n* copies of the *i*th element to the collection.

#### Note:

EXTEND (n,i) is the only form that you can use for a collection whose elements have the NOT NULL constraint.

EXTEND operates on the internal size of a collection. That is, if DELETE deletes an element but keeps a placeholder for it, then EXTEND considers the element to exist.

#### Example 6-26 EXTEND Method with Nested Table

This example declares a nested table variable, initializing it with three elements; appends two copies of the first element; deletes the fifth (last) element; and then appends one null element. Because EXTEND considers the deleted fifth element to exist, the appended null element is the sixth element. The procedure print\_nt prints the nested table variable after initialization and after the EXTEND and DELETE operations. The type nt\_type and procedure print\_nt are defined in Example 6-6.

```
DECLARE
  nt nt_type := nt_type(11, 22, 33);
BEGIN
  print_nt(nt);
  nt.EXTEND(2,1); -- Append two copies of first element
  print_nt(nt);
  nt.DELETE(5); -- Delete fifth element
  print_nt(nt);
  nt.EXTEND; -- Append one null element
  print_nt(nt);
END;
/
```

#### Result:

nt.(1) = 11 nt.(2) = 22 nt.(3) = 33 --nt.(1) = 11 nt.(2) = 22 nt.(3) = 33 nt.(4) = 11

```
nt.(5) = 11
----
nt.(1) = 11
nt.(2) = 22
nt.(3) = 33
nt.(4) = 11
----
nt.(1) = 11
nt.(2) = 22
nt.(3) = 33
nt.(4) = 11
nt.(6) = NULL
```

# **EXISTS Collection Method**

EXISTS is a function that tells you whether the specified element of a varray or nested table exists.

EXISTS (*n*) returns TRUE if the *n*th element of the collection exists and FALSE otherwise. If *n* is out of range, EXISTS returns FALSE instead of raising the predefined exception SUBSCRIPT\_OUTSIDE\_LIMIT.

For a deleted element, EXISTS (n) returns FALSE, even if DELETE kept a placeholder for it.

#### Example 6-27 EXISTS Method with Nested Table

This example initializes a nested table with four elements, deletes the second element, and prints either the value or status of elements 1 through 6.

```
DECLARE
TYPE NumList IS TABLE OF INTEGER;
n NumList := NumList(1,3,5,7);
BEGIN
n.DELETE(2); -- Delete second element
FOR i IN 1..6 LOOP
IF n.EXISTS(i) THEN
DBMS_OUTPUT.PUT_LINE('n(' || i || ') = ' || n(i));
ELSE
DBMS_OUTPUT.PUT_LINE('n(' || i || ') does not exist');
END IF;
END LOOP;
END;
/
```

#### Result:

```
n(1) = 1

n(2) \text{ does not exist}

n(3) = 5

n(4) = 7

n(5) \text{ does not exist}

n(6) \text{ does not exist}
```

# FIRST and LAST Collection Methods

FIRST and LAST are functions.

If the collection has at least one element, FIRST and LAST return the indexes of the first and last elements, respectively (ignoring deleted elements, even if DELETE kept placeholders for them).

If the collection has only one element, FIRST and LAST return the same index. If the collection is empty, FIRST and LAST return NULL.

#### Topics

- FIRST and LAST Methods for Associative Array
- FIRST and LAST Methods for Varray
- FIRST and LAST Methods for Nested Table

### FIRST and LAST Methods for Associative Array

For an associative array indexed by PLS INTEGER, the first and last elements are those with the smallest and largest indexes, respectively. For an associative array indexed by string, the first and last elements are those with the lowest and highest key values, respectively.

Key values are in sorted order (for more information, see "NLS Parameter Values Affect Associative Arrays Indexed by String").

#### Example 6-28 FIRST and LAST Values for Associative Array Indexed by PLS\_INTEGER

This example shows the values of FIRST and LAST for an associative array indexed by PLS INTEGER, deletes the first and last elements, and shows the values of FIRST and LAST again.

```
DECLARE
 TYPE aa type int IS TABLE OF INTEGER INDEX BY PLS INTEGER;
  aa_int aa_type_int;
  PROCEDURE print first and last IS
  BEGIN
    DBMS_OUTPUT.PUT_LINE('FIRST = ' || aa_int.FIRST);
    DBMS_OUTPUT.PUT_LINE('LAST = ' || aa_int.LAST);
 END print first and last;
BEGIN
  aa int(1) := 3;
  aa int(2) := 6;
  aa int(3) := 9;
  aa int(4) := 12;
  DBMS OUTPUT.PUT LINE('Before deletions:');
 print first and last;
  aa_int.DELETE(1);
 aa int.DELETE(4);
 DBMS OUTPUT.PUT LINE('After deletions:');
 print first and last;
END;
/
Result:
```

```
Before deletions:
FIRST = 1
LAST = 4
After deletions:
FIRST = 2
LAST = 3
```

#### Example 6-29 FIRST and LAST Values for Associative Array Indexed by String

This example shows the values of FIRST and LAST for an associative array indexed by string, deletes the first and last elements, and shows the values of FIRST and LAST again.

```
DECLARE
 TYPE aa_type_str IS TABLE OF INTEGER INDEX BY VARCHAR2(10);
  aa str aa type str;
  PROCEDURE print first and last IS
 BEGIN
    DBMS_OUTPUT.PUT_LINE('FIRST = ' || aa_str.FIRST);
    DBMS_OUTPUT.PUT_LINE('LAST = ' || aa_str.LAST);
 END print_first_and_last;
BEGIN
 aa str('Z') := 26;
 aa str('A') := 1;
 aa str('K') := 11;
 aa str('R') := 18;
  DBMS OUTPUT.PUT LINE ('Before deletions:');
 print first and last;
  aa str.DELETE('A');
 aa str.DELETE('Z');
 DBMS OUTPUT.PUT LINE('After deletions:');
 print_first_and_last;
END;
/
```

#### Result:

```
Before deletions:

FIRST = A

LAST = Z

After deletions:

FIRST = K

LAST = R
```

### FIRST and LAST Methods for Varray

For a varray that is not empty, FIRST always returns 1. For every varray, LAST always equals COUNT.

#### Example 6-30 Printing Varray with FIRST and LAST in FOR LOOP

This example prints the varray team using a FOR LOOP statement with the bounds team.FIRST and team.LAST. Because a varray is always dense, team(i) inside the loop always exists.

```
DECLARE
TYPE team_type IS VARRAY(4) OF VARCHAR2(15);
team team_type;
PROCEDURE print_team (heading VARCHAR2)
IS
BEGIN
DBMS_OUTPUT.PUT_LINE(heading);
IF team IS NULL THEN
DBMS_OUTPUT.PUT_LINE('Does not exist');
```

```
ELSIF team.FIRST IS NULL THEN
     DBMS OUTPUT.PUT LINE('Has no members');
    ELSE
      FOR i IN team.FIRST..team.LAST LOOP
        DBMS OUTPUT.PUT LINE(i || '. ' || team(i));
     END LOOP;
    END IF;
    DBMS OUTPUT.PUT LINE('---');
  END;
BEGIN
 print_team('Team Status:');
  team := team_type(); -- Team is funded, but nobody is on it.
 print team('Team Status:');
  team := team type('John', 'Mary'); -- Put 2 members on team.
 print team('Initial Team:');
 team := team type('Arun', 'Amitha', 'Allan', 'Mae'); -- Change team.
 print team('New Team:');
END;
/
```

```
Team Status:
Does not exist
___
Team Status:
Has no members
____
Initial Team:
1. John
2. Mary
___
New Team:
1. Arun
2. Amitha
3. Allan
4. Mae
___
```

#### **Related Topic**

Example 6-32

### FIRST and LAST Methods for Nested Table

For a nested table, LAST equals COUNT unless you delete elements from its middle, in which case LAST is larger than COUNT.

#### Example 6-31 Printing Nested Table with FIRST and LAST in FOR LOOP

This example prints the nested table team using a FOR LOOP statement with the bounds team.FIRST and team.LAST. Because a nested table can be sparse, the FOR LOOP statement prints team(i) only if team.EXISTS(i) is TRUE.

```
DECLARE
  TYPE team_type IS TABLE OF VARCHAR2(15);
  team team_type;
```

```
PROCEDURE print team (heading VARCHAR2) IS
 BEGIN
   DBMS_OUTPUT.PUT_LINE(heading);
   IF team IS NULL THEN
     DBMS OUTPUT.PUT LINE ('Does not exist');
   ELSIF team.FIRST IS NULL THEN
     DBMS_OUTPUT.PUT_LINE('Has no members');
   ELSE
     FOR i IN team.FIRST..team.LAST LOOP
       DBMS OUTPUT.PUT(i || '. ');
       IF team.EXISTS(i) THEN
         DBMS_OUTPUT.PUT_LINE(team(i));
       ELSE
         DBMS OUTPUT.PUT LINE('(to be hired)');
       END IF;
     END LOOP;
   END IF;
   DBMS OUTPUT.PUT LINE('---');
 END;
BEGIN
 print_team('Team Status:');
 team := team type(); -- Team is funded, but nobody is on it.
 print team('Team Status:');
 team := team_type('Arun', 'Amitha', 'Allan', 'Mae'); -- Add members.
 print team('Initial Team:');
 team.DELETE(2,3); -- Remove 2nd and 3rd members.
 print_team('Current Team:');
END;
/
```

```
Team Status:
Does not exist
---
Team Status:
Has no members
___
Initial Team:
1. Arun
2. Amitha
3. Allan
4. Mae
____
Current Team:
1. Arun
2. (to be hired)
3. (to be hired)
4. Mae
___
```

#### **Related Topic**

• Example 6-33

### **COUNT Collection Method**

COUNT is a function that returns the number of elements in the collection (ignoring deleted elements, even if DELETE kept placeholders for them).

#### **Topics**

- COUNT Method for Varray
- COUNT Method for Nested Table

### COUNT Method for Varray

For a varray, COUNT always equals LAST. If you increase or decrease the size of a varray (with the EXTEND or TRIM method), the value of COUNT changes.

#### Example 6-32 COUNT and LAST Values for Varray

This example shows the values of COUNT and LAST for a varray after initialization with four elements, after EXTEND(3), and after TRIM(5).

```
DECLARE
 TYPE NumList IS VARRAY(10) OF INTEGER;
 n NumList := NumList(1,3,5,7);
 PROCEDURE print count and last IS
 BEGIN
   DBMS OUTPUT.PUT('n.COUNT = ' || n.COUNT || ', ');
   DBMS OUTPUT.PUT LINE('n.LAST = ' || n.LAST);
 END print count and last;
BEGIN
 print_count_and_last;
 n.EXTEND(3);
 print count and last;
 n.TRIM(5);
 print_count_and_last;
END;
/
```

#### Result:

n.COUNT = 4, n.LAST = 4 n.COUNT = 7, n.LAST = 7 n.COUNT = 2, n.LAST = 2

### COUNT Method for Nested Table

For a nested table, COUNT equals LAST unless you delete elements from the middle of the nested table, in which case COUNT is smaller than LAST.

#### Example 6-33 COUNT and LAST Values for Nested Table

This example shows the values of COUNT and LAST for a nested table after initialization with four elements, after deleting the third element, and after adding two null elements to the end. Finally, the example prints the status of elements 1 through 8.

```
DECLARE
 TYPE NumList IS TABLE OF INTEGER;
 n NumList := NumList(1,3,5,7);
 PROCEDURE print_count_and_last IS
 BEGIN
   DBMS OUTPUT.PUT('n.COUNT = ' || n.COUNT || ', ');
   DBMS OUTPUT.PUT LINE ('n.LAST = ' || n.LAST);
 END print count and last;
BEGIN
 print_count_and_last;
 n.DELETE(3); -- Delete third element
 print count and last;
 n.EXTEND(2); -- Add two null elements to end
 print count and last;
 FOR i IN 1..8 LOOP
   IF n.EXISTS(i) THEN
     IF n(i) IS NOT NULL THEN
       DBMS_OUTPUT.PUT_LINE('n(' || i || ') = ' || n(i));
     ELSE
       DBMS OUTPUT.PUT LINE('n(' || i || ') = NULL');
     END IF;
   ELSE
     DBMS OUTPUT.PUT LINE('n(' || i || ') does not exist');
   END IF;
 END LOOP;
END;
/
```

```
n.COUNT = 4, n.LAST = 4
n.COUNT = 3, n.LAST = 4
n.COUNT = 5, n.LAST = 6
n(1) = 1
n(2) = 3
n(3) does not exist
n(4) = 7
n(5) = NULL
n(6) = NULL
n(7) does not exist
n(8) does not exist
```

### LIMIT Collection Method

LIMIT is a function that returns the maximum number of elements that the collection can have. If the collection has no maximum number of elements, LIMIT returns NULL. Only a varray has a maximum size.

Example 6-34 LIMIT and COUNT Values for Different Collection Types

This example prints the values of LIMIT and COUNT for an associative array with four elements, a varray with two elements, and a nested table with three elements.

```
DECLARE

TYPE aa_type IS TABLE OF INTEGER INDEX BY PLS_INTEGER;

aa aa_type; -- associative array
```

```
TYPE va type IS VARRAY(4) OF INTEGER;
 va va type := va type(2,4); -- varray
 TYPE nt type IS TABLE OF INTEGER;
 nt nt_type := nt_type(1,3,5); -- nested table
BEGIN
 aa(1):=3; aa(2):=6; aa(3):=9; aa(4):= 12;
 DBMS OUTPUT.PUT('aa.COUNT = ');
 DBMS OUTPUT.PUT LINE (NVL (TO CHAR (aa.COUNT), 'NULL'));
 DBMS OUTPUT.PUT('aa.LIMIT = ');
 DBMS OUTPUT.PUT_LINE(NVL(TO_CHAR(aa.LIMIT), 'NULL'));
 DBMS OUTPUT.PUT('va.COUNT = ');
 DBMS OUTPUT.PUT LINE (NVL (TO CHAR (va.COUNT), 'NULL'));
 DBMS OUTPUT.PUT('va.LIMIT = ');
 DBMS OUTPUT.PUT LINE (NVL (TO CHAR (va.LIMIT), 'NULL'));
 DBMS OUTPUT.PUT('nt.COUNT = ');
 DBMS OUTPUT.PUT LINE (NVL (TO CHAR (nt.COUNT), 'NULL'));
 DBMS OUTPUT.PUT('nt.LIMIT = ');
 DBMS OUTPUT.PUT LINE (NVL (TO CHAR (nt.LIMIT), 'NULL'));
END;
/
```

```
aa.COUNT = 4
aa.LIMIT = NULL
va.COUNT = 2
va.LIMIT = 4
nt.COUNT = 3
nt.LIMIT = NULL
```

# PRIOR and NEXT Collection Methods

PRIOR and NEXT are functions that let you move backward and forward in the collection (ignoring deleted elements, even if DELETE kept placeholders for them). These methods are useful for traversing sparse collections.

Given an index:

• PRIOR returns the index of the preceding existing element of the collection, if one exists. Otherwise, PRIOR returns NULL.

For any collection c, c.PRIOR(c.FIRST) returns NULL.

• NEXT returns the index of the succeeding existing element of the collection, if one exists. Otherwise, NEXT returns NULL.

For any collection c, c.NEXT (c.LAST) returns NULL.

The given index need not exist. However, if the collection c is a varray, and the index exceeds c.LIMIT, then:

- c.PRIOR(*index*) returns c.LAST.
- c.NEXT (*index*) returns NULL.

#### For example:

```
DECLARE

TYPE Arr_Type IS VARRAY(10) OF NUMBER;

v_Numbers Arr_Type := Arr_Type();

BEGIN

v_Numbers.EXTEND(4);

v_Numbers (1) := 10;

v_Numbers (2) := 20;

v_Numbers (2) := 20;

v_Numbers (3) := 30;

v_Numbers (4) := 40;

DBMS_OUTPUT.PUT_LINE(NVL(v_Numbers.prior (3400), -1));

DBMS_OUTPUT.PUT_LINE(NVL(v_Numbers.next (3400), -1));

END;

/
```

#### Result:

4 -1

For an associative array indexed by string, the prior and next indexes are determined by key values, which are in sorted order (for more information, see "NLS Parameter Values Affect Associative Arrays Indexed by String"). Example 6-1 uses FIRST, NEXT, and a WHILE LOOP statement to print the elements of an associative array.

#### Example 6-35 PRIOR and NEXT Methods

This example initializes a nested table with six elements, deletes the fourth element, and then shows the values of PRIOR and NEXT for elements 1 through 7. Elements 4 and 7 do not exist. Element 2 exists, despite its null value.

```
DECLARE

TYPE nt_type IS TABLE OF NUMBER;

nt nt_type := nt_type(18, NULL, 36, 45, 54, 63);

BEGIN

nt.DELETE(4);

DBMS_OUTPUT.PUT_LINE('nt(4) was deleted.');

FOR i IN 1..7 LOOP

DBMS_OUTPUT.PUT('nt.PRIOR(' || i || ') = ');

DBMS_OUTPUT.PUT_LINE(NVL(TO_CHAR(nt.PRIOR(i)), 'NULL'));

DBMS_OUTPUT.PUT_LINE(NVL(TO_CHAR(nt.NEXT(i)), 'NULL'));

END LOOP;

END;

/
```

#### Result:

```
nt(4) was deleted.
nt.PRIOR(1) = NULL
nt.NEXT(1) = 2
nt.PRIOR(2) = 1
nt.NEXT(2) = 3
nt.PRIOR(3) = 2
nt.NEXT(3) = 5
nt.PRIOR(4) = 3
nt.NEXT(4) = 5
```

```
nt.PRIOR(5) = 3
nt.NEXT(5) = 6
nt.PRIOR(6) = 5
nt.NEXT(6) = NULL
nt.PRIOR(7) = 6
nt.NEXT(7) = NULL
```

#### Example 6-36 Printing Elements of Sparse Nested Table

This example prints the elements of a sparse nested table from first to last, using FIRST and NEXT, and from last to first, using LAST and PRIOR.

```
DECLARE
 TYPE NumList IS TABLE OF NUMBER;
 n NumList := NumList(1, 2, NULL, NULL, 5, NULL, 7, 8, 9, NULL);
 idx INTEGER;
BEGIN
 DBMS OUTPUT.PUT LINE('First to last:');
 idx := n.FIRST;
 WHILE idx IS NOT NULL LOOP
   DBMS OUTPUT.PUT('n(' || idx || ') = ');
   DBMS OUTPUT.PUT LINE (NVL (TO CHAR (n (idx)), 'NULL'));
   idx := n.NEXT(idx);
 END LOOP;
  DBMS_OUTPUT.PUT_LINE('-----');
  DBMS_OUTPUT.PUT_LINE('Last to first:');
  idx := n.LAST;
 WHILE idx IS NOT NULL LOOP
   DBMS OUTPUT.PUT('n(' || idx || ') = ');
   DBMS OUTPUT.PUT LINE(NVL(TO CHAR(n(idx)), 'NULL'));
   idx := n.PRIOR(idx);
 END LOOP;
END;
/
```

#### Result:

First to last: n(1) = 1n(2) = 2n(3) = NULLn(4) = NULLn(5) = 5 n(6) = NULL n(7) = 7 n(8) = 8 n(9) = 9 n(10) = NULL\_\_\_\_\_ Last to first: n(10) = NULLn(9) = 9n(8) = 8n(7) = 7n(6) = NULLn(5) = 5n(4) = NULLn(3) = NULLn(2) = 2n(1) = 1

# **Collection Types Defined in Package Specifications**

A collection type defined in a package specification is incompatible with an identically defined local or standalone collection type.

#### Note:

The examples in this topic define packages and procedures, which are explained in PL/SQL Packages and PL/SQL Subprograms, respectively.

#### Example 6-37 Identically Defined Package and Local Collection Types

In this example, the package specification and the anonymous block define the collection type NumList identically. The package defines a procedure, print\_numlist, which has a NumList parameter. The anonymous block declares the variable n1 of the type pkg.NumList (defined in the package) and the variable n2 of the type NumList (defined in the block). The anonymous block can pass n1 to print numlist, but it cannot pass n2 to print numlist.

#### Live SQL:

You can view and run this example on Oracle Live SQL at Identically Defined Package and Local Collection Types

```
CREATE OR REPLACE PACKAGE pkg AS
 TYPE NumList IS TABLE OF NUMBER;
 PROCEDURE print numlist (nums NumList);
END pkg;
CREATE OR REPLACE PACKAGE BODY pkg AS
 PROCEDURE print numlist (nums NumList) IS
 BEGIN
   FOR i IN nums.FIRST..nums.LAST LOOP
     DBMS OUTPUT.PUT LINE(nums(i));
   END LOOP;
 END:
END pkg;
DECLARE
 TYPE NumList IS TABLE OF NUMBER; -- local type identical to package type
 n1 pkg.NumList := pkg.NumList(2,4); -- package type
      NumList := NumList(6,8); -- local type
 n2
BEGIN
 pkg.print numlist(n1); -- succeeds
 pkg.print_numlist(n2); -- fails
END:
/
```

#### Result:

pkg.print\_numlist(n2); -- fails
 \*
ERROR at line 7:

```
ORA-06550: line 7, column 3:
PLS-00306: wrong number or types of arguments in call to 'PRINT_NUMLIST'
ORA-06550: line 7, column 3:
PL/SQL: Statement ignored
```

#### Example 6-38 Identically Defined Package and Standalone Collection Types

This example defines a standalone collection type NumList that is identical to the collection type NumList defined in the package specification in Example 6-37. The anonymous block declares the variable n1 of the type pkg.NumList (defined in the package) and the variable n2 of the standalone type NumList. The anonymous block can pass n1 to print\_numlist, but it cannot pass n2 to print numlist.

#### Live SQL:

You can view and run this example on Oracle Live SQL at Identically Defined Package and Standalone Collection Types

```
CREATE OR REPLACE TYPE NumList IS TABLE OF NUMBER;
-- standalone collection type identical to package type
/
DECLARE
  n1 pkg.NumList := pkg.NumList(2,4); -- package type
  n2 NumList := NumList(6,8); -- standalone type
BEGIN
  pkg.print_numlist(n1); -- succeeds
  pkg.print_numlist(n2); -- fails
END;
/
```

#### Result:

```
pkg.print_numlist(n2); -- fails
*
ERROR at line 7:
ORA-06550: line 7, column 3:
PLS-00306: wrong number or types of arguments in call to 'PRINT_NUMLIST'
ORA-06550: line 7, column 3:
PL/SQL: Statement ignored
```

# **Record Variables**

You can create a record variable in any of these ways:

- Define a RECORD type and then declare a variable of that type.
- Use %ROWTYPE to declare a record variable that represents either a full or partial row of a
  database table or view.
- Use %TYPE to declare a record variable of the same type as a previously declared record variable.

For syntax and semantics, see "Record Variable Declaration".

#### Topics

Initial Values of Record Variables

- Declaring Record Constants
- RECORD Types
- Declaring Items using the %ROWTYPE Attribute

### Initial Values of Record Variables

For a record variable of a RECORD type, the initial value of each field is NULL unless you specify a different initial value for it when you define the type.

For a record variable declared with <code>%ROWTYPE</code> or <code>%TYPE</code>, the initial value of each field is <code>NULL</code>. The variable does not inherit the initial value of the referenced item.

# **Declaring Record Constants**

When declaring a record constant, you can use qualified expressions positional or named association notations to initialize values in a compact form.

#### Example 6-39 Declaring Record Constant

This example shows the record constant r being initialized with a qualified expression. The values of 0 and 1 are assigned by explicitly indicating the My\_Rec typemark and an aggregate specified using the positional notation.

#### Live SQL:

You can view and run this example on Oracle Live SQL at Declaring Record Constant

```
DECLARE
  TYPE My_Rec IS RECORD (a NUMBER, b NUMBER);
  r CONSTANT My_Rec := My_Rec(0,1);
BEGIN
  DBMS_OUTPUT.PUT_LINE('r.a = ' || r.a);
  DBMS_OUTPUT.PUT_LINE('r.b = ' || r.b);
END;
/
```

Prior to Oracle Database Release 18c, to achieve the same result, you had to declare a record constant using a function that populates the record with its initial value and then invoke the function in the constant declaration. You can observe by comparing both examples that qualified expressions improve program clarity and developer productivity by being more compact.

```
CREATE OR REPLACE PACKAGE My_Types AUTHID CURRENT_USER IS

TYPE My_Rec IS RECORD (a NUMBER, b NUMBER);

FUNCTION Init_My_Rec RETURN My_Rec;

END My_Types;

/

CREATE OR REPLACE PACKAGE BODY My_Types IS

FUNCTION Init My Rec RETURN My Rec IS
```

```
Rec My_Rec;
BEGIN
Rec.a := 0;
Rec.b := 1;
RETURN Rec;
END Init_My_Rec;
END My_Types;
/
DECLARE
r CONSTANT My_Types.My_Rec := My_Types.Init_My_Rec();
BEGIN
DBMS_OUTPUT.PUT_LINE('r.a = ' || r.a);
DBMS_OUTPUT.PUT_LINE('r.b = ' || r.b);
END;
/
```

r.a = 0 r.b = 1

#### Example 6-40 Declaring Record Constant

This example shows a record constant c\_small initialized with a qualified expression using the positional notation. The c\_large record constant is initialized with a qualified expression using the named association notation.

```
DECLARE
TYPE t siz
```

```
TYPE t_size IS RECORD (x NUMBER, y NUMBER);
c_small CONSTANT t_size := t_size(32,36);
c_large CONSTANT t_size := t_size(x => 192, y => 292);
BEGIN
DBMS_OUTPUT.PUT_LINE('Small size is ' || c_small.x || ' by ' || c_small.y);
DBMS_OUTPUT.PUT_LINE('Large size is ' || c_large.x || ' by ' || c_large.y);
END;
/
```

#### Result:

Small size is 32 by 36 Large size is 192 by 292

# **RECORD** Types

A RECORD type defined in a PL/SQL block is a **local type**. It is available only in the block, and is stored in the database only if the block is in a standalone or package subprogram.

A RECORD type defined in a package specification is a **public item**. You can reference it from outside the package by qualifying it with the package name (*package\_name.type\_name*). It is stored in the database until you drop the package with the DROP PACKAGE statement.

You cannot create a RECORD type at schema level. Therefore, a RECORD type cannot be an ADT attribute data type.

To define a RECORD type, specify its name and define its fields. To define a field, specify its name and data type. By default, the initial value of a field is NULL. You can specify the NOT NULL

constraint for a field, in which case you must also specify a non-NULL initial value. Without the NOT NULL constraint, a non-NULL initial value is optional.

A RECORD type defined in a package specification is incompatible with an identically defined local RECORD type.

#### Example 6-41 RECORD Type Definition and Variable Declaration

This example defines a RECORD type named DeptRecTyp, specifying an initial value for each field. Then it declares a variable of that type named dept rec and prints its fields.

Live SQL:

You can view and run this example on Oracle Live SQL at RECORD Type Definition and Variable Declaration

```
DECLARE

TYPE DeptRecTyp IS RECORD (

    dept_id NUMBER(4) NOT NULL := 10,

    dept_name VARCHAR2(30) NOT NULL := 'Administration',

    mgr_id NUMBER(6) := 200,

    loc_id NUMBER(4) := 1700

);

dept_rec DeptRecTyp;

BEGIN

DBMS_OUTPUT.PUT_LINE('dept_id: ' || dept_rec.dept_id);

DBMS_OUTPUT.PUT_LINE('dept_name: ' || dept_rec.dept_name);

DBMS_OUTPUT.PUT_LINE('dept_id: ' || dept_rec.dept_id);

DBMS_OUTPUT.PUT_LINE('loc_id: ' || dept_rec.loc_id);

END;

/
```

#### Result:

dept\_id: 10
dept\_name: Administration
mgr\_id: 200
loc\_id: 1700

#### Example 6-42 RECORD Type with RECORD Field (Nested Record)

This example defines two RECORD types, name\_rec and contact. The type contact has a field of type name rec.

### Live SQL:

You can view and run this example on Oracle Live SQL at RECORD Type with RECORD Field (Nested Record)

```
DECLARE
 TYPE name_rec IS RECORD (
   first employees.first name%TYPE,
   last employees.last_name%TYPE
 );
 TYPE contact IS RECORD (
   name name rec,
                                       -- nested record
   phone employees.phone number%TYPE
 );
 friend contact;
BEGIN
 friend.name.first := 'John';
 friend.name.last := 'Smith';
 friend.phone := '1-650-555-1234';
 DBMS OUTPUT.PUT LINE (
   friend.name.first || ' ' ||
   friend.name.last || ', ' ||
   friend.phone
 );
END;
/
```

#### Result:

John Smith, 1-650-555-1234

#### Example 6-43 RECORD Type with Varray Field

This defines a VARRAY type, full\_name, and a RECORD type, contact. The type contact has a field of type full name.

### Live SQL:

You can view and run this example on Oracle Live SQL at RECORD Type with Varray Field

```
DECLARE
TYPE full_name IS VARRAY(2) OF VARCHAR2(20);
TYPE contact IS RECORD (
    name full_name := full_name('John', 'Smith'), -- varray field
    phone employees.phone_number%TYPE
);
friend contact;
BEGIN
friend.phone := '1-650-555-1234';
```

```
DBMS_OUTPUT.PUT_LINE (
    friend.name(1) || ' ' ||
    friend.name(2) || ', ' ||
    friend.phone
);
END;
/
```

John Smith, 1-650-555-1234

#### Example 6-44 Identically Defined Package and Local RECORD Types

In this example, the package pkg and the anonymous block define the RECORD type rec\_type identically. The package defines a procedure, print\_rec\_type, which has a rec\_type parameter. The anonymous block declares the variable r1 of the package type (pkg.rec\_type) and the variable r2 of the local type (rec\_type). The anonymous block can pass r1 to print\_rec\_type, but it cannot pass r2 to print\_rec\_type.

### Live SQL:

You can view and run this example on Oracle Live SQL at Identically Defined Package and Local RECORD Types

```
CREATE OR REPLACE PACKAGE pkg AS
 TYPE rec type IS RECORD (
                               -- package RECORD type
   f1 INTEGER,
   f2 VARCHAR2(4)
 );
 PROCEDURE print rec type (rec rec type);
END pkg;
/
CREATE OR REPLACE PACKAGE BODY pkg AS
 PROCEDURE print rec type (rec rec type) IS
 BEGIN
   DBMS OUTPUT.PUT LINE (rec.f1);
   DBMS OUTPUT.PUT LINE(rec.f2);
 END;
END pkg;
DECLARE
 TYPE rec_type IS RECORD ( -- local RECORD type
   f1 INTEGER,
   f2 VARCHAR2(4)
 );
 r1 pkg.rec type;
                               -- package type
 r2 rec type;
                                 -- local type
BEGIN
 r1.f1 := 10; r1.f2 := 'abcd';
 r2.f1 := 25; r2.f2 := 'wxyz';
 pkg.print rec type(r1); -- succeeds
 pkg.print_rec_type(r2); -- fails
END;
/
```

```
pkg.print_rec_type(r2); -- fails
*
ERROR at line 14:
ORA-06550: line 14, column 3:
PLS-00306: wrong number or types of arguments in call to 'PRINT REC TYPE'
```

### Declaring Items using the %ROWTYPE Attribute

The **%ROWTYPE** attribute lets you declare a record variable that represents either a full or partial row of a database table or view.

For the syntax and semantics details, see %ROWTYPE Attribute.

#### **Topics**

- Declaring a Record Variable that Always Represents Full Row
- Declaring a Record Variable that Can Represent Partial Row
- %ROWTYPE Attribute and Virtual Columns
- %ROWTYPE Attribute and Invisible Columns

### Declaring a Record Variable that Always Represents Full Row

To declare a record variable that always represents a full row of a database table or view, use this syntax:

```
variable name table or view name%ROWTYPE;
```

For every column of the table or view, the record has a field with the same name and data type.

#### Example 6-45 %ROWTYPE Variable Represents Full Database Table Row

This example declares a record variable that represents a row of the table departments, assigns values to its fields, and prints them. Compare this example to Example 6-41.

Live SQL:

You can view and run this example on Oracle Live SQL at %ROWTYPE Variable Represents Full Database Table Row

DECLARE
 dept\_rec departments%ROWTYPE;
BEGIN

```
-- Assign values to fields:
dept_rec.department_id := 10;
dept_rec.department_name := 'Administration';
dept_rec.manager_id := 200;
dept_rec.location_id := 1700;
-- Print fields:
DBMS_OUTPUT.PUT_LINE('dept_id: ' || dept_rec.department_id);
DBMS_OUTPUT.PUT_LINE('dept_name: ' || dept_rec.department_name);
DBMS_OUTPUT.PUT_LINE('dept_name: ' || dept_rec.department_name);
DBMS_OUTPUT.PUT_LINE('dept_id: ' || dept_rec.manager_id);
DBMS_OUTPUT.PUT_LINE('loc_id: ' || dept_rec.location_id);
END;
/
```

```
dept_id: 10
dept_name: Administration
mgr_id: 200
loc id: 1700
```

#### Example 6-46 %ROWTYPE Variable Does Not Inherit Initial Values or Constraints

This example creates a table with two columns, each with an initial value and a NOT NULL constraint. Then it declares a record variable that represents a row of the table and prints its fields, showing that they did not inherit the initial values or NOT NULL constraints.

#### Live SQL:

You can view and run this example on Oracle Live SQL at %ROWTYPE Variable Does Not Inherit Initial Values or Constraints

```
CREATE OR REPLACE PROCEDURE print (n INTEGER) IS
BEGIN
  IF n IS NOT NULL THEN
   DBMS OUTPUT.PUT LINE(n);
  ELSE
   DBMS OUTPUT.PUT LINE('NULL');
 END IF;
END print;
/
DROP TABLE t1;
CREATE TABLE t1 (
 c1 INTEGER DEFAULT 0 NOT NULL,
  c2 INTEGER DEFAULT 1 NOT NULL
);
DECLARE
  t1 row t1%ROWTYPE;
```

```
BEGIN
DBMS_OUTPUT.PUT('t1.c1 = ');
DBMS_OUTPUT.PUT_LINE(NVL(TO_CHAR(t1_row.c1), 'NULL'));
DBMS_OUTPUT.PUT('t1.c2 = '); print(t1_row.c2);
DBMS_OUTPUT.PUT_LINE(NVL(TO_CHAR(t1_row.c2), 'NULL'));
END;
/
Result:
t1.c1 = NULL
t1.c2 = NULL
```

### Declaring a Record Variable that Can Represent Partial Row

To declare a record variable that can represent a partial row of a database table or view, use this syntax:

#### variable\_name cursor%ROWTYPE;

A cursor is associated with a query. For every column that the query selects, the record variable must have a corresponding, type-compatible field. If the query selects every column of the table or view, then the variable represents a full row; otherwise, the variable represents a partial row. The cursor must be either an explicit cursor or a strong cursor variable.

#### See Also:

- "FETCH Statement" for complete syntax
- "Cursors Overview" for information about cursors
- "Explicit Cursors" for information about explicit cursors
- "Cursor Variables" for information about cursor variables
- Oracle Database SQL Language Reference for information about joins

#### Example 6-47 %ROWTYPE Variable Represents Partial Database Table Row

This example defines an explicit cursor whose query selects only the columns first\_name, last\_name, and phone\_number from the employees table in the sample schema HR. Then the example declares a record variable that has a field for each column that the cursor selects. The variable represents a partial row of employees. Compare this example to Example 6-42.

### Live SQL:

You can view and run this example on Oracle Live SQL at %ROWTYPE Variable Represents Partial Database Table Row

DECLARE CURSOR c IS

```
SELECT first name, last name, phone number
     FROM employees;
  friend c%ROWTYPE;
BEGIN
  friend.first_name := 'John';
friend.last_name := 'Smith';
```

```
friend.phone number := '1-650-555-1234';
 DBMS OUTPUT.PUT LINE (
   friend.first_name || ' ' ||
   friend.last_name || ', ' ||
   friend.phone_number
 );
END;
```

/

John Smith, 1-650-555-1234

#### Example 6-48 %ROWTYPE Variable Represents Join Row

This example defines an explicit cursor whose query is a join and then declares a record variable that has a field for each column that the cursor selects.

# Live SQL: You can view and run this example on Oracle Live SQL at %ROWTYPE Variable **Represents Join Row** DECLARE

```
CURSOR c2 IS
   SELECT employee id, email, employees.manager id, location id
   FROM employees, departments
   WHERE employees.department id = departments.department id;
 join rec c2%ROWTYPE; -- includes columns from two tables
BEGIN
 NULL;
END;
```

### %ROWTYPE Attribute and Virtual Columns

If you use the **ROWTYPE** attribute to define a record variable that represents a full row of a table that has a virtual column, then you cannot insert that record into the table. Instead, you must insert the individual record fields into the table, excluding the virtual column.

#### Example 6-49 Inserting %ROWTYPE Record into Table (Wrong)

This example creates a record variable that represents a full row of a table that has a virtual column, populates the record, and inserts the record into the table, causing ORA-54013.

```
DROP TABLE plch departure;
CREATE TABLE plch_departure (
```

```
VARCHAR2(100),
  destination
 departure time DATE,
 expected GENERATER -
              GENERATED ALWAYS AS (departure_time + delay/24/60/60)
);
DECLARE
dep_rec plch_departure%ROWTYPE;
BEGIN
 dep rec.destination := 'X';
 dep rec.departure time := SYSDATE;
 dep rec.delay := 1500;
 INSERT INTO plch departure VALUES dep rec;
END;
/
Result:
DECLARE
ERROR at line 1:
ORA-54013: INSERT operation disallowed on virtual columns
ORA-06512: at line 8
```

#### Example 6-50 Inserting %ROWTYPE Record into Table (Right)

This solves the problem in Example 6-49 by inserting the individual record fields into the table, excluding the virtual column.

```
DECLARE
  dep_rec plch_departure%rowtype;
BEGIN
  dep_rec.destination := 'X';
  dep_rec.departure_time := SYSDATE;
  dep_rec.delay := 1500;
  INSERT INTO plch_departure (destination, departure_time, delay)
  VALUES (dep_rec.destination, dep_rec.departure_time, dep_rec.delay);
end;
/
```

#### Result:

PL/SQL procedure successfully completed.

### %ROWTYPE Attribute and Invisible Columns

Suppose that you use the **ROWTYPE** attribute to define a record variable that represents a row of a table that has an invisible column, and then you make the invisible column visible.

If you define the record variable with a cursor, as in "Declaring a Record Variable that Can Represent Partial Row", then making the invisible column visible does not change the structure of the record variable.

However, if you define the record variable as in "Declaring a Record Variable that Always Represents Full Row" and use a SELECT \* INTO statement to assign values to the record, then making the invisible column visible does change the structure of the record—see Example 6-51.

### See Also:

Oracle Database SQL Language Reference for general information about invisible columns

#### Example 6-51 %ROWTYPE Affected by Making Invisible Column Visible

```
CREATE TABLE t (a INT, b INT, c INT INVISIBLE);
INSERT INTO t (a, b, c) VALUES (1, 2, 3);
COMMIT;
DECLARE
  t_rec t%ROWTYPE; -- t_rec has fields a and b, but not c
BEGIN
  SELECT * INTO t_rec FROM t WHERE ROWNUM < 2; -- t_rec(a)=1, t_rec(b)=2
  DBMS_OUTPUT.PUT_LINE('c = ' || t_rec.c);
END;
/
```

#### Result:

DBMS\_OUTPUT.PUT\_LINE('c = ' || t\_rec.c);

```
ERROR at line 5:
ORA-06550: line 5, column 40:
PLS-00302: component 'C' must be declared
ORA-06550: line 5, column 3:
PL/SQL: Statement ignored
```

#### Make invisible column visible:

```
ALTER TABLE t MODIFY (c VISIBLE);
```

#### Result:

Table altered.

Repeat preceding anonymous block:

#### Result:

#### c = 3

PL/SQL procedure successfully completed.

# Assigning Values to Record Variables

A *record variable* means either a record variable or a record component of a composite variable.

To any record variable, you can assign a value to each field individually.

You can assign values using qualified expressions.

In some cases, you can assign the value of one record variable to another record variable.

If a record variable represents a full or partial row of a database table or view, you can assign the represented row to the record variable.

#### **Topics**

- Assigning Values to RECORD Type Variables Using Qualified Expressions
- Assigning One Record Variable to Another
- Assigning Full or Partial Rows to Record Variables
- Assigning NULL to a Record Variable

### Assigning Values to RECORD Type Variables Using Qualified Expressions

You can assign values to RECORD type variables using qualified expressions positional association or named association aggregates.

A qualified expression combines expression elements to create values of a RECORD type. An aggregate defines a compound type value. You can assign values to a RECORD type using qualified expressions. Positional and named associations are allowed for qualified expressions of RECORD type. A positional association may not follow a named association in the same construct (and vice versa). A final optional others choice can be specified after the positional and named associations.

A qualified expression is this context has this structure:

```
qualified_expression ::= typemark ( aggregate )
aggregate ::= ( positional_association | named_association ) [ others_choice ]
positional_association ::= ( expr )+
named association ::= identifier => expr [,]+
```

# Example 6-52 Assigning Values to RECORD Type Variables Using Qualified Expressions

This example shows the declaration, initialization, and definition of RECORD type variables.

Type rec\_t is defined and partially initialized in package pkg.

Variable v\_rec1 is declared with that type and assigned initial values using a positional aggregate.

Variable v\_rec2 is declared with that type as well and assigned initial values using a named association aggregate.

Variable v\_rec3 is assigned the NULL values.

The procedure print\_rec displays the values of the local variable v\_rec1, followed by the procedure parameter pi\_rec variable values. If no parameter is passed to the procedure, it displays the initial values set in the procedure definition.

#### Live SQL:

You can view and run this example on Oracle Live SQL at "18c Assigning Values to RECORD Type Variables Using Qualified Expressions"

```
CREATE PACKAGE pkg IS
  TYPE rec t IS RECORD
   (year PLS INTEGER := 2,
    name VARCHAR2 (100) );
END;
/
DECLARE
  v rec1 pkg.rec t := pkg.rec t(1847, 'ONE EIGHT FOUR SEVEN');
  v rec2 pkg.rec t := pkg.rec t(year => 1, name => 'ONE');
  v rec3 pkg.rec t := pkg.rec t(NULL,NULL);
PROCEDURE print rec ( pi rec pkg.rec t := pkg.rec t(1847+1, 'a'||'b')) IS
  v rec1 pkg.rec t := pkg.rec t(2847,'TWO EIGHT FOUR SEVEN');
BEGIN
  DBMS_OUTPUT.PUT_LINE(NVL(v_rec1.year,0) ||' ' ||NVL(v rec1.name,'N/A'));
  DBMS OUTPUT.PUT LINE(NVL(pi rec.year,0) ||' ' ||NVL(pi rec.name,'N/A'));
END;
BEGIN
  print rec(v rec1);
  print rec(v rec2);
  print rec(v rec3);
  print rec();
END;
/
2847 TWO EIGHT FOUR SEVEN
1847 ONE EIGHT FOUR SEVEN
2847 TWO EIGHT FOUR SEVEN
1 ONE
2847 TWO EIGHT FOUR SEVEN
0 N/A
2847 TWO EIGHT FOUR SEVEN
1848 ab
```

### Assigning One Record Variable to Another

You can assign the value of one record variable to another record variable only in these cases:

The two variables have the same RECORD type.

 The target variable is declared with a RECORD type, the source variable is declared with %ROWTYPE, their fields match in number and order, and corresponding fields have the same data type.

For record components of composite variables, the types of the composite variables need not match.

#### Example 6-53 Assigning Record to Another Record of Same RECORD Type

In this example, name1 and name2 have the same RECORD type, so you can assign the value of name1 to name2.

```
DECLARE

TYPE name_rec IS RECORD (

   first employees.first_name%TYPE DEFAULT 'John',

   last employees.last_name%TYPE DEFAULT 'Doe'

);

name1 name_rec;

name2 name_rec;

BEGIN

   name1.first := 'Jane'; name1.last := 'Smith';

   DBMS_OUTPUT.PUT_LINE('name1.ist := 'Smith';

   name2 := name1;

   DBMS_OUTPUT.PUT_LINE('name2: ' || name1.first || ' ' || name1.last);

   END;

/
```

#### Result:

```
name1: Jane Smith
name2: Jane Smith
```

#### Example 6-54 Assigning %ROWTYPE Record to RECORD Type Record

In this example, the target variable is declared with a RECORD type, the source variable is declared with %ROWTYPE, their fields match in number and order, and corresponding fields have the same data type.

```
DECLARE
 TYPE name rec IS RECORD (
   first employees.first name%TYPE DEFAULT 'John',
          employees.last_name%TYPE DEFAULT 'Doe'
   last
 );
 CURSOR c IS
    SELECT first_name, last_name
   FROM employees;
  target name rec;
 source c%ROWTYPE;
BEGIN
 source.first name := 'Jane'; source.last name := 'Smith';
 DBMS OUTPUT.PUT LINE (
    'source: ' || source.first_name || ' ' || source.last_name
 );
target := source;
DBMS OUTPUT.PUT LINE (
```

```
'target: ' || target.first || ' ' || target.last
);
END;
/
```

source: Jane Smith target: Jane Smith

#### Example 6-55 Assigning Nested Record to Another Record of Same RECORD Type

This example assigns the value of one nested record to another nested record. The nested records have the same RECORD type, but the records in which they are nested do not.

```
DECLARE
 TYPE name_rec IS RECORD (
   first employees.first name%TYPE,
   last employees.last name%TYPE
 );
 TYPE phone rec IS RECORD (
   name name_rec,
                                       -- nested record
   phone employees.phone number%TYPE
 );
 TYPE email rec IS RECORD (
   name name rec,
                                       -- nested record
   email employees.email%TYPE
 );
 phone contact phone rec;
 email contact email rec;
BEGIN
 phone contact.name.first := 'John';
 phone contact.name.last := 'Smith';
 phone_contact.phone := '1-650-555-1234';
 email contact.name := phone contact.name;
 email contact.email := (
   email contact.name.first || '.' ||
   email contact.name.last || '@' ||
    'example.com'
 );
 DBMS_OUTPUT.PUT_LINE (email_contact.email);
END;
/
```

#### Result:

John.Smith@example.com

# Assigning Full or Partial Rows to Record Variables

If a record variable represents a full or partial row of a database table or view, you can assign the represented row to the record variable.

#### Topics

Using SELECT INTO to Assign a Row to a Record Variable

- Using FETCH to Assign a Row to a Record Variable
  - Using SQL Statements to Return Rows in PL/SQL Record Variables

### Using SELECT INTO to Assign a Row to a Record Variable

•

The syntax of a simple SELECT INTO statement is:

SELECT select\_list INTO record\_variable\_name FROM table\_or\_view\_name;

For each column in *select\_list*, the record variable must have a corresponding, typecompatible field. The columns in *select\_list* must appear in the same order as the record fields.

See Also: "SELECT INTO Statement" for complete syntax

#### Example 6-56 SELECT INTO Assigns Values to Record Variable

In this example, the record variable rec1 represents a partial row of the employees table—the columns last\_name and employee\_id. The SELECT INTO statement selects from employees the row for which job\_id is 'AD\_PRES' and assigns the values of the columns last\_name and employee id in that row to the corresponding fields of rec1.

```
DECLARE

TYPE RecordTyp IS RECORD (

   last employees.last_name%TYPE,

   id employees.employee_id%TYPE

);

rec1 RecordTyp;

BEGIN

SELECT last_name, employee_id INTO rec1

FROM employees

WHERE job_id = 'AD_PRES';

DBMS_OUTPUT.PUT_LINE ('Employee #' || rec1.id || ' = ' || rec1.last);

END;

/
```

#### Result:

Employee #100 = King

### Using FETCH to Assign a Row to a Record Variable

The syntax of a simple FETCH statement is:

FETCH cursor INTO record variable name;

A cursor is associated with a query. For every column that the query selects, the record variable must have a corresponding, type-compatible field. The cursor must be either an explicit cursor or a strong cursor variable.

#### See Also:

- "FETCH Statement" for complete syntax
- "Cursors Overview" for information about all cursors
- "Explicit Cursors" for information about explicit cursors
- "Cursor Variables" for information about cursor variables

#### Example 6-57 FETCH Assigns Values to Record that Function Returns

In this example, each variable of RECORD type EmpRecTyp represents a partial row of the employees table—the columns employee\_id and salary. Both the cursor and the function return a value of type EmpRecTyp. In the function, a FETCH statement assigns the values of the columns employee\_id and salary to the corresponding fields of a local variable of type EmpRecTyp.

```
DECLARE
 TYPE EmpRecTyp IS RECORD (
   emp id employees.employee id%TYPE,
   salary employees.salary%TYPE
 );
 CURSOR desc salary RETURN EmpRecTyp IS
   SELECT employee id, salary
   FROM employees
   ORDER BY salary DESC;
 highest_paid_emp
                         EmpRecTyp;
 next highest paid emp EmpRecTyp;
 FUNCTION nth highest salary (n INTEGER) RETURN EmpRecTyp IS
   emp rec EmpRecTyp;
 BEGIN
   OPEN desc salary;
   FOR i IN 1... LOOP
     FETCH desc salary INTO emp rec;
   END LOOP;
   CLOSE desc_salary;
   RETURN emp rec;
 END nth highest salary;
BEGIN
 highest paid emp := nth highest salary(1);
 next highest paid emp := nth highest salary(2);
 DBMS OUTPUT.PUT LINE (
    'Highest Paid: #' ||
   highest paid emp.emp id || ', $' ||
   highest paid emp.salary
 );
 DBMS OUTPUT.PUT LINE(
   'Next Highest Paid: #' ||
   next highest paid emp.emp id || ', $' ||
   next highest paid emp.salary
 );
END;
/
```

```
Highest Paid: #100, $24000
Next Highest Paid: #101, $17000
```

### Using SQL Statements to Return Rows in PL/SQL Record Variables

The SQL statements INSERT, UPDATE, and DELETE have an optional RETURNING INTO clause that can return the affected row in a PL/SQL record variable.

For information about this clause, see "RETURNING INTO Clause".

#### Example 6-58 UPDATE Statement Assigns Values to Record Variable

In this example, the UPDATE statement updates the salary of an employee and returns the name and new salary of the employee in a record variable.

```
DECLARE
 TYPE EmpRec IS RECORD (
   last_name employees.last_name%TYPE,
           employees.salary%TYPE
   salary
 );
           EmpRec;
 emp_info
 old salary employees.salary%TYPE;
BEGIN
 SELECT salary INTO old_salary
  FROM employees
  WHERE employee id = 100;
 UPDATE employees
   SET salary = salary * 1.1
   WHERE employee id = 100
   RETURNING last_name, salary INTO emp_info;
 DBMS OUTPUT.PUT LINE (
   'Salary of ' || emp info.last name || ' raised from ' ||
   old salary || ' to ' || emp info.salary
 );
END;
```

#### Result:

Salary of King raised from 24000 to 26400

### Assigning NULL to a Record Variable

Assigning the value NULL to a record variable assigns the value NULL to each of its fields.

This assignment is recursive; that is, if a field is a record, then its fields are also assigned the value NULL.

#### Example 6-59 Assigning NULL to Record Variable

This example prints the fields of a record variable (one of which is a record) before and after assigning NULL to it.

```
DECLARE

TYPE age_rec IS RECORD (

years INTEGER DEFAULT 35,

months INTEGER DEFAULT 6

);
```

```
TYPE name_rec IS RECORD (
    first employees.first_name%TYPE DEFAULT 'John',
    last employees.last name%TYPE DEFAULT 'Doe',
    age
          age_rec
  );
 name name rec;
  PROCEDURE print name AS
  BEGIN
    DBMS_OUTPUT.PUT(NVL(name.first, 'NULL') || ' ');
    DBMS_OUTPUT.PUT(NVL(name.last, 'NULL') || ', ');
    DBMS OUTPUT.PUT(NVL(TO CHAR(name.age.years), 'NULL') || ' yrs ');
    DBMS OUTPUT.PUT LINE(NVL(TO CHAR(name.age.months), 'NULL') || ' mos');
 END;
BEGIN
 print name;
 name := NULL;
 print name;
END;
/
Result:
```

John Doe, 35 yrs 6 mos NULL NULL, NULL yrs NULL mos

# **Record Comparisons**

Records cannot be tested natively for nullity, equality, or inequality.

These BOOLEAN expressions are illegal:

- My\_Record IS NULL
- My\_Record\_1 = My\_Record\_2
- My Record 1 > My Record 2

You must write your own functions to implement such tests. For information about writing functions, see PL/SQL Subprograms.

# Inserting Records into Tables

The PL/SQL extension to the SQL INSERT statement lets you insert a record into a table.

The record must represent a row of the table. For more information, see "INSERT Statement Extension". For restrictions on inserting records into tables, see "Restrictions on Record Inserts and Updates".

To efficiently insert a collection of records into a table, put the INSERT statement inside a FORALL statement. For information about the FORALL statement, see "FORALL Statement".

#### Example 6-60 Initializing Table by Inserting Record of Default Values

This example creates the table schedule and initializes it by putting default values in a record and inserting the record into the table for each week. (The COLUMN formatting commands are from SQL\*Plus.)

```
DROP TABLE schedule;
CREATE TABLE schedule (
 week NUMBER,
 Mon VARCHAR2(10),
 Tue VARCHAR2(10),
 Wed VARCHAR2(10),
      VARCHAR2(10),
 Thu
 Fri VARCHAR2(10),
  Sat VARCHAR2(10),
  Sun VARCHAR2 (10)
);
DECLARE
 default week schedule%ROWTYPE;
 i
             NUMBER;
BEGIN
 default week.Mon := '0800-1700';
 default week.Tue := '0800-1700';
 default week.Wed := '0800-1700';
 default week. Thu := '0800-1700';
 default week.Fri := '0800-1700';
 default week.Sat := 'Day Off';
 default_week.Sun := 'Day Off';
 FOR i IN 1..6 LOOP
   default week.week
                      := i;
   INSERT INTO schedule VALUES default week;
 END LOOP;
END;
/
COLUMN week FORMAT 99
COLUMN Mon FORMAT A9
COLUMN Tue FORMAT A9
COLUMN Wed FORMAT A9
COLUMN Thu FORMAT A9
COLUMN Fri FORMAT A9
COLUMN Sat FORMAT A9
COLUMN Sun FORMAT A9
SELECT * FROM schedule;
Result:
```

# Updating Rows with Records

The PL/SQL extension to the SQL UPDATE statement lets you update one or more table rows with a record.

The record must represent a row of the table. For more information, see "UPDATE Statement Extensions".

For restrictions on updating table rows with a record, see "Restrictions on Record Inserts and Updates".

To efficiently update a set of rows with a collection of records, put the UPDATE statement inside a FORALL statement. For information about the FORALL statement, see "FORALL Statement".

#### Example 6-61 Updating Rows with Record

This example updates the first three weeks of the table schedule (defined in Example 6-60) by putting the new values in a record and updating the first three rows of the table with that record.

```
DECLARE
 default week schedule%ROWTYPE;
BEGIN
 default week.Mon := 'Day Off';
 default week.Tue := '0900-1800';
 default week.Wed := '0900-1800';
 default week.Thu := '0900-1800';
 default week.Fri := '0900-1800';
 default_week.Sat := '0900-1800';
 default week.Sun := 'Day Off';
 FOR i IN 1..3 LOOP
   default week.week := i;
   UPDATE schedule
   SET ROW = default week
   WHERE week = i;
 END LOOP;
END;
```

SELECT \* FROM schedule;

#### Result:

```
        WEEK
        MON
        TUE
        WED
        THU
        FRI
        SAT
        SUN

        1
        Day Off
        0900-1800
        0900-1800
        0900-1800
        0900-1800
        0900-1800
        Day Off

        2
        Day Off
        0900-1800
        0900-1800
        0900-1800
        0900-1800
        0900-1800
        Day Off

        3
        Day Off
        0900-1800
        0900-1800
        0900-1800
        0900-1800
        0900-1800
        Day Off

        4
        0800-1700

        0800-1700
        0800-1700
        Day Off
        Day Off
```

# **Restrictions on Record Inserts and Updates**

These restrictions apply to record inserts and updates:

- Record variables are allowed only in these places:
  - On the right side of the SET clause in an UPDATE statement
  - In the VALUES clause of an INSERT statement
  - In the INTO subclause of a RETURNING clause

Record variables are not allowed in a SELECT list, WHERE clause, GROUP BY clause, or ORDER BY clause.

- The keyword ROW is allowed only on the left side of a SET clause. Also, you cannot use ROW with a subquery.
- In an UPDATE statement, only one SET clause is allowed if ROW is used.
- If the VALUES clause of an INSERT statement contains a record variable, no other variable or value is allowed in the clause.
- If the INTO subclause of a RETURNING clause contains a record variable, no other variable or value is allowed in the subclause.
- These are not supported:
  - Nested RECORD types
  - Functions that return a RECORD type
  - Record inserts and updates using the EXECUTE IMMEDIATE statement.

# 7 PL/SQL Static SQL

**Static SQL** is a PL/SQL feature that allows SQL syntax directly in a PL/SQL statement. This chapter describes static SQL and explains how to use it.

#### **Topics**

- Description of Static SQL
- Cursors Overview
- Processing Query Result Sets
- Cursor Variables
- CURSOR Expressions
- Transaction Processing and Control
- Autonomous Transactions

💉 See Also:

"Resolution of Names in Static SQL Statements"

# **Description of Static SQL**

Static SQL has the same syntax as SQL, except as noted.

#### Topics

- Statements
- Pseudocolumns

### Statements

These are the PL/SQL static SQL statements, which have the same syntax as the corresponding SQL statements, except as noted:

• SELECT (this statement is also called a query)

For the PL/SQL syntax, see "SELECT INTO Statement".

- Data manipulation language (DML) statements:
  - INSERT

For the PL/SQL syntax, see "INSERT Statement Extension".

– UPDATE

For the PL/SQL syntax, see "UPDATE Statement Extensions".

- DELETE

For the PL/SQL syntax, see "DELETE Statement Extension".

MERGE (for syntax, see Oracle Database SQL Language Reference)

### Note:

Oracle Database SQL Language Reference defines DML differently.

- Transaction control language (TCL) statements:
  - COMMIT (for syntax, see Oracle Database SQL Language Reference)
  - ROLLBACK (for syntax, see Oracle Database SQL Language Reference)
  - SAVEPOINT (for syntax, see Oracle Database SQL Language Reference)
  - SET TRANSACTION (for syntax, see Oracle Database SQL Language Reference)
- LOCK TABLE (for syntax, see Oracle Database SQL Language Reference)

A PL/SQL static SQL statement can have a PL/SQL identifier wherever its SQL counterpart can have a placeholder for a bind variable. The PL/SQL identifier must identify either a variable or a formal parameter.

To use PL/SQL identifiers for table names, column names, and so on, use the EXECUTE IMMEDIATE statement, explained in "Native Dynamic SQL"

### Note:

After PL/SQL code runs a DML statement, the values of some variables are undefined. For example:

- After a FETCH or SELECT statement raises an exception, the values of the define variables after that statement are undefined.
- After a DML statement that affects zero rows, the values of the OUT bind variables are undefined, unless the DML statement is a BULK or multiple-row operation.

#### Example 7-1 Static SQL Statements

In this example, a PL/SQL anonymous block declares three PL/SQL variables and uses them in the static SQL statements INSERT, UPDATE, DELETE. The block also uses the static SQL statement COMMIT.

```
DROP TABLE employees_temp;
CREATE TABLE employees_temp AS
SELECT employee_id, first_name, last_name
FROM employees;
DECLARE
emp_id employees_temp.employee_id%TYPE := 299;
emp_first_name employees_temp.first_name%TYPE := 'Bob';
emp_last_name employees_temp.last_name%TYPE := 'Henry';
BEGIN
INSERT INTO employees_temp (employee_id, first_name, last_name)
VALUES (emp_id, emp_first_name, emp_last_name);
```

```
UPDATE employees_temp
SET first_name = 'Robert'
WHERE employee_id = emp_id;
DELETE FROM employees_temp
WHERE employee_id = emp_id
RETURNING first_name, last_name
INTO emp_first_name, last_name;
COMMIT;
DBMS_OUTPUT.PUT_LINE (emp_first_name || ' ' || emp_last_name);
END;
/
```

### Result:

Robert Henry

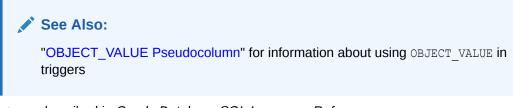

# Pseudocolumns

A pseudocolumn behaves like a table column, but it is not stored in the table.

For general information about pseudocolumns, including restrictions, see *Oracle Database SQL Language Reference*.

Static SQL includes these SQL pseudocolumns:

- CURRVAL and NEXTVAL, described in "CURRVAL and NEXTVAL in PL/SQL".
- LEVEL, described in Oracle Database SQL Language Reference
- OBJECT\_VALUE, described in Oracle Database SQL Language Reference

ROWID, described in Oracle Database SQL Language Reference

See Also: "Simulating CURRENT OF Clause with ROWID Pseudocolumn"

• ROWNUM, described in Oracle Database SQL Language Reference

# CURRVAL and NEXTVAL in PL/SQL

After a sequence is created, you can access its values in SQL statements with the CURRVAL pseudocolumn, which returns the current value of the sequence, or the NEXTVAL pseudocolumn, which increments the sequence and returns the new value.

To reference these pseudocolumns, use dot notation—for example, *sequence\_name.CURRVAL*.

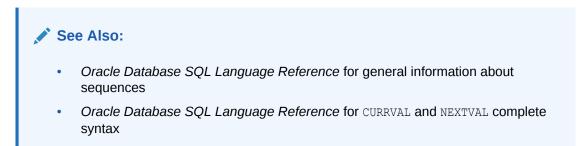

### Note:

Each time you reference *sequence\_name.NEXTVAL*, the sequence is incremented immediately and permanently, whether you commit or roll back the transaction.

You can use *sequence\_name*.CURRVAL and *sequence\_name*.NEXTVAL in a PL/SQL expression wherever you can use a NUMBER expression. However:

- Using sequence\_name.CURRVAL or sequence\_name.NEXTVAL to provide a default value for an ADT method parameter causes a compilation error.
- PL/SQL evaluates every occurrence of sequence\_name.CURRVAL and sequence\_name.NEXTVAL (unlike SQL, which evaluates a sequence expression for every row in which it appears).

### Example 7-2 CURRVAL and NEXTVAL Pseudocolumns

This example generates a sequence number for the sequence HR.EMPLOYEES\_SEQ and refers to that number in multiple statements.

```
DROP TABLE employees temp;
CREATE TABLE employees temp AS
 SELECT employee id, first name, last name
 FROM employees;
DROP TABLE employees temp2;
CREATE TABLE employees temp2 AS
  SELECT employee_id, first_name, last_name
 FROM employees;
DECLARE
  seq value NUMBER;
BEGIN
  -- Generate initial sequence number
  seq value := employees seq.NEXTVAL;
  -- Print initial sequence number:
  DBMS OUTPUT.PUT LINE (
    'Initial sequence value: ' || TO CHAR(seq value)
  );
  -- Use NEXTVAL to create unique number when inserting data:
     INSERT INTO employees temp (employee id, first name, last name)
     VALUES (employees seq.NEXTVAL, 'Lynette', 'Smith');
```

```
-- Use CURRVAL to store same value somewhere else:
  INSERT INTO employees temp2 VALUES (employees seq.CURRVAL,
                                       'Morgan', 'Smith');
/* Because NEXTVAL values might be referenced
  by different users and applications,
  and some NEXTVAL values might not be stored in database,
  there might be gaps in sequence. */
-- Use CURRVAL to specify record to delete:
  seq value := employees_seq.CURRVAL;
  DELETE FROM employees temp2
  WHERE employee_id = seq_value;
-- Update employee id with NEXTVAL for specified record:
  UPDATE employees temp
  SET employee id = employees seq.NEXTVAL
  WHERE first name = 'Lynette'
  AND last name = 'Smith';
-- Display final value of CURRVAL:
  seq value := employees seq.CURRVAL;
  DBMS OUTPUT.PUT LINE (
```

```
'Ending sequence value: ' || TO_CHAR(seq_value)
);
END;
/
```

# **Cursors Overview**

A **cursor** is a pointer to a private SQL area that stores information about processing a specific SELECT or DML statement.

### Note:

The cursors that this topic explains are session cursors. A **session cursor** lives in session memory until the session ends, when it ceases to exist.

A cursor that is constructed and managed by PL/SQL is an **implicit cursor**. A cursor that you construct and manage is an **explicit cursor**.

You can get information about any session cursor from its attributes (which you can reference in procedural statements, but not in SQL statements).

To list the session cursors that each user session currently has opened and parsed, query the dynamic performance view V\$OPEN CURSOR.

The number of cursors that a session can have open simultaneously is determined by:

The amount of memory available to the session

• The value of the initialization parameter OPEN CURSORS

### Note:

Generally, PL/SQL parses an explicit cursor only the first time the session opens it and parses a SQL statement (creating an implicit cursor) only the first time the statement runs.

All parsed SQL statements are cached. A SQL statement is reparsed only if it is aged out of the cache by a new SQL statement. Although you must close an explicit cursor before you can reopen it, PL/SQL need not reparse the associated query. If you close and immediately reopen an explicit cursor, PL/SQL does not reparse the associated query.

### Topics

- Implicit Cursors
- Explicit Cursors

### See Also:

- Oracle Database Reference for information about the dynamic performance view V\$OPEN\_CURSOR
- Oracle Database Reference for information about the initialization parameter
   OPEN\_CURSORS

# **Implicit Cursors**

An **implicit cursor** is a session cursor that is constructed and managed by PL/SQL. PL/SQL opens an implicit cursor every time you run a SELECT or DML statement. You cannot control an implicit cursor, but you can get information from its attributes.

The syntax of an implicit cursor attribute value is SQLattribute (therefore, an implicit cursor is also called a SQL cursor). SQLattribute always refers to the most recently run SELECT or DML statement. If no such statement has run, the value of SQLattribute is NULL.

An implicit cursor closes after its associated statement runs; however, its attribute values remain available until another SELECT or DML statement runs.

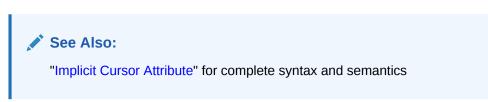

The most recently run SELECT or DML statement might be in a different scope. To save an attribute value for later use, assign it to a local variable immediately. Otherwise, other operations, such as subprogram invocations, might change the value of the attribute before you can test it.

The implicit cursor attributes are:

- SQL%ISOPEN Attribute: Is the Cursor Open?
- SQL%FOUND Attribute: Were Any Rows Affected?
- SQL%NOTFOUND Attribute: Were No Rows Affected?

- SQL%ROWCOUNT Attribute: How Many Rows Were Affected?
- SQL%BULK ROWCOUNT (see "Getting Number of Rows Affected by FORALL Statement"
- SQL%BULK\_EXCEPTIONS (see "Handling FORALL Exceptions After FORALL Statement Completes"

# SQL%ISOPEN Attribute: Is the Cursor Open?

SQL%ISOPEN always returns FALSE, because an implicit cursor always closes after its associated statement runs.

# SQL%FOUND Attribute: Were Any Rows Affected?

SQL%FOUND returns:

- NULL if no SELECT or DML statement has run
- TRUE if a SELECT statement returned one or more rows or a DML statement affected one or more rows
- FALSE otherwise

Example 7-3 uses SQL%FOUND to determine if a DELETE statement affected any rows.

### Example 7-3 SQL%FOUND Implicit Cursor Attribute

```
DROP TABLE dept temp;
CREATE TABLE dept temp AS
  SELECT * FROM departments;
CREATE OR REPLACE PROCEDURE p (
  dept no NUMBER
) AUTHID CURRENT USER AS
BEGIN
 DELETE FROM dept temp
 WHERE department id = dept no;
 IF SQL%FOUND THEN
    DBMS OUTPUT.PUT LINE (
      'Delete succeeded for department number ' || dept no
   );
 ELSE
   DBMS OUTPUT.PUT LINE ('No department number ' || dept no);
 END IF;
END;
/
BEGIN
 p(270);
 p(400);
END;
```

Result:

```
Delete succeeded for department number 270 No department number 400
```

# SQL%NOTFOUND Attribute: Were No Rows Affected?

SQL%NOTFOUND (the logical opposite of SQL%FOUND) returns:

- NULL if no SELECT or DML statement has run
- FALSE if a SELECT statement returned one or more rows or a DML statement affected one or more rows
- TRUE otherwise

The SQL%NOTFOUND attribute is not useful with the PL/SQL SELECT INTO statement, because:

- If the SELECT INTO statement returns no rows, PL/SQL raises the predefined exception NO DATA FOUND immediately, before you can check SQL%NOTFOUND.
- A SELECT INTO statement that invokes a SQL aggregate function always returns a value (possibly NULL). After such a statement, the SQL%NOTFOUND attribute is always FALSE, so checking it is unnecessary.

### SQL%ROWCOUNT Attribute: How Many Rows Were Affected?

SQL%ROWCOUNT returns:

- NULL if no SELECT or DML statement has run
- Otherwise, the number of rows returned by a SELECT statement or affected by a DML statement (an INTEGER)

### Note:

If a server is Oracle Database 12c or later and its client is Oracle Database 11g release 2 or earlier (or the reverse), then the maximum number that SQL&ROWCOUNT returns is 4,294,967,295.

Example 7-4 uses SQL%ROWCOUNT to determine the number of rows that were deleted.

If a SELECT INTO statement without a BULK COLLECT clause returns multiple rows, PL/SQL raises the predefined exception TOO\_MANY\_ROWS and SQL%ROWCOUNT returns 1, not the actual number of rows that satisfy the query.

The value of SQL%ROWCOUNT attribute is unrelated to the state of a transaction. Therefore:

- When a transaction rolls back to a savepoint, the value of SQL%ROWCOUNT is not restored to the value it had before the savepoint.
- When an autonomous transaction ends, SQL%ROWCOUNT is not restored to the original value in the parent transaction.

### Example 7-4 SQL%ROWCOUNT Implicit Cursor Attribute

```
DROP TABLE employees_temp;
CREATE TABLE employees_temp AS
SELECT * FROM employees;
```

```
DECLARE
  mgr_no NUMBER(6) := 122;
BEGIN
  DELETE FROM employees_temp WHERE manager_id = mgr_no;
  DBMS_OUTPUT.PUT_LINE
    ('Number of employees deleted: ' || TO_CHAR(SQL&ROWCOUNT));
END;
/
```

### Result:

Number of employees deleted: 8

# **Explicit Cursors**

An **explicit cursor** is a session cursor that you construct and manage. You must declare and define an explicit cursor, giving it a name and associating it with a query (typically, the query returns multiple rows). Then you can process the query result set in either of these ways:

- Open the explicit cursor (with the OPEN statement), fetch rows from the result set (with the FETCH statement), and close the explicit cursor (with the CLOSE statement).
- Use the explicit cursor in a cursor FOR LOOP statement (see "Processing Query Result Sets With Cursor FOR LOOP Statements".

You cannot assign a value to an explicit cursor, use it in an expression, or use it as a formal subprogram parameter or host variable. You *can* do those things with a cursor variable (see "Cursor Variables").

Unlike an implicit cursor, you can reference an explicit cursor or cursor variable by its name. Therefore, an explicit cursor or cursor variable is called a **named cursor**.

### Topics

- Declaring and Defining Explicit Cursors
- Opening and Closing Explicit Cursors
- Fetching Data with Explicit Cursors
- Variables in Explicit Cursor Queries
- When Explicit Cursor Queries Need Column Aliases
- Explicit Cursors that Accept Parameters
- Explicit Cursor Attributes

### Declaring and Defining Explicit Cursors

You can either declare an explicit cursor first and then define it later in the same block, subprogram, or package, or declare and define it at the same time.

An explicit cursor declaration, which only declares a cursor, has this syntax:

CURSOR cursor\_name [ parameter\_list ] RETURN return\_type;

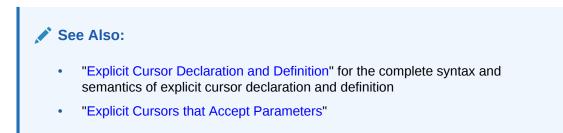

#### An explicit cursor definition has this syntax:

```
CURSOR cursor_name [ parameter_list ] [ RETURN return_type ]
IS select statement;
```

If you declared the cursor earlier, then the explicit cursor definition defines it; otherwise, it both declares and defines it.

Example 7-5 declares and defines three explicit cursors.

Example 7-5 Explicit Cursor Declaration and Definition

```
DECLARE
 CURSOR c1 RETURN departments%ROWTYPE;
                                          -- Declare cl
 CURSOR c2 IS
                                          -- Declare and define c2
   SELECT employee id, job id, salary FROM employees
   WHERE salary > 2000;
 CURSOR c1 RETURN departments%ROWTYPE IS -- Define c1,
   SELECT * FROM departments
                                          -- repeating return type
   WHERE department id = 110;
 CURSOR c3 RETURN locations%ROWTYPE;
                                          -- Declare c3
 CURSOR c3 IS
                                          -- Define c3,
   SELECT * FROM locations
                                          -- omitting return type
   WHERE country_id = 'JP';
BEGIN
 NULL;
END;
```

**Opening and Closing Explicit Cursors** 

After declaring and defining an explicit cursor, you can open it with the OPEN statement, which does the following:

- 1. Allocates database resources to process the query
- 2. Processes the query; that is:
  - a. Identifies the result set

If the query references variables or cursor parameters, their values affect the result set. For details, see "Variables in Explicit Cursor Queries" and "Explicit Cursors that Accept Parameters".

b. If the query has a FOR UPDATE clause, locks the rows of the result set

For details, see "SELECT FOR UPDATE and FOR UPDATE Cursors".

3. Positions the cursor before the first row of the result set

You close an open explicit cursor with the CLOSE statement, thereby allowing its resources to be reused. After closing a cursor, you cannot fetch records from its result set or reference its attributes. If you try, PL/SQL raises the predefined exception INVALID CURSOR.

You can reopen a closed cursor. You must close an explicit cursor before you try to reopen it. Otherwise, PL/SQL raises the predefined exception CURSOR ALREADY OPEN.

See Also:

- "OPEN Statement" for its syntax and semantics
- "CLOSE Statement" for its syntax and semantics

### Fetching Data with Explicit Cursors

After opening an explicit cursor, you can fetch the rows of the query result set with the FETCH statement. The basic syntax of a FETCH statement that returns one row is:

FETCH cursor name INTO into clause

The *into\_clause* is either a list of variables or a single record variable. For each column that the query returns, the variable list or record must have a corresponding type-compatible variable or field. The %TYPE and %ROWTYPE attributes are useful for declaring variables and records for use in FETCH statements.

The FETCH statement retrieves the current row of the result set, stores the column values of that row into the variables or record, and advances the cursor to the next row.

Typically, you use the FETCH statement inside a LOOP statement, which you exit when the FETCH statement runs out of rows. To detect this exit condition, use the cursor attribute %NOTFOUND (described in "%NOTFOUND Attribute: Has No Row Been Fetched?"). PL/SQL does not raise an exception when a FETCH statement returns no rows.

Example 7-6 fetches the result sets of two explicit cursors one row at a time, using FETCH and %NOTFOUND inside LOOP statements. The first FETCH statement retrieves column values into variables. The second FETCH statement retrieves column values into a record. The variables and record are declared with %TYPE and %ROWTYPE, respectively.

Example 7-7 fetches the first five rows of a result set into five records, using five FETCH statements, each of which fetches into a different record variable. The record variables are declared with <code>%ROWTYPE</code>.

### 🖍 See Also:

- "FETCH Statement" for its complete syntax and semantics
- "FETCH Statement with BULK COLLECT Clause" for information about FETCH statements that return more than one row at a time

Example 7-6 FETCH Statements Inside LOOP Statements

```
DECLARE
CURSOR c1 IS
SELECT last_name, job_id FROM employees
WHERE REGEXP_LIKE (job_id, 'S[HT]_CLERK')
ORDER BY last_name;
```

```
v lastname employees.last name%TYPE; -- variable for last name
 v_jobid employees.job_id%TYPE; -- variable for job_id
  CURSOR c2 IS
   SELECT * FROM employees
   WHERE REGEXP LIKE (job id, '[ACADFIMKSA] M[ANGR]')
   ORDER BY job id;
 v employees employees & ROWTYPE; -- record variable for row of table
BEGIN
 OPEN c1;
 LOOP -- Fetches 2 columns into variables
   FETCH c1 INTO v lastname, v jobid;
   EXIT WHEN c1%NOTFOUND;
   DBMS OUTPUT.PUT LINE ( RPAD (v lastname, 25, ' ') || v jobid );
 END LOOP;
 CLOSE c1;
 DBMS OUTPUT.PUT LINE( '-----');
 OPEN c2;
 LOOP -- Fetches entire row into the v_employees record
   FETCH c2 INTO v employees;
   EXIT WHEN c2%NOTFOUND;
   DBMS OUTPUT.PUT_LINE( RPAD(v_employees.last_name, 25, ' ') ||
                            v employees.job id );
 END LOOP;
 CLOSE c2;
END;
/

Sales Manager (SA MAN)
Stock Manager (ST MAN)
Administration Vice President (AD VP)
Stock Manager (ST MAN)
```

```
PL/SQL procedure successfully completed.
```

### Variables in Explicit Cursor Queries

An explicit cursor query can reference any variable in its scope. When you open an explicit cursor, PL/SQL evaluates any variables in the guery and uses those values when identifying the result set. Changing the values of the variables later does not change the result set.

In Example 7-8, the explicit cursor query references the variable factor. When the cursor opens, factor has the value 2. Therefore, sal multiple is always 2 times sal, despite that factor is incremented after every fetch.

To change the result set, you must close the cursor, change the value of the variable, and then open the cursor again, as in Example 7-9.

### Example 7-8 Variable in Explicit Cursor Query—No Result Set Change

```
DECLARE
 sal
               employees.salary%TYPE;
 sal multiple employees.salary%TYPE;
               INTEGER := 2;
 factor
 CURSOR c1 IS
   SELECT salary, salary*factor FROM employees
   WHERE job id LIKE 'AD %';
BEGIN
 OPEN c1; -- PL/SQL evaluates factor
 LOOP
   FETCH c1 INTO sal, sal_multiple;
   EXIT WHEN c1%NOTFOUND;
   DBMS OUTPUT.PUT LINE('factor = ' || factor);
   DBMS OUTPUT.PUT LINE ('sal = ' || sal);
   DBMS OUTPUT.PUT LINE ('sal multiple = ' || sal multiple);
   factor := factor + 1; -- Does not affect sal_multiple
```

END LOOP; CLOSE c1; END;

# Result:

/

```
factor = 2
          = 4400
sal
sal multiple = 8800
factor = 3
sal
           = 24000
sal multiple = 48000
factor = 4
sal
           = 17000
sal multiple = 34000
factor = 5
         = 17000
sal
sal multiple = 34000
```

### Example 7-9 Variable in Explicit Cursor Query—Result Set Change

```
DECLARE
 sal
              employees.salary%TYPE;
 sal_multiple employees.salary%TYPE;
 factor
              INTEGER := 2;
 CURSOR c1 IS
   SELECT salary, salary*factor FROM employees
   WHERE job id LIKE 'AD %';
BEGIN
 DBMS OUTPUT.PUT LINE ('factor = ' || factor);
 OPEN c1; -- PL/SQL evaluates factor
 LOOP
   FETCH c1 INTO sal, sal multiple;
   EXIT WHEN c1%NOTFOUND;
   DBMS OUTPUT.PUT LINE('sal = ' || sal);
   DBMS OUTPUT.PUT LINE ('sal multiple = ' || sal multiple);
 END LOOP;
 CLOSE c1;
 factor := factor + 1;
 DBMS OUTPUT.PUT LINE('factor = ' || factor);
 OPEN c1; -- PL/SQL evaluates factor
 LOOP
   FETCH c1 INTO sal, sal_multiple;
   EXIT WHEN c1%NOTFOUND;
                                = ' || sal);
   DBMS OUTPUT.PUT LINE('sal
   DBMS OUTPUT.PUT LINE ('sal multiple = ' || sal multiple);
 END LOOP;
 CLOSE c1;
END;
/
```

### Result:

factor = 2 sal = 4400 sal\_multiple = 8800 sal = 24000

```
sal_multiple = 48000
sal = 17000
sal_multiple = 34000
sal_multiple = 34000
factor = 3
sal = 4400
sal_multiple = 13200
sal_multiple = 72000
sal_multiple = 72000
sal_multiple = 51000
sal_multiple = 51000
sal_multiple = 51000
```

# When Explicit Cursor Queries Need Column Aliases

When an explicit cursor query includes a virtual column (an expression), that column must have an alias if either of the following is true:

- You use the cursor to fetch into a record that was declared with %ROWTYPE.
- You want to reference the virtual column in your program.

In Example 7-10, the virtual column in the explicit cursor needs an alias for both of the preceding reasons.

See Also: Example 7-21

Example 7-10 Explicit Cursor with Virtual Column that Needs Alias

```
DECLARE
 CURSOR c1 IS
   SELECT employee id,
          (salary * .05) raise
   FROM employees
   WHERE job id LIKE '% MAN'
   ORDER BY employee id;
 emp rec c1%ROWTYPE;
BEGIN
 OPEN cl;
 LOOP
   FETCH c1 INTO emp rec;
   EXIT WHEN c1%NOTFOUND;
   DBMS OUTPUT.PUT LINE (
      'Raise for employee #' || emp_rec.employee_id ||
      ' is $' || emp_rec.raise
   );
 END LOOP;
 CLOSE cl;
END:
/
```

### Result:

Raise for employee #114 is \$550 Raise for employee #120 is \$400

```
Raise for employee #121 is $410
Raise for employee #122 is $395
Raise for employee #123 is $325
Raise for employee #124 is $368.445
Raise for employee #145 is $700
Raise for employee #146 is $675
Raise for employee #147 is $600
Raise for employee #148 is $550
Raise for employee #149 is $525
Raise for employee #201 is $650
```

### Explicit Cursors that Accept Parameters

You can create an explicit cursor that has formal parameters, and then pass different actual parameters to the cursor each time you open it. In the cursor query, you can use a formal cursor parameter anywhere that you can use a constant. Outside the cursor query, you cannot reference formal cursor parameters.

### 🔵 Tip:

To avoid confusion, use different names for formal and actual cursor parameters.

Example 7-11 creates an explicit cursor whose two formal parameters represent a job and its maximum salary. When opened with a specified job and maximum salary, the cursor query selects the employees with that job who are overpaid (for each such employee, the query selects the first and last name and amount overpaid). Next, the example creates a procedure that prints the cursor query result set (for information about procedures, see PL/SQL Subprograms). Finally, the example opens the cursor with one set of actual parameters, prints the result set, closes the cursor, opens the cursor with different actual parameters, prints the result set, and closes the cursor.

### Topics

- Formal Cursor Parameters with Default Values
- Adding Formal Cursor Parameters with Default Values

### 🖍 See Also:

- "Explicit Cursor Declaration and Definition" for more information about formal cursor parameters
- "OPEN Statement" for more information about actual cursor parameters

Example 7-11 Explicit Cursor that Accepts Parameters

```
DECLARE
CURSOR c (job VARCHAR2, max_sal NUMBER) IS
SELECT last_name, first_name, (salary - max_sal) overpayment
FROM employees
WHERE job_id = job
AND salary > max_sal
ORDER BY salary;
```

```
PROCEDURE print overpaid IS
  last_name_ employees.last_name%TYPE;
   first name employees.first_name%TYPE;
   overpayment
                employees.salary%TYPE;
 BEGIN
   LOOP
    FETCH c INTO last name , first name , overpayment ;
    EXIT WHEN c%NOTFOUND;
    DBMS_OUTPUT.PUT_LINE(last_name_ || ', ' || first_name_ ||
      ' (by ' || overpayment_ || ')');
   END LOOP;
 END print overpaid;
BEGIN
 DBMS OUTPUT.PUT LINE ('-----');
 DBMS OUTPUT.PUT LINE ('Overpaid Stock Clerks:');
 DBMS OUTPUT.PUT LINE('-----');
 OPEN c('ST_CLERK', 5000);
 print overpaid;
 CLOSE c;
 DBMS OUTPUT.PUT LINE ('-----');
 DBMS OUTPUT.PUT LINE ('Overpaid Sales Representatives:');
 DBMS OUTPUT.PUT LINE('-----');
 OPEN c('SA_REP', 10000);
 print overpaid;
 CLOSE c;
END;
/
Result:
_____
Overpaid Stock Clerks:
------
_____
Overpaid Sales Representatives:
------
```

Vishney, Clara (by 500) Abel, Ellen (by 1000) Ozer, Lisa (by 1500)

PL/SQL procedure successfully completed.

### Formal Cursor Parameters with Default Values

When you create an explicit cursor with formal parameters, you can specify default values for them. When a formal parameter has a default value, its corresponding actual parameter is optional. If you open the cursor without specifying the actual parameter, then the formal parameter has its default value.

Example 7-12 creates an explicit cursor whose formal parameter represents a location ID. The default value of the parameter is the location ID of company headquarters.

### Example 7-12 Cursor Parameters with Default Values

```
DECLARE

CURSOR c (location NUMBER DEFAULT 1700) IS

SELECT d.department_name,

e.last_name manager,

l.city

FROM departments d, employees e, locations 1
```

```
WHERE 1.location id = location
     AND l.location id = d.location id
     AND d.department_id = e.department_id
   ORDER BY d.department id;
 PROCEDURE print depts IS
   dept name departments.department name%TYPE;
   mgr_name employees.last_name%TYPE;
   city name locations.city%TYPE;
 BEGIN
   LOOP
     FETCH c INTO dept_name, mgr_name, city_name;
     EXIT WHEN c%NOTFOUND;
     DBMS OUTPUT.PUT LINE(dept name || ' (Manager: ' || mgr name || ')');
   END LOOP;
 END print depts;
BEGIN
 DBMS OUTPUT.PUT LINE ('DEPARTMENTS AT HEADQUARTERS:');
 DBMS OUTPUT.PUT LINE('-----');
 OPEN c;
 print depts;
 DBMS OUTPUT.PUT LINE('-----');
 CLOSE c;
 DBMS OUTPUT.PUT LINE ('DEPARTMENTS IN CANADA:');
 DBMS_OUTPUT.PUT_LINE('-----');
 OPEN c(1800); -- Toronto
 print depts;
 CLOSE c;
 OPEN c(1900); -- Whitehorse
 print depts;
 CLOSE c;
END;
/
```

### Result is similar to:

```
DEPARTMENTS AT HEADOUARTERS:
_____
Administration (Manager: Whalen)
Purchasing (Manager: Himuro)
Purchasing (Manager: Tobias)
Purchasing (Manager: Baida)
Purchasing (Manager: Li)
Purchasing (Manager: Colmenares)
Purchasing (Manager: Khoo)

Executive (Manager: Garcia)
Executive (Manager: King)
Finance (Manager: Urman)
Finance (Manager: Sciarra)
Finance (Manager: Chen)
Finance (Manager: Faviet)
Finance (Manager: Gruenberg)
Finance (Manager: Popp)
Accounting (Manager: Higgins)
Accounting (Manager: Gietz)
_____
DEPARTMENTS IN CANADA:
 ------
```

```
Marketing (Manager: Davis)
Marketing (Manager: Martinez)
```

PL/SQL procedure successfully completed.

### Adding Formal Cursor Parameters with Default Values

If you add formal parameters to a cursor, and you specify default values for the added parameters, then you need not change existing references to the cursor. Compare Example 7-13 to Example 7-11.

### Example 7-13 Adding Formal Parameter to Existing Cursor

```
DECLARE
 CURSOR c (job VARCHAR2, max sal NUMBER,
          hired DATE DEFAULT TO_DATE('31-DEC-1999', 'DD-MON-YYYY')) IS
   SELECT last name, first name, (salary - max sal) overpayment
   FROM employees
   WHERE job id = job
   AND salary > max sal
   AND hire_date > hired
   ORDER BY salary;
 PROCEDURE print overpaid IS
   last_name_ employees.last_name%TYPE;
   first name employees.first name%TYPE;
   overpayment_
                 employees.salary%TYPE;
 BEGIN
   LOOP
     FETCH c INTO last_name_, first_name_, overpayment_;
     EXIT WHEN c%NOTFOUND;
     DBMS_OUTPUT.PUT_LINE(last_name_ || ', ' || first_name_ ||
       ' (by ' || overpayment || ')');
   END LOOP;
 END print overpaid;
BEGIN
 DBMS OUTPUT.PUT LINE ('-----');
 DBMS OUTPUT.PUT LINE ('Overpaid Sales Representatives:');
 DBMS OUTPUT.PUT LINE('-----');
 OPEN c('SA REP', 10000); -- existing reference
 print overpaid;
 CLOSE c;
 DBMS OUTPUT.PUT LINE('-----');
 DBMS OUTPUT.PUT LINE('Overpaid Sales Representatives Hired After 2014:');
 DBMS OUTPUT.PUT LINE('-----');
 OPEN c('SA REP', 10000, TO_DATE('31-DEC-2014', 'DD-MON-YYYY'));
                       -- new reference
 print overpaid;
 CLOSE c;
END;
Result:
-----
Overpaid Sales Representatives:
```

Vishney, Clara (by 500) Abel, Ellen (by 1000)

Ozer, Lisa (by 1500)

PL/SQL procedure successfully completed.

### Explicit Cursor Attributes

The syntax for the value of an explicit cursor attribute is *cursor\_name* immediately followed by *attribute* (for example, c1%ISOPEN).

### Note:

Explicit cursors and cursor variables (named cursors) have the same attributes. This topic applies to all named cursors except where noted.

The explicit cursor attributes are:

- %ISOPEN Attribute: Is the Cursor Open?
- %FOUND Attribute: Has a Row Been Fetched?
- %NOTFOUND Attribute: Has No Row Been Fetched?
- %ROWCOUNT Attribute: How Many Rows Were Fetched?

If an explicit cursor is not open, referencing any attribute except %ISOPEN raises the predefined exception INVALID CURSOR.

### See Also:

"Named Cursor Attribute" for complete syntax and semantics of named cursor (explicit cursor and cursor variable) attributes

### %ISOPEN Attribute: Is the Cursor Open?

**%ISOPEN** returns TRUE if its explicit cursor is open; FALSE otherwise.

%ISOPEN is useful for:

Checking that an explicit cursor is not already open before you try to open it.

If you try to open an explicit cursor that is already open, PL/SQL raises the predefined exception CURSOR\_ALREADY\_OPEN. You must close an explicit cursor before you can reopen it.

### Note:

The preceding paragraph does not apply to cursor variables.

Checking that an explicit cursor is open before you try to close it.

Example 7-14 opens the explicit cursor c1 only if it is not open and closes it only if it is open.

### Example 7-14 %ISOPEN Explicit Cursor Attribute

```
DECLARE
CURSOR c1 IS
SELECT last_name, salary FROM employees
WHERE ROWNUM < 11;
the_name employees.last_name%TYPE;
the_salary employees.salary%TYPE;
BEGIN
IF NOT c1%ISOPEN THEN
OPEN c1;
END IF;
FETCH c1 INTO the_name, the_salary;
IF c1%ISOPEN THEN
CLOSE c1;
END IF;
END;
/
```

%FOUND Attribute: Has a Row Been Fetched?

%FOUND returns:

- NULL after the explicit cursor is opened but before the first fetch
- TRUE if the most recent fetch from the explicit cursor returned a row
- FALSE otherwise

 ${\tt \ensuremath{\$FOUND}}$  is useful for determining whether there is a fetched row to process.

Example 7-15 loops through a result set, printing each fetched row and exiting when there are no more rows to fetch.

### Example 7-15 %FOUND Explicit Cursor Attribute

```
DECLARE
 CURSOR c1 IS
    SELECT last name, salary FROM employees
   WHERE ROWNUM < 11
   ORDER BY last name;
 my_ename employees.last_name%TYPE;
 my salary employees.salary%TYPE;
BEGIN
 OPEN cl;
 LOOP
   FETCH c1 INTO my ename, my salary;
   IF c1%FOUND THEN -- fetch succeeded
     DBMS_OUTPUT.PUT_LINE('Name = ' || my_ename || ', salary = ' || my_salary);
   ELSE -- fetch failed
     EXIT;
   END IF;
 END LOOP;
END;
/
```

### Result:

```
Name = Faviet, salary = 9000
Name = Garcia, salary = 17000
Name = Gruenberg, salary = 12008
Name = Jackson, salary = 4800
Name = James, salary = 9000
Name = King, salary = 24000
Name = Miller, salary = 6000
Name = Nguyen, salary = 4200
Name = Williams, salary = 4800
Name = Yang, salary = 17000
```

### %NOTFOUND Attribute: Has No Row Been Fetched?

**%NOTFOUND** (the logical opposite of **%FOUND**) returns:

- NULL after the explicit cursor is opened but before the first fetch
- FALSE if the most recent fetch from the explicit cursor returned a row
- TRUE otherwise

**%NOTFOUND** is useful for exiting a loop when FETCH fails to return a row, as in Example 7-16.

### Example 7-16 %NOTFOUND Explicit Cursor Attribute

```
DECLARE
  CURSOR c1 IS
    SELECT last name, salary FROM employees
   WHERE ROWNUM < 11
   ORDER BY last name;
  my ename employees.last name%TYPE;
  my salary employees.salary%TYPE;
BEGIN
  OPEN cl;
  T'OOD
    FETCH c1 INTO my ename, my salary;
    IF c1%NOTFOUND THEN -- fetch failed
      EXIT;
    ELSE -- fetch succeeded
      DBMS OUTPUT.PUT LINE
        ('Name = ' || my ename || ', salary = ' || my salary);
    END IF;
  END LOOP;
END;
/
```

### Result:

```
Name = Faviet, salary = 9000
Name = Garcia, salary = 17000
Name = Gruenberg, salary = 12008
Name = Jackson, salary = 4800
Name = James, salary = 9000
Name = King, salary = 24000
Name = Miller, salary = 6000
```

```
Name = Nguyen, salary = 4200
Name = Williams, salary = 4800
Name = Yang, salary = 17000
```

%ROWCOUNT Attribute: How Many Rows Were Fetched?

%ROWCOUNT returns:

- · Zero after the explicit cursor is opened but before the first fetch
- Otherwise, the number of rows fetched (an INTEGER)

### Note:

If a server is Oracle Database 12c or later and its client is Oracle Database 11g2 or earlier (or the reverse), then the maximum number that SQL&ROWCOUNT returns is 4,294,967,295.

Example 7-17 numbers and prints the rows that it fetches and prints a message after fetching the fifth row.

### Example 7-17 %ROWCOUNT Explicit Cursor Attribute

```
DECLARE
  CURSOR c1 IS
    SELECT last name FROM employees
    WHERE ROWNUM < 11
    ORDER BY last name;
  name employees.last_name%TYPE;
BEGIN
  OPEN cl;
  LOOP
   FETCH c1 INTO name;
   EXIT WHEN c1%NOTFOUND OR c1%NOTFOUND IS NULL;
    DBMS OUTPUT.PUT LINE(c1%ROWCOUNT || '. ' || name);
    IF c1%ROWCOUNT = 5 THEN
       DBMS OUTPUT.PUT LINE('--- Fetched 5th row ---');
   END IF;
  END LOOP;
  CLOSE c1;
END;
/
```

### Result:

- 1. Abel
- 2. Ande
- 3. Atkinson
- 4. Baida

- --- Fetched 5th row ---
- 6. Bates
- 7. Bell

- Bernstein
   Bissot
- 10. Bloom

# Processing Query Result Sets

In PL/SQL, as in traditional database programming, you use cursors to process query result sets. However, in PL/SQL, you can use either implicit or explicit cursors.

The former need less code, but the latter are more flexible. For example, explicit cursors can accept parameters.

The following PL/SQL statements use implicit cursors that PL/SQL defines and manages for you:

- SELECT INTO
- Implicit cursor FOR LOOP

The following PL/SQL statements use explicit cursors:

• Explicit cursor FOR LOOP

You define the explicit cursor, but PL/SQL manages it while the statement runs.

• OPEN, FETCH, and CLOSE

You define and manage the explicit cursor.

### Note:

If a query returns no rows, PL/SQL raises the exception NO DATA FOUND.

### Topics

- Processing Query Result Sets With SELECT INTO Statements
- Processing Query Result Sets With Cursor FOR LOOP Statements
- Processing Query Result Sets With Explicit Cursors, OPEN, FETCH, and CLOSE

# Processing Query Result Sets With SELECT INTO Statements

Using an implicit cursor, the SELECT INTO statement retrieves values from one or more database tables (as the SQL SELECT statement does) and stores them in variables (which the SQL SELECT statement does not do).

### Topics

- Handling Single-Row Result Sets
- Handling Large Multiple-Row Result Sets

### 💉 See Also:

"SELECT INTO Statement" for its complete syntax and semantics

## Handling Single-Row Result Sets

If you expect the query to return only one row, then use the SELECT INTO statement to store values from that row in either one or more scalar variables, or one record variable.

If the query might return multiple rows, but you care about only the *n*th row, then restrict the result set to that row with the clause WHERE ROWNUM=n.

### See Also:

- "Assigning Values to Variables with the SELECT INTO Statement"
- "Using SELECT INTO to Assign a Row to a Record Variable"
- Oracle Database SQL Language Reference for more information about the ROWNUM pseudocolumn

### Handling Large Multiple-Row Result Sets

If you must assign a large quantity of table data to variables, Oracle recommends using the SELECT INTO statement with the BULK COLLECT clause.

This statement retrieves an entire result set into one or more collection variables.

For more information, see "SELECT INTO Statement with BULK COLLECT Clause".

# Processing Query Result Sets With Cursor FOR LOOP Statements

The cursor FOR LOOP statement lets you run a SELECT statement and then immediately loop through the rows of the result set.

This statement can use either an implicit or explicit cursor (but not a cursor variable).

If you use the SELECT statement only in the cursor FOR LOOP statement, then specify the SELECT statement inside the cursor FOR LOOP statement. This form of the cursor FOR LOOP statement

uses an implicit cursor, and is called an **implicit cursor FOR LOOP statement**. Because the implicit cursor is internal to the statement, you cannot reference it with the name SQL.

If you use the SELECT statement multiple times in the same PL/SQL unit, then define an explicit cursor for it and specify that cursor in the cursor FOR LOOP statement. This form of the cursor FOR LOOP statement is called an **explicit cursor FOR LOOP statement**. You can use the same explicit cursor elsewhere in the same PL/SQL unit.

The cursor FOR LOOP statement implicitly declares its loop index as a <code>%ROWTYPE</code> record variable of the type that its cursor returns. This record is local to the loop and exists only during loop execution. Statements inside the loop can reference the record and its fields. They can reference virtual columns only by aliases.

After declaring the loop index record variable, the FOR LOOP statement opens the specified cursor. With each iteration of the loop, the FOR LOOP statement fetches a row from the result set and stores it in the record. When there are no more rows to fetch, the cursor FOR LOOP statement closes the cursor. The cursor also closes if a statement inside the loop transfers control outside the loop or if PL/SQL raises an exception.

### See Also:

"Cursor FOR LOOP Statement" for its complete syntax and semantics

### Note:

When an exception is raised inside a cursor FOR LOOP statement, the cursor closes before the exception handler runs. Therefore, the values of explicit cursor attributes are not available in the handler.

### Example 7-18 Implicit Cursor FOR LOOP Statement

In this example, an implicit cursor FOR LOOP statement prints the last name and job ID of every clerk whose manager has an ID greater than 120.

```
BEGIN
FOR item IN (
   SELECT last_name, job_id
   FROM employees
   WHERE job_id LIKE '%CLERK%'
   AND manager_id > 120
    ORDER BY last_name
)
LOOP
   DBMS_OUTPUT.PUT_LINE
    ('Name = ' || item.last_name || ', Job = ' || item.job_id);
END LOOP;
END;
//
```

#### Result:

Name = Atkinson, Job = ST\_CLERK Name = Bell, Job = SH\_CLERK Name = Bissot, Job = ST CLERK

Name = Walsh, Job = SH CLERK

### Example 7-19 Explicit Cursor FOR LOOP Statement

This example is like Example 7-18, except that it uses an explicit cursor FOR LOOP statement.

```
DECLARE
CURSOR c1 IS
SELECT last_name, job_id FROM employees
WHERE job_id LIKE '%CLERK%' AND manager_id > 120
ORDER BY last_name;
BEGIN
FOR item IN c1
LOOP
DBMS_OUTPUT.PUT_LINE
('Name = ' || item.last_name || ', Job = ' || item.job_id);
END LOOP;
END;
/
```

#### Result:

Name = Atkinson, Job = ST\_CLERK Name = Bell, Job = SH\_CLERK Name = Bissot, Job = ST\_CLERK ... Name = Walsh, Job = SH\_CLERK

### Example 7-20 Passing Parameters to Explicit Cursor FOR LOOP Statement

This example declares and defines an explicit cursor that accepts two parameters, and then uses it in an explicit cursor FOR LOOP statement to display the wages paid to employees who earn more than a specified wage in a specified department.

```
DECLARE
 CURSOR c1 (job VARCHAR2, max wage NUMBER) IS
    SELECT * FROM employees
   WHERE job id = job
   AND salary > max_wage;
BEGIN
 FOR person IN cl('ST CLERK', 3000)
 LOOP
    -- process data record
    DBMS OUTPUT.PUT LINE (
      'Name = ' || person.last_name || ', salary = ' ||
      person.salary || ', Job Id = ' || person.job id
   );
 END LOOP;
END;
/
```

### Result:

```
Name = Nayer, salary = 3200, Job Id = ST_CLERK
Name = Bissot, salary = 3300, Job Id = ST_CLERK
Name = Mallin, salary = 3300, Job Id = ST_CLERK
Name = Ladwig, salary = 3600, Job Id = ST_CLERK
Name = Stiles, salary = 3200, Job Id = ST_CLERK
Name = Rajs, salary = 3500, Job Id = ST_CLERK
Name = Davies, salary = 3100, Job Id = ST_CLERK
```

### Example 7-21 Cursor FOR Loop References Virtual Columns

In this example, the implicit cursor  $\ensuremath{\texttt{FOR LOOP}}$  references virtual columns by their aliases,

```
full name and dream salary.
```

```
BEGIN
FOR item IN (
SELECT first_name || ' ' || last_name AS full_name,
salary * 10
FROM employees
WHERE ROWNUM <= 5
ORDER BY dream_salary DESC, last_name ASC
) LOOP
DBMS_OUTPUT.PUT_LINE
(item.full_name || ' dreams of making ' || item.dream_salary);
END LOOP;
END;
//</pre>
```

### Result:

Stephen King dreams of making 240000 Lex Garcia dreams of making 170000 Neena Yang dreams of making 170000 Alexander James dreams of making 90000 Bruce Miller dreams of making 60000

# Processing Query Result Sets With Explicit Cursors, OPEN, FETCH, and CLOSE

For full control over query result set processing, declare explicit cursors and manage them with the statements OPEN, FETCH, and CLOSE.

This result set processing technique is more complicated than the others, but it is also more flexible. For example, you can:

- Process multiple result sets in parallel, using multiple cursors.
- Process multiple rows in a single loop iteration, skip rows, or split the processing into multiple loops.
- Specify the query in one PL/SQL unit but retrieve the rows in another.

For instructions and examples, see "Explicit Cursors".

# Processing Query Result Sets with Subqueries

If you process a query result set by looping through it and running another query for each row, then you can improve performance by removing the second query from inside the loop and making it a subquery of the first query.

While an ordinary subquery is evaluated for each table, a **correlated subquery** is evaluated for each row.

For more information about subqueries, see Oracle Database SQL Language Reference.

### Example 7-22 Subquery in FROM Clause of Parent Query

This example defines explicit cursor c1 with a query whose FROM clause contains a subquery.

```
DECLARE
 CURSOR c1 IS
   SELECT t1.department_id, department_name, staff
    FROM departments t1,
         ( SELECT department_id, COUNT(*) AS staff
           FROM employees
           GROUP BY department id
         ) t2
    WHERE (t1.department id = t2.department id) AND staff >= 5
    ORDER BY staff;
BEGIN
  FOR dept IN c1
  LOOP
     DBMS OUTPUT.PUT LINE ('Department = '
      || dept.department name || ', staff = ' || dept.staff);
  END LOOP;
END;
/
```

### Result:

```
Department = IT, staff = 5
Department = Finance, staff = 6
Department = Purchasing, staff = 6
Department = Sales, staff = 34
Department = Shipping, staff = 45
```

### Example 7-23 Correlated Subquery

This example returns the name and salary of each employee whose salary exceeds the departmental average. For each row in the table, the correlated subquery computes the average salary for the corresponding department.

```
DECLARE
 CURSOR c1 IS
   SELECT department id, last name, salary
   FROM employees t
   WHERE salary > ( SELECT AVG(salary)
                     FROM employees
                     WHERE t.department id = department id
                   )
   ORDER BY department_id, last_name;
BEGIN
 FOR person IN c1
 LOOP
   DBMS OUTPUT.PUT LINE ('Making above-average salary = ' || person.last name);
 END LOOP;
END;
/
```

#### Result:

```
Making above-average salary = Martinez
Making above-average salary = Li
Making above-average salary = Bell
...
Making above-average salary = Higgins
```

# **Cursor Variables**

A cursor variable is like an explicit cursor, except that:

It is not limited to one query.

You can open a cursor variable for a query, process the result set, and then use the cursor variable for another query.

- You can assign a value to it.
- You can use it in an expression.
- It can be a subprogram parameter.

You can use cursor variables to pass query result sets between subprograms.

• It can be a host variable.

You can use cursor variables to pass query result sets between PL/SQL stored subprograms and their clients.

It cannot accept parameters.

You cannot pass parameters to a cursor variable, but you can pass whole queries to it. The queries can include variables.

A cursor variable has this flexibility because it is a pointer; that is, its value is the address of an item, not the item itself.

Before you can reference a cursor variable, you must make it point to a SQL work area, either by opening it or by assigning it the value of an open PL/SQL cursor variable or open host cursor variable.

### Note:

Cursor variables and explicit cursors are not interchangeable—you cannot use one where the other is expected.

# Creating Cursor Variables

To create a cursor variable, either declare a variable of the predefined type SYS\_REFCURSOR or define a REF CURSOR type and then declare a variable of that type.

### Note:

Informally, a cursor variable is sometimes called a REF CURSOR).

The basic syntax of a REF CURSOR type definition is:

```
TYPE type_name IS REF CURSOR [ RETURN return_type ]
```

For the complete syntax and semantics, see "Cursor Variable Declaration".

If you specify *return\_type*, then the REF CURSOR type and cursor variables of that type are **strong**; if not, they are **weak**. SYS REFCURSOR and cursor variables of that type are weak.

With a strong cursor variable, you can associate only queries that return the specified type. With a weak cursor variable, you can associate any query.

Weak cursor variables are more error-prone than strong ones, but they are also more flexible. Weak REF CURSOR types are interchangeable with each other and with the predefined type SYS\_REFCURSOR. You can assign the value of a weak cursor variable to any other weak cursor variable.

You can assign the value of a strong cursor variable to another strong cursor variable only if both cursor variables have the same type (not merely the same return type).

### Note:

You can partition weak cursor variable arguments to table functions only with the PARTITION BY ANY clause, not with PARTITION BY RANGE or PARTITION BY HASH.

For syntax and semantics, see "PARALLEL\_ENABLE Clause".

### Example 7-24 Cursor Variable Declarations

This example defines strong and weak REF CURSOR types, variables of those types, and a variable of the predefined type SYS REFCURSOR.

```
DECLARE
TYPE empcurtyp IS REF CURSOR RETURN employees%ROWTYPE; -- strong type
TYPE genericcurtyp IS REF CURSOR; -- weak type
cursor1 empcurtyp; -- strong cursor variable
cursor2 genericcurtyp; -- weak cursor variable
my_cursor SYS_REFCURSOR; -- weak cursor variable
TYPE deptcurtyp IS REF CURSOR RETURN departments%ROWTYPE; -- strong type
dept_cv deptcurtyp; -- strong cursor variable
BEGIN
NULL;
END;
/
```

### Example 7-25 Cursor Variable with User-Defined Return Type

In this example, *EmpRecTyp* is a user-defined RECORD type.

```
DECLARE
TYPE EmpRecTyp IS RECORD (
    employee_id NUMBER,
    last_name VARCHAR2(25),
    salary NUMBER(8,2));

TYPE EmpCurTyp IS REF CURSOR RETURN EmpRecTyp;
emp_cv EmpCurTyp;
BEGIN
NULL;
END;
/
```

# **Opening and Closing Cursor Variables**

After declaring a cursor variable, you can open it with the OPEN FOR statement, which does the following:

1. Associates the cursor variable with a query (typically, the query returns multiple rows)

The query can include placeholders for bind variables, whose values you specify in the USING clause of the OPEN FOR statement.

- 2. Allocates database resources to process the query
- 3. Processes the query; that is:
  - a. Identifies the result set

If the query references variables, their values affect the result set. For details, see "Variables in Cursor Variable Queries".

b. If the query has a FOR UPDATE clause, locks the rows of the result set

For details, see "SELECT FOR UPDATE and FOR UPDATE Cursors".

4. Positions the cursor before the first row of the result set

You need not close a cursor variable before reopening it (that is, using it in another OPEN FOR statement). After you reopen a cursor variable, the query previously associated with it is lost.

When you no longer need a cursor variable, close it with the CLOSE statement, thereby allowing its resources to be reused. After closing a cursor variable, you cannot fetch records from its result set or reference its attributes. If you try, PL/SQL raises the predefined exception INVALID\_CURSOR.

You can reopen a closed cursor variable.

See Also:
"OPEN FOR Statement" for its syntax and semantics
"CLOSE Statement" for its syntax and semantics

# Fetching Data with Cursor Variables

After opening a cursor variable, you can fetch the rows of the query result set with the FETCH statement.

The return type of the cursor variable must be compatible with the *into\_clause* of the FETCH statement. If the cursor variable is strong, PL/SQL catches incompatibility at compile time. If the cursor variable is weak, PL/SQL catches incompatibility at run time, raising the predefined exception ROWTYPE MISMATCH before the first fetch.

### See Also:

- "Fetching Data with Explicit Cursors"
- "FETCH Statement" for its complete syntax and semantics
- "FETCH Statement with BULK COLLECT Clause" for information about FETCH statements that return more than one row at a time

### Example 7-26 Fetching Data with Cursor Variables

This example uses one cursor variable to do what Example 7-6 does with two explicit cursors. The first OPEN FOR statement includes the query itself. The second OPEN FOR statement references a variable whose value is a query.

```
DECLARE

cv SYS_REFCURSOR; -- cursor variable

v_lastname employees.last_name%TYPE; -- variable for last_name

v_jobid employees.job_id%TYPE; -- variable for job_id

query_2 VARCHAR2(200) :=

   'SELECT * FROM employees

   WHERE REGEXP_LIKE (job_id, ''[ACADFIMKSA]_M[ANGR]'')

   ORDER BY job_id';

v_employees employees%ROWTYPE; -- record variable row of table

BEGIN

OPEN cv FOR

   SELECT last_name, job_id FROM employees

   WHERE REGEXP_LIKE (job_id, 'S[HT]_CLERK')

   ORDER BY last name;
```

```
LOOP -- Fetches 2 columns into variables
   FETCH cv INTO v lastname, v jobid;
   EXIT WHEN cv%NOTFOUND;
   DBMS_OUTPUT.PUT_LINE( RPAD(v_lastname, 25, ' ') || v_jobid );
 END LOOP;
 DBMS OUTPUT.PUT LINE( '-----');
 OPEN cv FOR query_2;
 LOOP -- Fetches entire row into the v employees record
   FETCH cv INTO v_employees;
   EXIT WHEN cv%NOTFOUND;
   DBMS_OUTPUT.PUT_LINE( RPAD(v_employees.last_name, 25, ' ') ||
                             v employees.job id );
 END LOOP;
 CLOSE cv;
END;
/
Result:
```

Atkinson	ST_CLERK
Bell	SH_CLERK
Bissot	ST_CLERK
 Walsh	SH_CLERK
Higgins	AC MGR
Gruenberg	FI_MGR
Martinez	MK_MAN

### Example 7-27 Fetching from Cursor Variable into Collections

This example fetches from a cursor variable into two collections (nested tables), using the BULK COLLECT clause of the FETCH statement.

```
DECLARE

TYPE empcurtyp IS REF CURSOR;

TYPE namelist IS TABLE OF employees.last_name%TYPE;

TYPE sallist IS TABLE OF employees.salary%TYPE;

emp_cv empcurtyp;

names namelist;

sals sallist;

BEGIN

OPEN emp_cv FOR

SELECT last_name, salary FROM employees

WHERE job_id = 'SA_REP'

ORDER BY salary DESC;

FETCH emp_cv BULK COLLECT INTO names, sals;

CLOSE emp_cv;

-- loop through the names and sals collections
```

```
FOR i IN names.FIRST .. names.LAST
LOOP
DBMS_OUTPUT.PUT_LINE
('Name = ' || names(i) || ', salary = ' || sals(i));
END LOOP;
END;
/
Result:
Name = Ozer, salary = 11500
Name = Abel, salary = 11500
Name = Vishney, salary = 10500
....
```

#### Name = Kumar, salary = 6100

# Assigning Values to Cursor Variables

You can assign to a PL/SQL cursor variable the value of another PL/SQL cursor variable or host cursor variable.

### The syntax is:

target\_cursor\_variable := source\_cursor\_variable;

If *source\_cursor\_variable* is open, then after the assignment, *target\_cursor\_variable* is also open. The two cursor variables point to the same SQL work area.

If *source\_cursor\_variable* is not open, opening *target\_cursor\_variable* after the assignment does not open *source cursor variable*.

# Variables in Cursor Variable Queries

The query associated with a cursor variable can reference any variable in its scope.

When you open a cursor variable with the OPEN FOR statement, PL/SQL evaluates any variables in the query and uses those values when identifying the result set. Changing the values of the variables later does not change the result set.

To change the result set, you must change the value of the variable and then open the cursor variable again for the same query, as in Example 7-29.

### Example 7-28 Variable in Cursor Variable Query—No Result Set Change

This example opens a cursor variable for a query that references the variable factor, which has the value 2. Therefore, sal\_multiple is always 2 times sal, despite that factor is incremented after every fetch.

```
DECLARE

sal employees.salary%TYPE;

sal_multiple employees.salary%TYPE;

factor INTEGER := 2;

cv SYS_REFCURSOR;

BEGIN

OPEN cv FOR

SELECT salary, salary*factor

FROM employees

WHERE job_id LIKE 'AD_%'; -- PL/SQL evaluates factor
```

```
LOOP
FETCH cv INTO sal, sal_multiple;
EXIT WHEN cv%NOTFOUND;
DBMS_OUTPUT.PUT_LINE('factor = ' || factor);
DBMS_OUTPUT.PUT_LINE('sal = ' || sal);
DBMS_OUTPUT.PUT_LINE('sal_multiple = ' || sal_multiple);
factor := factor + 1; -- Does not affect sal_multiple
END LOOP;
CLOSE cv;
```

END; /

### Result:

```
factor = 2
sal = 4400
sal_multiple = 8800
factor = 3
sal = 24000
sal_multiple = 48000
factor = 4
sal = 17000
sal_multiple = 34000
factor = 5
sal = 17000
sal_multiple = 34000
```

### Example 7-29 Variable in Cursor Variable Query—Result Set Change

#### DECLARE

```
salemployees.salary%TYPE;sal_multipleemployees.salary%TYPE;factorINTEGER := 2;
```

cv SYS REFCURSOR;

#### BEGIN

```
DBMS OUTPUT.PUT LINE('factor = ' || factor);
```

### OPEN CV FOR

```
SELECT salary, salary*factor
FROM employees
WHERE job_id LIKE 'AD_%'; -- PL/SQL evaluates factor
```

### LOOP

```
FETCH cv INTO sal, sal_multiple;
EXIT WHEN cv%NOTFOUND;
DBMS_OUTPUT.PUT_LINE('sal = ' || sal);
DBMS_OUTPUT.PUT_LINE('sal_multiple = ' || sal_multiple);
END LOOP;
```

### factor := factor + 1;

DBMS OUTPUT.PUT LINE('factor = ' || factor);

```
OPEN cv FOR
SELECT salary, salary*factor
FROM employees
WHERE job_id LIKE 'AD_%'; -- PL/SQL evaluates factor
```

LOOP FETCH cv INTO sal, sal multiple;

```
EXIT WHEN cv%NOTFOUND;
DBMS_OUTPUT.PUT_LINE('sal = ' || sal);
DBMS_OUTPUT.PUT_LINE('sal_multiple = ' || sal_multiple);
END LOOP;
CLOSE cv;
END;
/
```

### Result:

```
factor = 2
sal
          = 4400
sal multiple = 8800
sal = 24000
sal multiple = 48000
sal = 17000
sal multiple = 34000
sal = 17000
sal multiple = 34000
factor = 3
sal
          = 4400
sal_multiple = 13200
sal = 24000
sal_multiple = 72000
sal = 17000
sal_multiple = 51000
sal = 17000
sal multiple = 51000
```

# Querying a Collection

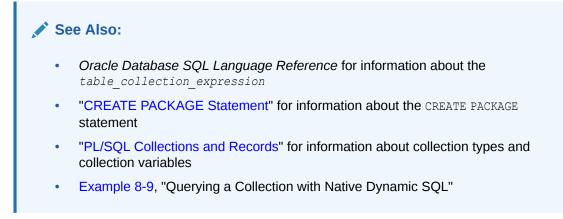

You can query a collection if all of the following are true:

- The data type of the collection was either created at schema level or declared in a package specification.
- The data type of the collection element is either a scalar data type, a user-defined type, or a record type.

In the query FROM clause, the collection appears in *table\_collection\_expression* as the argument of the TABLE operator.

### Note:

In SQL contexts, you cannot use a function whose return type was declared in a package specification.

### Example 7-30 Querying a Collection with Static SQL

In this example, the cursor variable is associated with a query on an associative array of records. The nested table type, mytab, is declared in a package specification.

```
CREATE OR REPLACE PACKAGE pkg AUTHID DEFINER AS
 TYPE rec IS RECORD(f1 NUMBER, f2 VARCHAR2(30));
 TYPE mytab IS TABLE OF rec INDEX BY pls integer;
END;
DECLARE
 v1 pkg.mytab; -- collection of records
 v2 pkg.rec;
 c1 SYS REFCURSOR;
BEGIN
 v1(1).f1 := 1;
 v1(1).f2 := 'one';
 OPEN c1 FOR SELECT * FROM TABLE (v1) ;
 FETCH c1 INTO v2;
 CLOSE cl;
 DBMS OUTPUT.PUT LINE('Values in record are ' || v2.f1 || ' and ' || v2.f2);
END;
/
```

#### Result:

Values in record are 1 and one

## Cursor Variable Attributes

A cursor variable has the same attributes as an explicit cursor (see Explicit Cursor Attributes.). The syntax for the value of a cursor variable attribute is *cursor\_variable\_name* immediately followed by *attribute* (for example, cv%ISOPEN). If a cursor variable is not open, referencing any attribute except %ISOPEN raises the predefined exception INVALID CURSOR.

## Cursor Variables as Subprogram Parameters

You can use a cursor variable as a subprogram parameter, which makes it useful for passing query results between subprograms.

For example:

- You can open a cursor variable in one subprogram and process it in a different subprogram.
- In a multilanguage application, a PL/SQL subprogram can use a cursor variable to return a
  result set to a subprogram written in a different language.

## Note:

The invoking and invoked subprograms must be in the same database instance. You cannot pass or return cursor variables to subprograms invoked through database links.

## Caution:

Because cursor variables are pointers, using them as subprogram parameters increases the likelihood of subprogram parameter aliasing, which can have unintended results. For more information, see "Subprogram Parameter Aliasing with Cursor Variable Parameters".

When declaring a cursor variable as the formal parameter of a subprogram:

- If the subprogram opens or assigns a value to the cursor variable, then the parameter mode must be IN OUT.
- If the subprogram only fetches from, or closes, the cursor variable, then the parameter mode can be either IN or IN OUT.

Corresponding formal and actual cursor variable parameters must have compatible return types. Otherwise, PL/SQL raises the predefined exception ROWTYPE MISMATCH.

To pass a cursor variable parameter between subprograms in different PL/SQL units, define the REF CURSOR type of the parameter in a package. When the type is in a package, multiple subprograms can use it. One subprogram can declare a formal parameter of that type, and other subprograms can declare variables of that type and pass them to the first subprogram.

### See Also:

- •
- "Subprogram Parameters" for more information about subprogram parameters
- "CURSOR Expressions" for information about CURSOR expressions, which can be actual parameters for formal cursor variable parameters
- PL/SQL Packages, for more information about packages

## Example 7-31 Procedure to Open Cursor Variable for One Query

This example defines, in a package, a REF CURSOR type and a procedure that opens a cursor variable parameter of that type.

### Example 7-32 Opening Cursor Variable for Chosen Query (Same Return Type)

In this example ,the stored procedure opens its cursor variable parameter for a chosen query. The queries have the same return type.

```
CREATE OR REPLACE PACKAGE emp data AUTHID DEFINER AS
 TYPE empcurtyp IS REF CURSOR RETURN employees%ROWTYPE;
  PROCEDURE open_emp_cv (emp_cv IN OUT empcurtyp, choice INT);
END emp_data;
CREATE OR REPLACE PACKAGE BODY emp data AS
 PROCEDURE open emp cv (emp cv IN OUT empcurtyp, choice INT) IS
 BEGIN
   IF choice = 1 THEN
     OPEN emp cv FOR SELECT *
     FROM employees
     WHERE commission_pct IS NOT NULL;
    ELSIF choice = 2 THEN
     OPEN emp cv FOR SELECT *
     FROM employees
     WHERE salary > 2500;
   ELSIF choice = 3 THEN
     OPEN emp cv FOR SELECT *
     FROM employees
     WHERE department id = 100;
   END IF;
 END;
END emp data;
```

#### Example 7-33 Opening Cursor Variable for Chosen Query (Different Return Types)

In this example, the stored procedure opens its cursor variable parameter for a chosen query. The queries have the different return types.

```
CREATE OR REPLACE PACKAGE admin_data AUTHID DEFINER AS
TYPE gencurtyp IS REF CURSOR;
PROCEDURE open_cv (generic_cv IN OUT gencurtyp, choice INT);
END admin_data;
/
CREATE OR REPLACE PACKAGE BODY admin_data AS
PROCEDURE open_cv (generic_cv IN OUT gencurtyp, choice INT) IS
BEGIN
IF choice = 1 THEN
OPEN generic_cv FOR SELECT * FROM employees;
ELSIF choice = 2 THEN
OPEN generic_cv FOR SELECT * FROM departments;
ELSIF choice = 3 THEN
OPEN generic_cv FOR SELECT * FROM jobs;
END IF;
```

END; END admin\_data;

## Cursor Variables as Host Variables

You can use a cursor variable as a host variable, which makes it useful for passing query results between PL/SQL stored subprograms and their clients.

When a cursor variable is a host variable, PL/SQL and the client (the host environment) share a pointer to the SQL work area that stores the result set.

To use a cursor variable as a host variable, declare the cursor variable in the host environment and then pass it as an input host variable (bind variable) to PL/SQL. Host cursor variables are compatible with any query return type (like weak PL/SQL cursor variables).

A SQL work area remains accessible while any cursor variable points to it, even if you pass the value of a cursor variable from one scope to another. For example, in Example 7-34, the Pro\*C program passes a host cursor variable to an embedded PL/SQL anonymous block. After the block runs, the cursor variable still points to the SQL work area.

If you have a PL/SQL engine on the client side, calls from client to server impose no restrictions. For example, you can declare a cursor variable on the client side, open and fetch from it on the server side, and continue to fetch from it on the client side. You can also reduce network traffic with a PL/SQL anonymous block that opens or closes several host cursor variables in a single round trip. For example:

```
/* PL/SQL anonymous block in host environment */
BEGIN
    OPEN :emp_cv FOR SELECT * FROM employees;
    OPEN :dept_cv FOR SELECT * FROM departments;
    OPEN :loc_cv FOR SELECT * FROM locations;
END;
/
```

Because the cursor variables still point to the SQL work areas after the PL/SQL anonymous block runs, the client program can use them. When the client program no longer needs the cursors, it can use a PL/SQL anonymous block to close them. For example:

```
/* PL/SQL anonymous block in host environment */
BEGIN
CLOSE :emp_cv;
CLOSE :dept_cv;
CLOSE :loc_cv;
END;
/
```

This technique is useful for populating a multiblock form, as in Oracle Forms. For example, you can open several SQL work areas in a single round trip, like this:

```
/* PL/SQL anonymous block in host environment */
BEGIN
OPEN :c1 FOR SELECT 1 FROM DUAL;
OPEN :c2 FOR SELECT 1 FROM DUAL;
OPEN :c3 FOR SELECT 1 FROM DUAL;
END;
/
```

# Note: If you bind a host cursor variable into PL/SQL from an Oracle Call Interface (OCI) client, then you cannot fetch from it on the server side unless you also open it there on the same server call.

### Example 7-34 Cursor Variable as Host Variable in Pro\*C Client Program

In this example, a Pro\*C client program declares a cursor variable and a selector and passes them as host variables to a PL/SQL anonymous block, which opens the cursor variable for the selected query.

```
EXEC SQL BEGIN DECLARE SECTION;
  SQL CURSOR generic cv; -- Declare host cursor variable.
 int choice; -- Declare selector.
EXEC SQL END DECLARE SECTION;
EXEC SQL ALLOCATE :generic cv; -- Initialize host cursor variable.
-- Pass host cursor variable and selector to PL/SQL block.
/
EXEC SQL EXECUTE
BEGIN
 IF :choice = 1 THEN
   OPEN :generic cv FOR SELECT * FROM employees;
 ELSIF :choice = 2 THEN
   OPEN :generic cv FOR SELECT * FROM departments;
 ELSIF : choice = 3 THEN
   OPEN :generic_cv FOR SELECT * FROM jobs;
 END IF;
END:
END-EXEC;
```

## **CURSOR Expressions**

A CURSOR expression returns a nested cursor.

It has this syntax:

CURSOR ( subquery )

You can use a CURSOR expression in a SELECT statement that is not a subquery (as in Example 7-35) or pass it to a function that accepts a cursor variable parameter (see "Passing CURSOR Expressions to Pipelined Table Functions"). You cannot use a cursor expression with an implicit cursor.

## See Also:

Oracle Database SQL Language Reference for more information about CURSOR expressions, including restrictions

#### Example 7-35 CURSOR Expression

This example declares and defines an explicit cursor for a query that includes a cursor expression. For each department in the departments table, the nested cursor returns the last name of each employee in that department (which it retrieves from the employees table).

```
DECLARE
 TYPE emp cur typ IS REF CURSOR;
  emp_cur emp_cur_typ;
  dept name departments.department name%TYPE;
  emp name employees.last name%TYPE;
  CURSOR c1 IS
    SELECT department name,
     CURSOR ( SELECT e.last name
                FROM employees e
                WHERE e.department_id = d.department_id
                ORDER BY e.last name
              ) employees
    FROM departments d
    WHERE department name LIKE 'A%'
    ORDER BY department name;
BEGIN
 OPEN cl:
 LOOP -- Process each row of query result set
    FETCH c1 INTO dept name, emp cur;
    EXIT WHEN c1%NOTFOUND;
    DBMS OUTPUT.PUT LINE('Department: ' || dept name);
    LOOP -- Process each row of subquery result set
     FETCH emp cur INTO emp name;
     EXIT WHEN emp cur%NOTFOUND;
     DBMS OUTPUT.PUT_LINE('-- Employee: ' || emp_name);
    END LOOP;
 END LOOP;
 CLOSE cl;
END;
/
```

### Result:

```
Department: Accounting

-- Employee: Gietz

-- Employee: Higgins

Department: Administration

-- Employee: Whalen
```

## **Transaction Processing and Control**

**Transaction processing** is an Oracle Database feature that lets multiple users work on the database concurrently, and ensures that each user sees a consistent version of data and that all changes are applied in the right order.

A **transaction** is a sequence of one or more SQL statements that Oracle Database treats as a unit: either all of the statements are performed, or none of them are.

Different users can write to the same data structures without harming each other's data or coordinating with each other, because Oracle Database locks data structures automatically. To maximize data availability, Oracle Database locks the minimum amount of data for the minimum amount of time.

You rarely must write extra code to prevent problems with multiple users accessing data concurrently. However, if you do need this level of control, you can manually override the Oracle Database default locking mechanisms.

### Topics

- COMMIT Statement
- ROLLBACK Statement
- SAVEPOINT Statement
- Implicit Rollbacks
- SET TRANSACTION Statement
- Overriding Default Locking

## See Also:

- Oracle Database Concepts for more information about transactions
- Oracle Database Concepts for more information about transaction processing
- Oracle Database Concepts for more information about the Oracle Database locking mechanism
- Oracle Database Concepts for more information about manual data locks

## **COMMIT Statement**

The COMMIT statement ends the current transaction, making its changes permanent and visible to other users.

## Note:

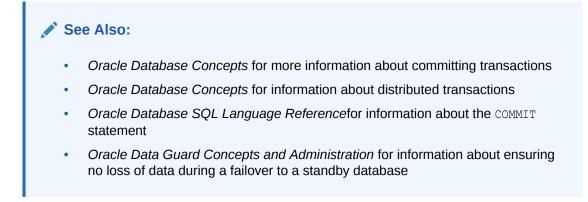

A transaction can span multiple blocks, and a block can contain multiple transactions.

The WRITE clause of the COMMIT statement specifies the priority with which Oracle Database writes to the redo log the information that the commit operation generates.

## Note:

The default PL/SQL commit behavior for nondistributed transactions is BATCH NOWAIT if the COMMIT\_LOGGING and COMMIT\_WAIT database initialization parameters have not been set.

## Example 7-36 COMMIT Statement with COMMENT and WRITE Clauses

In this example, a transaction transfers money from one bank account to another. It is important that the money both leaves one account and enters the other, hence the COMMIT WRITE IMMEDIATE NOWAIT statement.

```
DROP TABLE accounts;
CREATE TABLE accounts (
  account id NUMBER(6),
 balance NUMBER (10,2)
);
INSERT INTO accounts (account_id, balance)
VALUES (7715, 6350.00);
INSERT INTO accounts (account_id, balance)
VALUES (7720, 5100.50);
CREATE OR REPLACE PROCEDURE transfer (
  from acct NUMBER,
 to_acct NUMBER,
amount NUMBER
) AUTHID CURRENT USER AS
BEGIN
  UPDATE accounts
  SET balance = balance - amount
  WHERE account_id = from_acct;
  UPDATE accounts
  SET balance = balance + amount
  WHERE account id = to acct;
  COMMIT WRITE IMMEDIATE NOWAIT;
END;
/
```

#### Query before transfer:

SELECT \* FROM accounts;

### Result:

ACCOUNT\_ID BALANCE 7715 6350 7720 5100.5

BEGIN

```
transfer(7715, 7720, 250);
END;
/
```

### Query after transfer:

SELECT \* FROM accounts;

#### Result:

ACCOUNT\_ID BALANCE 7715 6100 7720 5350.5

## **ROLLBACK Statement**

The ROLLBACK statement ends the current transaction and undoes any changes made during that transaction.

If you make a mistake, such as deleting the wrong row from a table, a rollback restores the original data. If you cannot finish a transaction because a SQL statement fails or PL/SQL raises an exception, a rollback lets you take corrective action and perhaps start over.

## See Also:

Oracle Database SQL Language Reference for more information about the ROLLBACK statement

### Example 7-37 ROLLBACK Statement

This example inserts information about an employee into three different tables. If an INSERT statement tries to store a duplicate employee number, PL/SQL raises the predefined exception DUP\_VAL\_ON\_INDEX. To ensure that changes to all three tables are undone, the exception handler runs a ROLLBACK.

```
DROP TABLE emp_name;
CREATE TABLE emp_name AS
SELECT employee_id, last_name
FROM employees;
CREATE UNIQUE INDEX empname_ix
ON emp_name (employee_id);
DROP TABLE emp_sal;
CREATE TABLE emp_sal AS
SELECT employee_id, salary
FROM employees;
CREATE UNIQUE INDEX empsal_ix
ON emp_sal (employee_id);
DROP TABLE emp_job;
CREATE TABLE emp_job AS
SELECT employee_id, job_id
```

ORACLE

```
FROM employees;
CREATE UNIQUE INDEX empjobid ix
ON emp job (employee id);
DECLARE
 emp id NUMBER(6);
 emp_lastname VARCHAR2(25);
 emp_salary NUMBER(8,2);
emp_jobid VARCHAR2(10);
BEGIN
 SELECT employee_id, last_name, salary, job_id
 INTO emp id, emp lastname, emp salary, emp jobid
 FROM employees
 WHERE employee id = 120;
 INSERT INTO emp name (employee id, last name)
 VALUES (emp id, emp lastname);
  INSERT INTO emp sal (employee id, salary)
 VALUES (emp id, emp salary);
  INSERT INTO emp job (employee id, job id)
 VALUES (emp id, emp jobid);
EXCEPTION
 WHEN DUP VAL ON INDEX THEN
   ROLLBACK;
    DBMS OUTPUT.PUT LINE('Inserts were rolled back');
END;
```

## SAVEPOINT Statement

The SAVEPOINT statement names and marks the current point in the processing of a transaction.

Savepoints let you roll back part of a transaction instead of the whole transaction. The number of active savepoints for each session is unlimited.

When you roll back to a savepoint, any savepoints marked after that savepoint are erased. The savepoint to which you roll back is not erased. A simple rollback or commit erases all savepoints.

If you mark a savepoint in a recursive subprogram, new instances of the SAVEPOINT statement run at each level in the recursive descent, but you can only roll back to the most recently marked savepoint.

Savepoint names are undeclared identifiers. Reusing a savepoint name in a transaction moves the savepoint from its old position to the current point in the transaction, which means that a rollback to the savepoint affects only the current part of the transaction.

## See Also:

Oracle Database SQL Language Reference for more information about the SET TRANSACTION SQL statement

### Example 7-38 SAVEPOINT and ROLLBACK Statements

This example marks a savepoint before doing an insert. If the INSERT statement tries to store a duplicate value in the employee\_id column, PL/SQL raises the predefined exception DUP\_VAL\_ON\_INDEX and the transaction rolls back to the savepoint, undoing only the INSERT statement.

```
DROP TABLE emp name;
CREATE TABLE emp name AS
 SELECT employee id, last name, salary
 FROM employees;
CREATE UNIQUE INDEX empname ix
ON emp name (employee id);
DECLARE
 emp id
           employees.employee id%TYPE;
 emp_lastname employees.last_name%TYPE;
 emp salary employees.salary%TYPE;
BEGIN
  SELECT employee_id, last_name, salary
 INTO emp_id, emp_lastname, emp_salary
 FROM employees
 WHERE employee id = 120;
 UPDATE emp name
 SET salary = salary * 1.1
 WHERE employee id = emp id;
 DELETE FROM emp name
 WHERE employee id = 130;
 SAVEPOINT do insert;
 INSERT INTO emp name (employee id, last name, salary)
 VALUES (emp id, emp lastname, emp salary);
EXCEPTION
 WHEN DUP VAL ON INDEX THEN
   ROLLBACK TO do insert;
 DBMS OUTPUT.PUT LINE('Insert was rolled back');
END;
```

#### Example 7-39 Reusing SAVEPOINT with ROLLBACK

```
DROP TABLE emp_name;
CREATE TABLE emp_name AS
SELECT employee_id, last_name, salary
FROM employees;
CREATE UNIQUE INDEX empname_ix
ON emp_name (employee_id);
DECLARE
emp_id employees.employee_id%TYPE;
emp_lastname employees.last_name%TYPE;
emp_salary employees.salary%TYPE;
BEGIN
SELECT employee id, last name, salary
```

```
INTO emp id, emp_lastname, emp_salary
 FROM employees
 WHERE employee_id = 120;
 SAVEPOINT my_savepoint;
 UPDATE emp name
 SET salary = salary * 1.1
 WHERE employee id = emp id;
 DELETE FROM emp name
 WHERE employee id = 130;
 SAVEPOINT my_savepoint;
 INSERT INTO emp name (employee id, last name, salary)
 VALUES (emp id, emp lastname, emp salary);
EXCEPTION
 WHEN DUP VAL ON INDEX THEN
   ROLLBACK TO my savepoint;
   DBMS OUTPUT.PUT LINE ('Transaction rolled back.');
END;
```

## Implicit Rollbacks

Before running an INSERT, UPDATE, DELETE, or MERGE statement, the database marks an implicit savepoint (unavailable to you). If the statement fails, the database rolls back to the savepoint.

Usually, just the failed SQL statement is rolled back, not the whole transaction. If the statement raises an unhandled exception, the host environment determines what is rolled back.

The database can also roll back single SQL statements to break deadlocks. The database signals an error to a participating transaction and rolls back the current statement in that transaction.

Before running a SQL statement, the database must parse it, that is, examine it to ensure it follows syntax rules and refers to valid schema objects. Errors detected while running a SQL statement cause a rollback, but errors detected while parsing the statement do not.

If you exit a stored subprogram with an unhandled exception, PL/SQL does not assign values to OUT parameters, and does not do any rollback.

For information about handling exceptions, see PL/SQL Error Handling

## SET TRANSACTION Statement

You use the SET TRANSACTION statement to begin a read-only or read-write transaction, establish an isolation level, or assign your current transaction to a specified rollback segment.

Read-only transactions are useful for running multiple queries while other users update the same tables.

During a read-only transaction, all queries refer to the same snapshot of the database, providing a multi-table, multi-query, read-consistent view. Other users can continue to query or update data as usual. A commit or rollback ends the transaction.

The SET TRANSACTION statement must be the first SQL statement in a read-only transaction and can appear only once in a transaction. If you set a transaction to READ ONLY, subsequent

queries see only changes committed before the transaction began. The use of READ ONLY does not affect other users or transactions.

Only the SELECT, OPEN, FETCH, CLOSE, LOCK TABLE, COMMIT, and ROLLBACK statements are allowed in a read-only transaction. Queries cannot be FOR UPDATE.

See Also: Oracle Database SQL Language Reference for more information about the SQL statement SET TRANSACTION

### Example 7-40 SET TRANSACTION Statement in Read-Only Transaction

In this example, a read-only transaction gather order totals for the day, the past week, and the past month. The totals are unaffected by other users updating the database during the transaction. The orders table is in the sample schema OE.

```
DECLARE
 daily order total NUMBER(12,2);
 weekly_order_total NUMBER(12,2);
 monthly order total NUMBER(12,2);
BEGIN
  COMMIT; -- end previous transaction
  SET TRANSACTION READ ONLY NAME 'Calculate Order Totals';
  SELECT SUM (order total)
  INTO daily order total
  FROM orders
  WHERE order_date = SYSDATE;
  SELECT SUM (order total)
  INTO weekly_order_total
  FROM orders
  WHERE order date = SYSDATE - 7;
  SELECT SUM (order total)
  INTO monthly_order_total
  FROM orders
  WHERE order date = SYSDATE - 30;
  COMMIT; -- ends read-only transaction
END:
```

## **Overriding Default Locking**

By default, Oracle Database locks data structures automatically, which lets different applications write to the same data structures without harming each other's data or coordinating with each other.

If you must have exclusive access to data during a transaction, you can override default locking with these SQL statements:

- LOCK TABLE, which explicitly locks entire tables.
- SELECT with the FOR UPDATE clause (SELECT FOR UPDATE), which explicitly locks specific rows of a table.

## **Topics**

- LOCK TABLE Statement
- SELECT FOR UPDATE and FOR UPDATE Cursors
- Simulating CURRENT OF Clause with ROWID Pseudocolumn

## LOCK TABLE Statement

The LOCK TABLE statement explicitly locks one or more tables in a specified lock mode so that you can share or deny access to them.

The lock mode determines what other locks can be placed on the table. For example, many users can acquire row share locks on a table at the same time, but only one user at a time can acquire an exclusive lock. While one user has an exclusive lock on a table, no other users can insert, delete, or update rows in that table.

A table lock never prevents other users from querying a table, and a query never acquires a table lock. Only if two different transactions try to modify the same row does one transaction wait for the other to complete. The LOCK TABLE statement lets you specify how long to wait for another transaction to complete.

Table locks are released when the transaction that acquired them is either committed or rolled back.

See Also:

- Oracle Database Development Guide for more information about locking tables
   explicitly
- Oracle Database SQL Language Reference for more information about the LOCK TABLE statement

## SELECT FOR UPDATE and FOR UPDATE Cursors

The SELECT statement with the FOR UPDATE clause (SELECT FOR UPDATE statement) selects the rows of the result set and locks them. SELECT FOR UPDATE lets you base an update on the existing values in the rows, because it ensures that no other user can change those values before you update them. You can also use SELECT FOR UPDATE to lock rows that you do not want to update, as in Example 10-6.

## Note:

In tables compressed with Hybrid Columnar Compression (HCC), DML statements lock compression units rather than rows. HCC, a feature of certain Oracle storage systems, is described in *Oracle Database Concepts*.

By default, the SELECT FOR UPDATE statement waits until the requested row lock is acquired. To change this behavior, use the NOWAIT, WAIT, or SKIP LOCKED clause of the SELECT FOR UPDATE

statement. For information about these clauses, see Oracle Database SQL Language *Reference*.

When SELECT FOR UPDATE is associated with an explicit cursor, the cursor is called a FOR UPDATE cursor. Only a FOR UPDATE cursor can appear in the CURRENT OF clause of an UPDATE or DELETE statement. (The CURRENT OF clause, a PL/SQL extension to the WHERE clause of the SQL statements UPDATE and DELETE, restricts the statement to the current row of the cursor.)

When SELECT FOR UPDATE queries multiple tables, it locks only rows whose columns appear in the FOR UPDATE clause.

## Simulating CURRENT OF Clause with ROWID Pseudocolumn

The rows of the result set are locked when you open a FOR UPDATE cursor, not as they are fetched. The rows are unlocked when you commit or roll back the transaction. After the rows are unlocked, you cannot fetch from the FOR UPDATE cursor, as Example 7-41 shows (the result is the same if you substitute ROLLBACK for COMMIT).

The workaround is to simulate the CURRENT OF clause with the ROWID pseudocolumn (described in *Oracle Database SQL Language Reference*). Select the rowid of each row into a UROWID variable and use the rowid to identify the current row during subsequent updates and deletes, as in Example 7-42. (To print the value of a UROWID variable, convert it to VARCHAR2, using the ROWIDTOCHAR function described in *Oracle Database SQL Language Reference*.)

## Note:

When you update a row in a table compressed with Hybrid Columnar Compression (HCC), the ROWID of the row changes. HCC, a feature of certain Oracle storage systems, is described in *Oracle Database Concepts*.

## Caution:

Because no FOR UPDATE clause locks the fetched rows, other users might unintentionally overwrite your changes.

## Note:

The extra space needed for read consistency is not released until the cursor is closed, which can slow down processing for large updates.

### Example 7-41 FETCH with FOR UPDATE Cursor After COMMIT Statement

```
DROP TABLE emp;
CREATE TABLE emp AS SELECT * FROM employees;
DECLARE
```

CURSOR c1 IS SELECT \* FROM emp FOR UPDATE OF salary

```
ORDER BY employee id;
  emp_rec emp%ROWTYPE;
BEGIN
 OPEN cl;
 LOOP
   FETCH c1 INTO emp_rec; -- fails on second iteration
   EXIT WHEN c1%NOTFOUND;
   DBMS OUTPUT.PUT LINE (
     'emp_rec.employee_id = ' ||
     TO_CHAR(emp_rec.employee_id)
    );
   UPDATE emp
    SET salary = salary * 1.05
   WHERE employee id = 105;
   COMMIT; -- releases locks
 END LOOP;
END;
/
```

### Result:

```
emp_rec.employee_id = 100
DECLARE
*
ERROR at line 1:
ORA-01002: fetch out of sequence
ORA-06512: at line 11
```

#### Example 7-42 Simulating CURRENT OF Clause with ROWID Pseudocolumn

```
DROP TABLE emp;
CREATE TABLE emp AS SELECT * FROM employees;
DECLARE
  CURSOR c1 IS
   SELECT last_name, job_id, rowid
   FROM emp; -- no FOR UPDATE clause
  my lastname employees.last name%TYPE;
  my_jobid
               employees.job_id%TYPE;
  my_rowid
                UROWID;
BEGIN
  OPEN c1;
  LOOP
    FETCH c1 INTO my_lastname, my_jobid, my_rowid;
    EXIT WHEN c1%NOTFOUND;
    UPDATE emp
    SET salary = salary * 1.02
    WHERE rowid = my_rowid; -- simulates WHERE CURRENT OF c1
   COMMIT;
  END LOOP;
  CLOSE c1;
END;
```

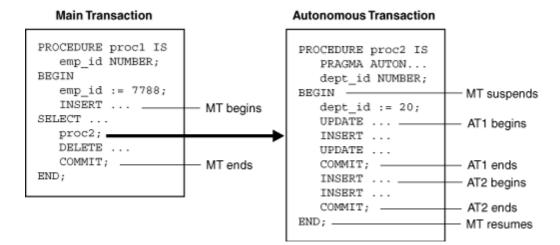

## **Autonomous Transactions**

An **autonomous transaction** is an independent transaction started by another transaction, the main transaction.

Autonomous transactions do SQL operations and commit or roll back, without committing or rolling back the main transaction.

Figure 7-1 shows how control flows from the main transaction (MT) to an autonomous routine (proc2) and back again. The autonomous routine commits two autonomous transactions (AT1 and AT2).

Figure 7-1 Transaction Control Flow

## Note:

Although an autonomous transaction is started by another transaction, it is not a nested transaction, because:

- It does not share transactional resources (such as locks) with the main transaction.
- It does not depend on the main transaction.

For example, if the main transaction rolls back, nested transactions roll back, but autonomous transactions do not.

Its committed changes are visible to other transactions immediately.

A nested transaction's committed changes are not visible to other transactions until the main transaction commits.

• Exceptions raised in an autonomous transaction cause a transaction-level rollback, not a statement-level rollback.

### **Topics**

Advantages of Autonomous Transactions

- Transaction Context
- Transaction Visibility
- Declaring Autonomous Routines
- Controlling Autonomous Transactions
- Autonomous Triggers
- Invoking Autonomous Functions from SQL

## 🖋 See Also:

*Oracle Database Development Guide* for more information about autonomous transactions

## Advantages of Autonomous Transactions

After starting, an autonomous transaction is fully independent. It shares no locks, resources, or commit-dependencies with the main transaction. You can log events, increment retry counters, and so on, even if the main transaction rolls back.

Autonomous transactions help you build modular, reusable software components. You can encapsulate autonomous transactions in stored subprograms. An invoking application needs not know whether operations done by that stored subprogram succeeded or failed.

## Transaction Context

The main transaction shares its context with nested routines, but not with autonomous transactions. When one autonomous routine invokes another (or itself, recursively), the routines share no transaction context. When an autonomous routine invokes a nonautonomous routine, the routines share the same transaction context.

## Transaction Visibility

Changes made by an autonomous transaction become visible to other transactions when the autonomous transaction commits. These changes become visible to the main transaction when it resumes, if its isolation level is set to READ COMMITTED (the default).

If you set the isolation level of the main transaction to SERIALIZABLE, changes made by its autonomous transactions are *not* visible to the main transaction when it resumes:

SET TRANSACTION ISOLATION LEVEL SERIALIZABLE;

## Note:

- Transaction properties apply only to the transaction in which they are set.
- Cursor attributes are not affected by autonomous transactions.

## **Declaring Autonomous Routines**

To declare an autonomous routine, use the AUTONOMOUS TRANSACTION pragma.

For information about this pragma, see "AUTONOMOUS\_TRANSACTION Pragma".

## **O** Tip:

For readability, put the AUTONOMOUS\_TRANSACTION pragma at the top of the declarative section. (The pragma is allowed anywhere in the declarative section.)

You cannot apply the AUTONOMOUS\_TRANSACTION pragma to an entire package or ADT, but you can apply it to each subprogram in a package or each method of an ADT.

### Example 7-43 Declaring Autonomous Function in Package

This example marks a package function as autonomous.

```
CREATE OR REPLACE PACKAGE emp actions AUTHID DEFINER AS -- package specification
 FUNCTION raise salary (emp id NUMBER, sal raise NUMBER)
 RETURN NUMBER;
END emp_actions;
CREATE OR REPLACE PACKAGE BODY emp actions AS -- package body
 -- code for function raise salary
 FUNCTION raise_salary (emp_id NUMBER, sal_raise NUMBER)
 RETURN NUMBER IS
   PRAGMA AUTONOMOUS TRANSACTION;
   new sal NUMBER(8,2);
 BEGIN
   UPDATE employees SET salary =
     salary + sal raise WHERE employee id = emp id;
   COMMIT;
   SELECT salary INTO new sal FROM employees
     WHERE employee id = emp id;
   RETURN new sal;
 END raise salary;
END emp actions;
```

#### Example 7-44 Declaring Autonomous Standalone Procedure

This example marks a standalone subprogram as autonomous.

```
CREATE OR REPLACE PROCEDURE lower_salary
  (emp_id NUMBER, amount NUMBER)
AUTHID DEFINER AS
  PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
  UPDATE employees
  SET salary = salary - amount
  WHERE employee_id = emp_id;
  COMMIT;
END lower_salary;
/
```

### Example 7-45 Declaring Autonomous PL/SQL Block

This example marks a schema-level PL/SQL block as autonomous. (A nested PL/SQL block cannot be autonomous.)

```
DROP TABLE emp;

CREATE TABLE emp AS SELECT * FROM employees;

DECLARE

PRAGMA AUTONOMOUS_TRANSACTION;

emp_id NUMBER(6) := 200;

amount NUMBER(6,2) := 200;

BEGIN

UPDATE employees

SET salary = salary - amount

WHERE employee_id = emp_id;

COMMIT;

END;

/
```

## Controlling Autonomous Transactions

The first SQL statement in an autonomous routine begins a transaction. When one transaction ends, the next SQL statement begins another transaction. All SQL statements run since the last commit or rollback comprise the current transaction. To control autonomous transactions, use these statements, which apply only to the current (active) transaction:

- COMMIT
- ROLLBACK [TO savepoint\_name]
- SAVEPOINT savepoint name
- SET TRANSACTION

### Topics

- Entering and Exiting Autonomous Routines
- Committing and Rolling Back Autonomous Transactions
- Savepoints
- Avoiding Errors with Autonomous Transactions

## Entering and Exiting Autonomous Routines

When you enter the executable section of an autonomous routine, the main transaction suspends. When you exit the routine, the main transaction resumes.

If you try to exit an active autonomous transaction without committing or rolling back, the database raises an exception. If the exception is unhandled, or if the transaction ends because of some other unhandled exception, then the transaction rolls back.

To exit normally, the routine must explicitly commit or roll back all autonomous transactions. If the routine (or any routine invoked by it) has pending transactions, then PL/SQL raises an exception and the pending transactions roll back.

## Committing and Rolling Back Autonomous Transactions

COMMIT and ROLLBACK end the active autonomous transaction but do not exit the autonomous routine. When one transaction ends, the next SQL statement begins another transaction. A single autonomous routine can contain several autonomous transactions, if it issues several COMMIT statements.

## Savepoints

The scope of a savepoint is the transaction in which it is defined. Savepoints defined in the main transaction are unrelated to savepoints defined in its autonomous transactions. In fact, the main transaction and an autonomous transaction can use the same savepoint names.

You can roll back only to savepoints marked in the current transaction. In an autonomous transaction, you cannot roll back to a savepoint marked in the main transaction. To do so, you must resume the main transaction by exiting the autonomous routine.

When in the main transaction, rolling back to a savepoint marked before you started an autonomous transaction does *not* roll back the autonomous transaction. Remember, autonomous transactions are fully independent of the main transaction.

## Avoiding Errors with Autonomous Transactions

To avoid some common errors, remember:

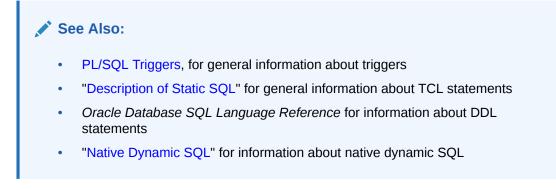

- If an autonomous transaction tries to access a resource held by the main transaction, a deadlock can occur. The database raises an exception in the autonomous transaction, which rolls back if the exception is unhandled.
- The database initialization parameter TRANSACTIONS specifies the maximum number of concurrent transactions. That number might be exceeded because an autonomous transaction runs concurrently with the main transaction.
- If you try to exit an active autonomous transaction without committing or rolling back, the database raises an exception. If the exception is unhandled, the transaction rolls back.
- You cannot run a PIPE ROW statement in an autonomous routine while an autonomous transaction is open. You must close the autonomous transaction before running the PIPE ROW statement. This is normally accomplished by committing or rolling back the autonomous transaction before running the PIPE ROW statement.

## Autonomous Triggers

A trigger must be autonomous to run TCL or DDL statements.

To run DDL statements, the trigger must use native dynamic SQL.

One use of triggers is to log events transparently—for example, to log all inserts into a table, even those that roll back.

### Example 7-46 Autonomous Trigger Logs INSERT Statements

In this example, whenever a row is inserted into the EMPLOYEES table, a trigger inserts the same row into a log table. Because the trigger is autonomous, it can commit changes to the log table regardless of whether they are committed to the main table.

```
DROP TABLE emp;
CREATE TABLE emp AS SELECT * FROM employees;
-- Log table:
DROP TABLE log;
CREATE TABLE log (
 log_id NUMBER(6),
 up date DATE,
 new sal NUMBER(8,2),
  old sal NUMBER(8,2)
);
-- Autonomous trigger on emp table:
CREATE OR REPLACE TRIGGER log sal
  BEFORE UPDATE OF salary ON emp FOR EACH ROW
DECLARE
  PRAGMA AUTONOMOUS TRANSACTION;
BEGIN
  INSERT INTO log (
   log id,
   up date,
   new sal,
   old sal
  )
  VALUES (
    :old.employee id,
    SYSDATE,
    :new.salary,
    :old.salary
  );
  COMMIT;
END;
/
UPDATE emp
SET salary = salary * 1.05
WHERE employee id = 115;
```

#### COMMIT;

```
UPDATE emp
SET salary = salary * 1.05
WHERE employee_id = 116;
```

#### ROLLBACK;

```
-- Show that both committed and rolled-back updates -- add rows to log table
```

SELECT \* FROM log
WHERE log\_id = 115 OR log\_id = 116;

Result:

LOG_ID	UP_DATE	NEW_SAL	OLD_SAL
115	02-OCT-12	3255	3100
116	02-OCT-12	3045	2900

2 rows selected.

### Example 7-47 Autonomous Trigger Uses Native Dynamic SQL for DDL

In this example, an autonomous trigger uses native dynamic SQL (an EXECUTE IMMEDIATE statement) to drop a temporary table after a row is inserted into the table log.

```
DROP TABLE temp;
CREATE TABLE temp (
  temp id NUMBER(6),
  up date DATE
);
CREATE OR REPLACE TRIGGER drop_temp_table
 AFTER INSERT ON log
DECLARE
 PRAGMA AUTONOMOUS TRANSACTION;
BEGIN
  EXECUTE IMMEDIATE 'DROP TABLE temp';
  COMMIT;
END;
/
-- Show how trigger works
SELECT * FROM temp;
```

Result:

```
no rows selected
```

INSERT INTO log (log\_id, up\_date, new\_sal, old\_sal)
VALUES (999, SYSDATE, 5000, 4500);

1 row created.

SELECT \* FROM temp;

Result:

SELECT \* FROM temp \*

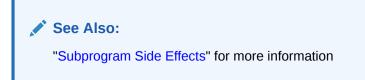

```
ERROR at line 1:
ORA-00942: table or view does not exist
```

## Invoking Autonomous Functions from SQL

A function invoked from SQL statements must obey rules meant to control side effects.

By definition, an autonomous routine never reads or writes database state (that is, it neither queries nor modifies any database table).

### Example 7-48 Invoking Autonomous Function

The package function log\_msg is autonomous. Therefore, when the query invokes the function, the function inserts a message into database table debug\_output without violating the rule against writing database state (modifying database tables).

```
DROP TABLE debug_output;
CREATE TABLE debug output (message VARCHAR2(200));
CREATE OR REPLACE PACKAGE debugging AUTHID DEFINER AS
 FUNCTION log_msg (msg VARCHAR2) RETURN VARCHAR2;
END debugging;
CREATE OR REPLACE PACKAGE BODY debugging AS
  FUNCTION log msg (msg VARCHAR2) RETURN VARCHAR2 IS
   PRAGMA AUTONOMOUS TRANSACTION;
 BEGIN
   INSERT INTO debug_output (message) VALUES (msg);
   COMMIT:
   RETURN msg;
 END;
END debugging;
-- Invoke package function from query
DECLARE
 my_emp_id NUMBER(6);
 my last name VARCHAR2(25);
 my count NUMBER;
BEGIN
 my emp id := 120;
  SELECT debugging.log_msg(last_name)
 INTO my last name
 FROM employees
 WHERE employee id = my emp id;
  /* Even if you roll back in this scope,
     the insert into 'debug_output' remains committed,
    because it is part of an autonomous transaction. */
 ROLLBACK;
END;
/
```

# 8 PL/SQL Dynamic SQL

**Dynamic SQL** is a programming methodology for generating and running SQL statements at run time.

It is useful when writing general-purpose and flexible programs like ad hoc query systems, when writing programs that must run database definition language (DDL) statements, or when you do not know at compile time the full text of a SQL statement or the number or data types of its input and output variables.

PL/SQL provides two ways to write dynamic SQL:

- Native dynamic SQL, a PL/SQL language (that is, native) feature for building and running dynamic SQL statements
- DBMS SQL package, an API for building, running, and describing dynamic SQL statements

Native dynamic SQL code is easier to read and write than equivalent code that uses the DBMS\_SQL package, and runs noticeably faster (especially when it can be optimized by the compiler). However, to write native dynamic SQL code, you must know at compile time the number and data types of the input and output variables of the dynamic SQL statement. If you do not know this information at compile time, you must use the DBMS\_SQL package. You must also use the DBMS\_SQL package if you want a stored subprogram to return a query result implicitly (not through an OUT REF CURSOR parameter).

When you need both the DBMS\_SQL package and native dynamic SQL, you can switch between them, using the "DBMS\_SQL.TO\_REFCURSOR Function" and "DBMS\_SQL.TO\_CURSOR\_NUMBER Function".

### Topics

- When You Need Dynamic SQL
- Native Dynamic SQL
- DBMS\_SQL Package
- SQL Injection

## When You Need Dynamic SQL

In PL/SQL, you need dynamic SQL to run:

• SQL whose text is unknown at compile time

For example, a SELECT statement that includes an identifier that is unknown at compile time (such as a table name) or a WHERE clause in which the number of subclauses is unknown at compile time.

SQL that is not supported as static SQL

That is, any SQL construct not included in "Description of Static SQL".

If you do not need dynamic SQL, use static SQL, which has these advantages:

- Successful compilation verifies that static SQL statements reference valid database objects and that the necessary privileges are in place to access those objects.
- Successful compilation creates schema object dependencies.

For information about schema object dependencies, see *Oracle Database Development Guide*.

For information about using static SQL statements with PL/SQL, see PL/SQL Static SQL.

## Native Dynamic SQL

Native dynamic SQL processes most dynamic SQL statements with the EXECUTE IMMEDIATE statement.

If the dynamic SQL statement is a SELECT statement that returns multiple rows, native dynamic SQL gives you these choices:

- Use the EXECUTE IMMEDIATE statement with the BULK COLLECT INTO clause.
- Use the OPEN FOR, FETCH, and CLOSE statements.

The SQL cursor attributes work the same way after native dynamic SQL INSERT, UPDATE, DELETE, MERGE, and single-row SELECT statements as they do for their static SQL counterparts. For more information about SQL cursor attributes, see "Cursors Overview".

### Topics

- EXECUTE IMMEDIATE Statement
- OPEN FOR, FETCH, and CLOSE Statements
- Repeated Placeholder Names in Dynamic SQL Statements

## EXECUTE IMMEDIATE Statement

The EXECUTE IMMEDIATE statement is the means by which native dynamic SQL processes most dynamic SQL statements.

If the dynamic SQL statement is **self-contained** (that is, if it has no placeholders for bind variables and the only result that it can possibly return is an error), then the EXECUTE IMMEDIATE statement needs no clauses.

If the dynamic SQL statement includes placeholders for bind variables, each placeholder must have a corresponding bind variable in the appropriate clause of the EXECUTE IMMEDIATE statement, as follows:

- If the dynamic SQL statement is a SELECT statement that can return at most one row, put out-bind variables (defines) in the INTO clause and in-bind variables in the USING clause.
- If the dynamic SQL statement is a SELECT statement that can return multiple rows, put outbind variables (defines) in the BULK COLLECT INTO clause and in-bind variables in the USING clause.
- If the dynamic SQL statement is a DML statement without a RETURNING INTO clause, other than SELECT, put all bind variables in the USING clause.
- If the dynamic SQL statement is a DML statement with a RETURNING INTO clause, put inbind variables in the USING clause and out-bind variables in the RETURNING INTO clause.

 If the dynamic SQL statement is an anonymous PL/SQL block or a CALL statement, put all bind variables in the USING clause.

If the dynamic SQL statement invokes a subprogram, ensure that:

- The subprogram is either created at schema level or declared and defined in a package specification.
- Every bind variable that corresponds to a placeholder for a subprogram parameter has the same parameter mode as that subprogram parameter and a data type that is compatible with that of the subprogram parameter.
- No bind variable is the reserved word NULL.

To work around this restriction, use an uninitialized variable where you want to use NULL, as in Example 8-7.

 No bind variable has a data type that SQL does not support (such as associative array indexed by string).

If the data type is a collection or record type, then it must be declared in a package specification.

## Note:

Bind variables can be evaluated in any order. If a program determines order of evaluation, then at the point where the program does so, its behavior is undefined.

In Example 8-4, Example 8-5, and Example 8-6, the dynamic PL/SQL block is an anonymous PL/SQL block that invokes a subprogram that has a formal parameter of a PL/SQL collection type. Collection types are not SQL data types. In each example, the collection type is declared in a package specification, and the subprogram is declared in the package specification and defined in the package body.

### Example 8-1 Invoking Subprogram from Dynamic PL/SQL Block

In this example, the dynamic PL/SQL block is an anonymous PL/SQL block that invokes a subprogram created at schema level.

```
-- Subprogram that dynamic PL/SQL block invokes:
CREATE OR REPLACE PROCEDURE create dept (
  deptid IN OUT NUMBER,
 dname IN VARCHAR2
 mgrid IN NUMBER,
 locid IN NUMBER
) AUTHID DEFINER AS
BEGIN
  deptid := departments seq.NEXTVAL;
 INSERT INTO departments (
   department id,
   department_name,
   manager id,
   location id
 )
 VALUES (deptid, dname, mgrid, locid);
END;
/
DECLARE
 plsql block VARCHAR2(500);
 new deptid NUMBER(4);
 new dname VARCHAR2(30) := 'Advertising';
 new_mgrid NUMBER(6)
                        := 200;
 new locid NUMBER(4)
                          := 1700;
BEGIN
-- Dynamic PL/SQL block invokes subprogram:
 plsql_block := 'BEGIN create_dept(:a, :b, :c, :d); END;';
/* Specify bind variables in USING clause.
    Specify mode for first parameter.
   Modes of other parameters are correct by default. */
 EXECUTE IMMEDIATE plsql block
    USING IN OUT new_deptid, new_dname, new_mgrid, new_locid;
END;
/
```

### Example 8-2 Dynamically Invoking Subprogram with BOOLEAN Formal Parameter

In this example, the dynamic PL/SQL block is an anonymous PL/SQL block that invokes a subprogram that has a formal parameter of the PL/SQL data type BOOLEAN.

```
CREATE OR REPLACE PROCEDURE p (x BOOLEAN) AUTHID DEFINER AS
BEGIN
    IF x THEN
    DBMS_OUTPUT.PUT_LINE('x is true');
    END IF;
END;
/
```

```
DECLARE
  dyn_stmt VARCHAR2(200);
  b BOOLEAN := TRUE;
BEGIN
  dyn_stmt := 'BEGIN p(:x); END;';
  EXECUTE IMMEDIATE dyn_stmt USING b;
END;
/
```

Result:

x is true

#### Example 8-3 Dynamically Invoking Subprogram with RECORD Formal Parameter

In this example, the dynamic PL/SQL block is an anonymous PL/SQL block that invokes a subprogram that has a formal parameter of the PL/SQL (but not SQL) data type RECORD. The record type is declared in a package specification, and the subprogram is declared in the package specification and defined in the package body.

```
CREATE OR REPLACE PACKAGE pkg AUTHID DEFINER AS
  TYPE rec IS RECORD (n1 NUMBER, n2 NUMBER);
  PROCEDURE p (x OUT rec, y NUMBER, z NUMBER);
END pkg;
/
CREATE OR REPLACE PACKAGE BODY pkg AS
  PROCEDURE p (x OUT rec, y NUMBER, z NUMBER) AS
  BEGIN
   x.n1 := y;
   x.n2 := z;
 END p;
END pkg;
/
DECLARE
          pkg.rec;
 r
  dyn str VARCHAR2(3000);
BEGIN
  dyn_str := 'BEGIN pkg.p(:x, 6, 8); END;';
  EXECUTE IMMEDIATE dyn str USING OUT r;
  DBMS OUTPUT.PUT LINE('r.n1 = ' || r.n1);
  DBMS OUTPUT.PUT LINE('r.n2 = ' || r.n2);
END;
/
```

### Result:

r.n1 = 6r.n2 = 8

#### Example 8-4 Dynamically Invoking Subprogram with Assoc. Array Formal Parameter

In this example, the dynamic PL/SQL block is an anonymous PL/SQL block that invokes a subprogram that has a formal parameter of the PL/SQL collection type associative array indexed by PLS INTEGER.

```
Note:
      An associative array type used in this context must be indexed by PLS INTEGER.
CREATE OR REPLACE PACKAGE pkg AUTHID DEFINER AS
  TYPE number names IS TABLE OF VARCHAR2(5)
    INDEX BY PLS INTEGER;
  PROCEDURE print number names (x number names);
END pkg;
/
CREATE OR REPLACE PACKAGE BODY pkg AS
  PROCEDURE print number names (x number names) IS
  BEGIN
    FOR i IN x.FIRST .. x.LAST LOOP
     DBMS OUTPUT.PUT LINE(x(i));
    END LOOP;
  END;
END pkg;
/
DECLARE
  digit_names pkg.number_names;
               VARCHAR2 (3000);
  dyn stmt
BEGIN
  digit names(0) := 'zero';
  digit names(1) := 'one';
  digit names(2) := 'two';
  digit names(3) := 'three';
  digit names(4) := 'four';
  digit names(5) := 'five';
  digit names(6) := 'six';
  digit names(7) := 'seven';
  digit names(8) := 'eight';
  digit names(9) := 'nine';
  dyn stmt := 'BEGIN pkg.print number names(:x); END;';
  EXECUTE IMMEDIATE dyn stmt USING digit names;
END;
/
Result:
```

zero one two

```
...
nine
```

### Example 8-5 Dynamically Invoking Subprogram with Nested Table Formal Parameter

In this example, the dynamic PL/SQL block is an anonymous PL/SQL block that invokes a subprogram that has a formal parameter of the PL/SQL collection type nested table.

```
CREATE OR REPLACE PACKAGE pkg AUTHID DEFINER AS
  TYPE names IS TABLE OF VARCHAR2(10);
  PROCEDURE print names (x names);
END pkg;
/
CREATE OR REPLACE PACKAGE BODY pkg AS
  PROCEDURE print names (x names) IS
  BEGIN
    FOR i IN x.FIRST .. x.LAST LOOP
     DBMS OUTPUT.PUT LINE(x(i));
   END LOOP;
 END;
END pkg;
/
DECLARE
  fruits pkg.names;
  dyn stmt VARCHAR2(3000);
BEGIN
  fruits := pkg.names('apple', 'banana', 'cherry');
  dyn stmt := 'BEGIN pkg.print names(:x); END;';
  EXECUTE IMMEDIATE dyn stmt USING fruits;
END;
/
```

### Result:

apple banana cherry

#### Example 8-6 Dynamically Invoking Subprogram with Varray Formal Parameter

In this example, the dynamic PL/SQL block is an anonymous PL/SQL block that invokes a subprogram that has a formal parameter of the PL/SQL collection type varray.

```
CREATE OR REPLACE PACKAGE pkg AUTHID DEFINER AS

TYPE foursome IS VARRAY(4) OF VARCHAR2(5);

PROCEDURE print_foursome (x foursome);

END pkg;

/

CREATE OR REPLACE PACKAGE BODY pkg AS

PROCEDURE print foursome (x foursome) IS
```

```
BEGIN
    IF x.COUNT = 0 THEN
     DBMS OUTPUT.PUT LINE ('Empty');
    ELSE
      FOR i IN x.FIRST .. x.LAST LOOP
        DBMS OUTPUT.PUT LINE(x(i));
      END LOOP;
    END IF;
  END;
END pkg;
/
DECLARE
  directions pkg.foursome;
  dyn stmt VARCHAR2(3000);
BEGIN
  directions := pkg.foursome('north', 'south', 'east', 'west');
  dyn stmt := 'BEGIN pkg.print foursome(:x); END;';
  EXECUTE IMMEDIATE dyn stmt USING directions;
END;
/
```

### Result:

north south east west

### Example 8-7 Uninitialized Variable Represents NULL in USING Clause

This example uses an uninitialized variable to represent the reserved word NULL in the USING clause.

```
CREATE TABLE employees_temp AS SELECT * FROM EMPLOYEES;
DECLARE
  a_null CHAR(1); -- Set to NULL automatically at run time
BEGIN
  EXECUTE IMMEDIATE 'UPDATE employees_temp SET commission_pct = :x'
   USING a_null;
END;
/
```

## OPEN FOR, FETCH, and CLOSE Statements

If the dynamic SQL statement represents a SELECT statement that returns multiple rows, you can process it with native dynamic SQL as follows:

 Use an OPEN FOR statement to associate a cursor variable with the dynamic SQL statement. In the USING clause of the OPEN FOR statement, specify a bind variable for each placeholder in the dynamic SQL statement.

The USING clause cannot contain the literal NULL. To work around this restriction, use an uninitialized variable where you want to use NULL, as in Example 8-7.

- Use the FETCH statement to retrieve result set rows one at a time, several at a time, or all at once.
- 3. Use the CLOSE statement to close the cursor variable.

The dynamic SQL statement can query a collection if the collection meets the criteria in "Querying a Collection".

🖍 See Also:

- "OPEN FOR Statement" for syntax details
- "FETCH Statement" for syntax details
- "CLOSE Statement" for syntax details

#### Example 8-8 Native Dynamic SQL with OPEN FOR, FETCH, and CLOSE Statements

This example lists all employees who are managers, retrieving result set rows one at a time.

```
DECLARE
  TYPE EmpCurTyp IS REF CURSOR;
 v_emp_cursor EmpCurTyp;
emp_record employees%ROWTYPE;
v_stmt_str VARCHAR2(200);
v_e_job employees.job_id%TYPE;
BEGIN
  -- Dynamic SQL statement with placeholder:
  v stmt str := 'SELECT * FROM employees WHERE job id = :j';
  -- Open cursor & specify bind variable in USING clause:
  OPEN v emp cursor FOR v stmt str USING 'MANAGER';
  -- Fetch rows from result set one at a time:
  LOOP
    FETCH v emp cursor INTO emp record;
    EXIT WHEN v emp cursor%NOTFOUND;
  END LOOP;
  -- Close cursor:
  CLOSE v emp cursor;
END;
```

#### Example 8-9 Querying a Collection with Native Dynamic SQL

This example is like Example 7-30 except that the collection variable v1 is a bind variable.

```
CREATE OR REPLACE PACKAGE pkg AUTHID DEFINER AS
  TYPE rec IS RECORD(f1 NUMBER, f2 VARCHAR2(30));
  TYPE mytab IS TABLE OF rec INDEX BY pls_integer;
END;
/
DECLARE
  v1 pkg.mytab; -- collection of records
```

/

```
v2 pkg.rec;
c1 SYS_REFCURSOR;
BEGIN
OPEN c1 FOR 'SELECT * FROM TABLE(:1)' USING v1;
FETCH c1 INTO v2;
CLOSE c1;
DBMS_OUTPUT.PUT_LINE('Values in record are ' || v2.f1 || ' and ' || v2.f2);
END;
/
```

## Repeated Placeholder Names in Dynamic SQL Statements

If you repeat placeholder names in dynamic SQL statements, be aware that the way placeholders are associated with bind variables depends on the kind of dynamic SQL statement.

### Topics

- Dynamic SQL Statement is Not Anonymous Block or CALL Statement
- Dynamic SQL Statement is Anonymous Block or CALL Statement

## Dynamic SQL Statement is Not Anonymous Block or CALL Statement

If the dynamic SQL statement does not represent an anonymous PL/SQL block or a CALL statement, repetition of placeholder names is insignificant.

Placeholders are associated with bind variables in the USING clause by position, not by name.

For example, in this dynamic SQL statement, the repetition of the name :x is insignificant:

sql\_stmt := 'INSERT INTO payroll VALUES (:x, :x, :y, :x)';

In the corresponding USING clause, you must supply four bind variables. They can be different; for example:

EXECUTE IMMEDIATE sql\_stmt USING a, b, c, d;

The preceding EXECUTE IMMEDIATE statement runs this SQL statement:

INSERT INTO payroll VALUES (a, b, c, d)

To associate the same bind variable with each occurrence of :x, you must repeat that bind variable; for example:

EXECUTE IMMEDIATE sql\_stmt USING a, a, b, a;

The preceding EXECUTE IMMEDIATE statement runs this SQL statement:

INSERT INTO payroll VALUES (a, a, b, a)

## Dynamic SQL Statement is Anonymous Block or CALL Statement

If the dynamic SQL statement represents an anonymous PL/SQL block or a CALL statement, repetition of placeholder names is significant.

Each unique placeholder name must have a corresponding bind variable in the USING clause. If you repeat a placeholder name, you need not repeat its corresponding bind variable. All references to that placeholder name correspond to one bind variable in the USING clause.

### Example 8-10 Repeated Placeholder Names in Dynamic PL/SQL Block

In this example, all references to the first unique placeholder name, :x, are associated with the first bind variable in the USING clause, a, and the second unique placeholder name, :y, is associated with the second bind variable in the USING clause, b.

```
CREATE PROCEDURE calc stats (
  w NUMBER,
  x NUMBER,
  y NUMBER,
  z NUMBER )
ΤS
BEGIN
  DBMS OUTPUT.PUT LINE (w + x + y + z);
END;
DECLARE
  a NUMBER := 4;
 b NUMBER := 7;
  plsql block VARCHAR2(100);
BEGIN
  plsql block := 'BEGIN calc stats(:x, :x, :y, :x); END;';
  EXECUTE IMMEDIATE plsql block USING a, b; -- calc stats(a, a, b, a)
END;
/
```

### Result:

19

## DBMS\_SQL Package

The DBMS\_SQL package defines an entity called a SQL cursor number. Because the SQL cursor number is a PL/SQL integer, you can pass it across call boundaries and store it.

You must use the DBMS\_SQL package to run a dynamic SQL statement if any of the following are true:

- You do not know the SELECT list until run time.
- You do not know until run time what placeholders in a SELECT or DML statement must be bound.
- You want a stored subprogram to return a query result implicitly (not through an OUT REF CURSOR parameter), which requires the DBMS SQL.RETURN RESULT procedure.

In these situations, you must use native dynamic SQL instead of the DBMS SQL package:

- The dynamic SQL statement retrieves rows into records.
- You want to use the SQL cursor attribute %FOUND, %ISOPEN, %NOTFOUND, or %ROWCOUNT after issuing a dynamic SQL statement that is an INSERT, UPDATE, DELETE, MERGE, or single-row SELECT statement.

When you need both the DBMS\_SQL package and native dynamic SQL, you can switch between them, using the functions DBMS SQL.TO REFCURSOR and DBMS SQL.TO CURSOR NUMBER.

### Topics

- DBMS\_SQL.RETURN\_RESULT Procedure
- DBMS\_SQL.GET\_NEXT\_RESULT Procedure
- DBMS\_SQL.TO\_REFCURSOR Function
- DBMS\_SQL.TO\_CURSOR\_NUMBER Function

### Note:

You can invoke DBMS SQL subprograms remotely.

## See Also:

- "Native Dynamic SQL" for information about native dynamic SQL
- Oracle Database PL/SQL Packages and Types Reference for more information about the DBMS\_SQL package, including instructions for running a dynamic SQL statement that has an unknown number of input or output variables ("Method 4")

## DBMS\_SQL.RETURN\_RESULT Procedure

The DBMS\_SQL.RETURN\_RESULT procedure lets a stored subprogram return a query result implicitly to either the client program (which invokes the subprogram indirectly) or the immediate caller of the subprogram. After DBMS\_SQL.RETURN\_RESULT returns the result, only the recipient can access it.

The DBMS SQL.RETURN RESULT has two overloads:

```
PROCEDURE RETURN_RESULT (rc IN OUT SYS_REFCURSOR,
to_client IN BOOLEAN DEFAULT TRUE);
PROCEDURE RETURN_RESULT (rc IN OUT INTEGER,
to client IN BOOLEAN DEFAULT TRUE);
```

The rc parameter is either an open cursor variable (SYS\_REFCURSOR) or the cursor number (INTEGER) of an open cursor. To open a cursor and get its cursor number, invoke the DBMS\_SQL.OPEN\_CURSOR function, described in Oracle Database PL/SQL Packages and Types Reference.

When the to\_client parameter is TRUE (the default), the DBMS\_SQL.RETURN\_RESULT procedure returns the query result to the client program (which invokes the subprogram indirectly); when this parameter is FALSE, the procedure returns the query result to the subprogram's immediate caller.

# See Also: Oracle Database PL/SQL Packages and Types Reference for more information about DBMS\_SQL.RETURN\_RESULT Oracle Call Interface Programmer's Guide for information about C and .NET support for implicit query results SQL\*Plus User's Guide and Reference for information about SQL\*Plus support for implicit query results

### Example 8-11 DBMS\_SQL.RETURN\_RESULT Procedure

In this example, the procedure p invokes DBMS\_SQL.RETURN\_RESULT without the optional to\_client parameter (which is TRUE by default). Therefore, DBMS\_SQL.RETURN\_RESULT returns the query result to the subprogram client (the anonymous block that invokes p). After p returns a result to the anonymous block, only the anonymous block can access that result.

```
CREATE OR REPLACE PROCEDURE p AUTHID DEFINER AS
 c1 SYS REFCURSOR;
 c2 SYS REFCURSOR;
BEGIN
 OPEN c1 FOR
   SELECT first name, last name
   FROM employees
   WHERE employee id = 176;
 DBMS SQL.RETURN RESULT (c1);
 -- Now p cannot access the result.
 OPEN c2 FOR
   SELECT city, state_province
   FROM locations
   WHERE country id = 'AU';
 DBMS SQL.RETURN RESULT (c2);
  -- Now p cannot access the result.
END;
/
BEGIN
 p;
END:
/
Result:
ResultSet #1
FIRST NAME LAST NAME
_____
                        _____
                 . .....
        Taylor
Jonathon
ResultSet #2
                         STATE PROVINCE
CITY
_____
Sydney
                          New South Wales
```

# DBMS\_SQL.GET\_NEXT\_RESULT Procedure

The DBMS\_SQL.GET\_NEXT\_RESULT procedure gets the next result that the DBMS\_SQL.RETURN\_RESULT procedure returned to the recipient. The two procedures return results in the same order.

The DBMS\_SQL.GET\_NEXT\_RESULT has two overloads:

PROCEDURE GET\_NEXT\_RESULT (c IN INTEGER, rc OUT SYS\_REFCURSOR);

PROCEDURE GET\_NEXT\_RESULT (c IN INTEGER, rc OUT INTEGER);

The  $\circ$  parameter is the cursor number of an open cursor that directly or indirectly invokes a subprogram that uses the <code>DBMS\_SQL.RETURN\_RESULT</code> procedure to return a query result implicitly.

To open a cursor and get its cursor number, invoke the DBMS\_SQL.OPEN\_CURSOR function. DBMS\_SQL.OPEN\_CURSOR has an optional parameter, treat\_as\_client\_for\_results. When this parameter is FALSE (the default), the caller that opens this cursor (to invoke a subprogram) is not treated as the client that receives query results for the client from the subprogram that uses DBMS\_SQL.RETURN\_RESULT—those query results are returned to the client in a upper tier instead. When this parameter is TRUE, the caller is treated as the client. For more information about the DBMS\_SQL.OPEN\_CURSOR function, see Oracle Database PL/SQL Packages and Types Reference.

The rc parameter is either a cursor variable (SYS\_REFCURSOR) or the cursor number (INTEGER) of an open cursor.

In Example 8-12, the procedure get\_employee\_info uses DBMS\_SQL.RETURN\_RESULT to return two query results to a client program and is invoked dynamically by the anonymous block <<main>>. Because <<main>> needs to receive the two query results that get\_employee\_info returns, <<main>> opens a cursor to invoke get\_employee\_info using DBMS\_SQL.OPEN\_CURSOR with the parameter treat\_as\_client\_for\_results set to TRUE. Therefore, DBMS\_SQL.GET\_NEXT\_RESULT returns its results to <<main>>, which uses the cursor rc to fetch them.

### Example 8-12 DBMS\_SQL.GET\_NEXT\_RESULT Procedure

```
CREATE OR REPLACE PROCEDURE get employee info (id IN VARCHAR2) AUTHID DEFINER AS
 rc SYS REFCURSOR;
BEGIN
  -- Return employee info
 OPEN rc FOR SELECT first name, last name, email, phone number
             FROM employees
              WHERE employee id = id;
 DBMS SQL.RETURN RESULT (rc);
  -- Return employee job history
 OPEN RC FOR SELECT job title, start date, end date
              FROM job history jh, jobs j
              WHERE jh.employee id = id AND
                   jh.job_id = j.job_id
              ORDER BY start_date DESC;
 DBMS_SQL.RETURN_RESULT(rc);
END;
1
```

```
<<main>>
DECLARE
             INTEGER;
 С
             SYS_REFCURSOR;
 rc
             NUMBER;
 n
 first name VARCHAR2(20);
 last_name VARCHAR2(25);
email VARCHAR2(25);
 phone number VARCHAR2(20);
 job_title VARCHAR2(35);
 start_date DATE;
 end date DATE;
BEGIN
 c := DBMS SQL.OPEN CURSOR(true);
 DBMS SQL.PARSE(c, 'BEGIN get employee info(:id); END;', DBMS SQL.NATIVE);
 DBMS SQL.BIND VARIABLE(c, ':id', 176);
 n := DBMS SQL.EXECUTE(c);
 -- Get employee info
 dbms sql.get next result(c, rc);
 FETCH rc INTO first_name, last_name, email, phone_number;
 DBMS OUTPUT.PUT LINE ('Employee: '||first name || ' ' || last name);
 DBMS OUTPUT.PUT LINE('Email: ' ||email);
 DBMS_OUTPUT.PUT_LINE('Phone: ' ||phone_number);
  -- Get employee job history
 DBMS OUTPUT.PUT LINE('Titles:');
 DBMS_SQL.GET_NEXT_RESULT(c, rc);
 LOOP
   FETCH rc INTO job_title, start_date, end_date;
   EXIT WHEN rc%NOTFOUND;
   DBMS_OUTPUT.PUT LINE
      ('- '||job title||' ('||start date||' - ' ||end date||')');
 END LOOP;
 DBMS SQL.CLOSE CURSOR(c);
END main;
/
Result:
```

PL/SQL procedure successfully completed.

# DBMS\_SQL.TO\_REFCURSOR Function

The DBMS\_SQL.TO\_REFCURSOR function converts a SQL cursor number to a weak cursor variable, which you can use in native dynamic SQL statements.

Before passing a SQL cursor number to the DBMS\_SQL.TO\_REFCURSOR function, you must OPEN, PARSE, and EXECUTE it (otherwise an error occurs).

After you convert a SQL cursor number to a REF CURSOR variable, DBMS\_SQL operations can access it only as the REF CURSOR variable, not as the SQL cursor number. For example, using the DBMS\_SQL.IS\_OPEN function to see if a converted SQL cursor number is still open causes an error.

**Example 8-13 uses the** DBMS\_SQL.TO\_REFCURSOR function to switch from the DBMS\_SQL package to native dynamic SQL.

### Example 8-13 Switching from DBMS\_SQL Package to Native Dynamic SQL

```
CREATE OR REPLACE TYPE vc array IS TABLE OF VARCHAR2(200);
/
CREATE OR REPLACE TYPE numlist IS TABLE OF NUMBER;
/
CREATE OR REPLACE PROCEDURE do_query_1 (
 placeholder vc array,
 bindvars vc array,
 sql stmt VARCHAR2
) AUTHID DEFINER
IS
 TYPE curtype IS REF CURSOR;
 src_cur curtype;
curid NUMBER;
 bindnames vc array;
            numlist;
 empnos
            numlist;
 depts
            NUMBER;
 ret
 isopen
            BOOLEAN;
BEGIN
  -- Open SQL cursor number:
  curid := DBMS SQL.OPEN CURSOR;
  -- Parse SQL cursor number:
  DBMS SQL.PARSE(curid, sql stmt, DBMS_SQL.NATIVE);
 bindnames := placeholder;
  -- Bind variables:
 FOR i IN 1 .. bindnames.COUNT LOOP
   DBMS SQL.BIND VARIABLE (curid, bindnames(i), bindvars(i));
 END LOOP;
  -- Run SQL cursor number:
 ret := DBMS SQL.EXECUTE(curid);
  -- Switch from DBMS SQL to native dynamic SQL:
 src cur := DBMS SQL.TO REFCURSOR(curid);
 FETCH src_cur BULK COLLECT INTO empnos, depts;
  -- This would cause an error because curid was converted to a REF CURSOR:
  -- isopen := DBMS_SQL.IS_OPEN(curid);
 CLOSE src cur;
END;
1
```

# DBMS\_SQL.TO\_CURSOR\_NUMBER Function

The DBMS\_SQL.TO\_CURSOR\_NUMBER function converts a REF CURSOR variable (either strong or weak) to a SQL cursor number, which you can pass to DBMS\_SQL subprograms.

Before passing a REF CURSOR variable to the DBMS\_SQL.TO\_CURSOR\_NUMBER function, you must OPEN it.

After you convert a REF CURSOR variable to a SQL cursor number, native dynamic SQL operations cannot access it.

Example 8-14 uses the DBMS\_SQL.TO\_CURSOR\_NUMBER function to switch from native dynamic SQL to the DBMS SQL package.

### Example 8-14 Switching from Native Dynamic SQL to DBMS\_SQL Package

```
CREATE OR REPLACE PROCEDURE do query 2 (
  sql stmt VARCHAR2
) AUTHID DEFINER
ΤS
 TYPE curtype IS REF CURSOR;
 src cur curtype;
          NUMBER;
 curid
 desctab DBMS SQL.DESC TAB;
 colcnt NUMBER;
 namevar VARCHAR2(50);
numvar NUMBER;
          DATE;
 datevar
         NUMBER := 100;
 empno
BEGIN
  -- sql stmt := SELECT ... FROM employees WHERE employee id = :b1';
  -- Open REF CURSOR variable:
 OPEN src cur FOR sql stmt USING empno;
  -- Switch from native dynamic SQL to DBMS_SQL package:
  curid := DBMS SQL.TO CURSOR NUMBER(src cur);
  DBMS SQL.DESCRIBE COLUMNS(curid, colcnt, desctab);
  -- Define columns:
  FOR i IN 1 .. colcnt LOOP
    IF desctab(i).col type = 2 THEN
     DBMS SQL.DEFINE COLUMN(curid, i, numvar);
   ELSIF desctab(i).col type = 12 THEN
     DBMS SQL.DEFINE COLUMN(curid, i, datevar);
     -- statements
   ELSE
     DBMS SQL.DEFINE COLUMN(curid, i, namevar, 50);
    END IF;
  END LOOP;
  -- Fetch rows with DBMS SQL package:
 WHILE DBMS SQL.FETCH ROWS(curid) > 0 LOOP
    FOR i IN 1 .. colcnt LOOP
     IF (desctab(i).col type = 1) THEN
       DBMS SQL.COLUMN VALUE(curid, i, namevar);
     ELSIF (desctab(i).col_type = 2) THEN
        DBMS SQL.COLUMN_VALUE(curid, i, numvar);
      ELSIF (desctab(i).col type = 12) THEN
        DBMS SQL.COLUMN VALUE(curid, i, datevar);
```

```
-- statements
END IF;
END LOOP;
END LOOP;
DBMS_SQL.CLOSE_CURSOR(curid);
END;
/
```

# **SQL** Injection

SQL injection maliciously exploits applications that use client-supplied data in SQL statements, thereby gaining unauthorized access to a database to view or manipulate restricted data.

This section describes SQL injection vulnerabilities in PL/SQL and explains how to guard against them.

### Topics

- SQL Injection Techniques
- Guards Against SQL Injection

### Example 8-15 Setup for SQL Injection Examples

To try the examples, run these statements.

### Live SQL:

You can view and run this example on Oracle Live SQL at SQL Injection Demo

```
DROP TABLE secret records;
CREATE TABLE secret records (
 user name VARCHAR2(9),
 service_type VARCHAR2(12),
 value
          VARCHAR2(30),
 date_created DATE
);
INSERT INTO secret_records (
 user_name, service_type, value, date_created
)
VALUES ('Andy', 'Waiter', 'Serve dinner at Cafe Pete', SYSDATE);
INSERT INTO secret records (
  user_name, service_type, value, date_created
)
VALUES ('Chuck', 'Merger', 'Buy company XYZ', SYSDATE);
```

# **SQL** Injection Techniques

All SQL injection techniques exploit a single vulnerability: String input is not correctly validated and is concatenated into a dynamic SQL statement.

### Topics

Statement Modification

- Statement Injection
- Data Type Conversion

### **Statement Modification**

**Statement modification** means deliberately altering a dynamic SQL statement so that it runs in a way unintended by the application developer.

Typically, the user retrieves unauthorized data by changing the WHERE clause of a SELECT statement or by inserting a UNION ALL clause. The classic example of this technique is bypassing password authentication by making a WHERE clause always TRUE.

### Example 8-16 Procedure Vulnerable to Statement Modification

This example creates a procedure that is vulnerable to statement modification and then invokes that procedure with and without statement modification. With statement modification, the procedure returns a supposedly secret record.

### Live SQL:

You can view and run this example on Oracle Live SQL at SQL Injection Demo

### Create vulnerable procedure:

```
CREATE OR REPLACE PROCEDURE get record (
 user name IN VARCHAR2,
 service type IN VARCHAR2,
            OUT VARCHAR2
 rec
) AUTHID DEFINER
IS
 query VARCHAR2(4000);
BEGIN
  -- Following SELECT statement is vulnerable to modification
 -- because it uses concatenation to build WHERE clause.
 query := 'SELECT value FROM secret_records WHERE user_name='''
          || user name
          || ''' AND service_type='''
          || service type
          || ''';
 DBMS OUTPUT.PUT LINE('Query: ' || query);
 EXECUTE IMMEDIATE query INTO rec ;
 DBMS OUTPUT.PUT LINE('Rec: ' || rec );
END;
```

### Demonstrate procedure without SQL injection:

```
SET SERVEROUTPUT ON;
DECLARE
record_value VARCHAR2(4000);
BEGIN
get_record('Andy', 'Waiter', record_value);
END;
/
```

Result:

```
Query: SELECT value FROM secret_records WHERE user_name='Andy' AND
service_type='Waiter'
Rec: Serve dinner at Cafe Pete
```

### Example of statement modification:

```
DECLARE
  record_value VARCHAR2(4000);
BEGIN
  get_record(
  'Anybody '' OR service_type=''Merger''--',
  'Anything',
  record_value);
END;
/
```

### Result:

```
Query: SELECT value FROM secret_records WHERE user_name='Anybody ' OR
service_type='Merger'--' AND service_type='Anything'
Rec: Buy company XYZ
```

PL/SQL procedure successfully completed.

### **Statement Injection**

**Statement injection** means that a user appends one or more SQL statements to a dynamic SQL statement.

Anonymous PL/SQL blocks are vulnerable to this technique.

### Example 8-17 Procedure Vulnerable to Statement Injection

This example creates a procedure that is vulnerable to statement injection and then invokes that procedure with and without statement injection. With statement injection, the procedure deletes the supposedly secret record exposed in Example 8-16.

### Live SQL:

You can view and run this example on Oracle Live SQL at SQL Injection Demo

### Create vulnerable procedure:

```
CREATE OR REPLACE PROCEDURE p (
    user_name IN VARCHAR2,
    service_type IN VARCHAR2
) AUTHID DEFINER
IS
    block1 VARCHAR2(4000);
BEGIN
    -- Following block is vulnerable to statement injection
    -- because it is built by concatenation.
    block1 :=
        'BEGIN
        DBMS_OUTPUT.PUT_LINE(''user_name: ' || user_name || ''');'
        || 'DBMS_OUTPUT.PUT_LINE(''service_type: ' || service_type || ''');
        END;';
```

```
DBMS_OUTPUT.PUT_LINE('Block1: ' || block1);
EXECUTE IMMEDIATE block1;
END;
```

Demonstrate procedure without SQL injection:

```
SET SERVEROUTPUT ON;
BEGIN
 p('Andy', 'Waiter');
END;
```

## Result:

/

### SQL\*Plus formatting command:

COLUMN date created FORMAT A12;

### Query:

SELECT \* FROM secret\_records ORDER BY user\_name;

### Result:

USER_NAME	SERVICE_TYPE	VALUE	DATE_CREATED
Andy	Waiter	Serve dinner at Cafe Pete	28-APR-10
Chuck	Merger	Buy company XYZ	28-APR-10

### Example of statement modification:

```
BEGIN
    p('Anybody', 'Anything'');
    DELETE FROM secret_records WHERE service_type=INITCAP(''Merger');
END;
/
```

### Result:

```
Block1: BEGIN
    DBMS_OUTPUT.PUT_LINE('user_name: Anybody');
    DBMS_OUTPUT.PUT_LINE('service_type: Anything');
    DELETE FROM secret_records WHERE service_type=INITCAP('Merger');
    END;
user_name: Anybody
service_type: Anything
```

PL/SQL procedure successfully completed.

### Query:

SELECT \* FROM secret\_records;

```
    USER_NAME
    SERVICE_TYPE
    VALUE
    DATE_CREATED

    ------
    -------
    -------
    -------

    Andy
    Waiter
    Serve dinner at Cafe Pete
    18-MAR-09
```

### 1 row selected.

### Data Type Conversion

A less known SQL injection technique uses NLS session parameters to modify or inject SQL statements.

A datetime or numeric value that is concatenated into the text of a dynamic SQL statement must be converted to the VARCHAR2 data type. The conversion can be either implicit (when the value is an operand of the concatenation operator) or explicit (when the value is the argument of the TO\_CHAR function). This data type conversion depends on the NLS settings of the database session that runs the dynamic SQL statement. The conversion of datetime values uses format models specified in the parameters NLS\_DATE\_FORMAT, NLS\_TIMESTAMP\_FORMAT, or NLS\_TIMESTAMP\_TZ\_FORMAT, depending on the particular datetime data type. The conversion of numeric values applies decimal and group separators specified in the parameter NLS\_NUMERIC\_CHARACTERS.

One datetime format model is "text". The text is copied into the conversion result. For example, if the value of NLS\_DATE\_FORMAT is '"Month:" Month', then in June, TO\_CHAR(SYSDATE) returns 'Month: June'. The datetime format model can be abused as shown in Example 8-18.

### Example 8-18 Procedure Vulnerable to SQL Injection Through Data Type Conversion

SELECT \* FROM secret\_records;

### Result:

USER_NAME	SERVICE_TYPE	VALUE	DATE_CREATE
	·		
Andy	Waiter	Serve dinner at Cafe Pete	28-APR-2010
Chuck	Merger	Buy company XYZ	28-APR-2010

### Create vulnerable procedure:

```
-- Return records not older than a month
CREATE OR REPLACE PROCEDURE get recent_record (
 user name IN VARCHAR2,
 service_type IN VARCHAR2,
 rec OUT VARCHAR2
) AUTHID DEFINER
TS
  query VARCHAR2(4000);
BEGIN
  /* Following SELECT statement is vulnerable to modification
    because it uses concatenation to build WHERE clause
    and because SYSDATE depends on the value of NLS DATE FORMAT. */
 query := 'SELECT value FROM secret records WHERE user name='''
          || user name
          || ''' AND service type='''
          || service_type
          || ''' AND date created>'''
```

```
|| (SYSDATE - 30)
|| '''';
DBMS_OUTPUT.PUT_LINE('Query: ' || query);
EXECUTE IMMEDIATE query INTO rec;
DBMS_OUTPUT.PUT_LINE('Rec: ' || rec);
END;
/
```

Demonstrate procedure without SQL injection:

```
SET SERVEROUTPUT ON;
ALTER SESSION SET NLS DATE FORMAT='DD-MON-YYYY';
```

```
DECLARE
  record_value VARCHAR2(4000);
BEGIN
  get_recent_record('Andy', 'Waiter', record_value);
END;
/
```

### Result:

```
Query: SELECT value FROM secret_records WHERE user_name='Andy' AND
service_type='Waiter' AND date_created>'29-MAR-2010'
Rec: Serve dinner at Cafe Pete
```

### Example of statement modification:

```
ALTER SESSION SET NLS_DATE_FORMAT='"'' OR service_type=''Merger"';
```

```
DECLARE
  record_value VARCHAR2(4000);
BEGIN
  get_recent_record('Anybody', 'Anything', record_value);
END;
/
```

### Result:

```
Query: SELECT value FROM secret_records WHERE user_name='Anybody' AND
service_type='Anything' AND date_created>'' OR service_type='Merger'
Rec: Buy company XYZ
```

PL/SQL procedure successfully completed.

# **Guards Against SQL Injection**

If you use dynamic SQL in your PL/SQL applications, you must check the input text to ensure that it is exactly what you expected.

You can use the following techniques:

- Bind Variables
- Validation Checks
- Explicit Format Models

### **Bind Variables**

The most effective way to make your PL/SQL code invulnerable to SQL injection attacks is to use bind variables.

The database uses the values of bind variables exclusively and does not interpret their contents in any way. (Bind variables also improve performance.)

### Example 8-19 Bind Variables Guarding Against SQL Injection

The procedure in this example is invulnerable to SQL injection because it builds the dynamic SQL statement with bind variables (not by concatenation as in the vulnerable procedure in Example 8-16). The same binding technique fixes the vulnerable procedure shown in Example 8-17.

### Create invulnerable procedure:

```
CREATE OR REPLACE PROCEDURE get record 2 (
 user name IN VARCHAR2,
 service type IN VARCHAR2,
          OUT VARCHAR2
 rec
) AUTHID DEFINER
IS
 query VARCHAR2(4000);
BEGIN
 query := 'SELECT value FROM secret records
           WHERE user_name=:a
           AND service type=:b';
 DBMS OUTPUT.PUT LINE('Query: ' || query);
 EXECUTE IMMEDIATE query INTO rec USING user name, service type;
 DBMS OUTPUT.PUT LINE('Rec: ' || rec);
END;
```

### Demonstrate procedure without SQL injection:

```
SET SERVEROUTPUT ON;
DECLARE
  record_value VARCHAR2(4000);
BEGIN
  get_record_2('Andy', 'Waiter', record_value);
END;
/
```

### Result:

```
Query: SELECT value FROM secret_records

WHERE user_name=:a

AND service_type=:b

Rec: Serve dinner at Cafe Pete

PL/SQL procedure successfully completed.
```

### Try statement modification:

### Validation Checks

Always have your program validate user input to ensure that it is what is intended.

For example, if the user is passing a department number for a DELETE statement, check the validity of this department number by selecting from the departments table. Similarly, if a user enters the name of a table to be deleted, check that this table exists by selecting from the static data dictionary view ALL TABLES.

### Caution:

When checking the validity of a user name and its password, always return the same error regardless of which item is invalid. Otherwise, a malicious user who receives the error message "invalid password" but not "invalid user name" (or the reverse) can realize that they have guessed one of these correctly.

In validation-checking code, the subprograms in the DBMS\_ASSERT package are often useful. For example, you can use the DBMS\_ASSERT.ENQUOTE\_LITERAL function to enclose a string literal in quotation marks, as Example 8-20 does. This prevents a malicious user from injecting text between an opening quotation mark and its corresponding closing quotation mark.

### Caution:

Although the DBMS\_ASSERT subprograms are useful in validation code, they do not replace it. For example, an input string can be a qualified SQL name (verified by DBMS\_ASSERT.QUALIFIED\_SQL\_NAME) and still be a fraudulent password.

See Also: Oracle Database PL/SQL Packages and Types Reference for information about DBMS\_ASSERT subprograms

### Example 8-20 Validation Checks Guarding Against SQL Injection

In this example, the procedure raise\_emp\_salary checks the validity of the column name that was passed to it before it updates the employees table, and then the anonymous block invokes the procedure from both a dynamic PL/SQL block and a dynamic SQL statement.

```
CREATE OR REPLACE PROCEDURE raise emp salary (
  column value NUMBER,
 emp_column VARCHAR2,
 amount NUMBER ) AUTHID DEFINER
IS
 v column VARCHAR2(30);
 sql stmt VARCHAR2(200);
BEGIN
  -- Check validity of column name that was given as input:
 SELECT column name INTO v column
 FROM USER TAB COLS
 WHERE TABLE NAME = 'EMPLOYEES'
 AND COLUMN_NAME = emp_column;
  sql stmt := 'UPDATE employees SET salary = salary + :1 WHERE '
    || DBMS ASSERT.ENQUOTE NAME (v_column, FALSE) || ' = :2';
 EXECUTE IMMEDIATE sql stmt USING amount, column value;
  -- If column name is valid:
 IF SOL%ROWCOUNT > 0 THEN
    DBMS_OUTPUT.PUT_LINE('Salaries were updated for: '
     || emp_column || ' = ' || column_value);
 END IF;
  -- If column name is not valid:
 EXCEPTION
   WHEN NO DATA FOUND THEN
     DBMS OUTPUT.PUT LINE ('Invalid Column: ' || emp column);
END raise emp salary;
/
DECLARE
 plsql_block VARCHAR2(500);
BEGIN
 -- Invoke raise_emp_salary from a dynamic PL/SQL block:
 plsql block :=
    'BEGIN raise emp salary(:cvalue, :cname, :amt); END;';
 EXECUTE IMMEDIATE plsql block
   USING 110, 'DEPARTMENT ID', 10;
  -- Invoke raise_emp_salary from a dynamic SQL statement:
 EXECUTE IMMEDIATE 'BEGIN raise_emp_salary(:cvalue, :cname, :amt); END;'
    USING 112, 'EMPLOYEE_ID', 10;
END;
/
```

```
Salaries were updated for: DEPARTMENT_ID = 110
Salaries were updated for: EMPLOYEE ID = 112
```

### **Explicit Format Models**

Using explicit locale-independent format models to construct SQL is recommended not only from a security perspective, but also to ensure that the dynamic SQL statement runs correctly in any globalization environment.

If you use datetime and numeric values that are concatenated into the text of a SQL or PL/SQL statement, and you cannot pass them as bind variables, convert them to text using explicit format models that are independent from the values of the NLS parameters of the running session. Ensure that the converted values have the format of SQL datetime or numeric literals.

### Example 8-21 Explicit Format Models Guarding Against SQL Injection

This procedure is invulnerable to SQL injection because it converts the datetime parameter value, SYSDATE – 30, to a VARCHAR2 value explicitly, using the TO\_CHAR function and a locale-independent format model (not implicitly, as in the vulnerable procedure in Example 8-18).

### Create invulnerable procedure:

```
-- Return records not older than a month
CREATE OR REPLACE PROCEDURE get recent record (
 user name IN VARCHAR2,
 service type IN VARCHAR2,
               OUT VARCHAR2
 rec
) AUTHID DEFINER
IS
 query VARCHAR2(4000);
BEGIN
  /* Following SELECT statement is vulnerable to modification
    because it uses concatenation to build WHERE clause. */
 query := 'SELECT value FROM secret records WHERE user name='''
          || user name
          || ''' AND service type='''
          || service type
          || ''' AND date created> DATE '''
           || TO CHAR (SYSDATE - 30, 'YYYY-MM-DD')
           11 ''';
 DBMS OUTPUT.PUT LINE('Query: ' || query);
 EXECUTE IMMEDIATE query INTO rec;
 DBMS OUTPUT.PUT LINE('Rec: ' || rec);
END;
/
```

### Try statement modification:

ALTER SESSION SET NLS\_DATE\_FORMAT='"'' OR service\_type=''Merger"';

```
DECLARE
  record_value VARCHAR2(4000);
BEGIN
  get_recent_record('Anybody', 'Anything', record_value);
END;
/
```

Query: SELECT value FROM secret\_records WHERE user\_name='Anybody' AND service\_type='Anything' AND date\_created> DATE '2010-03-29' DECLARE \* ERROR at line 1: ORA-01403: no data found ORA-06512: at "SYS.GET\_RECENT\_RECORD", line 21 ORA-06512: at line 4

# 9 PL/SQL Subprograms

A PL/SQL **subprogram** is a named PL/SQL block that can be invoked repeatedly. If the subprogram has parameters, their values can differ for each invocation.

A subprogram is either a procedure or a function. Typically, you use a procedure to perform an action and a function to compute and return a value.

### Topics

- Reasons to Use Subprograms
- Nested, Package, and Standalone Subprograms
- Subprogram Invocations
- Subprogram Properties
- Subprogram Parts
- Forward Declaration
- Subprogram Parameters
- Subprogram Invocation Resolution
- Overloaded Subprograms
- Recursive Subprograms
- Subprogram Side Effects
- PL/SQL Function Result Cache
- PL/SQL Functions that SQL Statements Can Invoke
- Invoker's Rights and Definer's Rights (AUTHID Property)
- External Subprograms

# Reasons to Use Subprograms

Subprograms support the development and maintenance of reliable, reusable code with the following features:

Modularity

Subprograms let you break a program into manageable, well-defined modules.

Easier Application Design

When designing an application, you can defer the implementation details of the subprograms until you have tested the main program, and then refine them one step at a time. (To define a subprogram without implementation details, use the NULL statement, as in Example 5-31.)

Maintainability

You can change the implementation details of a subprogram without changing its invokers.

Packageability

Subprograms can be grouped into packages, whose advantages are explained in "Reasons to Use Packages".

### Reusability

Any number of applications, in many different environments, can use the same package subprogram or standalone subprogram.

### Better Performance

Each subprogram is compiled and stored in executable form, which can be invoked repeatedly. Because stored subprograms run in the database server, a single invocation over the network can start a large job. This division of work reduces network traffic and improves response times. Stored subprograms are cached and shared among users, which lowers memory requirements and invocation overhead.

Subprograms are an important component of other maintainability features, such as packages (explained in PL/SQL Packages) and Abstract Data Types (explained in "Abstract Data Types").

# Nested, Package, and Standalone Subprograms

You can create a subprogram either inside a PL/SQL block (which can be another subprogram), inside a package, or at schema level.

A subprogram created inside a PL/SQL block is a **nested subprogram**. You can either declare and define it at the same time, or you can declare it first and then define it later in the same block (see "Forward Declaration"). A nested subprogram is stored in the database only if it is nested in a standalone or package subprogram.

A subprogram created inside a package is a **package subprogram**. You declare it in the package specification and define it in the package body. It is stored in the database until you drop the package. (Packages are described in PL/SQL Packages.)

A subprogram created at schema level is a standalone subprogram. You create it with the CREATE FUNCTION or CREATE PROCEDURE statement. It is stored in the database until you drop it with the DROP FUNCTION or DROP PROCEDURE statement. (These statements are described in SQL Statements for Stored PL/SQL Units.)

A stored subprogram is either a package subprogram or a standalone subprogram. A stored subprogram is affected by the AUTHID and ACCESSIBLE BY clauses, which can appear in the CREATE FUNCTION, CREATE PROCEDURE, and CREATE PACKAGE statements. The AUTHID clause affects the name resolution and privilege checking of SQL statements that the subprogram issues at run time (for more information, see "Invoker's Rights and Definer's Rights (AUTHID Property)"). The ACCESSIBLE BY clause specifies a white list of PL/SQL units that can access the subprogram.

# Subprogram Invocations

A subprogram invocation has this form:

subprogram name [ ( [ parameter [, parameter]... ] ) ]

If the subprogram has no parameters, or specifies a default value for every parameter, you can either omit the parameter list or specify an empty parameter list.

A procedure invocation is a PL/SQL statement. For example:

```
raise_salary(employee_id, amount);
```

A function invocation is an expression. For example:

```
new_salary := get_salary(employee_id);
IF salary ok(new salary, new title) THEN ...
```

See Also:

"Subprogram Parameters" for more information about specifying parameters in subprogram invocations

# **Subprogram Properties**

Each subprogram property can appear only once in the subprogram declaration. The properties can appear in any order. Properties appear before the IS or AS keyword in the subprogram heading. The properties cannot appear in nested subprograms.

Only the **ACCESSIBLE** BY property can appear in package subprograms. Standalone subprograms may have the following properties in their declaration.

- ACCESSIBLE BY Clause
- DEFAULT COLLATION Clause
- Invoker's Rights and Definer's Rights (AUTHID Property)

# Subprogram Parts

A subprogram begins with a **subprogram heading**, which specifies its name and (optionally) its parameter list.

Like an anonymous block, a subprogram has these parts:

### Declarative part (optional)

This part declares and defines local types, cursors, constants, variables, exceptions, and nested subprograms. These items cease to exist when the subprogram completes execution.

This part can also specify pragmas.

### Note:

The declarative part of a subprogram does not begin with the keyword DECLARE, as the declarative part of an anonymous block does.

Executable part (required)

This part contains one or more statements that assign values, control execution, and manipulate data. (Early in the application design process, this part might contain only a NULL statement, as in Example 5-31.)

### • Exception-handling part (optional)

This part contains code that handles runtime errors.

### Topics

- Additional Parts for Functions
- RETURN Statement

# See Also: "Pragmas" "Procedure Declaration and Definition" for the syntax of procedure declarations and definitions "Subprogram Parameters" for more information about subprogram parameters

### Example 9-1 Declaring, Defining, and Invoking a Simple PL/SQL Procedure

In this example, an anonymous block simultaneously declares and defines a procedure and invokes it three times. The third invocation raises the exception that the exception-handling part of the procedure handles.

```
DECLARE
 first_name employees.first_name%TYPE;
 last name employees.last name%TYPE;
 email employees.email%TYPE;
 employer VARCHAR2(8) := 'AcmeCorp';
 -- Declare and define procedure
  PROCEDURE create email ( -- Subprogram heading begins
   name1 VARCHAR2,
   name2 VARCHAR2,
   company VARCHAR2
                           -- Subprogram heading ends
 )
 IS
                           -- Declarative part begins
   error message VARCHAR2(30) := 'Email address is too long.';
 BEGIN
                           -- Executable part begins
   email := name1 || '.' || name2 || '@' || company;
 EXCEPTION
                               -- Exception-handling part begins
   WHEN VALUE ERROR THEN
     DBMS OUTPUT.PUT_LINE(error_message);
 END create email;
BEGIN
 first name := 'John';
 last name := 'Doe';
 create email(first name, last name, employer); -- invocation
 DBMS OUTPUT.PUT LINE ('With first name first, email is: ' || email);
 create email(last name, first name, employer); -- invocation
 DBMS OUTPUT.PUT LINE ('With last name first, email is: ' || email);
  first name := 'Elizabeth';
 last_name := 'MacDonald';
 create email(first name, last name, employer); -- invocation
```

```
END;
/
```

```
With first name first, email is: John.Doe@AcmeCorp
With last name first, email is: Doe.John@AcmeCorp
Email address is too long.
```

# Additional Parts for Functions

A function has the same structure as a procedure, except that:

- A function heading must include a **RETURN clause**, which specifies the data type of the value that the function returns. (A procedure heading cannot have a RETURN clause.)
- In the executable part of a function, every execution path must lead to a RETURN statement. Otherwise, the PL/SQL compiler issues a compile-time warning. (In a procedure, the RETURN statement is optional and not recommended. For details, see "RETURN Statement".)
- OptionDescriptionDETERMINISTIC optionHelps the optimizer avoid redundant function invocations.PARALLEL\_ENABLE optionEnables the function for parallel execution, making it safe for use in<br/>concurrent sessions of parallel DML evaluations.PIPELINED optionMakes a table function pipelined, for use as a row source.RESULT\_CACHE optionStores function results in the PL/SQL function result cache.
- A function declaration can include these options:

### See Also:

- "Function Declaration and Definition" for the syntax of function declarations and definitions, including descriptions of the items in the preceding table
- "PL/SQL Function Result Cache" for more information about the RESULT\_CACHE option

### Example 9-2 Declaring, Defining, and Invoking a Simple PL/SQL Function

In this example, an anonymous block simultaneously declares and defines a function and invokes it.

```
DECLARE

-- Declare and define function

FUNCTION square (original NUMBER) -- parameter list

RETURN NUMBER -- RETURN clause

AS

-- Declarative part begins

original_squared NUMBER;

BEGIN -- Executable part begins

original_squared := original * original;

RETURN original_squared; -- RETURN statement

END;
```

```
BEGIN
   DBMS_OUTPUT.PUT_LINE(square(100)); -- invocation
END;
/
```

10000

# **RETURN Statement**

The RETURN statement immediately ends the execution of the subprogram or anonymous block that contains it. A subprogram or anonymous block can contain multiple RETURN statements.

### Topics

- RETURN Statement in Function
- RETURN Statement in Procedure
- RETURN Statement in Anonymous Block

### See Also:

"RETURN Statement" for the syntax of the RETURN statement

### **RETURN Statement in Function**

In a function, every execution path must lead to a RETURN statement and every RETURN statement must specify an expression. The RETURN statement assigns the value of the expression to the function identifier and returns control to the invoker, where execution resumes immediately after the invocation.

### Note:

In a pipelined table function, a RETURN statement need not specify an expression. For information about the parts of a pipelined table function, see "Creating Pipelined Table Functions".

In Example 9-3, the anonymous block invokes the same function twice. The first time, the RETURN statement returns control to the inside of the invoking statement. The second time, the RETURN statement returns control to the statement immediately after the invoking statement.

In Example 9-4, the function has multiple RETURN statements, but if the parameter is not 0 or 1, then no execution path leads to a RETURN statement. The function compiles with warning PLW-05005: subprogram F returns without value at line 11.

**Example 9-5** is like **Example 9-4**, except for the addition of the ELSE clause. Every execution path leads to a RETURN statement, and the function compiles without warning PLW-05005.

### Example 9-3 Execution Resumes After RETURN Statement in Function

```
DECLARE
 x INTEGER;
 FUNCTION f (n INTEGER)
 RETURN INTEGER
 IS
 BEGIN
   RETURN (n*n);
 END;
BEGIN
 DBMS OUTPUT.PUT LINE (
   'f returns ' || f(2) || '. Execution returns here (1).'
 );
 x := f(2);
 DBMS_OUTPUT.PUT_LINE('Execution returns here (2).');
END;
/
```

### Result:

f returns 4. Execution returns here (1). Execution returns here (2).

### Example 9-4 Function Where Not Every Execution Path Leads to RETURN Statement

```
CREATE OR REPLACE FUNCTION f (n INTEGER)
RETURN INTEGER
AUTHID DEFINER
IS
BEGIN
IF n = 0 THEN
RETURN 1;
ELSIF n = 1 THEN
RETURN n;
END IF;
END;
/
```

### Example 9-5 Function Where Every Execution Path Leads to RETURN Statement

```
CREATE OR REPLACE FUNCTION f (n INTEGER)
 RETURN INTEGER
 AUTHID DEFINER
IS
BEGIN
 IF n = 0 THEN
   RETURN 1;
 ELSIF n = 1 THEN
   RETURN n;
 ELSE
   RETURN n*n;
 END IF;
END;
/
BEGIN
 FOR i IN 0 .. 3 LOOP
   DBMS_OUTPUT.PUT_LINE('f(' || i || ') = ' || f(i));
 END LOOP;
END;
/
```

f(0) = 1 f(1) = 1 f(2) = 4f(3) = 9

## **RETURN Statement in Procedure**

In a procedure, the RETURN statement returns control to the invoker, where execution resumes immediately after the invocation. The RETURN statement cannot specify an expression.

In Example 9-6, the RETURN statement returns control to the statement immediately after the invoking statement.

### Example 9-6 Execution Resumes After RETURN Statement in Procedure

```
DECLARE
PROCEDURE p IS
BEGIN
DBMS_OUTPUT.PUT_LINE('Inside p');
RETURN;
DBMS_OUTPUT.PUT_LINE('Unreachable statement.');
END;
BEGIN
p;
DBMS_OUTPUT.PUT_LINE('Control returns here.');
END;
/
```

Result:

Inside p Control returns here.

### **RETURN Statement in Anonymous Block**

In an anonymous block, the RETURN statement exits its own block and all enclosing blocks. The RETURN statement cannot specify an expression.

In Example 9-7, the RETURN statement exits both the inner and outer block.

### Example 9-7 Execution Resumes After RETURN Statement in Anonymous Block

```
BEGIN
BEGIN
BEGIN
DBMS_OUTPUT.PUT_LINE('Inside inner block.');
RETURN;
DBMS_OUTPUT.PUT_LINE('Unreachable statement.');
END;
DBMS_OUTPUT.PUT_LINE('Inside outer block. Unreachable statement.');
END;
/
```

### Result:

Inside inner block.

# **Forward Declaration**

If nested subprograms in the same PL/SQL block invoke each other, then one requires a forward declaration, because a subprogram must be declared before it can be invoked.

A **forward declaration** declares a nested subprogram but does not define it. You must define it later in the same block. The forward declaration and the definition must have the same subprogram heading.

In Example 9-8, an anonymous block creates two procedures that invoke each other.

### Example 9-8 Nested Subprograms Invoke Each Other

```
DECLARE
  -- Declare proc1 (forward declaration):
 PROCEDURE proc1(number1 NUMBER);
 -- Declare and define proc2:
 PROCEDURE proc2(number2 NUMBER) IS
 BEGIN
   proc1(number2);
 END;
  -- Define proc 1:
 PROCEDURE proc1(number1 NUMBER) IS
 BEGIN
   proc2 (number1);
 END;
BEGIN
 NULL;
END;
```

# Subprogram Parameters

If a subprogram has parameters, their values can differ for each invocation.

### **Topics**

- Formal and Actual Subprogram Parameters
- Subprogram Parameter Passing Methods
- Subprogram Parameter Modes
- Subprogram Parameter Aliasing
- Default Values for IN Subprogram Parameters
- Positional, Named, and Mixed Notation for Actual Parameters

# Formal and Actual Subprogram Parameters

If you want a subprogram to have parameters, declare **formal parameters** in the subprogram heading. In each formal parameter declaration, specify the name and data type of the parameter, and (optionally) its mode and default value. In the execution part of the subprogram, reference the formal parameters by their names.

When invoking the subprogram, specify the **actual parameters** whose values are to be assigned to the formal parameters. Corresponding actual and formal parameters must have compatible data types.

# Note: You can declare a formal parameter of a constrained subtype, like this: DECLARE SUBTYPE n1 IS NUMBER(1); SUBTYPE v1 IS VARCHAR2(1); PROCEDURE p (n n1, v v1) IS ... But you cannot include a constraint in a formal parameter declaration, like this: DECLARE DECLARE

```
PROCEDURE p (n NUMBER(1), v VARCHAR2(1)) IS ...
```

### Tip:

To avoid confusion, use different names for formal and actual parameters.

### Note:

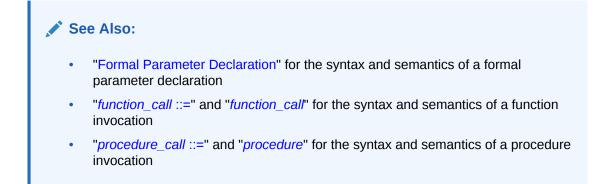

- Actual parameters (including default values of formal parameters) can be evaluated in any order. If a program determines order of evaluation, then at the point where the program does so, its behavior is undefined.
- You cannot use LOB parameters in a server-to-server remote procedure call (RPC).

In Example 9-9, the procedure has formal parameters emp\_id and amount. In the first procedure invocation, the corresponding actual parameters are emp\_num and bonus, whose value are 120 and 100, respectively. In the second procedure invocation, the actual parameters are emp\_num and merit + bonus, whose value are 120 and 150, respectively.

### **Topics:**

• Formal Parameters of Constrained Subtypes

### Example 9-9 Formal Parameters and Actual Parameters

```
DECLARE
 emp num NUMBER(6) := 120;
 bonus NUMBER(6) := 100;
 merit NUMBER(4) := 50;
 PROCEDURE raise salary (
   emp_id NUMBER, -- formal parameter
   amount NUMBER -- formal parameter
  ) IS
 BEGIN
   UPDATE employees
   SET salary = salary + amount -- reference to formal parameter
   WHERE employee id = emp id; -- reference to formal parameter
 END raise salary;
BEGIN
 raise salary(emp_num, bonus);
                                       -- actual parameters
 /* raise_salary runs this statement:
      UPDATE employees
      SET salary = salary + 100
      WHERE employee id = 120;
                                   */
 raise_salary(emp_num, merit + bonus); -- actual parameters
 /* raise_salary runs this statement:
      UPDATE employees
      SET salary = salary + 150
                                 */
      WHERE employee id = 120;
END;
```

### Formal Parameters of Constrained Subtypes

If the data type of a formal parameter is a constrained subtype, then:

- If the subtype has the NOT NULL constraint, then the actual parameter inherits it.
- If the subtype has the base type VARCHAR2, then the actual parameter does not inherit the size of the subtype.
- If the subtype has a numeric base type, then the actual parameter inherits the range of the subtype, but not the precision or scale.

Note:

In a function, the clause RETURN *datatype* declares a hidden formal parameter and the statement RETURN *value* specifies the corresponding actual parameter. Therefore, if *datatype* is a constrained data type, then the preceding rules apply to *value* (see Example 9-11).

Example 9-10 shows that an actual subprogram parameter inherits the NOT NULL constraint but not the size of a VARCHAR2 subtype.

As PL/SQL Predefined Data Types shows, PL/SQL has many predefined data types that are constrained subtypes of other data types. For example, INTEGER is a constrained subtype of NUMBER:

SUBTYPE INTEGER IS NUMBER(38,0);

In Example 9-11, the function has both an INTEGER formal parameter and an INTEGER return type. The anonymous block invokes the function with an actual parameter that is not an integer. Because the actual parameter inherits the range but not the precision and scale of INTEGER, and the actual parameter is in the INTEGER range, the invocation succeeds. For the same reason, the RETURN statement succeeds in returning the noninteger value.

In Example 9-12, the function implicitly converts its formal parameter to the constrained subtype INTEGER before returning it.

### See Also:

"Constrained Subtypes" for general information about constrained subtypes

### Example 9-10 Actual Parameter Inherits Only NOT NULL from Subtype

```
DECLARE
SUBTYPE License IS VARCHAR2(7) NOT NULL;
n License := 'DLLLDDD';
PROCEDURE p (x License) IS
BEGIN
DBMS_OUTPUT.PUT_LINE(x);
END;
BEGIN
p('1ABC123456789'); -- Succeeds; size is not inherited
p(NULL); -- Raises error; NOT NULL is inherited
END;
/
```

### Result:

```
p(NULL); -- Raises error; NOT NULL is inherited
 *
ERROR at line 12:
ORA-06550: line 12, column 5:
PLS-00567: cannot pass NULL to a NOT NULL constrained formal parameter
```

ORA-06550: line 12, column 3: PL/SQL: Statement ignored

### Example 9-11 Actual Parameter and Return Value Inherit Only Range From Subtype

```
DECLARE
FUNCTION test (p INTEGER) RETURN INTEGER IS
BEGIN
DBMS_OUTPUT.PUT_LINE('p = ' || p);
RETURN p;
END test;
BEGIN
DBMS_OUTPUT.PUT_LINE('test(p) = ' || test(0.66));
END;
/
```

Result:

p = .66
test(p) = .66

PL/SQL procedure successfully completed.

### Example 9-12 Function Implicitly Converts Formal Parameter to Constrained Subtype

```
DECLARE
FUNCTION test (p NUMBER) RETURN NUMBER IS
q INTEGER := p; -- Implicitly converts p to INTEGER
BEGIN
DBMS_OUTPUT.PUT_LINE('p = ' || q); -- Display q, not p
RETURN q; -- Return q, not p
END test;
BEGIN
DBMS_OUTPUT.PUT_LINE('test(p) = ' || test(0.66));
END;
/
Result:
p = 1
test(p) = 1
```

PL/SQL procedure successfully completed.

# Subprogram Parameter Passing Methods

The PL/SQL compiler has two ways of passing an actual parameter to a subprogram:

### By reference

The compiler passes the subprogram a pointer to the actual parameter. The actual and formal parameters refer to the same memory location.

By value

The compiler assigns the value of the actual parameter to the corresponding formal parameter. The actual and formal parameters refer to different memory locations.

If necessary, the compiler implicitly converts the data type of the actual parameter to the data type of the formal parameter. For information about implicit data conversion, see *Oracle Database SQL Language Reference*.

### 🔷 Tip:

Avoid implicit data conversion (for the reasons in *Oracle Database SQL Language Reference*), in either of these ways:

- Declare the variables that you intend to use as actual parameters with the same data types as their corresponding formal parameters (as in the declaration of variable x in Example 9-13).
- Explicitly convert actual parameters to the data types of their corresponding formal parameters, using the SQL conversion functions described in Oracle Database SQL Language Reference (as in the third invocation of the procedure in Example 9-13).

In Example 9-13, the procedure p has one parameter, n, which is passed by value. The anonymous block invokes p three times, avoiding implicit conversion twice.

The method by which the compiler passes a specific actual parameter depends on its mode, as explained in "Subprogram Parameter Modes".

### Example 9-13 Avoiding Implicit Conversion of Actual Parameters

```
CREATE OR REPLACE PROCEDURE p (
 n NUMBER
) AUTHID DEFINER IS
BEGIN
 NULL;
END;
/
DECLARE
 X NUMBER := 1;
 v VARCHAR2(1) := '1';
BEGIN
                 -- No conversion needed
 p(x);
        -- z implicitly converted from VARCHAR2 to NUMBER
 p(y);
 p(TO NUMBER(y)); -- z explicitly converted from VARCHAR2 to NUMBER
END;
```

# Subprogram Parameter Modes

The mode of a formal parameter determines its behavior.

Table 9-1 summarizes and compares the characteristics of the subprogram parameter modes.

Table 9-1	PL/SQL Subprogram Parameter Modes
-----------	-----------------------------------

Parameter Mode	Is Default?	Role
IN	Default mode	Passes a value to the subprogram.
OUT	Must be specified.	Returns a value to the invoker.
IN OUT	Must be specified.	Passes an initial value to the subprogram and returns an updated value to the invoker.

Parameter Mode	Formal Parameter	Actual Parameter	Passed by Reference ?
IN	Formal parameter acts like a constant: When the subprogram begins, its value is that of either its actual parameter or default value, and the subprogram cannot change this value.	Actual parameter can be a constant, initialized variable, literal, or expression.	Actual parameter is passed by reference.
OUT	Formal parameter is initialized to the default value of its type. The default value of the type is NULL except for a record type with a non- NULL default value (see Example 9-16).	If the default value of the formal parameter type is NULL, then the actual parameter must be a variable whose data type is not defined as NOT NULL.	By default, actual parameter is passed by value; if you specify NOCOPY, it might be passed by reference.
	When the subprogram begins, the formal parameter has its initial value regardless of the value of its actual parameter. Oracle recommends that the subprogram assign a value to the formal parameter.		
IN OUT	Formal parameter acts like an initialized variable: When the subprogram begins, its value is that of its actual parameter. Oracle recommends that the subprogram update its value.	Actual parameter must be a variable (typically, it is a string buffer or numeric accumulator).	By default, actual parameter is passed by value (in both directions); if you specify NOCOPY, it might be passed by reference.

### Table 9-2 PL/SQL Subprogram Parameter Modes Characteristics

### 💙 Tip:

Do not use <code>OUT</code> and <code>IN</code> <code>OUT</code> for function parameters. Ideally, a function takes zero or more parameters and returns a single value. A function with <code>IN</code> <code>OUT</code> parameters returns multiple values and has side effects.

### Note:

The specifications of many packages and types that Oracle Database supplies declare formal parameters with this notation:

i1 IN VARCHAR2 CHARACTER SET ANY\_CS
i2 IN VARCHAR2 CHARACTER SET i1%CHARSET

Do not use this notation when declaring your own formal or actual parameters. It is reserved for Oracle implementation of the supplied packages types.

Regardless of how an OUT or IN OUT parameter is passed:

- If the subprogram exits successfully, then the value of the actual parameter is the final value assigned to the formal parameter. (The formal parameter is assigned at least one value—the initial value.)
- If the subprogram ends with an exception, then the value of the actual parameter is undefined.
- Formal OUT and IN OUT parameters can be returned in any order. In this example, the final values of x and y are undefined:

```
CREATE OR REPLACE PROCEDURE p (x OUT INTEGER, y OUT INTEGER) AS
BEGIN
x := 17; y := 93;
END;
/
```

When an OUT or IN OUT parameter is passed by reference, the actual and formal parameters refer to the same memory location. Therefore, if the subprogram changes the value of the formal parameter, the change shows immediately in the actual parameter (see "Subprogram Parameter Aliasing with Parameters Passed by Reference").

In Example 9-14, the procedure p has two IN parameters, one OUT parameter, and one IN OUT parameter. The OUT and IN OUT parameters are passed by value (the default). The anonymous block invokes p twice, with different actual parameters. Before each invocation, the anonymous block prints the values of the actual parameters. The procedure p prints the initial values of its formal parameters. After each invocation, the anonymous block prints the values of the actual parameters anonymous block prints the values of the actual parameters.

In Example 9-15, the anonymous block invokes procedure p (from Example 9-14) with an actual parameter that causes p to raise the predefined exception <code>ZERO\_DIVIDE</code>, which p does not handle. The exception propagates to the anonymous block, which handles <code>ZERO\_DIVIDE</code> and shows that the actual parameters for the IN and IN OUT parameters of p have retained the values that they had before the invocation. (Exception propagation is explained in "Exception Propagation".)

In Example 9-16, the procedure p has three OUT formal parameters: x, of a record type with a non-NULL default value; y, of a record type with no non-NULL default value; and z, which is not a record.

The corresponding actual parameters for x, y, and z are r1, r2, and s, respectively. s is declared with an initial value. However, when p is invoked, the value of s is initialized to NULL. The values of r1 and r2 are initialized to the default values of their record types, 'abcde' and NULL, respectively.

### Example 9-14 Parameter Values Before, During, and After Procedure Invocation

```
CREATE OR REPLACE PROCEDURE p (
    a     PLS_INTEGER, -- IN by default
    b     IN PLS_INTEGER,
    c     OUT PLS_INTEGER,
    d IN OUT BINARY_FLOAT
) AUTHID DEFINER IS
BEGIN
    -- Print values of parameters:
    DBMS_OUTPUT.PUT_LINE('Inside procedure p:');
    DBMS_OUTPUT.PUT_LINE('Inside procedure p:');
    DBMS_OUTPUT.PUT_LINE(NVL(TO_CHAR(a), 'NULL'));
    DBMS OUTPUT.PUT('IN b = ');
```

```
DBMS OUTPUT.PUT LINE(NVL(TO CHAR(b), 'NULL'));
  DBMS OUTPUT.PUT('OUT c = ');
  DBMS OUTPUT.PUT LINE(NVL(TO CHAR(c), 'NULL'));
  DBMS OUTPUT.PUT LINE('IN OUT d = ' || TO CHAR(d));
  -- Can reference IN parameters a and b,
  -- but cannot assign values to them.
 c := a+10; -- Assign value to OUT parameter
 d := 10/b; -- Assign value to IN OUT parameter
END;
DECLARE
 aa CONSTANT PLS INTEGER := 1;
 bb PLS INTEGER := 2;
 cc PLS INTEGER := 3;
 dd BINARY FLOAT := 4;
 ee PLS INTEGER;
 ff BINARY FLOAT := 5;
BEGIN
 DBMS OUTPUT.PUT LINE ('Before invoking procedure p:');
  DBMS OUTPUT.PUT('aa = ');
  DBMS OUTPUT.PUT LINE(NVL(TO CHAR(aa), 'NULL'));
  DBMS OUTPUT.PUT('bb = ');
  DBMS OUTPUT.PUT LINE (NVL (TO CHAR (bb), 'NULL'));
  DBMS OUTPUT.PUT('cc = ');
  DBMS OUTPUT.PUT LINE(NVL(TO CHAR(cc), 'NULL'));
  DBMS_OUTPUT.PUT_LINE('dd = ' || TO_CHAR(dd));
 p (aa, -- constant
    bb, -- initialized variable
     cc, -- initialized variable
     dd -- initialized variable
 );
  DBMS OUTPUT.PUT LINE ('After invoking procedure p:');
  DBMS OUTPUT.PUT('aa = ');
  DBMS_OUTPUT.PUT_LINE(NVL(TO_CHAR(aa), 'NULL'));
  DBMS OUTPUT.PUT('bb = ');
  DBMS OUTPUT.PUT LINE (NVL (TO CHAR (bb), 'NULL'));
  DBMS OUTPUT.PUT('cc = ');
  DBMS OUTPUT.PUT LINE(NVL(TO CHAR(cc), 'NULL'));
  DBMS_OUTPUT.PUT_LINE('dd = ' || TO_CHAR(dd));
  DBMS OUTPUT.PUT LINE ('Before invoking procedure p:');
  DBMS OUTPUT.PUT('ee = ');
  DBMS OUTPUT.PUT_LINE(NVL(TO_CHAR(ee), 'NULL'));
  DBMS_OUTPUT.PUT_LINE('ff = ' || TO_CHAR(ff));
  p (1,
             -- literal
```

```
(bb+3)*4, -- expression
ee, -- uninitialized variable
ff -- initialized variable
);
DBMS_OUTPUT.PUT_LINE('After invoking procedure p:');
DBMS_OUTPUT.PUT_LINE('After invoking p:');
DBM
```

```
Before invoking procedure p:
aa = 1
bb = 2
cc = 3
dd = 4.0E + 000
Inside procedure p:
IN a = 1
IN b = 2
OUT c = NULL
IN OUT d = 4.0E + 000
After invoking procedure p:
aa = 1
bb = 2
cc = 11
dd = 5.0E + 000
Before invoking procedure p:
ee = NULL
ff = 5.0E + 000
Inside procedure p:
IN a = 1
IN b = 20
OUT c = NULL
IN OUT d = 5.0E + 000
After invoking procedure p:
ee = 11
ff = 5.0E - 001
```

PL/SQL procedure successfully completed.

### Example 9-15 OUT and IN OUT Parameter Values After Exception Handling

```
DECLARE
  j PLS_INTEGER := 10;
  k BINARY_FLOAT := 15;
BEGIN
  DBMS_OUTPUT.PUT_LINE('Before invoking procedure p:');
  DBMS_OUTPUT.PUT_LINE('Before invoking procedure p:');
  DBMS_OUTPUT.PUT_LINE(VL(TO_CHAR(j), 'NULL'));
  DBMS_OUTPUT.PUT_LINE('k = ' || TO_CHAR(k));
  p(4, 0, j, k); -- causes p to exit with exception ZERO_DIVIDE
EXCEPTION
  WHEN ZERO_DIVIDE THEN
  DBMS_OUTPUT.PUT_LINE('After invoking procedure p:');
```

```
DBMS_OUTPUT.PUT('j = ');
DBMS_OUTPUT.PUT_LINE(NVL(TO_CHAR(j), 'NULL'));
DBMS_OUTPUT.PUT_LINE('k = ' || TO_CHAR(k));
END;
/
```

```
Before invoking procedure p:

j = 10

k = 1.5E+001

Inside procedure p:

IN a = 4

IN b = 0

OUT c = NULL

IN OUT d = 1.5E+001

After invoking procedure p:

j = 10

k = 1.5E+001
```

PL/SQL procedure successfully completed.

### Example 9-16 OUT Formal Parameter of Record Type with Non-NULL Default Value

```
CREATE OR REPLACE PACKAGE r_types AUTHID DEFINER IS
  TYPE r_type_1 IS RECORD (f VARCHAR2(5) := 'abcde');
  TYPE r type 2 IS RECORD (f VARCHAR2(5));
END;
/
CREATE OR REPLACE PROCEDURE p (
 x OUT r types.r type 1,
 y OUT r types.r_type_2,
 z OUT VARCHAR2)
AUTHID CURRENT USER IS
BEGIN
  DBMS OUTPUT.PUT LINE('x.f is ' || NVL(x.f, 'NULL'));
  DBMS OUTPUT.PUT LINE ('y.f is ' || NVL(y.f, 'NULL'));
  DBMS OUTPUT.PUT LINE ('z is ' || NVL(z, 'NULL'));
END;
/
DECLARE
 r1 r_types.r_type_1;
 r2 r_types.r_type_2;
 s VARCHAR2(5) := 'fghij';
BEGIN
  p (r1, r2, s);
END;
/
```

### Result:

```
x.f is abcde
y.f is NULL
z is NULL
```

PL/SQL procedure successfully completed.

# Subprogram Parameter Aliasing

**Aliasing** is having two different names for the same memory location. If a stored item is visible by more than one path, and you can change the item by one path, then you can see the change by all paths.

Subprogram parameter aliasing always occurs when the compiler passes an actual parameter by reference, and can also occur when a subprogram has cursor variable parameters.

### Topics

- Subprogram Parameter Aliasing with Parameters Passed by Reference
- Subprogram Parameter Aliasing with Cursor Variable Parameters

### Subprogram Parameter Aliasing with Parameters Passed by Reference

When the compiler passes an actual parameter by reference, the actual and formal parameters refer to the same memory location. Therefore, if the subprogram changes the value of the formal parameter, the change shows immediately in the actual parameter.

The compiler always passes IN parameters by reference, but the resulting aliasing cannot cause problems, because subprograms cannot assign values to IN parameters.

The compiler *might* pass an OUT OF IN OUT parameter by reference, if you specify NOCOPY for that parameter. NOCOPY is only a hint—each time the subprogram is invoked, the compiler decides, silently, whether to obey or ignore NOCOPY. Therefore, aliasing can occur for one invocation but not another, making subprogram results indeterminate. For example:

- If the actual parameter is a global variable, then an assignment to the formal parameter *might* show in the global parameter (see Example 9-17).
- If the same variable is the actual parameter for two formal parameters, then an assignment to either formal parameter *might* show immediately in both formal parameters (see Example 9-18).
- If the actual parameter is a package variable, then an assignment to either the formal parameter or the package variable *might* show immediately in both the formal parameter and the package variable.
- If the subprogram is exited with an unhandled exception, then an assignment to the formal parameter *might* show in the actual parameter.

### See Also:

"NOCOPY" for the cases in which the compiler always ignores NOCOPY

In Example 9-17, the procedure has an IN OUT NOCOPY formal parameter, to which it assigns the value 'aardvark'. The anonymous block assigns the value 'aardwolf' to a global variable and then passes the global variable to the procedure. If the compiler obeys the NOCOPY hint, then the final value of the global variable is 'aardvark'. If the compiler ignores the NOCOPY hint, then the final value of the global variable is 'aardwolf'.

In Example 9-18, the procedure has an IN parameter, an IN OUT parameter, and an IN OUT NOCOPY parameter. The anonymous block invokes the procedure, using the same actual

parameter, a global variable, for all three formal parameters. The procedure changes the value of the IN OUT parameter before it changes the value of the IN OUT NOCOPY parameter. However, if the compiler obeys the NOCOPY hint, then the latter change shows in the actual parameter immediately. The former change shows in the actual parameter after the procedure is exited successfully and control returns to the anonymous block.

## Example 9-17 Aliasing from Global Variable as Actual Parameter

```
DECLARE
 TYPE Definition IS RECORD (
   word VARCHAR2(20),
   meaning VARCHAR2(200)
 );
 TYPE Dictionary IS VARRAY(2000) OF Definition;
 lexicon Dictionary := Dictionary(); -- global variable
 PROCEDURE add entry (
   word list IN OUT NOCOPY Dictionary -- formal NOCOPY parameter
 ) IS
 BEGIN
   word list(1).word := 'aardvark';
 END;
BEGIN
 lexicon.EXTEND;
 lexicon(1).word := 'aardwolf';
 add entry(lexicon); -- global variable is actual parameter
 DBMS OUTPUT.PUT LINE (lexicon(1).word);
END;
```

#### Result:

aardvark

Example 9-18 Aliasing from Same Actual Parameter for Multiple Formal Parameters

```
DECLARE
 n NUMBER := 10;
 PROCEDURE p (
   n1 IN NUMBER,
   n2 IN OUT NUMBER,
   n3 IN OUT NOCOPY NUMBER
 ) IS
 BEGIN
   n2 := 20; -- actual parameter is 20 only after procedure succeeds
   DBMS OUTPUT.put line(n1); -- actual parameter value is still 10
   n3 := 30; -- might change actual parameter immediately
   DBMS OUTPUT.put line(n1); -- actual parameter value is either 10 or 30
 END;
BEGIN
 p(n, n, n);
 DBMS OUTPUT.put_line(n);
END:
```

Result if the compiler obeys the NOCOPY hint:

```
10
30
20
```

Result if the compiler ignores the NOCOPY hint:

10 10 30

## Subprogram Parameter Aliasing with Cursor Variable Parameters

Cursor variable parameters are pointers. Therefore, if a subprogram assigns one cursor variable parameter to another, they refer to the same memory location. This aliasing can have unintended results.

In Example 9-19, the procedure has two cursor variable parameters,  $emp\_cv1$  and  $emp\_cv2$ . The procedure opens  $emp\_cv1$  and assigns its value (which is a pointer) to  $emp\_cv2$ . Now  $emp\_cv1$  and  $emp\_cv2$  refer to the same memory location. When the procedure closes  $emp\_cv1$ , it also closes  $emp\_cv2$ . Therefore, when the procedure tries to fetch from  $emp\_cv2$ , PL/SQL raises an exception.

## Example 9-19 Aliasing from Cursor Variable Subprogram Parameters

```
DECLARE
 TYPE EmpCurTyp IS REF CURSOR;
 c1 EmpCurTyp;
 c2 EmpCurTyp;
 PROCEDURE get emp data (
   emp cv1 IN OUT EmpCurTyp,
   emp cv2 IN OUT EmpCurTyp
 )
 IS
   emp rec employees%ROWTYPE;
 BEGIN
   OPEN emp cv1 FOR SELECT * FROM employees;
    emp cv2 := emp cv1; -- now both variables refer to same location
    FETCH emp cv1 INTO emp rec; -- fetches first row of employees
    FETCH emp cv1 INTO emp rec; -- fetches second row of employees
    FETCH emp cv2 INTO emp rec; -- fetches third row of employees
    CLOSE emp_cv1; -- closes both variables
   FETCH emp_cv2 INTO emp_rec; -- causes error when get_emp_data is invoked
 END;
BEGIN
 get_emp_data(c1, c2);
END;
Result:
DECLARE
```

\* ERROR at line 1: ORA-01001: cursor number is invalid or does not exist ORA-06512: at line 19 ORA-06512: at line 22

## Default Values for IN Subprogram Parameters

When you declare a formal IN parameter, you can specify a default value for it. A formal parameter with a default value is called an **optional parameter**, because its corresponding actual parameter is optional in a subprogram invocation. If the actual parameter is omitted, then the invocation assigns the default value to the formal parameter. A formal parameter with no default value is called a **required parameter**, because its corresponding actual parameter is required in a subprogram invocation.

Omitting an actual parameter does not make the value of the corresponding formal parameter NULL. To make the value of a formal parameter NULL, specify NULL as either the default value or the actual parameter.

In Example 9-20, the procedure has one required parameter and two optional parameters.

In Example 9-20, the procedure invocations specify the actual parameters in the same order as their corresponding formal parameters are declared—that is, the invocations use positional notation. Positional notation does not let you omit the second parameter of raise\_salary but specify the third; to do that, you must use either named or mixed notation. For more information, see "Positional, Named, and Mixed Notation for Actual Parameters".

The default value of a formal parameter can be any expression whose value can be assigned to the parameter; that is, the value and parameter must have compatible data types. If a subprogram invocation specifies an actual parameter for the formal parameter, then that invocation does not evaluate the default value.

In Example 9-21, the procedure p has a parameter whose default value is an invocation of the function f. The function f increments the value of a global variable. When p is invoked without an actual parameter, p invokes f, and f increments the global variable. When p is invoked with an actual parameter, p does not invoke f, and value of the global variable does not change.

Example 9-22 creates a procedure with two required parameters, invokes it, and then adds a third, optional parameter. Because the third parameter is optional, the original invocation remains valid.

## Example 9-20 Procedure with Default Parameter Values

```
DECLARE
PROCEDURE raise_salary (
    emp_id IN employees.employee_id%TYPE,
    amount IN employees.salary%TYPE := 100,
    extra IN employees.salary%TYPE := 50
) IS
BEGIN
    UPDATE employees
    SET salary = salary + amount + extra
    WHERE employee_id = emp_id;
END raise_salary;
BEGIN
    raise_salary(120); -- same as raise_salary(120, 100, 50)
    raise_salary(121, 200); -- same as raise_salary(121, 200, 50)
END;
/
```

## Example 9-21 Function Provides Default Parameter Value

DECLARE
global PLS\_INTEGER := 0;

```
FUNCTION f RETURN PLS INTEGER IS
 BEGIN
   DBMS_OUTPUT.PUT_LINE('Inside f.');
   global := global + 1;
   RETURN global * 2;
 END f;
 PROCEDURE p (
  x IN PLS INTEGER := f()
 ) IS
 BEGIN
   DBMS OUTPUT.PUT LINE (
     'Inside p. ' ||
     ' global = ' || global ||
     ', x = ' || x || '.'
   );
   DBMS OUTPUT.PUT LINE('-----');
 END p;
 PROCEDURE pre p IS
 BEGIN
   DBMS OUTPUT.PUT LINE (
    'Before invoking p, global = ' || global || '.'
   );
   DBMS OUTPUT.PUT LINE('Invoking p.');
 END pre_p;
BEGIN
 pre_p;
 p();
         -- default expression is evaluated
 pre p;
 p(100); -- default expression is not evaluated
 pre_p;
          -- default expression is evaluated
 p();
END;
/
```

## Result:

```
Before invoking p, global = 0.
Invoking p.
Inside f.
Inside p. global = 1, x = 2.
Before invoking p, global = 1.
Invoking p.
Inside p. global = 1, x = 100.
Before invoking p, global = 1.
Invoking p.
Inside f.
Inside p. global = 2, x = 4.
```

## Example 9-22 Adding Subprogram Parameter Without Changing Existing Invocations

#### Create procedure:

```
CREATE OR REPLACE PROCEDURE print_name ( first VARCHAR2,
```

```
last VARCHAR2
) AUTHID DEFINER IS
BEGIN
   DBMS_OUTPUT.PUT_LINE(first || ' ' || last);
END print_name;
/
```

#### Invoke procedure:

```
BEGIN
    print_name('John', 'Doe');
END;
/
```

## Result:

John Doe

Add third parameter with default value:

```
CREATE OR REPLACE PROCEDURE print_name (
   first VARCHAR2,
   last VARCHAR2,
   mi VARCHAR2 := NULL
) AUTHID DEFINER IS
BEGIN
   IF mi IS NULL THEN
      DBMS_OUTPUT.PUT_LINE(first || ' ' || last);
   ELSE
      DBMS_OUTPUT.PUT_LINE(first || ' ' || mi || '. ' || last);
   END IF;
END print_name;
/
```

## Invoke procedure:

```
BEGIN
    print_name('John', 'Doe'); -- original invocation
    print_name('John', 'Public', 'Q'); -- new invocation
END;
/
```

## Result:

John Doe John Q. Public

## Positional, Named, and Mixed Notation for Actual Parameters

When invoking a subprogram, you can specify the actual parameters using either positional, named, or mixed notation. Table 9-3 summarizes and compares these notations.

Notation	Syntax	<b>Optional parameters</b>	Advantages	Disadvantages
Positional	Specify the actual parameters in the same order as the formal parameters are declared.	You can omit trailing optional parameters.		Specifying actual parameters in the wrong order can cause problems that are hard to detect, especially if the actual parameters are literals.
				Subprogram invocations must change if the formal parameter list changes, unless the list only acquires new trailing optional parameters (as in Example 9-22).
				Reduced code clarity and maintainability. Not recommended if the subprogram has a large number of parameters.
Named	parameters in any optional parameters. specifying actual parameters	There is no wrong order for specifying actual parameters.		
	syntax: formal => actual		Subprogram invocations must change only if the formal parameter list acquires new required parameters.	
	formal is the name of			
	the formal parameter and <i>actual</i> is the actual parameter.		Recommended when you invoke a subprogram defined or maintained by someone else.	
Mixed	Start with positional notation, then use named notation for the remaining parameters.	In the positional notation, you can omit trailing optional parameters; in the named notation, you can omit any optional parameters.	Convenient when you invoke a subprogram that has required parameters followed by optional parameters, and you must specify only a few of the optional parameters.	In the positional notation, the wrong order can cause problems that are hard to detect, especially if the actual parameters are literals. Changes to the formal
		-		parameter list might require changes in the positional notation.

## Table 9-3 PL/SQL Actual Parameter Notations

In Example 9-23, the procedure invocations use different notations, but are equivalent.

In Example 9-24, the SQL SELECT statements invoke the PL/SQL function compute\_bonus, using equivalent invocations with different notations.

Example 9-23 Equivalent Invocations with Different Notations in Anonymous Block

```
DECLARE
  emp_num NUMBER(6) := 120;
  bonus NUMBER(6) := 50;
  PROCEDURE raise_salary (
```

```
emp id NUMBER,
   amount NUMBER
 ) TS
 BEGIN
   UPDATE employees
   SET salary = salary + amount
   WHERE employee id = emp id;
 END raise salary;
BEGIN
  -- Equivalent invocations:
 raise_salary(emp_num, bonus);
                                                     -- positional notation
 raise_salary(amount => bonus, emp_id => emp_num); -- named notation
 raise_salary(emp_id => emp_num, amount => bonus); -- named notation
                                                   -- mixed notation
 raise salary(emp num, amount => bonus);
END;
```

#### Example 9-24 Equivalent Invocations with Different Notations in SELECT Statements

```
CREATE OR REPLACE FUNCTION compute bonus (
 emp id NUMBER,
 bonus NUMBER
) RETURN NUMBER
 AUTHID DEFINER
IS
 emp sal NUMBER;
BEGIN
 SELECT salary INTO emp_sal
 FROM employees
 WHERE employee id = emp id;
 RETURN emp sal + bonus;
END compute bonus;
/
SELECT compute bonus (120, 50) FROM DUAL;
                                                           -- positional
SELECT compute bonus (bonus => 50, emp id => 120) FROM DUAL; -- named
SELECT compute bonus (120, bonus => 50) FROM DUAL;
                                                             -- mixed
```

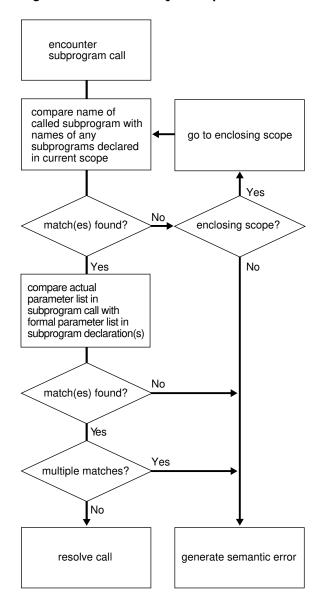

# Subprogram Invocation Resolution

When the PL/SQL compiler encounters a subprogram invocation, it searches for a matching subprogram declaration—first in the current scope and then, if necessary, in successive enclosing scopes.

A declaration and invocation match if their subprogram names and parameter lists match. The parameter lists match if each required formal parameter in the declaration has a corresponding actual parameter in the invocation.

If the compiler finds no matching declaration for an invocation, then it generates a semantic error.

Figure 9-1 shows how the PL/SQL compiler resolves a subprogram invocation.

#### Figure 9-1 How PL/SQL Compiler Resolves Invocations

In Example 9-25, the function balance tries to invoke the enclosing procedure swap, using appropriate actual parameters. However, balance contains two nested procedures named swap, and neither has parameters of the same type as the enclosing procedure swap. Therefore, the invocation causes compilation error PLS-00306.

## Example 9-25 Resolving PL/SQL Procedure Names

```
DECLARE

PROCEDURE swap (

n1 NUMBER,

n2 NUMBER

)

IS

num1 NUMBER;

num2 NUMBER;

FUNCTION balance

(bal NUMBER)
```

```
RETURN NUMBER
    IS
     x NUMBER := 10;
     PROCEDURE swap (
       d1 DATE,
       d2 DATE
      ) IS
      BEGIN
       NULL;
      END;
     PROCEDURE swap (
       b1 BOOLEAN,
       b2 BOOLEAN
      ) IS
     BEGIN
       NULL;
     END;
    BEGIN -- balance
      swap(num1, num2);
     RETURN x;
   END balance;
 BEGIN -- enclosing procedure swap
   NULL;
 END swap;
BEGIN -- anonymous block
 NULL;
END; -- anonymous block
/
Result:
```

```
swap(num1, num2);
ERROR at line 33:
ORA-06550: line 33, column 7:
PLS-00306: wrong number or types of arguments in call to 'SWAP'
ORA-06550: line 33, column 7:

```

# **Overloaded Subprograms**

PL/SQL lets you overload nested subprograms, package subprograms, and type methods. You can use the same name for several different subprograms if their formal parameters differ in name, number, order, or data type family. (A data type family is a data type and its subtypes. For the data type families of predefined PL/SQL data types, see PL/SQL Predefined Data Types. For information about user-defined PL/SQL subtypes, see "User-Defined PL/SQL Subtypes".) If formal parameters differ only in name, then you must use named notation to specify the corresponding actual parameters. (For information about named notation, see "Positional, Named, and Mixed Notation for Actual Parameters".)

Example 9-26 defines two subprograms with the same name, initialize. The procedures initialize different types of collections. Because the processing in the procedures is the same, it is logical to give them the same name.

You can put the two initialize procedures in the same block, subprogram, package, or type body. PL/SQL determines which procedure to invoke by checking their formal parameters. The version of initialize that PL/SQL uses depends on whether you invoke the procedure with a date tab typ Or num tab typ parameter.

For an example of an overloaded procedure in a package, see Example 11-9.

#### **Topics**

- Formal Parameters that Differ Only in Numeric Data Type
- Subprograms that You Cannot Overload
- Subprogram Overload Errors

#### Example 9-26 Overloaded Subprogram

```
DECLARE
  TYPE date tab typ IS TABLE OF DATE INDEX BY PLS INTEGER;
  TYPE num tab typ IS TABLE OF NUMBER INDEX BY PLS INTEGER;
 hiredate_tab date_tab_typ;
  sal_tab num_tab_typ;
  PROCEDURE initialize (tab OUT date_tab_typ, n INTEGER) IS
 BEGIN
   DBMS OUTPUT.PUT LINE ('Invoked first version');
   FOR i IN 1... LOOP
     tab(i) := SYSDATE;
   END LOOP;
  END initialize;
 PROCEDURE initialize (tab OUT num_tab_typ, n INTEGER) IS
 BEGIN
   DBMS OUTPUT.PUT LINE('Invoked second version');
   FOR i IN 1... LOOP
     tab(i) := 0.0;
   END LOOP;
 END initialize;
BEGIN
  initialize(hiredate_tab, 50);
  initialize(sal tab, 100);
END;
/
```

Result:

Invoked first version Invoked second version

## Formal Parameters that Differ Only in Numeric Data Type

You can overload subprograms if their formal parameters differ only in numeric data type. This technique is useful in writing mathematical application programming interfaces (APIs), because several versions of a function can use the same name, and each can accept a different numeric type. For example, a function that accepts <code>BINARY\_FLOAT</code> might be faster, while a function that accepts <code>BINARY\_DOUBLE</code> might be more precise.

To avoid problems or unexpected results when passing parameters to such overloaded subprograms:

• Ensure that the expected version of a subprogram is invoked for each set of expected parameters.

For example, if you have overloaded functions that accept BINARY\_FLOAT and BINARY DOUBLE, which is invoked if you pass a VARCHAR2 literal like '5.0'?

• Qualify numeric literals and use conversion functions to make clear what the intended parameter types are.

For example, use literals such as 5.0f (for BINARY\_FLOAT), 5.0d (for BINARY\_DOUBLE), or conversion functions such as TO BINARY FLOAT, TO BINARY DOUBLE, and TO NUMBER.

PL/SQL looks for matching numeric parameters in this order:

- 1. PLS INTEGER (or BINARY INTEGER, an identical data type)
- 2. NUMBER
- 3. BINARY FLOAT
- 4. BINARY DOUBLE

A VARCHAR2 value can match a NUMBER, BINARY FLOAT, or BINARY DOUBLE parameter.

PL/SQL uses the first overloaded subprogram that matches the supplied parameters. For example, the SQRT function takes a single parameter. There are overloaded versions that accept a NUMBER, a BINARY\_FLOAT, or a BINARY\_DOUBLE parameter. If you pass a PLS\_INTEGER parameter, the first matching overload is the one with a NUMBER parameter.

The SQRT function that takes a NUMBER parameter is likely to be slowest. To use a faster version, use the TO\_BINARY\_FLOAT OF TO\_BINARY\_DOUBLE function to convert the parameter to another data type before passing it to the SQRT function.

If PL/SQL must convert a parameter to another data type, it first tries to convert it to a higher data type. For example:

- The ATAN2 function takes two parameters of the same type. If you pass parameters of different types—for example, one PLS\_INTEGER and one BINARY\_FLOAT—PL/SQL tries to find a match where both parameters use the higher type. In this case, that is the version of ATAN2 that takes two BINARY\_FLOAT parameters; the PLS\_INTEGER parameter is converted upwards.
- A function takes two parameters of different types. One overloaded version takes a
  PLS\_INTEGER and a BINARY\_FLOAT parameter. Another overloaded version takes a NUMBER
  and a BINARY\_DOUBLE parameter. If you invoke this function and pass two NUMBER
  parameters, PL/SQL first finds the overloaded version where the second parameter is
  BINARY\_FLOAT. Because this parameter is a closer match than the BINARY\_DOUBLE
  parameter in the other overload, PL/SQL then looks downward and converts the first
  NUMBER parameter to PLS\_INTEGER.

## Subprograms that You Cannot Overload

You cannot overload these subprograms:

- Standalone subprograms
- Subprograms whose formal parameters differ only in mode; for example:

```
PROCEDURE s (p IN VARCHAR2) IS ...
PROCEDURE s (p OUT VARCHAR2) IS ...
```

• Subprograms whose formal parameters differ only in subtype; for example:

```
PROCEDURE s (p INTEGER) IS ...
PROCEDURE s (p REAL) IS ...
```

INTEGER and REAL are subtypes of NUMBER, so they belong to the same data type family.

 Functions that differ only in return value data type, even if the data types are in different families; for example:

FUNCTION f (p INTEGER) RETURN **BOOLEAN** IS ... FUNCTION f (p INTEGER) RETURN **INTEGER** IS ...

## Subprogram Overload Errors

The PL/SQL compiler catches overload errors as soon as it determines that it cannot tell which subprogram was invoked. When subprograms have identical headings, the compiler catches the overload error when you try to compile the subprograms themselves (if they are nested) or when you try to compile the package specification that declares them. Otherwise, the compiler catches the error when you try to compile an ambiguous invocation of a subprogram.

When you try to compile the package specification in Example 9-27, which declares subprograms with identical headings, you get compile-time error PLS-00305.

Although the package specification in Example 9-28 violates the rule that you cannot overload subprograms whose formal parameters differ only in subtype, you can compile it without error.

However, when you try to compile an invocation of pkg2.s, as in Example 9-29, you get compile-time error PLS-00307.

Suppose that you correct the overload error in Example 9-28 by giving the formal parameters of the overloaded subprograms different names, as in Example 9-30.

Now you can compile an invocation of pkg2.s without error if you specify the actual parameter with named notation, as in Example 9-31. (If you specify the actual parameter with positional notation, as in Example 9-29, you still get compile-time error PLS-00307.)

The package specification in Example 9-32 violates no overload rules and compiles without error. However, you can still get compile-time error PLS-00307 when invoking its overloaded procedure, as in the second invocation in Example 9-33.

When trying to determine which subprogram was invoked, if the PL/SQL compiler implicitly converts one parameter to a matching type, then the compiler looks for other parameters that it can implicitly convert to matching types. If there is more than one match, then compile-time error PLS-00307 occurs, as in Example 9-34.

The initialization parameter PLSQL\_IMPLICIT\_CONVERSION\_BOOL affects how overloaded subprograms with BOOLEAN and other type parameters are handled. If a subprogram is overloaded with BOOLEAN and numeric or character types, setting PLSQL\_IMPLICIT\_CONVERSION\_BOOL to TRUE can cause compile-time errors. However, if the

parameter is set to FALSE, the subprogram will implicitly convert arguments to the alternate type.

For example, if PLSQL\_IMPLICIT\_CONVERSION\_BOOL is set to FALSE, the string value '1', or any other non-zero numeric value represented by a string, is converted to a number by default, as in Example 9-35. If PLSQL\_IMPLICIT\_CONVERSION\_BOOL is set to TRUE, '1' can be converted to either BOOLEAN or number, resulting in a PLS-00307 error, as in Example 9-36. This error will be encountered any time the argument supplied can be converted to either BOOLEAN or the alternate overloaded type.

 "BOOLEAN Data Type"
 Oracle Database Reference for more information about the PLSQL\_IMPLICIT\_CONVERSION\_BOOL parameter

Example 9-27 Overload Error Causes Compile-Time Error

```
CREATE OR REPLACE PACKAGE pkg1 AUTHID DEFINER IS
    PROCEDURE s (p VARCHAR2);
    PROCEDURE s (p VARCHAR2);
END pkg1;
/
```

Example 9-28 Overload Error Compiles Successfully

```
CREATE OR REPLACE PACKAGE pkg2 AUTHID DEFINER IS
SUBTYPE t1 IS VARCHAR2(10);
SUBTYPE t2 IS VARCHAR2(10);
PROCEDURE s (p t1);
PROCEDURE s (p t2);
END pkg2;
/
```

Example 9-29 Invoking Subprogram in Example 9-28 Causes Compile-Time Error

```
CREATE OR REPLACE PROCEDURE p AUTHID DEFINER IS
    a pkg2.tl := 'a';
BEGIN
    pkg2.s(a); -- Causes compile-time error PLS-00307
END p;
/
```

#### Example 9-30 Correcting Overload Error in Example 9-28

```
CREATE OR REPLACE PACKAGE pkg2 AUTHID DEFINER IS
SUBTYPE t1 IS VARCHAR2(10);
SUBTYPE t2 IS VARCHAR2(10);
PROCEDURE s (p1 t1);
PROCEDURE s (p2 t2);
END pkg2;
/
```

Example 9-31 Invoking Subprogram in Example 9-30

```
CREATE OR REPLACE PROCEDURE p AUTHID DEFINER IS
    a pkg2.t1 := 'a';
BEGIN
    pkg2.s(p1=>a); -- Compiles without error
```

```
END p;
/
```

#### Example 9-32 Package Specification Without Overload Errors

```
CREATE OR REPLACE PACKAGE pkg3 AUTHID DEFINER IS

PROCEDURE s (p1 VARCHAR2);

PROCEDURE s (p1 VARCHAR2, p2 VARCHAR2 := 'p2');

END pkg3;

/
```

#### Example 9-33 Improper Invocation of Properly Overloaded Subprogram

```
CREATE OR REPLACE PROCEDURE p AUTHID DEFINER IS
  a1 VARCHAR2(10) := 'a1';
  a2 VARCHAR2(10) := 'a2';
BEGIN
  pkg3.s(p1=>a1, p2=>a2); -- Compiles without error
  pkg3.s(p1=>a1); -- Causes compile-time error PLS-00307
END p;
/
```

Example 9-34 Implicit Conversion of Parameters Causes Overload Error

```
CREATE OR REPLACE PACKAGE pack1 AUTHID DEFINER AS
  PROCEDURE proc1 (a NUMBER, b VARCHAR2);
  PROCEDURE proc1 (a NUMBER, b NUMBER);
END;
CREATE OR REPLACE PACKAGE BODY pack1 AS
  PROCEDURE proc1 (a NUMBER, b VARCHAR2) IS BEGIN NULL; END;
  PROCEDURE proc1 (a NUMBER, b NUMBER) IS BEGIN NULL; END;
END;
/
BEGIN
 pack1.proc1(1,'2'); -- Compiles without error
 pack1.proc1(1,2);
                       -- Compiles without error
 pack1.proc1('1','2'); -- Causes compile-time error PLS-00307
 pack1.proc1('1',2); -- Causes compile-time error PLS-00307
END;
/
```

#### Example 9-35 Implicit Conversion to Number Successful

The successful execution of this example depends on the initialization parameter PLSQL\_IMPLICIT\_CONVERSION\_BOOL being set to FALSE. Note that the parameter is set to FALSE by default.

```
ALTER SESSION SET PLSQL_IMPLICIT_CONVERSION_BOOL = FALSE;
CREATE OR REPLACE PACKAGE pkg1 AUTHID DEFINER IS
PROCEDURE s (p INTEGER);
PROCEDURE s (p BOOLEAN);
END pkg1;
/
```

```
CREATE OR REPLACE PACKAGE BODY pkg1 IS
PROCEDURE s (p INTEGER) AS
BEGIN
   dbms_output.put_line ( 'Integer' );
END;
PROCEDURE s (p BOOLEAN) AS
BEGIN
   dbms_output.put_line ( 'Boolean' );
END;
END pkg1;
/
BEGIN
pkg1.s('1'); -- Compiles without error
END;
/
```

Result:

Integer

#### Example 9-36 Implicit Conversion to BOOLEAN or Number Causes Overload Error

This example relies on the subprogram declared in Example 9-35.

ALTER SESSION SET PLSQL IMPLICIT CONVERSION BOOL = TRUE;

exec pkg1.s('1'); -- Causes compile-time error PLS-00307

Note that the same error would occur if procedure s accepted VARCHAR2 instead of INTEGER and the number 1 had been supplied to the procedure.

# **Recursive Subprograms**

A **recursive subprogram** invokes itself. Recursion is a powerful technique for simplifying an algorithm.

A recursive subprogram must have at least two execution paths—one leading to the recursive invocation and one leading to a terminating condition. Without the latter, recursion continues until PL/SQL runs out of memory and raises the predefined exception STORAGE ERROR.

In Example 9-37, the function implements the following recursive definition of *n* factorial (*n*!), the product of all integers from 1 to *n*:

n! = n \* (n - 1)!

In Example 9-38, the function returns the *n*th Fibonacci number, which is the sum of the *n*-1st and *n*-2nd Fibonacci numbers. The first and second Fibonacci numbers are zero and one, respectively.

Note: The function in Example 9-38 is a good candidate for result caching. For more information, see "Result-Cached Recursive Function".

Each recursive invocation of a subprogram creates an instance of each item that the subprogram declares and each SQL statement that it runs.

A recursive invocation inside a cursor FOR LOOP statement, or between an OPEN or OPEN FOR statement and a CLOSE statement, opens another cursor at each invocation, which might cause the number of open cursors to exceed the limit set by the database initialization parameter OPEN CURSORS.

Example 9-37 Recursive Function Returns n Factorial (n!)

```
CREATE OR REPLACE FUNCTION factorial (
  n POSITIVE
) RETURN POSITIVE
 AUTHID DEFINER
IS
BEGIN
  IF n = 1 THEN
                               -- terminating condition
   RETURN n;
  ELSE
   RETURN n * factorial(n-1); -- recursive invocation
  END IF;
END;
BEGIN
  FOR i IN 1..5 LOOP
   DBMS_OUTPUT.PUT_LINE(i || '! = ' || factorial(i));
  END LOOP;
END;
/
```

#### Result:

1! = 12! = 23! = 64! = 245! = 120

## Example 9-38 Recursive Function Returns nth Fibonacci Number

```
CREATE OR REPLACE FUNCTION fibonacci (
 n PLS INTEGER
) RETURN PLS INTEGER
 AUTHID DEFINER
ΤS
 fib 1 PLS INTEGER := 0;
 fib 2 PLS INTEGER := 1;
BEGIN
 IF n = 1 THEN
                                             -- terminating condition
   RETURN fib 1;
 ELSIF n = 2 THEN
   RETURN fib 2;
                                            -- terminating condition
 ELSE
   RETURN fibonacci(n-2) + fibonacci(n-1); -- recursive invocations
```

```
END IF;
END;
/
BEGIN
FOR i IN 1..10 LOOP
DBMS_OUTPUT.PUT(fibonacci(i));
IF i < 10 THEN
DBMS_OUTPUT.PUT(', ');
END IF;
END LOOP;
DBMS_OUTPUT.PUT_LINE(' ...');
END;
/
```

#### Result:

0, 1, 1, 2, 3, 5, 8, 13, 21, 34 ...

# Subprogram Side Effects

A subprogram has side effects if it changes anything except the values of its own local variables. For example, a subprogram that changes any of the following has side effects:

- Its own OUT or IN OUT parameter
- A global variable
- A public variable in a package
- A database table
- The database
- The external state (by invoking DBMS OUTPUT or sending e-mail, for example)

Side effects can prevent the parallelization of a query, yield order-dependent (and therefore, indeterminate) results, or require that package state be maintained across user sessions.

Minimizing side effects is especially important when defining a result-cached function or a stored function for SQL statements to invoke.

## 💉 See Also:

*Oracle Database Development Guide* for information about controlling side effects in PL/SQL functions invoked from SQL statements

# PL/SQL Function Result Cache

When a PL/SQL function has the RESULT\_CACHE option, its results are cached so sessions can reuse these results when available.

Oracle Database automatically detects all data sources (tables and views) that are queried while a result-cached function is running. If changes to any of these data sources are committed, the cached result becomes invalid across all instances. The best candidates for result-caching are functions that are invoked frequently but depend on information that changes infrequently or never.

A result object is the result of a query or result cached function execution. A temp object is the result of a query or result-cached function execution that exceeds the limit set by the multiplication of the RESULT\_CACHE\_MAX\_SIZE by RESULT\_CACHE\_MAX\_RESULT parameters. Temp objects are temporary segments stored in the temporary tablespace defined for the SYS user.

You can view the result and temp objects together by joining the V\$RESULT\_CACHE\_OBJECTS using the type *Temp* for temp object and type *Result* for result objects.

```
SELECT rc1.NAME, rc2.STATUS, rc3.STATUS, rc2.BLOCK_COUNT
FROM V$RESULT_CACHE_OBJECTS rc1, V$RESULT_CACHE_OBJECTS rc2
WHERE rc1.TYPE = 'Result'
AND rc2.TYPE = 'Temp'
AND rc1.CACHE_KEY = rc2.CACHE_KEY;
```

The RESULT\_CACHE\_MAX\_TEMP\_SIZE parameter sets the maximum amount of temporary tablespace that the result cache can consume in a PDB.

The result cache usage is optimized for best performance based on changes in the application workload.

Before fetching a cached result from a remote instance, the database uses heuristics to determine if it is more cost efficient to recompute the result on the local instance.

Oracle Database tracks recently used result-cached functions. Using this history, the database only caches a result-cached function and arguments pair if it has seen it *x* times in recent history, where *x* is set by the initialization parameter RESULT\_CACHE\_EXECUTION\_THRESHOLD. Assuming the default value of 2, the result is cached on the second execution and reused on the third execution.

You can assess the health of your result cache by running the following query. It shows the distribution of the reuse rate of cached functions. If you notice a majority of these results have a scan count of 0, consider increasing the value of the RESULT\_CACHE\_EXECUTION\_THRESHOLD by 1 or 2.

```
SELECT SCAN_COUNT, COUNT(CACHE_KEY)
FROM V$RESULT_CACHE_OBJECTS
WHERE NAMESPACE = 'PLSQL'
GROUP BY SCAN COUNT;
```

# Enabling Result-Caching for a Function

To make a function result-cached, include the RESULT\_CACHE clause in the function declaration and definition. For syntax details, see "Function Declaration and Definition".

Note:

For more information about configuring and managing the database server result cache, see *Oracle Database Reference* and *Oracle Database Performance Tuning Guide*.

In Example 9-39, the package department\_pkg declares and then defines a result-cached function, get\_dept\_info, which returns a record of information about a given department. The function depends on the database tables DEPARTMENTS and EMPLOYEES.

You invoke the function get\_dept\_info as you invoke any function. For example, this invocation returns a record of information about department number 10:

```
department pkg.get dept info(10);
```

This invocation returns only the name of department number 10:

```
department pkg.get dept info(10).dept name;
```

If the result for get\_dept\_info(10) is in the result cache, the result is returned from the cache; otherwise, the result is computed and added to the cache. Because get\_dept\_info depends on the DEPARTMENTS and EMPLOYEES tables, any committed change to DEPARTMENTS or EMPLOYEES invalidates all cached results for get\_dept\_info, relieving you of programming cache invalidation logic everywhere that DEPARTMENTS or EMPLOYEES might change.

#### Example 9-39 Declaring and Defining Result-Cached Function

CREATE OR REPLACE PACKAGE department\_pkg AUTHID DEFINER IS

```
TYPE dept info record IS RECORD (
   dept_name departments.department_name%TYPE,
   mgr name employees.last name%TYPE,
   dept size PLS INTEGER
 );
 -- Function declaration
 FUNCTION get_dept_info (dept_id NUMBER)
   RETURN dept info record
   RESULT CACHE;
END department pkg;
CREATE OR REPLACE PACKAGE BODY department pkg IS
  -- Function definition
 FUNCTION get dept info (dept id NUMBER)
   RETURN dept info record
   RESULT CACHE
 IS
   rec dept info record;
 BEGIN
   SELECT department name INTO rec.dept name
   FROM departments
   WHERE department id = dept id;
    SELECT e.last name INTO rec.mgr name
    FROM departments d, employees e
    WHERE d.department_id = dept_id
```

```
AND d.manager_id = e.employee_id;
SELECT COUNT(*) INTO rec.dept_size
FROM EMPLOYEES
WHERE department_id = dept_id;
RETURN rec;
END get_dept_info;
END department_pkg;
/
```

# Developing Applications with Result-Cached Functions

When developing an application that uses a result-cached function, make no assumptions about the number of times the body of the function will run for a given set of parameter values.

Some situations in which the body of a result-cached function runs are:

 The first time a session on this database instance invokes the function with these parameter values is run

```
Note:
```

RESULT\_CACHE\_EXECUTION\_THRESHOLD specifies the number of times a function and a particular set of arguments must be seen until it is cached. The default value for that parameter is 2 and can be configured at the system level.

· When the cached result for these parameter values is invalid

When a change to any data source on which the function depends is committed, the cached result becomes invalid

· When the cached results for these parameter values have aged out

If the system needs memory, it might discard the oldest or rarely used cached values based on PL/SQL function history tracking

- When the DBMS\_RESULT\_CACHE block list procedure is invoked to explicitly block some result caching related objects from being cached on a local instance or globally
- After the DBMS\_RESULT\_CACHE.FLUSH has run and flushed all the cached results for SQL queries and all the cached results for PL/SQL functions
- When the function bypasses the cache (see "Result Cache Bypass")

## **Requirements for Result-Cached Functions**

A result-cached PL/SQL function is safe if it always produces the same output for any input that it would produce were it not marked with RESULT\_CACHE. This safety is only guaranteed if these conditions are met:

• When the function is run, it has no side effects.

For information about side effects, see "Subprogram Side Effects".

- All tables that the function accesses are ordinary, non-SYS-owned permanent tables in the same database as the function.
- The function's result must be determined only by the vector of input actuals together with the committed content, at the current SCN, of the tables that it references.

It is recommended that a result-cached function also meet these criteria:

It does not depend on session-specific settings.

For more information, see "Making Result-Cached Functions Handle Session-Specific Settings".

It does not depend on session-specific application contexts.

For more information, see "Making Result-Cached Functions Handle Session-Specific Application Contexts".

For more information, see Oracle Database Performance Tuning Guide.

## Examples of Result-Cached Functions

The best candidates for result-caching are functions that are invoked frequently but depend on information that changes infrequently (as might be the case in the first example). Result-caching avoids redundant computations in recursive functions.

Examples:

- Result-Cached Application Configuration Parameters
- Result-Cached Recursive Function

## **Result-Cached Application Configuration Parameters**

Consider an application that has configuration parameters that can be set at either the global level, the application level, or the role level. The application stores the configuration information in these tables:

```
-- Global Configuration Settings
DROP TABLE global config params;
CREATE TABLE global config params
  (name VARCHAR2(20), -- parameter NAME
  val VARCHAR2(20), -- parameter VALUE
  PRIMARY KEY (name)
 );
-- Application-Level Configuration Settings
CREATE TABLE app level config params
  (app id VARCHAR2(20), -- application ID
  name VARCHAR2(20), -- parameter NAME
  val
         VARCHAR2(20), -- parameter VALUE
  PRIMARY KEY (app id, name)
 );
-- Role-Level Configuration Settings
CREATE TABLE role level config params
  (role id VARCHAR2(20), -- application (role) ID
  name VARCHAR2(20), -- parameter VALUE
  PRIMARY KEY (role id, name)
 );
```

For each configuration parameter, the role-level setting overrides the application-level setting, which overrides the global setting. To determine which setting applies to a parameter, the

application defines the PL/SQL function get\_value. Given a parameter name, application ID, and role ID, get value returns the setting that applies to the parameter.

The function get\_value is a good candidate for result-caching if it is invoked frequently and if the configuration information changes infrequently.

Example 9-40 shows a possible definition for get\_value. Suppose that for one set of parameter values, the global setting determines the result of get\_value. While get\_value is running, the database detects that three tables are queried—role\_level\_config\_params, app\_level\_config\_params, and global\_config\_params. If a change to any of these three tables is committed, the cached result for this set of parameter values is invalidated and must be recomputed.

Now suppose that, for a second set of parameter values, the role-level setting determines the result of get\_value. While get\_value is running, the database detects that only the role\_level\_config\_params table is queried. If a change to role\_level\_config\_params is committed, the cached result for the second set of parameter values is invalidated; however, committed changes to app\_level\_config\_params or global\_config\_params do not affect the cached result.

#### Example 9-40 Result-Cached Function Returns Configuration Parameter Setting

```
CREATE OR REPLACE FUNCTION get value
  (p param VARCHAR2,
  p app id NUMBER,
  p role id NUMBER
  )
 RETURN VARCHAR2
 RESULT CACHE
 AUTHID DEFINER
ΤS
  answer VARCHAR2(20);
BEGIN
  -- Is parameter set at role level?
 BEGIN
    SELECT val INTO answer
     FROM role level config params
        WHERE role id = p role id
         AND name = p param;
    RETURN answer; -- Found
   EXCEPTION
     WHEN no data found THEN
        NULL; -- Fall through to following code
  END;
  -- Is parameter set at application level?
 BEGIN
    SELECT val INTO answer
     FROM app level config params
        WHERE app id = p app id
         AND name = p param;
   RETURN answer; -- Found
    EXCEPTION
     WHEN no data found THEN
        NULL; -- Fall through to following code
  END;
  -- Is parameter set at global level?
   SELECT val INTO answer
```

```
FROM global_config_params
    WHERE name = p_param;
    RETURN answer;
END;
/
```

## **Result-Cached Recursive Function**

A recursive function for finding the *n*th term of a Fibonacci series that mirrors the mathematical definition of the series might do many redundant computations. For example, to evaluate fibonacci (7), the function must compute fibonacci (6) and fibonacci (5). To compute fibonacci (6), the function must compute fibonacci (5) and fibonacci (4). Therefore, fibonacci (5) and several other terms are computed redundantly. Result-caching avoids these redundant computations.

## Note:

The maximum number of recursive invocations cached is 128.

```
CREATE OR REPLACE FUNCTION fibonacci (n NUMBER)

RETURN NUMBER

RESULT_CACHE

AUTHID DEFINER

IS

BEGIN

IF (n =0) OR (n =1) THEN

RETURN 1;

ELSE

RETURN fibonacci(n - 1) + fibonacci(n - 2);

END IF;

END;

/
```

- Result Cache Management
- Hot-Patching PL/SQL Units on Which Result-Cached Functions Depend

## Rules for a Cache Hit

Each time a result-cached function is invoked with different parameter values, those parameters and their result are stored in the cache. Subsequently, when the same function is

invoked with the same parameter values (that is, when there is a **cache hit**), the result is retrieved from the cache, instead of being recomputed.

The rules for parameter comparison for a cache hit differ from the rules for the PL/SQL "equal to" (=) operator, as follows:

Category	Cache Hit Rules	"Equal To" Operator Rules
NULL comparison	NULL equals NULL	NULL = NULL evaluates to NULL.
Non-null scalar comparison	Non-null scalars are the same if and only if their values are identical; that is, if and only if their values have identical bit patterns on the given platform. For example, CHAR values 'AA' and 'AA' are different. (This rule is stricter than the rule for the "equal to" operator.)	Non-null scalars can be equal even if their values do not have identical bit patterns on the given platform; for example, CHAR values 'AA' and 'AA ' are equal.

## **Result Cache Bypass**

In some situations, the cache is bypassed. When the cache is bypassed:

- The function computes the result instead of retrieving it from the cache.
- The result that the function computes is not added to the cache.

Some examples of situations in which the cache is bypassed are:

The cache is unavailable to all sessions.

For example, the database administrator has disabled the use of the result cache during application patching (as in "Hot-Patching PL/SQL Units on Which Result-Cached Functions Depend").

• A session is performing a DML statement on a table or view on which a result-cached function depends.

The session bypasses the result cache for that function until the DML statement is completed—either committed or rolled back. If the statement is rolled back, the session resumes using the cache for that function.

Cache bypass ensures that:

- The user of each session sees their own uncommitted changes.
- The PL/SQL function result cache has only committed changes that are visible to all sessions, so that uncommitted changes in one session are not visible to other sessions.

## Making Result-Cached Functions Handle Session-Specific Settings

If a function depends on settings that might vary from session to session (such as <code>NLS\_DATE\_FORMAT</code> and <code>TIME\_ZONE</code>), make the function result-cached only if you can modify it to handle the various settings.

The function, get\_hire\_date, in Example 8–39 uses the TO\_CHAR function to convert a DATE item to a VARCHAR item. The function get\_hire\_date does not specify a format mask, so the format mask defaults to the one that NLS\_DATE\_FORMAT specifies. If sessions that invoke get\_hire\_date have different NLS\_DATE\_FORMAT settings, cached results can have different formats. If a cached result computed by one session ages out, and another session

recomputes it, the format might vary even for the same parameter value. If a session gets a cached result whose format differs from its own format, that result is probably incorrect.

Some possible solutions to this problem are:

- Change the return type of get\_hire\_date to DATE and have each session invoke the TO CHAR function.
- If a common format is acceptable to all sessions, specify a format mask, removing the dependency on NLS DATE FORMAT. For example:

```
TO_CHAR(date_hired, 'mm/dd/yy');
```

• Add a format mask parameter to get hire date. For example:

```
CREATE OR REPLACE FUNCTION get_hire_date (emp_id NUMBER, fmt VARCHAR)
RETURN VARCHAR
RESULT_CACHE
AUTHID DEFINER
IS
date_hired DATE;
BEGIN
SELECT hire_date INTO date_hired
FROM HR.EMPLOYEES
WHERE EMPLOYEE_ID = emp_id;
RETURN TO_CHAR(date_hired, fmt);
END;
/
```

## Example 9-41 Result-Cached Function Handles Session-Specific Settings

```
CREATE OR REPLACE FUNCTION get_hire_date (emp_id NUMBER)
RETURN VARCHAR
RESULT_CACHE
AUTHID DEFINER
IS
date_hired DATE;
BEGIN
SELECT hire_date INTO date_hired
FROM HR.EMPLOYEES
WHERE EMPLOYEE_ID = emp_id;
RETURN TO_CHAR(date_hired);
END;
```

## Making Result-Cached Functions Handle Session-Specific Application Contexts

An **application context**, which can be either global or session-specific, is a set of attributes and their values. A PL/SQL function depends on session-specific application contexts if it does one or more of the following:

- Directly invokes the SQL function SYS\_CONTEXT, which returns the value of a specified attribute in a specified context
- Indirectly invokes SYS\_CONTEXT by using Virtual Private Database (VPD) mechanisms for fine-grained security

(For information about VPD, see Oracle Database Security Guide.)

The PL/SQL function result-caching feature does not automatically handle dependence on session-specific application contexts. If you must cache the results of a function that depends on session-specific application contexts, you must pass the application context to the function

as a parameter. You can give the parameter a default value, so that not every user must specify it.

In Example 9-42, assume that a table, config tab, has a VPD policy that translates this query:

SELECT value FROM config\_tab WHERE name = param\_name;

To this query:

SELECT value FROM config\_tab
WHERE name = param\_name
AND app\_id = SYS\_CONTEXT('Config', 'App\_ID');

#### Example 9-42 Result-Cached Function Handles Session-Specific Application Context

```
CREATE OR REPLACE FUNCTION get_param_value (
   param_name VARCHAR,
   appctx VARCHAR DEFAULT SYS_CONTEXT('Config', 'App_ID')
) RETURN VARCHAR
   RESULT_CACHE
   AUTHID DEFINER
IS
   rec VARCHAR(2000);
BEGIN
   SELECT val INTO rec
   FROM config_tab
   WHERE name = param_name;
   RETURN rec;
END;
//
```

## Choosing Result-Caching Granularity

PL/SQL provides the function result cache, but you choose the caching granularity. To understand the concept of granularity, consider the Product\_Descriptions table in the Order Entry (OE) sample schema:

NAME	NULL?	TYPE
PRODUCT_ID	NOT NULL	NUMBER(6)
LANGUAGE_ID	NOT NULL	VARCHAR2(3)
TRANSLATED_NAME	NOT NULL	NVARCHAR2(50)
TRANSLATED_DESCRIPTION	NOT NULL	NVARCHAR2(2000)

The table has the name and description of each product in several languages. The unique key for each row is **PRODUCT ID**, LANGUAGE ID.

Suppose that you must define a function that takes a PRODUCT\_ID and a LANGUAGE\_ID and returns the associated TRANSLATED\_NAME. You also want to cache the translated names. Some of the granularity choices for caching the names are:

- One name at a time (finer granularity)
- One language at a time (coarser granularity)

Granularity	Benefits
Finer	Each function result corresponds to one logical result.
	Stores only data that is needed at least once.
	Each data item ages out individually.
	Does not allow bulk loading optimizations.
Coarser	Each function result contains many logical subresults.
	Might store data that is never used.
	One aged-out data item ages out the whole set.
	Allows bulk loading optimizations.

Table 9-4	Finer and Coarser	Caching Granularity
-----------	-------------------	---------------------

In Example 9-43 and Example 9-44, the function productName takes a PRODUCT\_ID and a LANGUAGE\_ID and returns the associated TRANSLATED\_NAME. Each version of productName caches translated names, but at a different granularity.

In Example 9-43, get\_product\_name\_1 is a result-cached function. Whenever get\_product\_name\_1 is invoked with a different PRODUCT\_ID and LANGUAGE\_ID, it caches the associated TRANSLATED\_NAME. Each invocation of get\_product\_name\_1 adds at most one TRANSLATED NAME to the cache.

In Example 9-44, get\_product\_name\_2 defines a result-cached function, all\_product\_names. Whenever get\_product\_name\_2 invokes all\_product\_names with a different LANGUAGE\_ID, all\_product\_names caches every TRANSLATED\_NAME associated with that LANGUAGE\_ID. Each invocation of all\_product\_names adds every TRANSLATED\_NAME of at most one LANGUAGE\_ID to the cache.

## Example 9-43 Caching One Name at a Time (Finer Granularity)

```
CREATE OR REPLACE FUNCTION get product name 1 (
 prod id NUMBER,
 lang id VARCHAR2
)
 RETURN NVARCHAR2
 RESULT CACHE
 AUTHID DEFINER
IS
 result_ VARCHAR2(50);
BEGIN
 SELECT translated name INTO result
 FROM OE. Product Descriptions
 WHERE PRODUCT ID = prod id
 AND LANGUAGE ID = lang id;
 RETURN result ;
END;
/
```

# Example 9-44 Caching Translated Names One Language at a Time (Coarser Granularity)

```
CREATE OR REPLACE FUNCTION get_product_name_2 (
prod_id NUMBER,
lang_id VARCHAR2
)
RETURN NVARCHAR2
AUTHID DEFINER
```

```
IS
  TYPE product names IS TABLE OF NVARCHAR2(50) INDEX BY PLS INTEGER;
 FUNCTION all product names (lang id VARCHAR2)
   RETURN product names
   RESULT CACHE
  IS
    all names product names;
 BEGIN
   FOR c IN (SELECT * FROM OE.Product Descriptions
             WHERE LANGUAGE ID = lang id) LOOP
     all names(c.PRODUCT ID) := c.TRANSLATED NAME;
    END LOOP;
    RETURN all_names;
 END;
BEGIN
 RETURN all product names (lang id) (prod id);
END;
```

## Result Caches in Oracle RAC Environment

Cached results are stored in the system global area (SGA). In an Oracle RAC environment, each database instance manages its own local function result cache. However, the contents of the local result cache are accessible to sessions attached to other Oracle RAC instances. If a required result is missing from the result cache of the local instance, the result might be retrieved from the local cache of another instance, instead of being locally computed. The access pattern and workload of an instance determine the set of results in its local cache; therefore, the local caches of different instances can have different sets of results.

Before fetching a cached result from a remote instance, the database uses heuristics to determine if it is more cost efficient to recompute the result on the local instance. You can monitor the use of this functionality by querying the v\$RESULT\_CACHE\_OBJECTS and V\$RESULT\_CACHE\_STATISTICS views. The V\$RESULT\_CACHE\_OBJECTS has a value 'Yes' in the GLOBAL column if the object has been fetched from the result cache of another instance. A value of 'No' means that the result was locally recomputed, either because it was not available remotely, or because the system has decided it is more efficient to do so instead of fetching it remotely. The statistics 'Global Prune Count' in the V\$RESULT\_CACHE\_STATISTICS view shows the number of times the decision was made not to fetch from a remote instance. 'Global Prune By Self Count' shows the number of times an instance asked to provide a local result and has decided it is more efficient for the requesting instance to compute the result locally. Finally, 'Global Load Rate' shows the computed rate - in bytes per 10 milliseconds - of fetching results from result cache of other instances. All these statistics only apply to global result caches in a RAC environment.

Although each database instance might have its own set of cached results, the mechanisms for handling invalid results are Oracle RAC environment-wide. For example, consider a result cache of item prices that are computed from data in database tables. If any of these database tables is updated in a way that affects the price of an item, the cached price of that item is invalidated in every database instance in the Oracle RAC environment.

## See Also:

*Real Application Clusters Administration and Deployment Guide* for more information about setting RESULT\_CACHE\_MAX\_SIZE parameter and other initialization parameters in an Oracle RAC database

## **Result Cache Management**

The PL/SQL function result cache shares its administrative and manageability infrastructure with the Result Cache.

You can administer the shared pool area part that is used by the SQL result cache and the PL/SQL function result cache using the DBMS\_RESULT\_CACHE subprograms. Using the DBMS\_RESULT\_CACHE.BLACKLIST\_ADD procedure, you can add a query or a PL/SQL function to a blocklist to stop caching the results. No matter the bind variables or arguments used, there will be no objects generated for it. The result cache row source may still appear in the explain plan, but at runtime it will be a no-op. You can solve a result cache issue if you diagnose by looking for a case when ten of thousands set of cached results unique arguments is run for a function. Depending on the workload, the overhead of managing these cached results might offset the benefits of caching the results. The performance views gives you insight on this special cases.

You can run a query to identify problematic queries or functions. The <code>cache\_id</code> is the result cache identifier of a SQL cursor or PL/SQL function. This query counts how many unique result cache objects were made for each cache id. A unique object is created for every run of a query or function with unique bind variables or arguments.

SELECT cache\_id, COUNT(cache\_key) AS uniq\_args
FROM GV\$RESULT\_CACHE\_OBJECTS
WHERE type = 'Result'
GROUP BY cache\_id
ORDER BY uniq\_args DESC;

When a dependent object is frequently updated by a workload, it can adversely impact the performance benefits of using result cache. For example, when a large transaction is committed and is affecting already cached results, messages are sent to invalidate these cached results to prevent wrong results. The first hint that this bottleneck is happening is the observation of high waits with CHANNEL = 'Result Cache: Channel' in the GV\$CHANNEL\_WAITS view. You can run a query to check the culprit and take appropriate action such as adding the object to the blocklist. An object with an extremely high number of invalidations can be diagnosed using this query.

```
SELECT object_no, SUM(invalidations) AS num_invals
FROM GV$RESULT_CACHE_OBJECTS
WHERE type = 'Dependency'
GROUP BY object_no
ORDER BY num invals DESC;
```

 Infrastructure

## Hot-Patching PL/SQL Units on Which Result-Cached Functions Depend

When you hot-patch a PL/SQL unit on which a result-cached function depends (directly or indirectly), the cached results associated with the result-cached function might not be automatically flushed in all cases.

For example, suppose that the result-cached function P1.foo() depends on the package subprogram P2.bar(). If a new version of the body of package P2 is loaded, the cached results associated with P1.foo() are not automatically flushed.

Therefore, this is the recommended procedure for hot-patching a PL/SQL unit:

## Note:

To follow these steps, you must have the EXECUTE privilege on the package DBMS RESULT CACHE.

1. Put the result cache in bypass mode and flush existing results:

```
BEGIN
DBMS_RESULT_CACHE.Bypass(TRUE);
DBMS_RESULT_CACHE.Flush;
END;
/
```

In an Oracle RAC environment, perform this step for each database instance.

- 2. Patch the PL/SQL code.
- 3. Resume using the result cache:

```
BEGIN
   DBMS_RESULT_CACHE.Bypass(FALSE);
END;
/
```

In an Oracle RAC environment, perform this step for each database instance.

# PL/SQL Functions that SQL Statements Can Invoke

To be invocable from SQL statements, a stored function (and any subprograms that it invokes) must obey the following purity rules, which are meant to control side effects:

- When invoked from a SELECT statement or a parallelized INSERT, UPDATE, DELETE, or MERGE statement, the subprogram cannot modify any database tables.
- When invoked from an INSERT, UPDATE, DELETE, or MERGE statement, the subprogram cannot query or modify any database tables modified by that statement.

If a function either queries or modifies a table, and a DML statement on that table invokes the function, then ORA-04091 (mutating-table error) occurs. There is one exception: ORA-04091 does not occur if a single-row INSERT statement that is not in a FORALL statement invokes the function in a VALUES clause.

- When invoked from a SELECT, INSERT, UPDATE, DELETE, or MERGE statement, the subprogram cannot run any of the following SQL statements (unless PRAGMA AUTONOMOUS TRANSACTION was specified):
  - Transaction control statements (such as COMMIT)
  - Session control statements (such as SET ROLE)
  - System control statements (such as ALTER SYSTEM)
  - Database definition language (DDL) statements (such as CREATE), which are committed automatically

(For the description of PRAGMA AUTONOMOUS\_TRANSACTION, see "AUTONOMOUS\_TRANSACTION Pragma".)

If any SQL statement in the execution part of the function violates a rule, then a runtime error occurs when that statement is parsed.

The fewer side effects a function has, the better it can be optimized in a SELECT statement, especially if the function is declared with the option DETERMINISTIC or PARALLEL\_ENABLE (for descriptions of these options, see "DETERMINISTIC Clause" and "PARALLEL\_ENABLE Clause").

# Invoker's Rights and Definer's Rights (AUTHID Property)

The AUTHID property of a stored PL/SQL unit affects the name resolution and privilege checking of SQL statements that the unit issues at run time. The AUTHID property does not affect compilation, and has no meaning for units that have no code, such as collection types.

AUTHID property values are exposed in the static data dictionary view \*\_PROCEDURES. For units for which AUTHID has meaning, the view shows the value CURRENT\_USER or DEFINER; for other units, the view shows NULL.

For stored PL/SQL units that you create or alter with the following statements, you can use the optional AUTHID clause to specify either DEFINER (the default, for backward compatibility) or CURRENT USER (the preferred usage):

- "CREATE FUNCTION Statement"
- "CREATE PACKAGE Statement"
- "CREATE PROCEDURE Statement"
- "CREATE TYPE Statement"
- "ALTER TYPE Statement"

A unit whose AUTHID value is CURRENT\_USER is called an invoker's rights unit, or IR unit. A unit whose AUTHID value is DEFINER (the default) is called a definer's rights unit, or DR unit. PL/SQL units and schema objects for which you cannot specify an AUTHID value behave like this:

PL/SQL Unit or Schema Object	Behavior	
Anonymous block	IR unit	
BEQUEATH CURRENT_USER <b>view</b>	Somewhat like an IR unit—see Oracle Database Security Guide.	
BEQUEATH DEFINER $view$	DR unit	
Trigger	DR unit	

The AUTHID property of a unit determines whether the unit is IR or DR, and it affects both name resolution and privilege checking at run time:

- The context for name resolution is CURRENT SCHEMA.
- The privileges checked are those of the CURRENT USER and the enabled roles.

When a session starts, CURRENT\_SCHEMA has the value of the schema owned by SESSION\_USER, and CURRENT\_USER has the same value as SESSION\_USER. (To get the current value of CURRENT\_SCHEMA, CURRENT\_USER, or SESSION\_USER, use the SYS\_CONTEXT function, documented in Oracle Database SQL Language Reference.)

CURRENT\_SCHEMA can be changed during the session with the SQL statement ALTER SESSION SET CURRENT\_SCHEMA. CURRENT\_USER cannot be changed programmatically, but it might change when a PL/SQL unit or a view is pushed onto, or popped from, the call stack.

## Note:

Oracle recommends against issuing ALTER SESSION SET CURRENT\_SCHEMA from in a stored PL/SQL unit.

During a server call, when a DR unit is pushed onto the call stack, the database stores the currently enabled roles and the current values of CURRENT\_USER and CURRENT\_SCHEMA. It then changes both CURRENT\_USER and CURRENT\_SCHEMA to the owner of the DR unit, and enables only the role PUBLIC. (The stored and new roles and values are not necessarily different.) When the DR unit is popped from the call stack, the database restores the stored roles and values. In contrast, when an IR unit is pushed onto, or popped from, the call stack, the values of CURRENT\_USER and CURRENT\_SCHEMA, and the currently enabled roles do not change (unless roles are granted to the IR unit itself—see "Granting Roles to PL/SQL Packages and Standalone Subprograms").

For dynamic SQL statements issued by a PL/SQL unit, name resolution and privilege checking are done once, at run time. For static SQL statements, name resolution and privilege checking are done twice: first, when the PL/SQL unit is compiled, and then again at run time. At compile time, the AUTHID property has no effect—both DR and IR units are treated like DR units. At run time, however, the AUTHID property determines whether a unit is IR or DR, and the unit is treated accordingly.

Upon entry into an IR unit, the runtime system checks privileges before doing any initialization or running any code. If the unit owner has neither the INHERIT PRIVILEGES privilege on the invoker nor the INHERIT ANY PRIVILEGES privilege, then the runtime system raises error ORA-06598.

## Note:

If the unit owner has the required privilege, then one of these statements granted it:

GRANT INHERIT PRIVILEGES ON current\_user TO PUBLIC GRANT INHERIT PRIVILEGES ON current\_user TO unit\_owner GRANT INHERIT ANY PRIVILEGES TO unit owner

For information about the GRANT statement, see Oracle Database SQL Language Reference.

# Granting Roles to PL/SQL Packages and Standalone Subprograms

Using the SQL GRANT command, you can grant roles to PL/SQL packages and standalone subprograms. Roles granted to a PL/SQL unit do not affect compilation. They affect the privilege checking of SQL statements that the unit issues at run time: The unit runs with the privileges of both its own roles and any other currently enabled roles.

Typically, you grant roles to an IR unit, so that users with lower privileges than yours can run the unit with only the privileges needed to do so. You grant roles to a DR unit (whose invokers run it with all your privileges) only if the DR unit issues dynamic SQL, which is checked only at run time.

The basic syntax for granting roles to PL/SQL units is:

```
GRANT role [, role ]... TO unit [, unit ]...
```

For example, this command grants the roles read and execute to the function scott.func and the package sys.pkg:

GRANT read, execute TO FUNCTION scott.func, PACKAGE sys.pkg

For the complete syntax and semantics of the GRANT command, see Oracle Database SQL Language Reference.

## 🖍 See Also:

- Oracle Database SQL Language Reference for information about the REVOKE command, which lets you revoke roles from PL/SQL units
- Oracle Database Security Guide for more information about configuring application users and application roles

## IR Units Need Template Objects

One user (that is, one schema) owns an IR unit and other users run it in their schemas. If the IR unit issues static SQL statements, then the schema objects that these statements affect must exist in the owner's schema at compile time (so that the compiler can resolve references) and in the invoker's schema at run time. The definitions of corresponding schema objects must match (for example, corresponding tables must have the same names and columns); otherwise, you get an error or unexpected results. However, the objects in the owner's schema need not contain data, because the compiler does not need it; therefore, they are called **template objects**.

# Connected User Database Links in DR Units

If you include a connected user database link in a DR unit (definer's rights unit), then you must grant the user who will run the DR unit the INHERIT REMOTE PRIVILEGES privilege.

Granting the user this privilege enables the user to run the DR unit; otherwise, the execution will fail with an ORA-25433: User does not have INHERIT REMOTE PRIVILEGES error. To include a connected user database link from within a definer's rights (DR) procedure, include @database link in the procedure.

The following example shows how a DR unit can use a database link called dblink to access the EMPLOYEE ID column of the HR.EMPLOYEES table:

#### Example 9-45 Database Link in a DR Unit

## See Also:

Oracle Database Security Guide for more information about using the INHERIT REMOTE PRIVILEGES privilege, including a tutorial on how a DR unit can use a database link

# **External Subprograms**

If a C procedure, Java method, or JavaScript function is stored in the database, you can publish it as an external subprogram and then invoke it from PL/SQL.

To publish an external subprogram, define a stored PL/SQL subprogram with a call specification. The call specification maps the name, parameter types, and return type of the external subprogram to PL/SQL equivalents. Invoke the published external subprogram by its PL/SQL name.

For example, suppose that this Java class, Adjuster, is stored in the database:

```
import java.sql.*;
import oracle.jdbc.driver.*;
public class Adjuster {
  public static void raiseSalary (int empNo, float percent)
  throws SQLException {
    Connection conn = new OracleDriver().defaultConnection();
    String sql = "UPDATE employees SET salary = salary * ?
                    WHERE employee id = ?";
    try {
      PreparedStatement pstmt = conn.prepareStatement(sql);
      pstmt.setFloat(1, (1 + percent / 100));
      pstmt.setInt(2, empNo);
     pstmt.executeUpdate();
      pstmt.close();
    } catch (SQLException e)
          {System.err.println(e.getMessage());}
```

The Java class Adjuster has one method, raiseSalary, which raises the salary of a specified employee by a specified percentage. Because raiseSalary is a void method, you publish it as a PL/SQL procedure (rather than a function).

Example 9-46 publishes the stored Java method Adjuster.raiseSalary as a PL/SQL standalone procedure, mapping the Java method name Adjuster.raiseSalary to the PL/SQL procedure name raise\_salary and the Java data types int and float to the PL/SQL data type NUMBER. Then the anonymous block invokes raise\_salary.

Example 9-47 publishes the stored Java method java.lang.Thread.sleep as a PL/SQL standalone procedure, mapping the Java method name to the PL/SQL procedure name java\_sleep and the Java data type long to the PL/SQL data type NUMBER. The PL/SQL standalone procedure sleep invokes java sleep.

Example 9-48 implements the functionality of the Java adjuster example in JavaScript. The JavaScript function raiseSal is mapped to the PL/SQL procedure js\_raise\_sal, which is then invoked using an anonymous PL/SQL block.

## See Also:

- Oracle Database Development Guide for more information about calling external programs
- Oracle Database JavaScript Developer's Guide for information about using call specifications to publish JavaScript functions

#### Example 9-46 PL/SQL Anonymous Block Invokes External Procedure

```
-- Publish Adjuster.raiseSalary as standalone PL/SQL procedure:
CREATE OR REPLACE PROCEDURE raise_salary (
   empid NUMBER,
   pct NUMBER
) AS
   LANGUAGE JAVA NAME 'Adjuster.raiseSalary (int, float)'; -- call
   specification
/
BEGIN
   raise_salary(120, 10); -- invoke Adjuster.raiseSalary by PL/SQL name
END;
/
```

#### Example 9-47 PL/SQL Standalone Procedure Invokes External Procedure

```
-- Java call specification:
CREATE PROCEDURE java_sleep (
  milli_seconds IN NUMBER
) AS LANGUAGE JAVA NAME 'java.lang.Thread.sleep(long)';
/
```

```
CREATE OR REPLACE PROCEDURE sleep (
```

```
milli_seconds IN NUMBER
) AUTHID DEFINER IS
BEGIN
DBMS_OUTPUT.PUT_LINE(DBMS_UTILITY.get_time());
java_sleep (milli_seconds);
DBMS_OUTPUT.PUT_LINE(DBMS_UTILITY.get_time());
END;
/
```

#### Example 9-48 Implement JavaScript External Procedure

```
CREATE OR REPLACE MLE MODULE js adjuster LANGUAGE JAVASCRIPT AS
import oracledb from "mle-js-oracledb";
/**
* Give an employee a raise
* @param {number} empNo - ID of the employee to give a raise
* @param {number} percent - the raise in percent (0 - 100)
* @returns {number} the new salary
*/
export function raiseSal(empNo, percent) {
  if (empNo === undefined || percent === undefined) {
    throw "provide the employee ID and the raise percentage";
  }
  if(percent < 0 || percent > 100) {
    throw new Error("raise must be greater than 0 and less than 100");
 const result = session.execute(
    `UPDATE hr.employees
      SET salary = salary * (1 + (:percent / 100))
    WHERE employee id = :empNo
    RETURNING new salary into :newSal`,
    {
     percent: {
       type: oracledb.NUMBER,
        val: percent,
        dir: oracledb.BIND IN,
     },
     empNo: {
       type: oracledb.NUMBER,
       val: empNo,
       dir: oracledb.BIND IN,
      },
     newSal: {
       type: oracledb.NUMBER,
       dir: oracledb.BIND OUT,
      },
    },
 );
  //report an error in case the update did not affect any rows
```

```
if(result.rowsAffected !== 1) {
   throw new Error(`error updating the salary for employee ${empNo}`);
}
//outBinds contain the new salary returned by the RETURNING clause
//the first element indicates the first new salary (there is only 1)
return result.outBinds.newSal[0];
}
//
```

The following call specification publishes the JavaScript function <code>raiseSal</code> as a standalone PL/SQL function.

```
CREATE OR REPLACE FUNCTION js_raise_sal(
   p_empno NUMBER,
   p_percent NUMBER
) RETURN NUMBER
AS MLE MODULE js_adjuster
SIGNATURE 'raiseSal';
/
```

The PL/SQL procedure js raise sal is invoked by the following anonymous block.

```
SET SERVEROUTPUT ON;
DECLARE
  l new sal NUMBER;
  l old sal NUMBER;
  1 empNo NUMBER := 100;
BEGIN
  SELECT salary
  INTO 1 old sal
  FROM hr.employees
  WHERE employee id = 1 empNo;
DBMS OUTPUT.PUT LINE ('Current salary for employee ' || 1 empNo
                           || ' amounts to ' || l old sal);
l new sal := js raise sal(
  p empno => l empNo,
  p percent => 10
);
DBMS OUTPUT.PUT LINE('New salary for employee ' || 1 empNo
                           || ' increased to ' || l new sal);
END;
/
```

#### Result:

```
Current salary for employee 100 amounts to 24000 New salary for employee 100 increased to 26400
```

# 10 PL/SQL Triggers

A trigger is like a stored procedure that Oracle Database invokes automatically whenever a specified event occurs.

#### Note:

The database can detect only system-defined events. You cannot define your own events.

#### **Topics**

- Views for Information About Triggers

## **Overview of Triggers**

Like a stored procedure, a trigger is a named PL/SQL unit that is stored in the database and can be invoked repeatedly. Unlike a stored procedure, you can enable and disable a trigger, but you cannot explicitly invoke it.

While a trigger is **enabled**, the database automatically invokes it—that is, the trigger **fires** whenever its triggering event occurs. While a trigger is **disabled**, it does not fire.

You create a trigger with the CREATE TRIGGER statement. You specify the triggering event in terms of triggering statements and the item on which they act. The trigger is said to be created on or defined on the item, which is either a table, a view, a schema, or the database.

You also specify the **timing point**, which determines whether the trigger fires before or after the triggering statement runs and whether it fires for each row that the triggering statement affects. By default, a trigger is created in the enabled state.

If the trigger is created on a table or view, then the triggering event is composed of DML statements, and the trigger is called a **DML trigger**.

A crossedition trigger is a DML trigger for use only in edition-based redefinition.

If the trigger is created on a schema or the database, then the triggering event is composed of either DDL or database operation statements, and the trigger is called a **system trigger**.

A **conditional trigger** is a DML or system trigger that has a WHEN clause that specifies a SQL condition that the database evaluates for each row that the triggering statement affects.

When a trigger fires, tables that the trigger references might be undergoing changes made by SQL statements in other users' transactions. SQL statements running in triggers follow the same rules that standalone SQL statements do. Specifically:

- Queries in the trigger see the current read-consistent materialized view of referenced tables and any data changed in the same transaction.
- Updates in the trigger wait for existing data locks to be released before proceeding.

An INSTEAD OF trigger is either:

- A DML trigger created on either a noneditioning view or a nested table column of a noneditioning view
- A system trigger defined on a CREATE statement

The database fires the INSTEAD OF trigger instead of running the triggering statement.

#### Note:

A trigger is often called by the name of its triggering statement (for example, DELETE trigger or LOGON trigger), the name of the item on which it is defined (for example, DATABASE trigger or SCHEMA trigger), or its timing point (for example, BEFORE statement trigger or AFTER each row trigger).

## Reasons to Use Triggers

Triggers let you customize your database management system.

For example, you can use triggers to:

- Automatically generate virtual column values
- Log events
- Gather statistics on table access
- Modify table data when DML statements are issued against views
- Enforce referential integrity when child and parent tables are on different nodes of a distributed database
- Publish information about database events, user events, and SQL statements to subscribing applications
- Prevent DML operations on a table after regular business hours
- Prevent invalid transactions
- Enforce complex business or referential integrity rules that you cannot define with constraints (see "How Triggers and Constraints Differ")

#### Caution:

Triggers are not reliable security mechanisms, because they are programmatic and easy to disable. For high-assurance security, use Oracle Database Vault, described in *Oracle Database Vault Administrator's Guide*.

#### How Triggers and Constraints Differ

Both triggers and constraints can constrain data input, but they differ significantly.

A trigger always applies to new data only. For example, a trigger can prevent a DML statement from inserting a NULL value into a database column, but the column might contain NULL values that were inserted into the column before the trigger was defined or while the trigger was disabled.

A constraint can apply either to new data only (like a trigger) or to both new and existing data. Constraint behavior depends on constraint state, as explained in *Oracle Database SQL Language Reference*.

Constraints are easier to write and less error-prone than triggers that enforce the same rules. However, triggers can enforce some complex business rules that constraints cannot. Oracle strongly recommends that you use triggers to constrain data input only in these situations:

- To enforce referential integrity when child and parent tables are on different nodes of a distributed database
- To enforce complex business or referential integrity rules that you cannot define with constraints

#### See Also:

- Oracle Database Development Guide for information about using constraints to enforce business rules and prevent the entry of invalid information into tables
- "Triggers for Ensuring Referential Integrity" for information about using triggers and constraints to maintain referential integrity between parent and child tables

## **DML Triggers**

A **DML trigger** is created on either a table or view, and its triggering event is composed of the **DML statements** DELETE, INSERT, and UPDATE.

To create a trigger that fires in response to a MERGE statement, create triggers on the INSERT and UPDATE statements to which the MERGE operation decomposes.

A DML trigger is either simple or compound.

A simple DML trigger fires at exactly one of these timing points:

Before the triggering statement runs

(The trigger is called a **BEFORE** statement trigger or statement-level **BEFORE** trigger.)

After the triggering statement runs

(The trigger is called an AFTER statement trigger or statement-level AFTER trigger.)

Before each row that the triggering statement affects

(The trigger is called a **BEFORE** each row trigger or row-level **BEFORE** trigger.)

After each row that the triggering statement affects

(The trigger is called an AFTER each row trigger or row-level AFTER trigger.)

When a trigger is created on an INSERT statement with FORALL, the inserts are treated as a single operation. This means that all statement level triggers fire only once, not for each insert. When a trigger is created on an UPDATE or DELETE statement with FORALL, the trigger is executed for each DML statement. This results in better performance for insert operations.

A **compound DML trigger** created on a table or editioning view can fire at one, some, or all of the preceding timing points. Compound DML triggers help program an approach where you want the actions that you implement for the various timing points to share common data.

A simple or compound DML trigger that fires at row level can access the data in the row that it is processing. For details, see "Correlation Names and Pseudorecords".

An **INSTEAD** OF **DML trigger** is a DML trigger created on either a noneditioning view or a nested table column of a noneditioning view.

Except in an INSTEAD OF trigger, a triggering UPDATE statement can include a column list. With a column list, the trigger fires only when a specified column is updated. Without a column list, the trigger fires when any column of the associated table is updated.

#### Topics

- Conditional Predicates for Detecting Triggering DML Statement
- INSTEAD OF DML Triggers

- Compound DML Triggers
- Triggers for Ensuring Referential Integrity
- FORALL Statement

## Conditional Predicates for Detecting Triggering DML Statement

The triggering event of a DML trigger can be composed of multiple triggering statements. When one of them fires the trigger, the trigger can determine which one by using these **conditional predicates**.

Table 10-1 Conditional Predicate	s
----------------------------------	---

Conditional Predicate	TRUE if and only if:
INSERTING	An INSERT statement fired the trigger.
UPDATING	An UPDATE statement fired the trigger.
UPDATING ('column')	An UPDATE statement that affected the specified column fired the trigger.
DELETING	A DELETE statement fired the trigger.

A conditional predicate can appear wherever a BOOLEAN expression can appear.

#### Example 10-1 Trigger Uses Conditional Predicates to Detect Triggering Statement

This example creates a DML trigger that uses conditional predicates to determine which of its four possible triggering statements fired it.

```
CREATE OR REPLACE TRIGGER t
 BEFORE
   INSERT OR
   UPDATE OF salary, department_id OR
   DELETE
 ON employees
BEGIN
 CASE
   WHEN INSERTING THEN
     DBMS OUTPUT.PUT LINE ('Inserting');
   WHEN UPDATING('salary') THEN
     DBMS OUTPUT.PUT LINE ('Updating salary');
   WHEN UPDATING('department id') THEN
     DBMS OUTPUT.PUT LINE ('Updating department ID');
   WHEN DELETING THEN
     DBMS OUTPUT.PUT LINE('Deleting');
 END CASE;
END;
```

## INSTEAD OF DML Triggers

An INSTEAD OF DML **trigger** is a DML trigger created on a noneditioning view, or on a nested table column of a noneditioning view. The database fires the INSTEAD OF trigger instead of running the triggering DML statement.

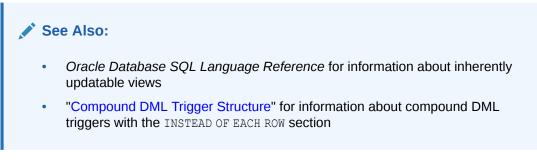

An INSTEAD OF trigger cannot be conditional.

An INSTEAD OF trigger is the only way to update a view that is not inherently updatable. Design the INSTEAD OF trigger to determine what operation was intended and do the appropriate DML operations on the underlying tables.

An INSTEAD OF trigger is always a row-level trigger. An INSTEAD OF trigger can read OLD and NEW values, but cannot change them.

An INSTEAD OF trigger with the NESTED TABLE clause fires only if the triggering statement operates on the elements of the specified nested table column of the view. The trigger fires for each modified nested table element.

#### Example 10-2 INSTEAD OF Trigger

This example creates the view oe.order\_info to display information about customers and their orders. The view is not inherently updatable (because the primary key of the orders table, order\_id, is not unique in the result set of the join view). The example creates an INSTEAD OF trigger to process INSERT statements directed to the view. The trigger inserts rows into the base tables of the view, customers and orders.

```
CREATE OR REPLACE VIEW order info AS
  SELECT c.customer id, c.cust last name, c.cust first name,
         o.order id, o.order date, o.order status
  FROM customers c, orders o
  WHERE c.customer id = o.customer id;
CREATE OR REPLACE TRIGGER order info insert
  INSTEAD OF INSERT ON order info
  DECLARE
    duplicate info EXCEPTION;
     PRAGMA EXCEPTION INIT (duplicate info, -00001);
  BEGIN
     INSERT INTO customers
       (customer id, cust last name, cust first name)
    VALUES (
     :new.customer id,
     :new.cust_last_name,
     :new.cust first name);
   INSERT INTO orders (order_id, order_date, customer_id)
  VALUES (
     :new.order id,
     :new.order date,
     :new.customer id);
  EXCEPTION
    WHEN duplicate info THEN
      RAISE APPLICATION ERROR (
         num=> -20107,
```

```
msg=> 'Duplicate customer or order ID');
END order_info_insert;
```

#### Query to show that row to be inserted does not exist:

SELECT COUNT(\*) FROM order\_info WHERE customer\_id = 999;

#### Result:

/

COUNT (\*)

1 row selected.

#### Insert row into view:

```
INSERT INTO order_info VALUES
    (999, 'Smith', 'John', 2500, TO_DATE('13-MAR-2001', 'DD-MON-YYYY'), 0);
```

#### Result:

1 row created.

#### Query to show that row has been inserted in view:

SELECT COUNT(\*) FROM order\_info WHERE customer\_id = 999;

#### Result:

```
COUNT (*)
_____1
```

```
1 row selected.
```

#### Query to show that row has been inserted in customers table:

SELECT COUNT(\*) FROM customers WHERE customer\_id = 999;

#### Result:

```
COUNT (*)
_____1
```

1 row selected.

#### Query to show that row has been inserted in orders table:

SELECT COUNT(\*) FROM orders WHERE customer\_id = 999;

#### Result:

```
COUNT(*)
1
1 row selected.
```

#### Example 10-3 INSTEAD OF Trigger on Nested Table Column of View

In this example, the view dept\_view contains a nested table of employees, emplist, created by the CAST function (described in *Oracle Database SQL Language Reference*). To modify the emplist column, the example creates an INSTEAD OF trigger on the column.

```
-- Create type of nested table element:
CREATE OR REPLACE TYPE nte
AUTHID DEFINER IS
OBJECT (
  emp id
         NUMBER(6),
  lastname VARCHAR2(25),
 job
       VARCHAR2(10),
  sal
           NUMBER(8,2)
);
-- Created type of nested table:
CREATE OR REPLACE TYPE emp list IS
  TABLE OF nte;
/
-- Create view:
CREATE OR REPLACE VIEW dept view AS
  SELECT d.department id,
         d.department name,
         CAST (MULTISET (SELECT e.employee_id, e.last_name, e.job_id, e.salary
                         FROM employees e
                        WHERE e.department id = d.department id
                        )
                        AS emp list
              ) emplist
  FROM departments d;
-- Create trigger:
CREATE OR REPLACE TRIGGER dept emplist tr
  INSTEAD OF INSERT ON NESTED TABLE emplist OF dept view
  REFERENCING NEW AS Employee
              PARENT AS Department
  FOR EACH ROW
BEGIN
  -- Insert on nested table translates to insert on base table:
  INSERT INTO employees (
    employee id,
    last name,
    email,
   hire date,
    job id,
    salary,
    department id
  )
  VALUES (
```

```
:Employee.emp id,
                                           -- employee id
    :Employee.lastname,
                                           -- last name
    :Employee.lastname || '@example.com', -- email
                                           -- hire date
    SYSDATE,
    :Employee.job,
                                           -- job id
   :Employee.sal,
                                           -- salary
   :Department.department id
                                           -- department id
 );
END;
/
```

#### Query view before inserting row into nested table:

SELECT emplist FROM dept\_view WHERE department\_id=10;

#### Result:

EMPLIST(EMP\_ID, LASTNAME, JOB, SAL)

EMP LIST (NTE(200, 'Whalen', 'AD ASST', 4200))

\_\_\_\_\_

1 row selected.

#### Query table before inserting row into nested table:

```
SELECT employee_id, last_name, job_id, salary
FROM employees
WHERE department id = 10;
```

#### Result:

EMPLOYEE_ID	LAST_NAME	JOB_ID	SALARY
200	Whalen	AD_ASST	4200

1 row selected.

#### Insert a row into nested table:

```
INSERT INTO TABLE (
   SELECT d.emplist
   FROM dept_view d
   WHERE department_id = 10
)
VALUES (1001, 'Glenn', 'AC_MGR', 10000);
```

#### Query view after inserting row into nested table:

SELECT emplist FROM dept\_view WHERE department\_id=10;

#### Result (formatted to fit page):

#### Query table after inserting row into nested table:

```
SELECT employee_id, last_name, job_id, salary
FROM employees
WHERE department id = 10;
```

#### Result:

EMPLOYEE_ID	LAST_NAME	JOB_ID	SALARY
200	Whalen	AD_ASST	4200
1001	Glenn	AC_MGR	10000

2 rows selected.

## **Compound DML Triggers**

A compound DML trigger created on a table or editioning view can fire at multiple timing points. Each timing point section has its own executable part and optional exception-handling part, but all of these parts can access a common PL/SQL state. The common state is established when the triggering statement starts and is destroyed when the triggering statement completes, even when the triggering statement causes an error.

A compound DML trigger created on a noneditioning view is not really compound, because it has only one timing point section.

A compound trigger can be conditional, but not autonomous.

Two common uses of compound triggers are:

- To accumulate rows destined for a second table so that you can periodically bulk-insert them
- To avoid the mutating-table error (ORA-04091)

#### **Topics**

- Compound DML Trigger Structure
- Compound DML Trigger Restrictions
- Performance Benefit of Compound DML Triggers
- Using Compound DML Triggers with Bulk Insertion
- Using Compound DML Triggers to Avoid Mutating-Table Error

### Compound DML Trigger Structure

The optional declarative part of a compound trigger declares variables and subprograms that all of its timing-point sections can use. When the trigger fires, the declarative part runs before any timing-point sections run. The variables and subprograms exist for the duration of the triggering statement.

A compound DML trigger created on a noneditioning view is not really compound, because it has only one timing point section. The syntax for creating the simplest compound DML trigger on a noneditioning view is:

```
CREATE trigger FOR dml_event_clause ON view
COMPOUND TRIGGER
INSTEAD OF EACH ROW IS BEGIN
```

statement; END INSTEAD OF EACH ROW;

A compound DML trigger created on a table or editioning view has at least one timing-point section in Table 10-2. If the trigger has multiple timing-point sections, they can be in any order, but no timing-point section can be repeated. If a timing-point section is absent, then nothing happens at its timing point.

#### Table 10-2 Compound Trigger Timing-Point Sections

Timing Point	Section
Before the triggering statement runs	BEFORE STATEMENT
After the triggering statement runs	AFTER STATEMENT
Before each row that the triggering statement affects	BEFORE EACH ROW
After each row that the triggering statement affects	AFTER EACH ROW

#### See Also:

"CREATE TRIGGER Statement" for more information about the syntax of compound triggers

A compound DML trigger does not have an initialization section, but the BEFORE STATEMENT section, which runs before any other timing-point section, can do any necessary initialization.

If a compound DML trigger has neither a BEFORE STATEMENT section nor an AFTER STATEMENT section, and its triggering statement affects no rows, then the trigger never fires.

### Compound DML Trigger Restrictions

In addition to the "Trigger Restrictions"), compound DML triggers have these restrictions:

- OLD, NEW, and PARENT cannot appear in the declarative part, the BEFORE STATEMENT section, or the AFTER STATEMENT section.
- Only the BEFORE EACH ROW section can change the value of NEW.
- A timing-point section cannot handle exceptions raised in another timing-point section.
- If a timing-point section includes a GOTO statement, the target of the GOTO statement must be in the same timing-point section.

### Performance Benefit of Compound DML Triggers

A compound DML trigger has a performance benefit when the triggering statement affects many rows.

For example, suppose that this statement triggers a compound DML trigger that has all four timing-point sections in Table 10-2:

```
INSERT INTO Target
  SELECT c1, c2, c3
  FROM Source
  WHERE Source.c1 > 0
```

Although the BEFORE EACH ROW and AFTER EACH ROW sections of the trigger run for each row of Source whose column c1 is greater than zero, the BEFORE STATEMENT section runs only before the INSERT statement runs and the AFTER STATEMENT section runs only after the INSERT statement runs.

A compound DML trigger has a greater performance benefit when it uses bulk SQL, described in "Bulk SQL and Bulk Binding".

### Using Compound DML Triggers with Bulk Insertion

A compound DML trigger is useful for accumulating rows destined for a second table so that you can periodically bulk-insert them. To get the performance benefit from the compound trigger, you must specify BULK COLLECT INTO in the FORALL statement (otherwise, the FORALL statement does a single-row DML operation multiple times). For more information about using the BULK COLLECT clause with the FORALL statement, see "Using FORALL Statement and BULK COLLECT Clause Together".

See Also: "FORALL Statement"

Scenario: You want to log every change to hr.employees.salary in a new table, employee\_salaries. A single UPDATE statement updates many rows of the table hr.employees; therefore, bulk-inserting rows into employee.salaries is more efficient than inserting them individually.

**Solution:** Define a compound trigger on updates of the table hr.employees, as in Example 10-4. You do not need a BEFORE STATEMENT section to initialize idx or salaries, because they are state variables, which are initialized each time the trigger fires (even when the triggering statement is interrupted and restarted).

#### Note:

To run Example 10-4, you must have the EXECUTE privilege on the package DBMS LOCK.

#### Example 10-4 Compound Trigger Logs Changes to One Table in Another Table

```
CREATE TABLE employee_salaries (

employee_id NUMBER NOT NULL,

change_date DATE NOT NULL,

salary NUMBER(8,2) NOT NULL,

CONSTRAINT pk_employee_salaries PRIMARY KEY (employee_id, change_date),

CONSTRAINT fk_employee_salaries FOREIGN KEY (employee_id)

REFERENCES employees (employee_id)

ON DELETE CASCADE)

/

CREATE OR REPLACE TRIGGER maintain_employee_salaries

FOR UPDATE OF salary ON employees

COMPOUND TRIGGER
```

```
-- Declarative Part:
-- Choose small threshhold value to show how example works:
  threshhold CONSTANT SIMPLE INTEGER := 7;
 TYPE salaries t IS TABLE OF employee salaries%ROWTYPE INDEX BY
SIMPLE INTEGER;
 salaries salaries t;
  idx
       SIMPLE INTEGER := 0;
  PROCEDURE flush array IS
   n CONSTANT SIMPLE INTEGER := salaries.count();
 BEGIN
   FORALL j IN 1..n
     INSERT INTO employee_salaries VALUES salaries(j);
    salaries.delete();
   idx := 0;
   DBMS OUTPUT.PUT LINE('Flushed ' || n || ' rows');
 END flush array;
 -- AFTER EACH ROW Section:
 AFTER EACH ROW IS
 BEGIN
   idx := idx + 1;
   salaries(idx).employee_id := :NEW.employee_id;
   salaries(idx).change date := SYSTIMESTAMP;
   salaries(idx).salary := :NEW.salary;
   IF idx >= threshhold THEN
     flush array();
   END IF;
 END AFTER EACH ROW;
 -- AFTER STATEMENT Section:
 AFTER STATEMENT IS
 BEGIN
   flush array();
 END AFTER STATEMENT;
END maintain employee salaries;
```

Increase salary of every employee in department 50 by 10%:

```
UPDATE employees
  SET salary = salary * 1.1
  WHERE department_id = 50
/
```

#### Result:

Flushed 7 rows Flushed 7 rows Flushed 7 rows Flushed 7 rows

```
Flushed 7 rows
Flushed 7 rows
Flushed 3 rows
45 rows updated.
Wait two seconds:
BEGIN
DBMS_SESSION.SLEEP(2);
END;
```

/

Increase salary of every employee in department 50 by 5%:

```
UPDATE employees
  SET salary = salary * 1.05
  WHERE department_id = 50
/
```

#### Result:

```
Flushed 7 rows
Flushed 3 rows
```

See changes to employees table reflected in employee\_salaries table:

```
SELECT employee_id, count(*) c
FROM employee_salaries
GROUP BY employee_id
/
```

#### Result:

EMPLOYEE_ID	С
120	2
121	2
122	2
123	2
124	2
125	2
•••	
199	2

```
45 rows selected.
```

## Using Compound DML Triggers to Avoid Mutating-Table Error

A compound DML trigger is useful for avoiding the mutating-table error (ORA-04091) explained in "Mutating-Table Restriction".

**Scenario:** A business rule states that an employee's salary increase must not exceed 10% of the average salary for the employee's department. This rule must be enforced by a trigger.

**Solution:** Define a compound trigger on updates of the table hr.employees, as in Example 10-5. The state variables are initialized each time the trigger fires (even when the triggering statement is interrupted and restarted).

Example 10-5 Compound Trigger Avoids Mutating-Table Error

```
CREATE OR REPLACE TRIGGER Check Employee Salary Raise
  FOR UPDATE OF Salary ON Employees
COMPOUND TRIGGER
 Ten_Percent CONSTANT NUMBER := 0.1;

TYPE Salaries_t IS TABLE OF Employees.Salary%TYPE;

Avg_Salaries Salaries_t;

TYPE Department_IDs_t IS TABLE OF Employees.Department_ID%TYPE;

Department_IDs Department_IDs_t;
  Ten Percent
  -- Declare collection type and variable:
  TYPE Department Salaries t IS TABLE OF Employees.Salary%TYPE
                                    INDEX BY VARCHAR2(80);
  Department Avg Salaries Department Salaries t;
  BEFORE STATEMENT IS
  BEGIN
    SELECT
                           AVG(e.Salary), NVL(e.Department ID, -1)
      BULK COLLECT INTO Avg Salaries, Department IDs
      FROM Employees e
GROUP BY e.Department
                           e.Department ID;
    FOR j IN 1..Department IDs.COUNT() LOOP
      Department Avg Salaries (Department IDs (j)) := Avg Salaries (j);
    END LOOP;
  END BEFORE STATEMENT;
  AFTER EACH ROW IS
  BEGIN
    IF :NEW.Salary - :Old.Salary >
      Ten Percent*Department Avg Salaries (:NEW.Department ID)
    THEN
      Raise Application Error(-20000, 'Raise too big');
    END IF;
  END AFTER EACH ROW;
END Check_Employee_Salary_Raise;
```

## Triggers for Ensuring Referential Integrity

You can use triggers and constraints to maintain referential integrity between parent and child tables, as Table 10-3 shows. (For more information about constraints, see *Oracle Database SQL Language Reference*.)

Table	Constraint to Declare on Table	Triggers to Create on Table
Parent	PRIMARY KEY or UNIQUE	One or more triggers that ensure that when PRIMARY KEY or UNIQUE values are updated or deleted, the desired action (RESTRICT, CASCADE, or SET NULL) occurs on corresponding FOREIGN KEY values.
		No action is required for inserts into the parent table, because no dependent foreign keys exist.
Child	FOREIGN KEY, if parent and child are in the same database. (The database does not support declarative referential constraints between tables on different nodes of a distributed database.)	One trigger that ensures that values inserted or updated in the FOREIGN KEY correspond to PRIMARY KEY or UNIQUE values in the parent table.
	Disable this foreign key constraint to prevent the corresponding PRIMARY KEY or UNIQUE constraint from being dropped (except explicitly with the CASCADE option).	

#### Table 10-3 Constraints and Triggers for Ensuring Referential Integrity

#### Topics

- Foreign Key Trigger for Child Table
- UPDATE and DELETE RESTRICT Trigger for Parent Table
- UPDATE and DELETE SET NULL Trigger for Parent Table
- DELETE CASCADE Trigger for Parent Table
- UPDATE CASCADE Trigger for Parent Table
- Triggers for Complex Constraint Checking
- Triggers for Complex Security Authorizations
- Triggers for Transparent Event Logging
- Triggers for Deriving Column Values
- Triggers for Building Complex Updatable Views
- Triggers for Fine-Grained Access Control

#### Note:

The examples in the following topics use these tables, which share the column Deptno:

```
CREATE TABLE emp (
 Empno NUMBER NOT NULL,
 Ename
         VARCHAR2(10),
         VARCHAR2(9),
 Job
 JobVARCHARZ (3)MgrNUMBER (4) ,
 Hiredate DATE,
 Sal
         NUMBER(7,2),
 Comm
           NUMBER(7,2),
 Deptno NUMBER(2) NOT NULL);
CREATE TABLE dept (
 Deptno
           NUMBER (2) NOT NULL,
 Dname
           VARCHAR2(14),
 Loc
          VARCHAR2(13),
 Mgr no NUMBER,
 Dept type NUMBER);
```

Several triggers include statements that lock rows (SELECT FOR UPDATE). This operation is necessary to maintain concurrency while the rows are being processed.

These examples are not meant to be used exactly as written. They are provided to assist you in designing your own triggers.

### Foreign Key Trigger for Child Table

The trigger in Example 10-6 ensures that before an INSERT or UPDATE statement affects a foreign key value, the corresponding value exists in the parent key. The exception ORA-04091 (mutating-table error) allows the trigger emp\_dept\_check to be used with the UPDATE\_SET\_DEFAULT and UPDATE\_CASCADE triggers. This exception is unnecessary if the trigger emp\_dept\_check is used alone.

#### Example 10-6 Foreign Key Trigger for Child Table

```
CREATE OR REPLACE TRIGGER emp_dept_check
BEFORE INSERT OR UPDATE OF Deptno ON emp
FOR EACH ROW WHEN (NEW.Deptno IS NOT NULL)
-- Before row is inserted or DEPTNO is updated in emp table,
-- fire this trigger to verify that new foreign key value (DEPTNO)
-- is present in dept table.
DECLARE
Dummy INTEGER; -- Use for cursor fetch
Invalid_department EXCEPTION;
Valid_department EXCEPTION;
Mutating_table EXCEPTION;
PRAGMA EXCEPTION_INIT (Invalid_department, -4093);
PRAGMA EXCEPTION_INIT (Valid_department, -4092);
PRAGMA EXCEPTION_INIT (Mutating_table, -4091);
-- Cursor used to verify parent key value exists.
```

```
-- If present, lock parent key's row so it cannot be deleted
  -- by another transaction until this transaction is
  -- committed or rolled back.
  CURSOR Dummy_cursor (Dn NUMBER) IS
    SELECT Deptno FROM dept
    WHERE Deptno = Dn
    FOR UPDATE OF Deptno;
BEGIN
 OPEN Dummy cursor (:NEW.Deptno);
 FETCH Dummy cursor INTO Dummy;
  -- Verify parent key.
  -- If not found, raise user-specified error code and message.
  -- If found, close cursor before allowing triggering statement to complete:
  IF Dummy cursor%NOTFOUND THEN
   RAISE Invalid department;
 ELSE
   RAISE Valid department;
 END IF;
 CLOSE Dummy cursor;
EXCEPTION
 WHEN Invalid department THEN
   CLOSE Dummy cursor;
   Raise_application_error(-20000, 'Invalid Department'
      || ' Number' || TO CHAR(:NEW.deptno));
 WHEN Valid department THEN
    CLOSE Dummy cursor;
 WHEN Mutating_table THEN
    NULL;
END;
/
```

## UPDATE and DELETE RESTRICT Trigger for Parent Table

The trigger in Example 10-7 enforces the UPDATE and DELETE RESTRICT referential action on the primary key of the dept table.

## **Caution**:

The trigger in Example 10-7 does not work with self-referential tables (tables with both the primary/unique key and the foreign key). Also, this trigger does not allow triggers to cycle (such as when A fires B, which fires A).

#### Example 10-7 UPDATE and DELETE RESTRICT Trigger for Parent Table

```
CREATE OR REPLACE TRIGGER dept_restrict

BEFORE DELETE OR UPDATE OF Deptno ON dept

FOR EACH ROW

-- Before row is deleted from dept or primary key (DEPTNO) of dept is updated,

-- check for dependent foreign key values in emp;

-- if any are found, roll back.

DECLARE

Dummy INTEGER; -- Use for cursor fetch

employees_present EXCEPTION;
```

```
employees not present EXCEPTION;
 PRAGMA EXCEPTION_INIT (employees_present, -4094);
 PRAGMA EXCEPTION_INIT (employees_not_present, -4095);
  -- Cursor used to check for dependent foreign key values.
 CURSOR Dummy cursor (Dn NUMBER) IS
    SELECT Deptno FROM emp WHERE Deptno = Dn;
BEGIN
 OPEN Dummy_cursor (:OLD.Deptno);
 FETCH Dummy cursor INTO Dummy;
 -- If dependent foreign key is found, raise user-specified
 -- error code and message. If not found, close cursor
 -- before allowing triggering statement to complete.
 IF Dummy cursor%FOUND THEN
   RAISE employees present;
                                 -- Dependent rows exist
 ELSE
   RAISE employees not present; -- No dependent rows exist
 END IF;
 CLOSE Dummy cursor;
EXCEPTION
 WHEN employees present THEN
   CLOSE Dummy cursor;
   Raise_application_error(-20001, 'Employees Present in'
      || ' Department ' || TO_CHAR(:OLD.DEPTNO));
 WHEN employees not present THEN
    CLOSE Dummy_cursor;
END;
```

## UPDATE and DELETE SET NULL Trigger for Parent Table

The trigger in Example 10-8 enforces the UPDATE and DELETE SET NULL referential action on the primary key of the dept table.

#### Example 10-8 UPDATE and DELETE SET NULL Trigger for Parent Table

```
CREATE OR REPLACE TRIGGER dept_set_null
AFTER DELETE OR UPDATE OF Deptno ON dept
FOR EACH ROW
-- Before row is deleted from dept or primary key (DEPTNO) of dept is updated,
-- set all corresponding dependent foreign key values in emp to NULL:
BEGIN
IF UPDATING AND :OLD.Deptno != :NEW.Deptno OR DELETING THEN
    UPDATE emp SET emp.Deptno = NULL
    WHERE emp.Deptno = :OLD.Deptno;
END IF;
END;
/
```

### **DELETE CASCADE Trigger for Parent Table**

The trigger in Example 10-9 enforces the DELETE CASCADE referential action on the primary key of the dept table.

#### Note:

Typically, the code for DELETE CASCADE is combined with the code for UPDATE SET NULL or UPDATE SET DEFAULT, to account for both updates and deletes.

#### Example 10-9 DELETE CASCADE Trigger for Parent Table

```
CREATE OR REPLACE TRIGGER dept_del_cascade
  AFTER DELETE ON dept
  FOR EACH ROW
  -- Before row is deleted from dept,
   -- delete all rows from emp table whose DEPTNO is same as
   -- DEPTNO being deleted from dept table:
BEGIN
  DELETE FROM emp
  WHERE emp.Deptno = :OLD.Deptno;
END;
/
```

### UPDATE CASCADE Trigger for Parent Table

The triggers in Example 10-10 ensure that if a department number is updated in the dept table, then this change is propagated to dependent foreign keys in the emp table.

#### Note:

Because the trigger dept\_cascade2 updates the emp table, the emp\_dept\_check trigger in Example 10-6, if enabled, also fires. The resulting mutating-table error is trapped by the emp\_dept\_check trigger. Carefully test any triggers that require error trapping to succeed to ensure that they always work properly in your environment.

#### Example 10-10 UPDATE CASCADE Trigger for Parent Table

```
-- Generate sequence number to be used as flag
-- for determining if update occurred on column:
CREATE SEQUENCE Update_sequence
INCREMENT BY 1 MAXVALUE 5000 CYCLE;
CREATE OR REPLACE PACKAGE Integritypackage AUTHID DEFINER AS
Updateseq NUMBER;
END Integritypackage;
/
CREATE OR REPLACE PACKAGE BODY Integritypackage AS
END Integritypackage;
/
-- Create flag col:
ALTER TABLE emp ADD Update_id NUMBER;
CREATE OR REPLACE TRIGGER dept_cascade1
BEFORE UPDATE OF Deptno ON dept
```

```
DECLARE
 -- Before updating dept table (this is a statement trigger),
 -- generate sequence number
 -- & assign it to public variable UPDATESEQ of
 -- user-defined package named INTEGRITYPACKAGE:
BEGIN
 Integritypackage.Updateseq := Update sequence.NEXTVAL;
END;
CREATE OR REPLACE TRIGGER dept cascade2
 AFTER DELETE OR UPDATE OF Deptno ON dept
 FOR EACH ROW
  -- For each department number in dept that is updated,
 -- cascade update to dependent foreign keys in emp table.
  -- Cascade update only if child row was not updated by this trigger:
BEGIN
 IF UPDATING THEN
   UPDATE emp
   SET Deptno = :NEW.Deptno,
       Update id = Integritypackage.Updateseq --from 1st
    WHERE emp.Deptno = :OLD.Deptno
   AND Update id IS NULL;
    /* Only NULL if not updated by 3rd trigger
       fired by same triggering statement */
 END IF;
  IF DELETING THEN
    -- After row is deleted from dept,
    -- delete all rows from emp table whose DEPTNO is same as
    -- DEPTNO being deleted from dept table:
   DELETE FROM emp
   WHERE emp.Deptno = :OLD.Deptno;
 END IF;
END;
/
CREATE OR REPLACE TRIGGER dept cascade3
 AFTER UPDATE OF Deptno ON dept
BEGIN UPDATE emp
 SET Update id = NULL
 WHERE Update id = Integritypackage.Updateseq;
END;
/
```

## Triggers for Complex Constraint Checking

Triggers can enforce integrity rules other than referential integrity. The trigger in Example 10-11 does a complex check before allowing the triggering statement to run.

Note: Example 10-11 needs this data structure: CREATE TABLE Salgrade ( Grade NUMBER, Losal NUMBER, Hisal NUMBER, Job\_classification VARCHAR2(9));

#### Example 10-11 Trigger Checks Complex Constraints

```
CREATE OR REPLACE TRIGGER salary check
 BEFORE INSERT OR UPDATE OF Sal, Job ON Emp
 FOR EACH ROW
DECLARE
 Minsal
                       NUMBER;
                      NUMBER;
 Maxsal
 Salary out of range EXCEPTION;
 PRAGMA EXCEPTION INIT (Salary out of range, -4096);
BEGIN
 /* Retrieve minimum & maximum salary for employee's new job classification
    from SALGRADE table into MINSAL and MAXSAL: */
 SELECT Losal, Hisal INTO Minsal, Maxsal
 FROM Salgrade
 WHERE Job classification = :NEW.Job;
  /* If employee's new salary is less than or greater than
     job classification's limits, raise exception.
    Exception message is returned and pending INSERT or UPDATE statement
    that fired the trigger is rolled back: */
 IF (:NEW.Sal < Minsal OR :NEW.Sal > Maxsal) THEN
   RAISE Salary_out_of_range;
 END IF;
EXCEPTION
 WHEN Salary out of range THEN
   Raise application error (
      -20300,
      'Salary '|| TO CHAR(:NEW.Sal) ||' out of range for '
     || 'job classification ' ||:NEW.Job
     ||' for employee ' || :NEW.Ename
   );
 WHEN NO DATA FOUND THEN
    Raise_application_error(-20322, 'Invalid Job Classification');
END;
```

### Triggers for Complex Security Authorizations

Triggers are commonly used to enforce complex security authorizations for table data. Use triggers only to enforce complex security authorizations that you cannot define using the

database security features provided with the database. For example, use a trigger to prohibit updates to the employee table during weekends and nonworking hours.

When using a trigger to enforce a complex security authorization, it is best to use a BEFORE statement trigger. Using a BEFORE statement trigger has these benefits:

- The security check is done before the triggering statement is allowed to run, so that no wasted work is done by an unauthorized statement.
- The security check is done only for the triggering statement, not for each row affected by the triggering statement.

The trigger in Example 10-12 enforces security by raising exceptions when anyone tries to update the table employees during weekends or nonworking hours.

#### See Also:

*Oracle Database Security Guide* for detailed information about database security features

#### Example 10-12 Trigger Enforces Security Authorizations

```
CREATE OR REPLACE TRIGGER Employee permit changes
 BEFORE INSERT OR DELETE OR UPDATE ON employees
DECLARE
                   INTEGER;
 Dummy
 Not on weekends EXCEPTION;
 Nonworking hours EXCEPTION;
 PRAGMA EXCEPTION INIT (Not on weekends, -4097);
 PRAGMA EXCEPTION INIT (Nonworking hours, -4099);
BEGIN
   -- Check for weekends:
  IF (TO_CHAR(Sysdate, 'DAY') = 'SAT' OR
    TO CHAR(Sysdate, 'DAY') = 'SUN') THEN
      RAISE Not_on_weekends;
  END IF;
 -- Check for work hours (8am to 6pm):
 IF (TO CHAR(Sysdate, 'HH24') < 8 OR
   TO CHAR(Sysdate, 'HH24') > 18) THEN
     RAISE Nonworking hours;
 END IF;
EXCEPTION
 WHEN Not_on_weekends THEN
   Raise application error (-20324, 'Might not change '
      ||'employee table during the weekend');
 WHEN Nonworking hours THEN
    Raise application error (-20326, 'Might not change '
     ||'emp table during Nonworking hours');
END;
/
```

## Triggers for Transparent Event Logging

Triggers are very useful when you want to transparently do a related change in the database following certain events.

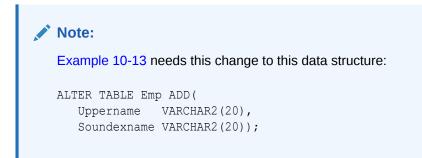

The REORDER trigger example shows a trigger that reorders parts as necessary when certain conditions are met. (In other words, a triggering statement is entered, and the PARTS\_ON\_HAND value is less than the REORDER POINT value.)

### Triggers for Deriving Column Values

Triggers can derive column values automatically, based upon a value provided by an INSERT or UPDATE statement. This type of trigger is useful to force values in specific columns that depend on the values of other columns in the same row. BEFORE row triggers are necessary to complete this type of operation for these reasons:

- The dependent values must be derived before the INSERT or UPDATE occurs, so that the triggering statement can use the derived values.
- The trigger must fire for each row affected by the triggering INSERT or UPDATE statement.

The trigger in Example 10-13 derives new column values for a table whenever a row is inserted or updated.

#### Example 10-13 Trigger Derives New Column Values

```
CREATE OR REPLACE TRIGGER Derived
BEFORE INSERT OR UPDATE OF Ename ON Emp
/* Before updating the ENAME field, derive the values for
    the UPPERNAME and SOUNDEXNAME fields. Restrict users
    from updating these fields directly: */
FOR EACH ROW
BEGIN
    :NEW.Uppername := UPPER(:NEW.Ename);
    :NEW.Soundexname := SOUNDEX(:NEW.Ename);
END;
/
```

### Triggers for Building Complex Updatable Views

Views are an excellent mechanism to provide logical windows over table data. However, when the view query gets complex, the system implicitly cannot translate the DML on the view into those on the underlying tables. INSTEAD OF triggers help solve this problem. These triggers can be defined over views, and they fire instead of the actual DML.

Consider a library system where books are arranged by title. The library consists of a collection of book type objects:

```
CREATE OR REPLACE TYPE Book_t AS OBJECT (
Booknum NUMBER,
Title VARCHAR2(20),
Author VARCHAR2(20),
Available CHAR(1)
);
/
CREATE OR REPLACE TYPE Book_list_t AS TABLE OF Book_t;
/
```

The table Book table is created and populated like this:

```
DROP TABLE Book table;
CREATE TABLE Book table (
 Booknum NUMBER,
 Section VARCHAR2(20),
 Title VARCHAR2(20),
Author VARCHAR2(20),
  Available CHAR(1)
);
INSERT INTO Book table (
  Booknum, Section, Title, Author, Available
)
VALUES (
  121001, 'Classic', 'Iliad', 'Homer', 'Y'
);
INSERT INTO Book table (
  Booknum, Section, Title, Author, Available
)
VALUES (
  121002, 'Novel', 'Gone with the Wind', 'Mitchell M', 'N'
);
```

```
SELECT * FROM Book_table ORDER BY Booknum;
```

#### Result:

BOOKNUM	SECTION	TITLE	AUTHOR	А
				-
121001	Classic	Iliad	Homer	Y
121002	Novel	Gone with the Wind	Mitchell M	Ν

2 rows selected.

#### The table Library table is created and populated like this:

```
DROP TABLE Library_table;
CREATE TABLE Library_table (Section VARCHAR2(20));
INSERT INTO Library_table (Section)
VALUES ('Novel');
INSERT INTO Library_table (Section)
VALUES ('Classic');
SELECT * FROM Library_table ORDER BY Section;
```

Result:

```
SECTION
Classic
Novel
```

2 rows selected.

You can define a complex view over the tables <code>Book\_table</code> and <code>Library\_table</code> to create a logical view of the library with sections and a collection of books in each section:

```
CREATE OR REPLACE VIEW Library_view AS
SELECT i.Section, CAST (
    MULTISET (
    SELECT b.Booknum, b.Title, b.Author, b.Available
    FROM Book_table b
    WHERE b.Section = i.Section
    AS Book_list_t
    BOOKLIST
    FROM Library_table i;
```

(For information about the CAST function, see Oracle Database SQL Language Reference.)

Make Library view updatable by defining an INSTEAD OF trigger on it:

```
CREATE OR REPLACE TRIGGER Library trigger
 INSTEAD OF
 INSERT ON Library_view
 FOR EACH ROW
DECLARE
 Bookvar Book t;
          INTEGER;
 i
BEGIN
 INSERT INTO Library table
 VALUES (:NEW.Section);
 FOR i IN 1..:NEW.Booklist.COUNT LOOP
   Bookvar := :NEW.Booklist(i);
   INSERT INTO Book_table (
     Booknum, Section, Title, Author, Available
    )
   VALUES (
     Bookvar.booknum, :NEW.Section, Bookvar.Title,
     Bookvar.Author, bookvar.Available
   );
 END LOOP;
END;
/
```

#### Insert a new row into Library\_view:

```
INSERT INTO Library_view (Section, Booklist)
VALUES (
    'History',
    book_list_t (book_t (121330, 'Alexander', 'Mirth', 'Y'))
);
```

See the effect on Library view:

SELECT \* FROM Library\_view ORDER BY Section;

Result:

```
SECTION
BOOKLIST(BOOKNUM, TITLE, AUTHOR, AVAILABLE)
Classic
BOOK_LIST_T(BOOK_T(121001, 'Iliad', 'Homer', 'Y'))
History
BOOK_LIST_T(BOOK_T(121330, 'Alexander', 'Mirth', 'Y'))
Novel
BOOK_LIST_T(BOOK_T(121002, 'Gone with the Wind', 'Mitchell M', 'N'))
```

3 rows selected.

#### See the effect on Book table:

SELECT \* FROM Book table ORDER BY Booknum;

#### Result:

BOOKNUM	SECTION	TITLE	AUTHOR	A
121002	Classic	Iliad	Homer	Y
	Novel	Gone with the Wind	Mitchell M	N
	History	Alexander	Mirth	Y

3 rows selected.

See the effect on Library table:

SELECT \* FROM Library\_table ORDER BY Section;

#### Result:

SECTION -----Classic History Novel

3 rows selected.

Similarly, you can also define triggers on the nested table booklist to handle modification of the nested table element.

### Triggers for Fine-Grained Access Control

You can use LOGON triggers to run the package associated with an application context. An application context captures session-related information about the user who is logging in to the database. From there, your application can control how much access this user has, based on their session information.

#### Note:

If you have very specific logon requirements, such as preventing users from logging in from outside the firewall or after work hours, consider using Oracle Database Vault instead of LOGON triggers. With Oracle Database Vault, you can create custom rules to strictly control user access.

#### See Also:

- Oracle Database Security Guide for information about creating a LOGON trigger to run a database session application context package
- Oracle Database Vault Administrator's Guide for information about Oracle
   Database Vault

## **Correlation Names and Pseudorecords**

#### Note:

This topic applies only to triggers that fire at row level. That is:

- Row-level simple DML triggers
- Compound DML triggers with row-level timing point sections

A trigger that fires at row level can access the data in the row that it is processing by using **correlation names**. The default correlation names are OLD, NEW, and PARENT. To change the correlation names, use the REFERENCING clause of the CREATE TRIGGER statement (see "referencing\_clause ::=").

If the trigger is created on a nested table, then OLD and NEW refer to the current row of the nested table, and PARENT refers to the current row of the parent table. If the trigger is created on a table or view, then OLD and NEW refer to the current row of the table or view, and PARENT is undefined.

OLD, NEW, and PARENT are also called **pseudorecords**, because they have record structure, but are allowed in fewer contexts than records are. The structure of a pseudorecord is *table\_name*%ROWTYPE, where *table\_name* is the name of the table on which the trigger is created (for OLD and NEW) or the name of the parent table (for PARENT).

In the *trigger\_body* of a simple trigger or the *tps\_body* of a compound trigger, a correlation name is a placeholder for a bind variable. Reference the field of a pseudorecord with this syntax:

:pseudorecord\_name.field\_name

In the WHEN clause of a conditional trigger, a correlation name is not a placeholder for a bind variable. Therefore, omit the colon in the preceding syntax.

Table 10-4 shows the values of OLD and NEW fields for the row that the triggering statement is processing.

Triggering Statement	OLD.field Value	NEW. <i>field</i> Value
INSERT	NULL	Post-insert value
UPDATE	Pre-update value	Post-update value
DELETE	Pre-delete value	NULL

Table 10-4 OLD and NEW Pseudorecord Field Values

The restrictions on pseudorecords are:

• A pseudorecord cannot appear in a record-level operation.

For example, the trigger cannot include this statement:

:NEW := NULL;

• A pseudorecord cannot be an actual subprogram parameter.

(A pseudorecord field can be an actual subprogram parameter.)

• The trigger cannot change OLD field values.

Trying to do so raises ORA-04085.

• If the triggering statement is DELETE, then the trigger cannot change NEW field values.

Trying to do so raises ORA-04084.

• An AFTER trigger cannot change NEW field values, because the triggering statement runs before the trigger fires.

Trying to do so raises ORA-04084.

A BEFORE trigger can change NEW field values before a triggering INSERT or UPDATE statement puts them in the table.

If a statement triggers both a BEFORE trigger and an AFTER trigger, and the BEFORE trigger changes a NEW field value, then the AFTER trigger "sees" that change.

#### Example 10-14 Trigger Logs Changes to EMPLOYEES.SALARY

This example creates a log table and a trigger that inserts a row in the log table after any UPDATE statement affects the SALARY column of the EMPLOYEES table, and then updates EMPLOYEES.SALARY and shows the log table.

#### Create log table:

```
DROP TABLE Emp_log;
CREATE TABLE Emp_log (
Emp_id NUMBER,
Log_date DATE,
New_salary NUMBER,
Action VARCHAR2(20));
```

Create trigger that inserts row in log table after EMPLOYEES.SALARY is updated:

```
CREATE OR REPLACE TRIGGER log_salary_increase
AFTER UPDATE OF salary ON employees
FOR EACH ROW
BEGIN
INSERT INTO Emp_log (Emp_id, Log_date, New_salary, Action)
VALUES (:NEW.employee_id, SYSDATE, :NEW.salary, 'New Salary');
END;
/
```

Update EMPLOYEES.SALARY:

UPDATE employees SET salary = salary + 1000.0 WHERE Department id = 20;

#### Result:

```
2 rows updated.
```

#### Show log table:

SELECT \* FROM Emp log;

#### Result:

```
        EMP_ID
        LOG_DATE
        NEW_SALARY
        ACTION

        201
        28-APR-10
        13650
        New Salary

        202
        28-APR-10
        6300
        New Salary
```

2 rows selected.

#### Example 10-15 Conditional Trigger Prints Salary Change Information

This example creates a conditional trigger that prints salary change information whenever a DELETE, INSERT, or UPDATE statement affects the EMPLOYEES table—unless that information is about the President. The database evaluates the WHEN condition for each affected row. If the WHEN condition is TRUE for an affected row, then the trigger fires for that row before the triggering statement runs. If the WHEN condition is not TRUE for an affected row, then trigger does not fire for that row, but the triggering statement still runs.

```
CREATE OR REPLACE TRIGGER print_salary_changes
BEFORE DELETE OR INSERT OR UPDATE ON employees
FOR EACH ROW
WHEN (NEW.job_id <> 'AD_PRES') -- do not print information about President
DECLARE
sal_diff NUMBER;
BEGIN
```

```
sal_diff := :NEW.salary - :OLD.salary;
DBMS_OUTPUT.PUT(:NEW.last_name || ': ');
DBMS_OUTPUT.PUT('Old salary = ' || :OLD.salary || ', ');
DBMS_OUTPUT.PUT('New salary = ' || :NEW.salary || ', ');
DBMS_OUTPUT.PUT_LINE('Difference: ' || sal_diff);
END;
/
```

#### Query:

```
SELECT last_name, department_id, salary, job_id
FROM employees
WHERE department_id IN (10, 20, 90)
ORDER BY department_id, last_name;
```

#### Result:

LAST_NAME	DEPARTMENT_ID	SALARY	JOB_ID
Whalen	10	4200	AD_ASST
Davis	20	6000	MK_REP
Martinez	20	13000	MK_MAN
Garcia	90	17000	AD_VP
King	90	24000	AD_PRES
Yang	90	17000	AD_VP

#### 6 rows selected.

#### Triggering statement:

UPDATE employees SET salary = salary \* 1.05 WHERE department id IN (10, 20, 90);

#### Result:

```
Whalen: Old salary = 4200, New salary = 4410, Difference: 210
Martinez: Old salary = 13000, New salary = 13650, Difference: 650
Davis: Old salary = 6000, New salary = 6300, Difference: 300
Yang: Old salary = 17000, New salary = 17850, Difference: 850
Garcia: Old salary = 17000, New salary = 17850, Difference: 850
```

#### 6 rows updated.

Query:

SELECT salary FROM employees WHERE job id = 'AD PRES';

#### Result:

SALARY -----25200

1 row selected.

#### Example 10-16 Trigger Modifies CLOB Columns

This example creates an UPDATE trigger that modifies CLOB columns.

For information about TO\_CLOB and other conversion functions, see Oracle Database SQL Language Reference.

```
DROP TABLE tab1;
CREATE TABLE tab1 (c1 CLOB);
INSERT INTO tab1 VALUES ('<h1>HTML Document Fragment</h1>Some text.', 3);
CREATE OR REPLACE TRIGGER trq1
  BEFORE UPDATE ON tab1
  FOR EACH ROW
BEGIN
  DBMS OUTPUT.PUT LINE('Old value of CLOB column: '||:OLD.c1);
  DBMS OUTPUT.PUT LINE('Proposed new value of CLOB column: '||:NEW.c1);
  :NEW.c1 := :NEW.c1 || TO CLOB('<hr>Standard footer paragraph.');
  DBMS OUTPUT.PUT LINE('Final value of CLOB column: '||:NEW.c1);
END;
/
SET SERVEROUTPUT ON;
UPDATE tab1 SET c1 = '<h1>Different Document Fragment</h1>Different text.';
SELECT * FROM tab1;
```

#### Example 10-17 Trigger with REFERENCING Clause

This example creates a table with the same name as a correlation name, new, and then creates a trigger on that table. To avoid conflict between the table name and the correlation name, the trigger references the correlation name as Newest.

```
CREATE TABLE new (
   field1 NUMBER,
   field2 VARCHAR2(20)
);
CREATE OR REPLACE TRIGGER Print_salary_changes
BEFORE UPDATE ON new
REFERENCING new AS Newest
FOR EACH ROW
BEGIN
 :Newest.Field2 := TO CHAR (:newest.field1);
```

END; /

## OBJECT\_VALUE Pseudocolumn

A DML trigger on an object table can reference the SQL pseudocolumn <code>OBJECT\_VALUE</code>, which returns system-generated names for the columns of the object table. The trigger can also invoke a PL/SQL subprogram that has a formal IN parameter whose data type is <code>OBJECT\_VALUE</code>.

#### See Also:

- Oracle Database SQL Language Reference for more information about
   OBJECT\_VALUE
- Oracle Database SQL Language Reference for general information about pseudocolumns

Example 10-18 creates object table tbl, table tbl\_history for logging updates to tbl, and trigger Tbl\_Trg. The trigger runs for each row of tbl that is affected by a DML statement, causing the old and new values of the object t in tbl to be written in tbl\_history. The old and new values are :OLD.OBJECT VALUE and :NEW.OBJECT VALUE.

All values of column n were increased by 1. The value of m remains 0.

#### Example 10-18 Trigger References OBJECT\_VALUE Pseudocolumn

Create, populate, and show object table:

```
CREATE OR REPLACE TYPE t AUTHID DEFINER AS OBJECT (n NUMBER, m NUMBER)

/

CREATE TABLE tbl OF t

/

BEGIN

FOR j IN 1..5 LOOP

INSERT INTO tbl VALUES (t(j, 0));

END LOOP;

END;

/

SELECT * FROM tbl ORDER BY n;
```

#### Result:

N	М
1	0
2	0
3	0
4	0
5	0

5 rows selected.

Create history table and trigger:

```
CREATE TABLE tbl_history ( d DATE, old_obj t, new_obj t) /
```

```
CREATE OR REPLACE TRIGGER Tbl_Trg
AFTER UPDATE ON tbl
FOR EACH ROW
BEGIN
INSERT INTO tbl_history (d, old_obj, new_obj)
VALUES (SYSDATE, :OLD.OBJECT_VALUE, :NEW.OBJECT_VALUE);
END Tbl_Trg;
/
```

#### Update object table:

```
UPDATE tbl SET tbl.n = tbl.n+1
/
```

#### Result:

5 rows updated.

#### Show old and new values:

```
BEGIN
FOR j IN (SELECT d, old_obj, new_obj FROM tbl_history) LOOP
DBMS_OUTPUT.PUT_LINE (
        j.d ||
        ' -- old: ' || j.old_obj.n || ' ' || j.old_obj.m ||
        ' -- new: ' || j.new_obj.n || ' ' || j.new_obj.m
    );
END LOOP;
END;
/
```

#### Result:

```
28-APR-10 -- old: 1 0 -- new: 2 0
28-APR-10 -- old: 2 0 -- new: 3 0
28-APR-10 -- old: 3 0 -- new: 4 0
28-APR-10 -- old: 4 0 -- new: 5 0
28-APR-10 -- old: 5 0 -- new: 6 0
```

## System Triggers

A system trigger is created on either a schema or the database.

Its triggering event is composed of either DDL statements (listed in "*ddl\_event*") or database operation statements (listed in "*database\_event*").

A system trigger fires at exactly one of these timing points:

Before the triggering statement runs

(The trigger is called a **BEFORE** statement trigger or statement-level **BEFORE** trigger.)

After the triggering statement runs

(The trigger is called a AFTER statement trigger or statement-level AFTER trigger.)

Instead of the triggering CREATE statement

(The trigger is called an INSTEAD OF CREATE trigger.)

Topics

- SCHEMA Triggers
- DATABASE Triggers
- INSTEAD OF CREATE Triggers

# SCHEMA Triggers

A **SCHEMA trigger** is created on a schema and fires whenever the user who owns it is the current user and initiates the triggering event.

Suppose that both user1 and user2 own schema triggers, and user1 invokes a DR unit owned by user2. Inside the DR unit, user2 is the current user. Therefore, if the DR unit initiates the triggering event of a schema trigger that user2 owns, then that trigger fires. However, if the DR unit initiates the triggering event of a schema trigger that user1 owns, then that trigger does not fire.

Example 10-19 creates a BEFORE statement trigger on the sample schema HR. When a user connected as HR tries to drop a database object, the database fires the trigger before dropping the object.

#### Example 10-19 BEFORE Statement Trigger on Sample Schema HR

```
CREATE OR REPLACE TRIGGER drop_trigger

BEFORE DROP ON hr.SCHEMA

BEGIN

RAISE_APPLICATION_ERROR (

num => -20000,

msg => 'Cannot drop object');

END;

/
```

# DATABASE Triggers

A **DATABASE trigger** is created on the database and fires whenever any database user initiates the triggering event.

Example 10-20 shows the basic syntax for a trigger to log errors. This trigger fires after an unsuccessful statement execution, such as unsuccessful logon.

# Note:

An AFTER SERVERERROR trigger fires only if Oracle relational database management system (RDBMS) determines that it is safe to fire error triggers. For more information about AFTER SERVERERROR triggers, see CREATE TRIGGER Statement.

The trigger in Example 10-21 runs the procedure check\_user after a user logs onto the database.

Example 10-20 AFTER Statement Trigger on Database

```
CREATE TRIGGER log_errors

AFTER SERVERERROR ON DATABASE

BEGIN

IF (IS_SERVERERROR (1017)) THEN

NULL; -- (substitute code that processes logon error)

ELSE
```

```
NULL; -- (substitute code that logs error code)
   END IF;
 END:
Example 10-21 Trigger Monitors Logons
CREATE OR REPLACE TRIGGER check user
 AFTER LOGON ON DATABASE
 BEGIN
```

```
check user;
EXCEPTION
  WHEN OTHERS THEN
    RAISE APPLICATION ERROR
       (-20000, 'Unexpected error: '|| DBMS Utility.Format Error Stack);
END;
```

# **INSTEAD OF CREATE Triggers**

/

An INSTEAD OF CREATE trigger is a SCHEMA trigger whose triggering event is a CREATE statement. The database fires the trigger instead of executing its triggering statement.

Example 10-22 shows the basic syntax for an INSTEAD OF CREATE trigger on the current schema. This trigger fires when the owner of the current schema issues a CREATE statement in the current schema.

#### Example 10-22 INSTEAD OF CREATE Trigger on Schema

```
CREATE OR REPLACE TRIGGER t
 INSTEAD OF CREATE ON SCHEMA
 BEGIN
   EXECUTE IMMEDIATE 'CREATE TABLE T (n NUMBER, m NUMBER)';
 END;
```

# Subprograms Invoked by Triggers

Triggers can invoke subprograms written in PL/SQL, C, and Java. The trigger in Example 10-4 invokes a PL/SQL subprogram. The trigger in Example 10-23 invokes a Java subprogram.

A subprogram invoked by a trigger cannot run transaction control statements, because the subprogram runs in the context of the trigger body.

If a trigger invokes an invoker rights (IR) subprogram, then the user who created the trigger, not the user who ran the triggering statement, is considered to be the current user. For information about IR subprograms, see "Invoker's Rights and Definer's Rights (AUTHID Property)".

If a trigger invokes a remote subprogram, and a time stamp or signature mismatch is found during execution of the trigger, then the remote subprogram does not run and the trigger is invalidated.

Example 10-23 Trigger Invokes Java Subprogram

```
CREATE OR REPLACE PROCEDURE Before_delete (Id IN NUMBER, Ename VARCHAR2)
IS LANGUAGE Java
name 'thjvTriggers.beforeDelete (oracle.jdbc.NUMBER, oracle.jdbc.CHAR)';
CREATE OR REPLACE TRIGGER Pre del trigger BEFORE DELETE ON Tab
```

```
FOR EACH ROW
CALL Before_delete (:OLD.Id, :OLD.Ename)
The corresponding Java file is thjvTriggers.java:
import java.sql.*
import java.io.*
import oracle.jdbc.*
import oracle.oracore.*
public class thjvTriggers
public static void
beforeDelete (NUMBER old id, CHAR old name)
Throws SQLException, CoreException
   {
  Connection conn = JDBCConnection.defaultConnection();
  Statement stmt = conn.CreateStatement();
  String sql = "insert into logtab values
   ("+ old_id.intValue() +", '"+ old ename.toString() + ", BEFORE DELETE');
  stmt.executeUpdate (sql);
  stmt.close();
  return;
   }
```

# Trigger Compilation, Invalidation, and Recompilation

The CREATE TRIGGER statement compiles the trigger and stores its code in the database. If a compilation error occurs, the trigger is still created, but its triggering statement fails, except in these cases:

- The trigger was created in the disabled state.
- The triggering event is AFTER STARTUP ON DATABASE.
- The triggering event is either AFTER LOGON ON DATABASE or AFTER LOGON ON SCHEMA, and someone logs on as SYSTEM.

To see trigger compilation errors, either use the SHOW ERRORS command in SQL\*Plus or Enterprise Manager, or query the static data dictionary view \*\_ERRORS (described in Oracle Database Reference).

If a trigger does not compile successfully, then its exception handler cannot run. For an example, see "Remote Exception Handling".

If a trigger references another object, such as a subprogram or package, and that object is modified or dropped, then the trigger becomes invalid. The next time the triggering event occurs, the compiler tries to revalidate the trigger (for details, see *Oracle Database Development Guide*).

## Note:

}

Because the DBMS\_AQ package is used to enqueue a message, dependency between triggers and queues cannot be maintained.

To recompile a trigger manually, use the ALTER TRIGGER statement, described in "ALTER TRIGGER Statement".

# **Exception Handling in Triggers**

In most cases, if a trigger runs a statement that raises an exception, and the exception is not handled by an exception handler, then the database rolls back the effects of both the trigger and its triggering statement.

In the following cases, the database rolls back only the effects of the trigger, not the effects of the triggering statement (and logs the error in trace files and the alert log):

- The triggering event is either AFTER STARTUP ON DATABASE or BEFORE SHUTDOWN ON DATABASE.
- The triggering event is AFTER LOGON ON DATABASE and the user has the ADMINISTER DATABASE TRIGGER privilege.
- The triggering event is AFTER LOGON ON SCHEMA and the user either owns the schema or has the ALTER ANY TRIGGER privilege.

In the case of a compound DML trigger, the database rolls back only the effects of the triggering statement, not the effects of the trigger. However, variables declared in the trigger are re-initialized, and any values computed before the triggering statement was rolled back are lost.

## Note:

Triggers that enforce complex security authorizations or constraints typically raise user-defined exceptions, which are explained in "User-Defined Exceptions".

## See Also:

PL/SQL Error Handling, for general information about exception handling

#### **Remote Exception Handling**

A trigger that accesses a remote database can do remote exception handling only if the remote database is available. If the remote database is unavailable when the local database must compile the trigger, then the local database cannot validate the statement that accesses the remote database, and the compilation fails. If the trigger cannot be compiled, then its exception handler cannot run.

The trigger in Example 10-24 has an INSERT statement that accesses a remote database. The trigger also has an exception handler. However, if the remote database is unavailable when the local database tries to compile the trigger, then the compilation fails and the exception handler cannot run.

Example 10-25 shows the workaround for the problem in Example 10-24: Put the remote INSERT statement and exception handler in a stored subprogram and have the trigger invoke the stored subprogram. The subprogram is stored in the local database in compiled form, with a validated statement for accessing the remote database. Therefore, when the remote INSERT statement fails because the remote database is unavailable, the exception handler in the subprogram can handle it.

## Example 10-24 Trigger Cannot Handle Exception if Remote Database is Unavailable

```
CREATE OR REPLACE TRIGGER employees tr
 AFTER INSERT ON employees
 FOR EACH ROW
BEGIN
  -- When remote database is unavailable, compilation fails here:
 INSERT INTO employees@remote (
   employee id, first name, last name, email, hire date, job id
  )
 VALUES (
   99, 'Jane', 'Doe', 'jane.doe@example.com', SYSDATE, 'ST MAN'
 );
EXCEPTION
 WHEN OTHERS THEN
   INSERT INTO emp log (Emp id, Log date, New salary, Action)
     VALUES (99, SYSDATE, NULL, 'Could not insert');
   RAISE;
END;
```

## Example 10-25 Workaround for Example 10-24

```
CREATE OR REPLACE PROCEDURE insert row proc AUTHID CURRENT_USER AS
 no_remote_db EXCEPTION; -- declare exception
 PRAGMA EXCEPTION_INIT (no_remote_db, -20000);
                           -- assign error code to exception
BEGIN
 INSERT INTO employees@remote (
   employee id, first name, last name, email, hire date, job id
 )
 VALUES (
   99, 'Jane', 'Doe', 'jane.doe@example.com', SYSDATE, 'ST MAN'
 );
EXCEPTION
 WHEN OTHERS THEN
   INSERT INTO emp log (Emp id, Log date, New salary, Action)
     VALUES (99, SYSDATE, NULL, 'Could not insert row.');
 RAISE APPLICATION ERROR (-20000, 'Remote database is unavailable.');
END;
/
CREATE OR REPLACE TRIGGER employees tr
 AFTER INSERT ON employees
 FOR EACH ROW
BEGIN
  insert_row_proc;
END:
```

# **Trigger Design Guidelines**

 Use triggers to ensure that whenever a specific event occurs, any necessary actions are done (regardless of which user or application issues the triggering statement).

For example, use a trigger to ensure that whenever anyone updates a table, its log file is updated.

• Do not create triggers that duplicate database features.

For example, do not create a trigger to reject invalid data if you can do the same with constraints (see "How Triggers and Constraints Differ").

 Do not create triggers that depend on the order in which a SQL statement processes rows (which can vary).

For example, do not assign a value to a global package variable in a row trigger if the current value of the variable depends on the row being processed by the row trigger. If a trigger updates global package variables, initialize those variables in a BEFORE statement trigger.

- Use BEFORE row triggers to modify the row before writing the row data to disk.
- Use AFTER row triggers to obtain the row ID and use it in operations.

An AFTER row trigger fires when the triggering statement results in ORA-02292.

## Note:

AFTER row triggers are slightly more efficient than BEFORE row triggers. With BEFORE row triggers, affected data blocks are read first for the trigger and then for the triggering statement. With AFTER row triggers, affected data blocks are read only for the trigger.

- If the triggering statement of a BEFORE row trigger is an UPDATE or DELETE statement that conflicts with an UPDATE statement that is running, then the database does a transparent ROLLBACK to SAVEPOINT and restarts the triggering statement. The database can do this many times before the triggering statement completes successfully. Each time the database restarts the triggering statement, the trigger fires. The ROLLBACK to SAVEPOINT does not undo changes to package variables that the trigger references. To ensure that there are no unwanted side effects with each restart, make sure that the BEFORE row trigger is idempotent, meaning the trigger should be written so that the result remains the same with each subsequent execution. Any additional work that should not be repeated can be handled in an AFTER row trigger. To detect this situation, you can also include a counter variable in the package.
- Do not create recursive triggers.

For example, do not create an AFTER UPDATE trigger that issues an UPDATE statement on the table on which the trigger is defined. The trigger fires recursively until it runs out of memory.

 If you create a trigger that includes a statement that accesses a remote database, then put the exception handler for that statement in a stored subprogram and invoke the subprogram from the trigger.

For more information, see "Remote Exception Handling".

- Use DATABASE triggers judiciously. They fire every time any database user initiates a triggering event.
- If a trigger runs the following statement, the statement returns the owner of the trigger, not the user who is updating the table:

SELECT Username FROM USER\_USERS;

Only committed triggers fire.

A trigger is committed, implicitly, after the CREATE TRIGGER statement that creates it succeeds. Therefore, the following statement cannot fire the trigger that it creates:

```
CREATE OR REPLACE TRIGGER my_trigger
AFTER CREATE ON DATABASE
BEGIN
NULL;
END;
/
```

 To allow the modular installation of applications that have triggers on the same tables, create multiple triggers of the same type, rather than a single trigger that runs a sequence of operations.

Each trigger sees the changes made by the previously fired triggers. Each trigger can see OLD and NEW values.

# **Trigger Restrictions**

In addition to the restrictions that apply to all PL/SQL units (see Table C-1), triggers have these restrictions:

- Trigger Size Restriction
- Trigger LONG and LONG RAW Data Type Restrictions
- Mutating-Table Restriction
- Only an autonomous trigger can run TCL or DDL statements.

For information about autonomous triggers, see "Autonomous Triggers".

• A trigger cannot invoke a subprogram that runs transaction control statements, because the subprogram runs in the context of the trigger body.

For more information about subprograms invoked by triggers, see "Subprograms Invoked by Triggers".

• A trigger cannot access a SERIALLY REUSABLE package.

For information about SERIALLY\_REUSABLE packages, see "SERIALLY\_REUSABLE Packages".

See Also:

"Compound DML Trigger Restrictions"

# **Trigger Size Restriction**

The size of the trigger cannot exceed 32K.

If the logic for your trigger requires much more than 60 lines of PL/SQL source text, then put most of the source text in a stored subprogram and invoke the subprogram from the trigger. For information about subprograms invoked by triggers, see "Subprograms Invoked by Triggers".

# Trigger LONG and LONG RAW Data Type Restrictions

# Note:

Oracle supports the LONG and LONG RAW data types only for backward compatibility with existing applications.

For information about how to migrate columns from LONG data types to LOB data types, see Oracle Database SecureFiles and Large Objects Developer's Guide.

In addition to the restrictions that apply to all PL/SQL units (see "LONG and LONG RAW Variables"), triggers have these restrictions:

- A trigger cannot declare a variable of the LONG or LONG RAW data type.
- A SQL statement in a trigger can reference a LONG or LONG RAW column only if the column data can be converted to the data type CHAR or VARCHAR2.
- A trigger cannot use the correlation name NEW or PARENT with a LONG or LONG RAW column.

# Mutating-Table Restriction

## Note:

This topic applies only to row-level simple DML triggers.

A **mutating table** is a table that is being modified by a DML statement (possibly by the effects of a DELETE CASCADE constraint). (A view being modified by an INSTEAD OF trigger is not considered to be mutating.)

The mutating-table restriction prevents the trigger from querying or modifying the table that the triggering statement is modifying. When a row-level trigger encounters a mutating table, ORA-04091 occurs, the effects of the trigger and triggering statement are rolled back, and control returns to the user or application that issued the triggering statement, as Example 10-26 shows.

## Caution:

Oracle Database does not enforce the mutating-table restriction for a trigger that accesses remote nodes, because the database does not support declarative referential constraints between tables on different nodes of a distributed database.

Similarly, the database does not enforce the mutating-table restriction for tables in the same database that are connected by loop-back database links. A loop-back database link makes a local table appear remote by defining an Oracle Net path back to the database that contains the link.

If you must use a trigger to update a mutating table, you can avoid the mutating-table error in either of these ways:

- Use a compound DML trigger (see "Using Compound DML Triggers to Avoid Mutating-Table Error").
- Use a temporary table.

For example, instead of using one AFTER each row trigger that updates the mutating table, use two triggers—an AFTER each row trigger that updates the temporary table and an AFTER statement trigger that updates the mutating table with the values from the temporary table.

#### **Mutating-Table Restriction Relaxed**

As of Oracle Database 8g Release 1, a deletion from the parent table causes BEFORE and AFTER triggers to fire once. Therefore, you can create row-level and statement-level triggers that query and modify the parent and child tables. This allows most foreign key constraint actions to be implemented through their after-row triggers (unless the constraint is self-referential). Update cascade, update set null, update set default, delete set default, inserting a missing parent, and maintaining a count of children can all be implemented easily—see "Triggers for Ensuring Referential Integrity".

However, cascades require care for multiple-row foreign key updates. The trigger cannot miss rows that were changed but not committed by another transaction, because the foreign key constraint guarantees that no matching foreign key rows are locked before the after-row trigger is invoked.

In Example 10-27, the triggering statement updates p correctly but causes problems when the trigger updates f. First, the triggering statement changes (1) to (2) in p, and the trigger updates (1) to (2) in f, leaving two rows of value (2) in f. Next, the triggering statement updates (2) to (3) in p, and the trigger updates both rows of value (2) to (3) in f. Finally, the statement updates (3) to (4) in p, and the trigger updates all three rows in f from (3) to (4). The relationship between the data items in p and f is lost.

To avoid this problem, either forbid multiple-row updates to p that change the primary key and reuse existing primary key values, or track updates to foreign key values and modify the trigger to ensure that no row is updated twice.

#### Example 10-26 Trigger Causes Mutating-Table Error

```
-- Create log table
DROP TABLE log;
CREATE TABLE log (
  emp id NUMBER(6),
 l_name VARCHAR2(25),
  f name VARCHAR2(20)
);
-- Create trigger that updates log and then reads employees
CREATE OR REPLACE TRIGGER log deletions
 AFTER DELETE ON employees
 FOR EACH ROW
DECLARE
 n INTEGER;
BEGIN
  INSERT INTO log VALUES (
    :OLD.employee id,
    :OLD.last name,
```

```
:OLD.first_name
);
SELECT COUNT(*) INTO n FROM employees;
DBMS_OUTPUT.PUT_LINE('There are now ' || n || ' employees.');
END;
/
-- Issue triggering statement:
DELETE FROM employees WHERE employee_id = 197;
Descrit:
```

#### Result:

DELETE FROM employees WHERE employee\_id = 197

```
ERROR at line 1:

ORA-04091: table HR.EMPLOYEES is mutating, trigger/function might not see it

ORA-06512: at "HR.LOG_DELETIONS", line 10

ORA-04088: error during execution of trigger 'HR.LOG DELETIONS'
```

#### Show that effect of trigger was rolled back:

SELECT count(\*) FROM log;

#### Result:

COUNT (\*)

1 row selected.

#### Show that effect of triggering statement was rolled back:

SELECT employee\_id, last\_name FROM employees WHERE employee\_id = 197;

#### Result:

1 row selected.

## Example 10-27 Update Cascade

```
DROP TABLE p;

CREATE TABLE p (p1 NUMBER CONSTRAINT pk_p_p1 PRIMARY KEY);

INSERT INTO p VALUES (1);

INSERT INTO p VALUES (2);

INSERT INTO p VALUES (3);

DROP TABLE f;

CREATE TABLE f (f1 NUMBER CONSTRAINT fk_f_f1 REFERENCES p);

INSERT INTO f VALUES (1);

INSERT INTO f VALUES (2);

INSERT INTO f VALUES (2);

INSERT INTO f VALUES (3);

CREATE TRIGGER pt

AFTER UPDATE ON p

FOR EACH ROW

BEGIN
```

```
UPDATE f SET f1 = :NEW.p1 WHERE f1 = :OLD.p1;
END;
/
```

## Query:

SELECT \* FROM p ORDER BY p1;

#### Result:

P1 -----1 2 3

# Query:

SELECT \* FROM f ORDER BY f1;

## Result:

## Issue triggering statement:

UPDATE p SET p1 = p1+1;

## Query:

SELECT \* FROM p ORDER BY p1;

## Result:

## Query:

SELECT \* FROM f ORDER BY f1;

## Result:

F1

# Order in Which Triggers Fire

If two or more triggers *with different timing points* are defined for the same statement on the same table, then they fire in this order:

- 1. All before statement triggers
- 2. All BEFORE EACH ROW triggers
- 3. All AFTER EACH ROW triggers
- 4. All AFTER STATEMENT triggers

If it is practical, replace the set of individual triggers with different timing points with a single compound trigger that explicitly codes the actions in the order you intend. For information about compound triggers, see "Compound DML Triggers".

If you are creating two or more triggers *with the same timing point*, and the order in which they fire is important, then you can control their firing order using the FOLLOWS and PRECEDES clauses (see "FOLLOWS | PRECEDES").

If multiple compound triggers are created on a table, then:

• All BEFORE STATEMENT sections run at the BEFORE STATEMENT timing point, BEFORE EACH ROW sections run at the BEFORE EACH ROW timing point, and so forth.

If trigger execution order was specified using the FOLLOWS clause, then the FOLLOWS clause determines the order of execution of compound trigger sections. If FOLLOWS is specified for some but not all triggers, then the order of execution of triggers is guaranteed only for those that are related using the FOLLOWS clause.

• All AFTER STATEMENT sections run at the AFTER STATEMENT timing point, AFTER EACH ROW sections run at the AFTER EACH ROW timing point, and so forth.

If trigger execution order was specified using the PRECEDES clause, then the PRECEDES clause determines the order of execution of compound trigger sections. If PRECEDES is specified for some but not all triggers, then the order of execution of triggers is guaranteed only for those that are related using the PRECEDES clause.

# Note:

PRECEDES applies only to reverse crossedition triggers, which are described in *Oracle Database Development Guide*.

The firing of compound triggers can be interleaved with the firing of simple triggers.

When one trigger causes another trigger to fire, the triggers are said to be **cascading**. The database allows up to 32 triggers to cascade simultaneously. To limit the number of trigger cascades, use the initialization parameter OPEN\_CURSORS (described in *Oracle Database Reference*), because a cursor opens every time a trigger fires.

# **Trigger Enabling and Disabling**

By default, the CREATE TRIGGER statement creates a trigger in the enabled state. To create a trigger in the disabled state, specify DISABLE. Creating a trigger in the disabled state lets you ensure that it compiles without errors before you enable it.

Some reasons to temporarily disable a trigger are:

- The trigger refers to an unavailable object.
- You must do a large data load, and you want it to proceed quickly without firing triggers.
- You are reloading data.

To enable or disable a single trigger, use this statement:

ALTER TRIGGER [schema.]trigger\_name { ENABLE | DISABLE };

To enable or disable all triggers in all editions created on a specific table, use this statement:

ALTER TABLE table\_name { ENABLE | DISABLE } ALL TRIGGERS;

In both of the preceding statements, *schema* is the name of the schema containing the trigger, and the default is your schema.

## See Also:

- "ALTER TRIGGER Statement" for more information about the ALTER TRIGGER statement
- Oracle Database SQL Language Reference for more information about the ALTER TABLE statement

# **Trigger Changing and Debugging**

To change a trigger, you must either replace or re-create it. (The ALTER TRIGGER statement only enables, disables, compiles, or renames a trigger.)

To replace a trigger, use the CREATE TRIGGER statement with the OR REPLACE clause.

To re-create a trigger, first drop it with the DROP TRIGGER statement and then create it again with the CREATE TRIGGER statement.

To debug a trigger, you can use the facilities available for stored subprograms. For information about these facilities, see *Oracle Database Development Guide*.

## See Also:

- "CREATE TRIGGER Statement" for more information about the CREATE TRIGGER
   statement
- "DROP TRIGGER Statement" for more information about the DROP TRIGGER
   statement
- "ALTER TRIGGER Statement" for more information about the ALTER TRIGGER
   statement

# Triggers and Oracle Database Data Transfer Utilities

The Oracle database utilities that transfer data to your database, possibly firing triggers, are:

• SQL\*Loader (sqlldr)

SQL\*Loader loads data from external files into tables of an Oracle database.

During a SQL\*Loader conventional load, INSERT triggers fire.

Before a SQL\*Loader direct load, triggers are disabled.

## See Also:

Oracle Database Utilities for more information about SQL\*Loader

## Data Pump Import (impdp)

Data Pump Import (impdp) reads an export dump file set created by Data Pump Export (expdp) and writes it to an Oracle database.

If a table to be imported does not exist on the target database, or if you specify TABLE\_EXISTS\_ACTION=REPLACE, then impdp creates and loads the table before creating any triggers, so no triggers fire.

If a table to be imported exists on the target database, and you specify either TABLE\_EXISTS\_ACTION=APPEND or TABLE\_EXISTS\_ACTION=TRUNCATE, then impdp loads rows into the existing table, and INSERT triggers created on the table fire.

## See Also:

Oracle Database Utilities for more information about Data Pump Import

Original Import (imp)

Original Import (the original Import utility, imp) reads object definitions and table data from dump files created by original Export (the original Export utility, exp) and writes them to the target database.

## Note:

To import files that original Export created, you must use original Import. In all other cases, Oracle recommends that you use Data Pump Import instead of original Import.

If a table to be imported does not exist on the target database, then imp creates and loads the table before creating any triggers, so no triggers fire.

If a table to be imported exists on the target database, then the Import IGNORE parameter determines whether triggers fire during import operations. The IGNORE parameter specifies whether object creation errors are ignored or not, resulting in the following behavior:

- If IGNORE=n (default), then imp does not change the table and no triggers fire.
- If IGNORE=y, then imp loads rows into the existing table, and INSERT triggers created on the table fire.

## See Also:

- Oracle Database Utilities for more information about the original Import utility
- Oracle Database Utilities for more information about the original Export utility
- Oracle Database Utilities for more information about IGNORE

# **Triggers for Publishing Events**

To use a trigger to publish an event, create a trigger that:

- Has the event as its triggering event
- Invokes the appropriate subprograms in the DBMS\_AQ package, which provides an interface to Oracle Advanced Queuing (AQ)

For information about the DBMS\_AQ package, see Oracle Database PL/SQL Packages and Types Reference.

For information about AQ, see Oracle Database Advanced Queuing User's Guide.

By enabling and disabling such triggers, you can turn event notification on and off. For information about enabling and disabling triggers, see "Trigger Enabling and Disabling".

#### **How Triggers Publish Events**

When the database detects an event, it fires all enabled triggers that are defined on that event, except:

• Any trigger that is the target of the triggering event.

For example, a trigger for all DROP events does not fire when it is dropped itself.

 Any trigger that was modified, but not committed, in the same transaction as the triggering event.

For example, if a recursive DDL statement in a system trigger modifies another trigger, then events in the same transaction cannot fire the modified trigger.

When a trigger fires and invokes AQ, AQ publishes the event and passes to the trigger the publication context and specified attributes. The trigger can access the attributes by invoking event attribute functions.

The attributes that a trigger can specify to AQ (by passing them to AQ as IN parameters) and then access with event attribute functions depends on the triggering event, which is either a database event or a client event.

## Note:

- A trigger always behaves like a definer rights (DR) unit. The trigger action of an event runs as the definer of the action (as the definer of the package or function in callouts, or as owner of the trigger in queues). Because the owner of the trigger must have EXECUTE privileges on the underlying queues, packages, or subprograms, this action is consistent. For information about DR units, see "Invoker's Rights and Definer's Rights (AUTHID Property)".
- The database ignores the return status from callback functions for all events. For example, the database does nothing with the return status from a SHUTDOWN event.

## **Topics**

- Event Attribute Functions
- Event Attribute Functions for Database Event Triggers
- Event Attribute Functions for Client Event Triggers

# **Event Attribute Functions**

By invoking system-defined event attribute functions in Table 10-5, a trigger can retrieve certain attributes of the triggering event. Not all triggers can invoke all event attribute functions —for details, see "Event Attribute Functions for Database Event Triggers" and "Event Attribute Functions for Client Event Triggers".

# Note:

- In earlier releases, you had to access these functions through the SYS package. Now Oracle recommends accessing them with their public synonyms (the names starting with ora\_ in the first column of Table 10-5).
- The function parameter ora\_name\_list\_t is defined in package DBMS\_STANDARD as:

TYPE ora\_name\_list\_t IS TABLE OF VARCHAR2(2\*(ORA\_MAX\_NAME\_LEN+2)+1);

#### Attribute Return Type and Value Example VARCHAR2: IP address of DECLARE ora client ip address client in LOGON event v addr VARCHAR2(11); when underlying protocol $\ _{\text{BEGIN}}$ is TCP/IP IF (ora sysevent = 'LOGON') THEN v addr := ora client ip address; END IF: END; / VARCHAR2(50): ora database name DECLARE Database name v db name VARCHAR2(50); BEGIN v db name := ora\_database\_name; END; VARCHAR2: DES-IF (ora\_dict\_obj\_type = 'USER') THEN ora\_des\_encrypted\_password encrypted password of INSERT INTO event table user being created or VALUES (ora\_des\_encrypted\_password); altered END IF; VARCHAR2 (128): Name INSERT INTO event table ora dict obj name of dictionary object on VALUES ('Changed object is ' || which DDL operation ora\_dict\_obj\_name); occurred PLS INTEGER: Number ora dict obj name list ( DECLARE of object names modified name list OUT ora name list t name list ora name list t; in event ) number modified PLS INTEGER; OUT parameter: List of BEGIN IF (ora sysevent='ASSOCIATE STATISTICS') THEN object names modified in event number modified := ora\_dict\_obj\_name\_list(name\_list); END IF: END; VARCHAR2 (128): Owner INSERT INTO event\_table ora dict obj owner of dictionary object on VALUES ('object owner is' || which DDL operation ora\_dict\_obj\_owner); occurred PLS INTEGER: Number DECLARE ora dict obj owner list ( of owners of objects owner\_list OUT ora\_name\_list\_t owner\_list ora\_name\_list\_t; modified in event number modified PLS INTEGER; ) OUT parameter: List of BEGIN owners of objects IF (ora sysevent='ASSOCIATE STATISTICS') THEN modified in event number modified := ora\_dict\_obj\_name\_list(owner\_list); END IF; END;

# Table 10-5 System-Defined Event Attributes

Attribute	Return Type and Value	Example
ora_dict_obj_type	VARCHAR2 (20): Type of dictionary object on which DDL operation occurred	<pre>INSERT INTO event_table VALUES ('This object is a '   </pre>
ora_grantee ( user_list OUT ora_name_list_t )	PLS_INTEGER: Number of grantees in grant event OUT parameter: List of grantees in grant event	<pre>DECLARE   user_list ora_name_list_t;   number_of_grantees PLS_INTEGER; BEGIN   IF (ora_sysevent = 'GRANT') THEN     number_of_grantees :=     ora_grantee(user_list);   END IF; END;</pre>
ora_instance_num	NUMBER: Instance number	<pre>IF (ora_instance_num = 1) THEN     INSERT INTO event_table VALUES ('1'); END IF;</pre>
ora_is_alter_column ( column_name IN VARCHAR2 )	BOOLEAN: TRUE if specified column is altered, FALSE otherwise	<pre>IF (ora_sysevent = 'ALTER' AND ora_dict_obj_type = 'TABLE') THEN alter_column := ora_is_alter_column('C'); END IF;</pre>
ora_is_creating_nested_table	BOOLEAN: TRUE if current event is creating nested table, FALSE otherwise	<pre>IF (ora_sysevent = 'CREATE' AND ora_dict_obj_type = 'TABLE' AND ora_is_creating_nested_table) THEN INSERT INTO event_table VALUES ('A nested table is created'); END IF;</pre>
ora_is_drop_column ( column_name IN VARCHAR2 )	BOOLEAN: TRUE if specified column is dropped, FALSE otherwise	<pre>IF (ora_sysevent = 'ALTER' AND ora_dict_obj_type = 'TABLE') THEN drop_column := ora_is_drop_column('C'); END IF;</pre>
ora_is_servererror ( error_number IN VARCHAR2 )	BOOLEAN: TRUE if given error is on error stack, FALSE otherwise	<pre>IF ora_is_servererror(error_number) THEN     INSERT INTO event_table     VALUES ('Server error!!'); END IF;</pre>
ora_login_user	VARCHAR2 (128) : Login user name	SELECT ora_login_user FROM DUAL;
ora_partition_pos	PLS_INTEGER: In INSTEAD OF trigger for CREATE TABLE, position in SQL text where you can insert PARTITION clause	Retrieve ora_sql_txt into sql_text variable v_n := <b>ora_partition_pos</b> ; v_new_stmt := SUBSTR(sql_text,1,v_n - 1)    ' '    my_partition_clause    ' '    SUBSTR(sql_text, v_n));

# Table 10-5 (Cont.) System-Defined Event Attributes

Attribute	Return Type and Value	Example
<pre>ora_privilege_list ( privilege_list OUT ora_name_list_t )</pre>	PLS_INTEGER: Number of privileges in grant or revoke event OUT parameter: List of privileges granted or revoked in event	<pre>DECLARE    privilege_list ora_name_list_t;    number_of_privileges PLS_INTEGER; BEGIN    IF (ora_sysevent = 'GRANT' OR         ora_sysevent = 'REVOKE') THEN         number_of_privileges :=         ora_privilege_list(privilege_list);    END IF; END;</pre>
ora_revokee ( user_list OUT ora_name_list_t )	PLS_INTEGER: Number of revokees in revoke event OUT parameter: List of revokees in event	<pre>DECLARE   user_list ora_name_list_t;   number_of_users PLS_INTEGER; BEGIN   IF (ora_sysevent = 'REVOKE') THEN      number_of_users := ora_revokee(user_list);   END IF; END;</pre>
ora_server_error ( position IN PLS_INTEGER )	NUMBER: Error code at given position on error stack <sup>1</sup>	<pre>INSERT INTO event_table VALUES ('top stack error '   </pre>
ora_server_error_depth	PLS_INTEGER: Number of error messages on error stack	<pre>n := ora_server_error_depth; Use n with functions such as ora_server_error</pre>
ora_server_error_msg ( position IN PLS_INTEGER )	VARCHAR2: Error message at given position on error stack <sup>1</sup>	<pre>INSERT INTO event_table VALUES ('top stack error message'   </pre>
ora_server_error_num_params ( position IN PLS_INTEGER )	PLS_INTEGER: Number of strings substituted into error message (using format like %s) at given position on error stack <sup>1</sup>	<pre>n := ora_server_error_num_params(1);</pre>
ora_server_error_param ( position IN PLS_INTEGER, param IN PLS_INTEGER )	VARCHAR2: Matching substitution value (%s, %d, and so on) in error message at given position and parameter number <sup>1</sup>	<pre> Second %s in "Expected %s, found %s": param := ora_server_error_param(1,2);</pre>

# Table 10-5 (Cont.) System-Defined Event Attributes

Attribute	Return Type and Value	Example
ora_sql_txt ( sql_text OUT ora_name_list_t )	PLS_INTEGER: Number of elements in PL/SQL table OUT parameter: SQL text of triggering statement (broken into multiple collection elements if statement is long)	<pre>CREATE TABLE event_table (col VARCHAR2(2030)); DECLARE sql_text ora_name_list_t; n PLS_INTEGER; v_stmt VARCHAR2(2000); BEGIN n := ora_sql_txt(sql_text); FOR i IN 1n LOOP v_stmt := v_stmt    sql_text(i); END LOOP; INSERT INTO event_table VALUES ('text of triggering statement: '    v_stmt); END;</pre>
ora_sysevent	VARCHAR2 (20) : Name of triggering event, as given in syntax	<pre>INSERT INTO event_table VALUES (ora_sysevent);</pre>
ora_with_grant_option	BOOLEAN: TRUE if privileges are granted with GRANT option, FALSE otherwise	<pre>IF (ora_sysevent = 'GRANT' AND ora_with_grant_option = TRUE) THEN INSERT INTO event_table VALUES ('with grant option'); END IF;</pre>
<pre>ora_space_error_info ( error_number OUT NUMBER, error_type OUT VARCHAR2, object_owner OUT VARCHAR2, table_space_name OUT VARCHAR2, object_name OUT VARCHAR2, sub_object_name OUT VARCHAR2 )</pre>	BOOLEAN: TRUE if error is related to out-of-space condition, FALSE otherwise OUT parameters: Information about object that caused error	<pre>IF (ora_space_error_info (     eno,typ,owner,ts,obj,subobj) = TRUE) THEN DBMS_OUTPUT.PUT_LINE('The object '   obj        ' owned by '    owner        ' has run out of space.'); END IF;</pre>

## Table 10-5 (Cont.) System-Defined Event Attributes

<sup>1</sup> Position 1 is the top of the stack.

# Event Attribute Functions for Database Event Triggers

Table 10-6 summarizes the database event triggers that can invoke event attribute functions. For more information about the triggering events in Table 10-6, see "*database\_event*".

Triggering Event	When Trigger Fires	WHEN Conditions	Restrictions	Transaction	Attribute Functions
AFTER STARTUP	When database is opened.	None allowed	Trigger cannot do database operations.	Starts a separate transaction and commits it after firing the triggers.	ora_sysevent ora_login_user ora_instance_num ora_database_name
BEFORE SHUTDOWN	Just before server starts shutdown of an instance. This lets the cartridge shutdown completely. For nonstandard instance shutdown, this trigger might not fire.	None allowed	Trigger cannot do database operations.	Starts separate transaction and commits it after firing triggers.	ora_sysevent ora_login_user ora_instance_num ora_database_name
AFTER DB_ROLE_CHANGE	When database is opened for first time after role change.	None allowed	None	Starts separate transaction and commits it after firing triggers.	ora_sysevent ora_login_user ora_instance_num ora_database_name
AFTER SERVERERROR	With condition, whenever specified error occurs. Without condition, whenever any error occurs. Trigger does not fire for errors listed in "database_event".	ERRNO = eno	Depends on error.	Starts separate transaction and commits it after firing triggers.	ora_sysevent ora_login_user ora_instance_num ora_database_name ora_server_error ora_is_servererro r ora_space_error_i nfo

## Table 10-6 Database Event Triggers

# Event Attribute Functions for Client Event Triggers

Table 10-7 summarizes the client event triggers that can invoke event attribute functions. For more information about the triggering events in Table 10-7, see "*ddl\_event*" and "*database\_event*".

If a client event trigger becomes the target of a DDL operation (such as CREATE OR REPLACE TRIGGER), then it cannot fire later during the same transaction.

Triggering Event	When Trigger Fires	WHEN Conditions	Restrictions	Transaction	Attribute Functions
BEFORE ALTER AFTER ALTER	When catalog object is altered	Simple conditions on type and name of object, UID, and USER	Trigger cannot do DDL operations on object that caused event to be generated. DDL on other objects is limited to compiling an object, creating a trigger, and creating, altering, and dropping a table.	Fires triggers in current transaction.	<pre>ora_sysevent ora_login_user ora_instance_num ora_database_name ora_dict_obj_type ora_dict_obj_owner ora_dict_obj_owner ora_des_encrypted_password (for ALTER USER events) ora_is_alter_column (for ALTER TABLE events) ora_is_drop_column (for ALTER TABLE events)</pre>
BEFORE DROP AFTER DROP	When catalog object is dropped	Simple conditions on type and name of object, UID, and USER	Trigger cannot do DDL operations on object that caused event to be generated. DDL on other objects is limited to compiling an object, creating a trigger, and creating, altering, and dropping a table.	Fires triggers in current transaction.	<pre>ora_sysevent ora_login_user ora_instance_num ora_database_name ora_dict_obj_type ora_dict_obj_name ora_dict_obj_owner</pre>
BEFORE ANALYZE AFTER ANALYZE	When ANALYZE statement is issued	Simple conditions on type and name of object, UID, and USER	Trigger cannot do DDL operations on object that caused event to be generated. DDL on other objects is limited to compiling an object, creating a trigger, and creating, altering, and dropping a table.	Fires triggers in current transaction.	<pre>ora_sysevent ora_login_user ora_instance_num ora_database_name ora_dict_obj_name ora_dict_obj_type ora_dict_obj_owner</pre>
BEFORE ASSOCIATE STATISTICS AFTER ASSOCIATE STATISTICS	When ASSOCIATE STATISTICS statement is issued	Simple conditions on type and name of object, UID, and USER	Trigger cannot do DDL operations on object that caused event to be generated. DDL on other objects is limited to compiling an object, creating a trigger, and creating, altering, and dropping a table.	Fires triggers in current transaction.	<pre>ora_sysevent ora_login_user ora_instance_num ora_database_name ora_dict_obj_name ora_dict_obj_type ora_dict_obj_owner ora_dict_obj_name_list ora_dict_obj_owner_list</pre>

# Table 10-7 Client Event Triggers

Triggering Event	When Trigger Fires	WHEN Conditions	Restrictions	Transaction	Attribute Functions
BEFORE AUDIT AFTER AUDIT BEFORE NOAUDIT AFTER NOAUDIT	When AUDIT or NOAUDIT statement is issued	Simple conditions on type and name of object, UID, and USER	Trigger cannot do DDL operations on object that caused event to be generated. DDL on other objects is limited to compiling an object, creating a trigger, and creating, altering, and dropping a table.	Fires triggers in current transaction.	ora_sysevent ora_login_user ora_instance_num ora_database_name
BEFORE COMMENT AFTER COMMENT	When object is commented	Simple conditions on type and name of object, UID, and USER	Trigger cannot do DDL operations on object that caused event to be generated. DDL on other objects is limited to compiling an object, creating a trigger, and creating, altering, and dropping a table.	Fires triggers in current transaction.	<pre>ora_sysevent ora_login_user ora_instance_num ora_database_name ora_dict_obj_name ora_dict_obj_type ora_dict_obj_owner</pre>
BEFORE CREATE AFTER CREATE	When catalog object is created	Simple conditions on type and name of object, UID, and USER	Trigger cannot do DDL operations on object that caused event to be generated. DDL on other objects is limited to compiling an object, creating a trigger, and creating, altering, and dropping a table.	Fires triggers in current transaction.	<pre>ora_sysevent ora_login_user ora_instance_num ora_database_name ora_dict_obj_type ora_dict_obj_name ora_dict_obj_owner ora_is_creating_nested_tabl e (for CREATE TABLE events)</pre>

# Table 10-7 (Cont.) Client Event Triggers

Triggering Event	When Trigger Fires	WHEN Conditions	Restrictions	Transaction	Attribute Functions
BEFORE DDL	When most SQL DDL statements are issued. Not fired for ALTER DATABASE, CREATE CONTROLFILE, CREATE DATABASE, and DDL issued through the PL/SQL subprogram interface, such as creating an advanced queue.	Simple conditions on type and name of object, UID, and USER	Trigger cannot do DDL operations on object that caused event to be generated. DDL on other objects is limited to compiling an object, creating a trigger, and creating, altering, and dropping a table.	Fires triggers in current transaction.	<pre>ora_sysevent ora_login_user ora_instance_num ora_database_name ora_dict_obj_name ora_dict_obj_type ora_dict_obj_owner</pre>
BEFORE DISASSOCIATE STATISTICS AFTER DISASSOCIATE STATISTICS	When DISASSOCIATE STATISTICS statement is issued	Simple conditions on type and name of object, UID, and USER	Trigger cannot do DDL operations on object that caused event to be generated. DDL on other objects is limited to compiling an object, creating a trigger, and creating, altering, and dropping a table.	Fires triggers in current transaction.	<pre>ora_sysevent ora_login_user ora_instance_num ora_database_name ora_dict_obj_name ora_dict_obj_type ora_dict_obj_owner ora_dict_obj_owner ora_dict_obj_name_list ora_dict_obj_owner_list</pre>
BEFORE GRANT AFTER GRANT	When GRANT statement is issued	Simple conditions on type and name of object, UID, and USER	Trigger cannot do DDL operations on object that caused event to be generated. DDL on other objects is limited to compiling an object, creating a trigger, and creating, altering, and dropping a table.	Fires triggers in current transaction.	<pre>ora_sysevent ora_login_user ora_instance_num ora_database_name ora_dict_obj_name ora_dict_obj_type ora_dict_obj_owner ora_grantee ora_with_grant_option ora_privilege_list</pre>
BEFORE LOGOFF	At start of user logoff	Simple conditions on UID and USER	DDL on other objects is limited to compiling an object, creating a trigger, and creating, altering, and dropping a table.	Fires triggers in current transaction.	<pre>ora_sysevent ora_login_user ora_instance_num ora_database_name</pre>

# Table 10-7 (Cont.) Client Event Triggers

Triggering Event	When Trigger Fires	WHEN Conditions	Restrictions	Transaction	Attribute Functions
AFTER LOGON	After successful user logon	Simple conditions on UID and USER	DDL on other objects is limited to compiling an object, creating a trigger, and creating, altering, and dropping a table.	Starts separate transaction and commits it after firing triggers.	ora_sysevent ora_login_user ora_instance_num ora_database_name ora_client_ip_address
BEFORE RENAME AFTER RENAME	When RENAME statement is issued	Simple conditions on type and name of object, UID, and USER	Trigger cannot do DDL operations on object that caused event to be generated. DDL on other objects is limited to compiling an object, creating a trigger, and creating, altering, and dropping a table.	Fires triggers in current transaction.	<pre>ora_sysevent ora_login_user ora_instance_num ora_database_name ora_dict_obj_name ora_dict_obj_owner ora_dict_obj_type</pre>
BEFORE REVOKE AFTER REVOKE	When REVOKE statement is issued	Simple conditions on type and name of object, UID, and USER	Trigger cannot do DDL operations on object that caused event to be generated. DDL on other objects is limited to compiling an object, creating a trigger, and creating, altering, and dropping a table.	Fires triggers in current transaction.	<pre>ora_sysevent ora_login_user ora_instance_num ora_database_name ora_dict_obj_name ora_dict_obj_type ora_dict_obj_owner ora_revokee ora_privilege_list</pre>
AFTER SUSPEND	After SQL statement is suspended because of out-of- space condition. (Trigger must correct condition so statement can be resumed.)	Simple conditions on type and name of object, UID, and USER	Trigger cannot do DDL operations	Fires triggers in current transaction.	ora_sysevent ora_login_user ora_instance_num ora_database_name ora_server_error ora_is_servererror ora_space_error_info

# Table 10-7 (Cont.) Client Event Triggers

Triggering Event	When Trigger Fires	WHEN Conditions	Restrictions	Transaction	Attribute Functions
BEFORE TRUNCATE AFTER TRUNCATE	When object is truncated	Simple conditions on type and name of object, UID, and USER		Fires triggers in current transaction.	ora_sysevent ora_login_user ora_instance_num ora_database_name ora_dict_obj_name ora_dict_obj_type ora_dict_obj_owner

#### Table 10-7 (Cont.) Client Event Triggers

# Views for Information About Triggers

The \*\_TRIGGERS static data dictionary views reveal information about triggers. For information about these views, see Oracle Database Reference.

#### Example 10-28 Viewing Information About Triggers

This example creates a trigger and queries the static data dictionary view USER\_TRIGGERS twice —first to show its type, triggering event, and the name of the table on which it is created, and then to show its body.

```
CREATE OR REPLACE TRIGGER Emp_count
AFTER DELETE ON employees
DECLARE
n INTEGER;
BEGIN
SELECT COUNT(*) INTO n FROM employees;
DBMS_OUTPUT.PUT_LINE('There are now ' || n || ' employees.');
END;
/
```

These SQL\*Plus commands format the query results.

```
COLUMN Trigger_type FORMAT A15
COLUMN Triggering_event FORMAT A16
COLUMN Table_name FORMAT A11
COLUMN Trigger_body FORMAT A50
SET LONG 9999
```

#### Query:

```
SELECT Trigger_type, Triggering_event, Table_name
FROM USER_TRIGGERS
WHERE Trigger name = 'EMP COUNT';
```

#### Result:

TRIGGE	ER_TYPE	TRIGGERING	EVENT	TABLE	NAME
AFTER	STATEMENT	DELETE		EMPLOY	YEES

## Query:

```
SELECT Trigger_body
FROM USER_TRIGGERS
WHERE Trigger_name = 'EMP_COUNT';
```

## Result:

```
TRIGGER_BODY
------
DECLARE
n INTEGER;
BEGIN
SELECT COUNT(*) INTO n FROM employees;
DBMS_OUTPUT.PUT_LINE('There are now ' || n || '
employees.');
END;
```

# 11 PL/SQL Packages

This chapter explains how to bundle related PL/SQL code and data into a package, whose contents are available to many applications.

#### Topics

- What is a Package?
- Reasons to Use Packages
- Package Specification
- Package Body
- Package Instantiation and Initialization
- Package State
- SERIALLY\_REUSABLE Packages
- Package Writing Guidelines
- Package Example
- How STANDARD Package Defines the PL/SQL Environment

# What is a Package?

A **package** is a schema object that groups logically related PL/SQL types, variables, constants, subprograms, cursors, and exceptions. A package is compiled and stored in the database, where many applications can share its contents.

A package always has a **specification**, which declares the **public items** that can be referenced from outside the package.

If the public items include cursors or subprograms, then the package must also have a **body**. The body must define queries for public cursors and code for public subprograms. The body can also declare and define **private items** that cannot be referenced from outside the package, but are necessary for the internal workings of the package. Finally, the body can have an **initialization part**, whose statements initialize variables and do other one-time setup steps, and an exception-handling part. You can change the body without changing the specification or the references to the public items; therefore, you can think of the package body as a black box.

In either the package specification or package body, you can map a package subprogram to an external Java, JavaScript, or C subprogram by using a **call specification**, which maps the external subprogram name, parameter types, and return type to their SQL counterparts.

The AUTHID clause of the package specification determines whether the subprograms and cursors in the package run with the privileges of their definer (the default) or invoker, and whether their unqualified references to schema objects are resolved in the schema of the definer or invoker.

The **ACCESSIBLE BY clause** of the package specification lets you specify a white list of PL/SQL units that can access the package. You use this clause in situations like these:

- You implement a PL/SQL application as several packages—one package that provides the application programming interface (API) and helper packages to do the work. You want clients to have access to the API, but not to the helper packages. Therefore, you omit the ACCESSIBLE BY clause from the API package specification and include it in each helper package specification, where you specify that only the API package can access the helper package.
- You create a utility package to provide services to some, but not all, PL/SQL units in the same schema. To restrict use of the package to the intended units, you list them in the ACCESSIBLE BY clause in the package specification.

# See Also:

- "Package Body" for more information about the package body
- "Function Declaration and Definition"
- "Procedure Declaration and Definition"
- "Invoker's Rights and Definer's Rights (AUTHID Property)"

# Reasons to Use Packages

Packages support the development and maintenance of reliable, reusable code with the following features:

## Modularity

Packages let you encapsulate logically related types, variables, constants, subprograms, cursors, and exceptions in named PL/SQL modules. You can make each package easy to understand, and make the interfaces between packages simple, clear, and well defined. This practice aids application development.

## Easier Application Design

When designing an application, all you need initially is the interface information in the package specifications. You can code and compile specifications without their bodies. Next, you can compile standalone subprograms that reference the packages. You need not fully define the package bodies until you are ready to complete the application.

## Hidden Implementation Details

Packages let you share your interface information in the package specification, and hide the implementation details in the package body. Hiding the implementation details in the body has these advantages:

- You can change the implementation details without affecting the application interface.
- Application users cannot develop code that depends on implementation details that you might want to change.

## Added Functionality

Package public variables and cursors can persist for the life of a session. They can be shared by all subprograms that run in the environment. They let you maintain data across transactions without storing it in the database. (For the situations in which package public variables and cursors do not persist for the life of a session, see "Package State".)

#### Better Performance

The first time you invoke a package subprogram, Oracle Database loads the whole package into memory. Subsequent invocations of other subprograms in same the package require no disk I/O.

Packages prevent cascading dependencies and unnecessary recompiling. For example, if you change the body of a package function, Oracle Database does not recompile other subprograms that invoke the function, because these subprograms depend only on the parameters and return value that are declared in the specification.

#### • Easier to Grant Roles

You can grant roles on the package, instead of granting roles on each object in the package.

Note:

You cannot reference host variables from inside a package.

# Package Specification

A **package specification** declares **public items**. The scope of a public item is the schema of the package. A public item is visible everywhere in the schema. To reference a public item that is in scope but not visible, qualify it with the package name. (For information about scope, visibility, and qualification, see "Scope and Visibility of Identifiers".)

Each public item declaration has all information needed to use the item. For example, suppose that a package specification declares the function factorial this way:

FUNCTION factorial (n INTEGER) RETURN INTEGER; -- returns n!

The declaration shows that factorial needs one argument of type INTEGER and returns a value of type INTEGER, which is invokers must know to invoke factorial. Invokers need not know how factorial is implemented (for example, whether it is iterative or recursive).

## Note:

To restrict the use of your package to specified PL/SQL units, include the ACCESSIBLE BY clause in the package specification.

#### **Topics**

- Appropriate Public Items
- Creating Package Specifications

# Appropriate Public Items

Appropriate public items are:

Types, variables, constants, subprograms, cursors, and exceptions used by multiple subprograms

A type defined in a package specification is either a PL/SQL user-defined subtype (described in "User-Defined PL/SQL Subtypes") or a PL/SQL composite type (described in PL/SQL Collections and Records).

## Note:

A PL/SQL composite type defined in a package specification is incompatible with an identically defined local or standalone type (see Example 6-37, Example 6-38, and Example 6-44).

• Associative array types of standalone subprogram parameters

You cannot declare an associative array type at schema level. Therefore, to pass an associative array variable as a parameter to a standalone subprogram, you must declare the type of that variable in a package specification. Doing so makes the type available to both the invoked subprogram (which declares a formal parameter of that type) and to the invoking subprogram or anonymous block (which declares a variable of that type). See Example 11-2.

- Variables that must remain available between subprogram invocations in the same session
- Subprograms that read and write public variables ("get" and "set" subprograms)

Provide these subprograms to discourage package users from reading and writing public variables directly.

Subprograms that invoke each other

You need not worry about compilation order for package subprograms, as you must for standalone subprograms that invoke each other.

Overloaded subprograms

Overloaded subprograms are variations of the same subprogram. That is, they have the same name but different formal parameters. For more information about them, see "Overloaded Subprograms".

## Note:

You cannot reference remote package public variables, even indirectly. For example, if a subprogram refers to a package public variable, you cannot invoke the subprogram through a database link.

# Creating Package Specifications

To create a package specification, use the "CREATE PACKAGE Statement".

Because the package specifications in Example 11-1 and Example 11-2 do not declare cursors or subprograms, the packages trans\_data and aa\_pkg do not need bodies.

## Example 11-1 Simple Package Specification

In this example, the specification for the package trans\_data declares two public types and three public variables.

CREATE OR REPLACE PACKAGE trans\_data AUTHID DEFINER AS TYPE TimeRec IS RECORD (

```
minutes SMALLINT,
hours SMALLINT);
TYPE TransRec IS RECORD (
category VARCHAR2(10),
account INT,
amount REAL,
time_of TimeRec);
minimum_balance CONSTANT REAL := 10.00;
number_processed INT;
insufficient_funds EXCEPTION;
PRAGMA EXCEPTION_INIT(insufficient_funds, -4097);
END trans_data;
/
```

#### Example 11-2 Passing Associative Array to Standalone Subprogram

In this example, the specification for the package <code>aa\_pkg</code> declares an associative array type, <code>aa\_type</code>. Then, the standalone procedure <code>print\_aa</code> declares a formal parameter of type <code>aa\_type</code>. Next, the anonymous block declares a variable of type <code>aa\_type</code>, populates it, and passes it to the procedure <code>print\_aa</code>, which prints it.

```
CREATE OR REPLACE PACKAGE aa pkg AUTHID DEFINER IS
  TYPE aa_type IS TABLE OF INTEGER INDEX BY VARCHAR2(15);
END;
/
CREATE OR REPLACE PROCEDURE print aa (
  aa aa pkg.aa type
) AUTHID DEFINER IS
  i VARCHAR2(15);
BEGIN
  i := aa.FIRST;
  WHILE i IS NOT NULL LOOP
    DBMS_OUTPUT.PUT_LINE (aa(i) || ' ' || i);
    i := aa.NEXT(i);
  END LOOP;
END;
DECLARE
 aa_var aa_pkg.aa_type;
BEGIN
  aa var('zero') := 0;
 aa var('one') := 1;
  aa var('two') := 2;
 print_aa(aa_var);
END;
/
Result:
```

1 one 2 two 0 zero

# Package Body

If a package specification declares cursors or subprograms, then a package body is required; otherwise, it is optional. The package body and package specification must be in the same schema.

Every cursor or subprogram declaration in the package specification must have a corresponding definition in the package body. The headings of corresponding subprogram declarations and definitions must match word for word, except for white space.

To create a package body, use the "CREATE PACKAGE BODY Statement".

The cursors and subprograms declared in the package specification and defined in the package body are public items that can be referenced from outside the package. The package body can also declare and define **private items** that cannot be referenced from outside the package, but are necessary for the internal workings of the package.

Finally, the body can have an **initialization part**, whose statements initialize public variables and do other one-time setup steps. The initialization part runs only the first time the package is referenced. The initialization part can include an exception handler.

You can change the package body without changing the specification or the references to the public items.

#### Example 11-3 Matching Package Specification and Body

In this example, the headings of the corresponding subprogram declaration and definition do not match word for word; therefore, PL/SQL raises an exception, even though employees.hire date%TYPE is DATE.

```
CREATE PACKAGE emp_bonus AS
PROCEDURE calc_bonus (date_hired employees.hire_date%TYPE);
END emp_bonus;
/
CREATE PACKAGE BODY emp_bonus AS
-- DATE does not match employees.hire_date%TYPE
PROCEDURE calc_bonus (date_hired DATE) IS
BEGIN
DBMS_OUTPUT.PUT_LINE
('Employees hired on ' || date_hired || ' get bonus.');
END;
END emp_bonus;
/
```

#### Result:

Warning: Package Body created with compilation errors.

#### Show errors (in SQL\*Plus):

SHOW ERRORS

#### Result:

Errors for PACKAGE BODY EMP\_BONUS:

LINE/COL ERROR

2/13 PLS-00323: subprogram or cursor 'CALC\_BONUS' is declared in a package specification and must be defined in the package body

#### Correct problem:

```
CREATE OR REPLACE PACKAGE BODY emp_bonus AS

PROCEDURE calc_bonus

(date_hired employees.hire_date%TYPE) IS

BEGIN

DBMS_OUTPUT.PUT_LINE

('Employees hired on ' || date_hired || ' get bonus.');
```

```
END;
END emp_bonus;
/
```

#### Result:

Package body created.

# Package Instantiation and Initialization

When a session references a package item, Oracle Database instantiates the package for that session. Every session that references a package has its own instantiation of that package.

When Oracle Database instantiates a package, it initializes it. Initialization includes whichever of the following are applicable:

- Assigning initial values to public constants
- Assigning initial values to public variables whose declarations specify them
- Executing the initialization part of the package body

# Package State

The values of the variables, constants, and cursors that a package declares (in either its specification or body) comprise its **package state**.

If a PL/SQL package declares at least one variable, constant, or cursor, then the package is **stateful**; otherwise, it is **stateless**.

Each session that references a package item has its own instantiation of that package. If the package is stateful, the instantiation includes its state.

The package state persists for the life of a session, except in these situations:

- The package is SERIALLY REUSABLE.
- The package body is recompiled.

If the body of an instantiated, stateful package is recompiled (either explicitly, with the "ALTER PACKAGE Statement", or implicitly), the next invocation of a subprogram in the package causes Oracle Database to discard the existing package state and raise the exception ORA-04068.

After PL/SQL raises the exception, a reference to the package causes Oracle Database to re-instantiate the package, which re-initializes it. Therefore, previous changes to the package state are lost.

• Any of the session's instantiated packages are invalidated and revalidated.

All of a session's package instantiations (including package states) can be lost if any of the session's instantiated packages are invalidated and revalidated.

Oracle Database treats a package as stateless if its state is constant for the life of a session (or longer). This is the case for a package whose items are all compile-time constants.

A **compile-time constant** is a constant whose value the PL/SQL compiler can determine at compilation time. A constant whose initial value is a literal is always a compile-time constant. A constant whose initial value is not a literal, but which the optimizer reduces to a literal, is also a compile-time constant. Whether the PL/SQL optimizer can reduce a nonliteral expression to a literal depends on optimization level. Therefore, a package that is stateless when compiled at one optimization level might be stateful when compiled at a different optimization level.

Starting with Oracle Database 19c, Release Update 19.23, the initialization parameter SESSION\_EXIT\_ON\_PACKAGE\_STATE\_ERROR allows you to specify behavior in the event package state is invalidated. When a stateful PL/SQL package undergoes modification, the sessions that have an active instantiation of the package receive the following error when they attempt to run it:

ORA-04068: existing state of package has been discarded

When SESSION\_EXIT\_ON\_PACKAGE\_STATE\_ERROR is set to TRUE, the session immediately exits instead of just raising ORA-04068. This can be advantageous because many applications are better equipped to handle a session being discarded, simplifying recovery.

# SERIALLY\_REUSABLE Packages

SERIALLY\_REUSABLE packages let you design applications that manage memory better for scalability.

If a package is not SERIALLY\_REUSABLE, its package state is stored in the user global area (UGA) for each user. Therefore, the amount of UGA memory needed increases linearly with the number of users, limiting scalability. The package state can persist for the life of a session, locking UGA memory until the session ends. In some applications, such as Oracle Office, a typical session lasts several days.

If a package is SERIALLY\_REUSABLE, its package state is stored in a work area in a small pool in the system global area (SGA). The package state persists only for the life of a server call. After the server call, the work area returns to the pool. If a subsequent server call references the package, then Oracle Database reuses an instantiation from the pool. Reusing an instantiation re-initializes it; therefore, changes made to the package state in previous server calls are invisible. (For information about initialization, see "Package Instantiation and Initialization".)

## Note:

Trying to access a SERIALLY\_REUSABLE package from a database trigger, or from a PL/SQL subprogram invoked by a SQL statement, raises an error.

#### Topics

Creating SERIALLY\_REUSABLE Packages

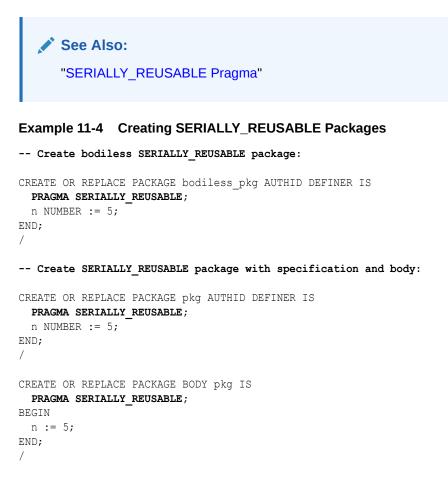

- SERIALLY\_REUSABLE Package Work Unit
- Explicit Cursors in SERIALLY\_REUSABLE Packages

# Creating SERIALLY\_REUSABLE Packages

•

To create a SERIALLY\_REUSABLE package, include the SERIALLY\_REUSABLE pragma in the package specification and, if it exists, the package body.

Example 11-4 creates two very simple SERIALLY\_REUSABLE packages, one with only a specification, and one with both a specification and a body.

# SERIALLY\_REUSABLE Package Work Unit

For a SERIALLY REUSABLE package, the work unit is a server call.

You must use its public variables only within the work unit.

## Note:

If you make a mistake and depend on the value of a public variable that was set in a previous work unit, then your program can fail. PL/SQL cannot check for such cases.

After the work unit (server call) of a SERIALLY\_REUSABLE package completes, Oracle Database does the following:

- Closes any open cursors.
- Frees some nonreusable memory (for example, memory for collection and long VARCHAR2 variables)
- Returns the package instantiation to the pool of reusable instantiations kept for this package.

#### Example 11-5 Effect of SERIALLY\_REUSABLE Pragma

In this example, the bodiless packages pkg and sr\_pkg are the same, except that sr\_pkg is SERIALLY\_REUSABLE and pkg is not. Each package declares public variable n with initial value 5. Then, an anonymous block changes the value of each variable to 10. Next, another anonymous block prints the value of each variable. The value of pkg.n is still 10, because the state of pkg persists for the life of the session. The value of sr\_pkg.n is 5, because the state of sr pkg persists only for the life of the server call.

```
CREATE OR REPLACE PACKAGE pkg IS
 n NUMBER := 5;
END pkg;
CREATE OR REPLACE PACKAGE sr_pkg IS
 PRAGMA SERIALLY REUSABLE;
 n NUMBER := 5;
END sr pkg;
/
BEGIN
 pkg.n := 10;
 sr pkg.n := 10;
END;
/
BEGIN
 DBMS OUTPUT.PUT LINE('pkg.n: ' || pkg.n);
  DBMS OUTPUT.PUT LINE('sr pkg.n: ' || sr pkg.n);
END;
/
```

Result:

pkg.n: 10 sr\_pkg.n: 5

## Explicit Cursors in SERIALLY\_REUSABLE Packages

An explicit cursor in a SERIALLY\_REUSABLE package remains open until either you close it or its work unit (server call) ends. To re-open the cursor, you must make a new server call. A server call can be different from a subprogram invocation, as Example 11-6 shows.

In contrast, an explicit cursor in a package that is not SERIALLY\_REUSABLE remains open until you either close it or disconnect from the session.

#### Example 11-6 Cursor in SERIALLY\_REUSABLE Package Open at Call Boundary

```
DROP TABLE people;
CREATE TABLE people (name VARCHAR2(20));
```

```
INSERT INTO people (name) VALUES ('John Smith');
INSERT INTO people (name) VALUES ('Mary Jones');
INSERT INTO people (name) VALUES ('Joe Brown');
INSERT INTO people (name) VALUES ('Jane White');
CREATE OR REPLACE PACKAGE sr_pkg IS
 PRAGMA SERIALLY REUSABLE;
 CURSOR c IS SELECT name FROM people;
END sr pkg;
CREATE OR REPLACE PROCEDURE fetch_from_cursor IS
 v_name people.name%TYPE;
BEGIN
 IF sr pkg.c%ISOPEN THEN
   DBMS OUTPUT.PUT LINE ('Cursor is open.');
 ELSE
   DBMS OUTPUT.PUT LINE ('Cursor is closed; opening now.');
   OPEN sr pkg.c;
 END IF;
 FETCH sr pkg.c INTO v name;
 DBMS_OUTPUT.PUT_LINE('Fetched: ' || v_name);
 FETCH sr_pkg.c INTO v_name;
    DBMS OUTPUT.PUT LINE('Fetched: ' || v name);
 END fetch from cursor;
/
```

#### First call to server:

```
BEGIN
  fetch_from_cursor;
  fetch_from_cursor;
END;
/
```

#### Result:

```
Cursor is closed; opening now.
Fetched: John Smith
Fetched: Mary Jones
Cursor is open.
Fetched: Joe Brown
Fetched: Jane White
```

#### New call to server:

```
BEGIN
  fetch_from_cursor;
  fetch_from_cursor;
END;
/
```

#### Result:

Cursor is closed; opening now. Fetched: John Smith Fetched: Mary Jones Cursor is open.

Fetched: Joe Brown Fetched: Jane White

# Package Writing Guidelines

 Become familiar with the packages that Oracle Database supplies, and avoid writing packages that duplicate their features.

For more information about the packages that Oracle Database supplies, see Oracle Database PL/SQL Packages and Types Reference.

- Keep your packages general so that future applications can reuse them.
- Design and define the package specifications before the package bodies.
- In package specifications, declare only items that must be visible to invoking programs.

This practice prevents other developers from building unsafe dependencies on your implementation details and reduces the need for recompilation.

If you change the package specification, you must recompile any subprograms that invoke the public subprograms of the package. If you change only the package body, you need not recompile those subprograms.

 Declare public cursors in package specifications and define them in package bodies, as in Example 11-7.

This practice lets you hide cursors' queries from package users and change them without changing cursor declarations.

Assign initial values in the initialization part of the package body instead of in declarations.

This practice has these advantages:

- The code for computing the initial values can be more complex and better documented.
- If computing an initial value raises an exception, the initialization part can handle it with its own exception handler.
- If you implement a database application as several PL/SQL packages—one package that provides the API and helper packages to do the work, then make the helper packages available only to the API package, as in Example 11-8.

In Example 11-7, the declaration and definition of the cursor c1 are in the specification and body, respectively, of the package emp\_stuff. The cursor declaration specifies only the data type of the return value, not the query, which appears in the cursor definition (for complete syntax and semantics, see "Explicit Cursor Declaration and Definition").

Example 11-8 creates an API package and a helper package. Because of the ACCESSIBLE BY clause in the helper package specification, only the API package can access the helper package.

#### Example 11-7 Separating Cursor Declaration and Definition in Package

```
CREATE PACKAGE emp_stuff AS
CURSOR c1 RETURN employees%ROWTYPE; -- Declare cursor
END emp_stuff;
/
CREATE PACKAGE BODY emp_stuff AS
CURSOR c1 RETURN employees%ROWTYPE IS
SELECT * FROM employees WHERE salary > 2500; -- Define cursor
END emp_stuff;
/
```

```
CREATE OR REPLACE PACKAGE helper
  AUTHID DEFINER
  ACCESSIBLE BY (api)
IS
  PROCEDURE h1;
  PROCEDURE h2;
END;
/
CREATE OR REPLACE PACKAGE BODY helper
IS
  PROCEDURE h1 IS
  BEGIN
   DBMS_OUTPUT.PUT_LINE('Helper procedure h1');
  END;
  PROCEDURE h2 IS
  BEGIN
   DBMS_OUTPUT.PUT_LINE('Helper procedure h2');
  END;
END;
/
CREATE OR REPLACE PACKAGE api
  AUTHID DEFINER
IS
 PROCEDURE p1;
  PROCEDURE p2;
END;
/
CREATE OR REPLACE PACKAGE BODY api
IS
  PROCEDURE p1 IS
  BEGIN
   DBMS_OUTPUT.PUT_LINE('API procedure p1');
   helper.h1;
  END;
  PROCEDURE p2 IS
  BEGIN
   DBMS OUTPUT.PUT LINE('API procedure p2');
   helper.h2;
  END;
END;
/
```

#### Example 11-8 ACCESSIBLE BY Clause

#### Invoke procedures in API package:

BEGIN
 api.p1;
 api.p2;
END;
/

#### Result:

API procedure pl Helper procedure hl

API procedure p2 Helper procedure h2

Invoke a procedure in helper package:

BEGIN
 helper.h1;
END;
/

#### Result:

```
SQL> BEGIN
2 helper.h1;
3 END;
4 /
helper.h1;
*
ERROR at line 2:
ORA-06550: line 2, column 3:
PLS-00904: insufficient privilege to access object HELPER
ORA-06550: line 2, column 3:
PL/SQL: Statement ignored
```

## Package Example

Example 11-9 creates a table, log, and a package, emp\_admin, and then invokes package subprograms from an anonymous block. The package has both specification and body.

The specification declares a public type, cursor, and exception, and three public subprograms. One public subprogram is overloaded (for information about overloaded subprograms, see "Overloaded Subprograms").

The body declares a private variable, defines the public cursor and subprograms that the specification declares, declares and defines a private function, and has an initialization part.

The initialization part (which runs only the first time the anonymous block references the package) inserts one row into the table log and initializes the private variable number\_hired to zero. Every time the package procedure hire\_employee is invoked, it updates the private variable number hired.

#### Example 11-9 Creating emp\_admin Package

```
-- Log to track changes (not part of package):
DROP TABLE log;
CREATE TABLE log (
    date_of_action DATE,
    user_id VARCHAR2(20),
    package_name VARCHAR2(30)
);
-- Package specification:
CREATE OR REPLACE PACKAGE emp_admin AUTHID DEFINER AS
    -- Declare public type, cursor, and exception:
    TYPE EmpRecTyp IS RECORD (emp_id NUMBER, sal NUMBER);
    CURSOR desc_salary RETURN EmpRecTyp;
    invalid salary EXCEPTION;
```

```
-- Declare public subprograms:
  FUNCTION hire_employee (
   last_name VARCHAR2,
first_name VARCHAR2,
email VARCHAR2,
   phone_number VARCHAR2,
job_id VARCHAR2,
salary NUMBER,
   commission_pct NUMBER,
   manager id NUMBER,
   department_id NUMBER
  ) RETURN NUMBER;
 -- Overload preceding public subprogram:
  PROCEDURE fire employee (emp id NUMBER);
 PROCEDURE fire employee (emp email VARCHAR2);
  PROCEDURE raise salary (emp id NUMBER, amount NUMBER);
  FUNCTION nth highest salary (n NUMBER) RETURN EmpRecTyp;
END emp_admin;
/
-- Package body:
CREATE OR REPLACE PACKAGE BODY emp admin AS
 number hired NUMBER; -- private variable, visible only in this package
 -- Define cursor declared in package specification:
  CURSOR desc salary RETURN EmpRecTyp IS
    SELECT employee id, salary
    FROM employees
   ORDER BY salary DESC;
  -- Define subprograms declared in package specification:
  FUNCTION hire_employee (
   last_name VARCHAR2,
   first name
                  VARCHAR2,
   email
                  VARCHAR2,
   phone number VARCHAR2,
            VARCHAR2,
   job id
                   NUMBER,
   salary
   commission_pct NUMBER,
   manager_id NUMBER,
   department id NUMBER
 ) RETURN NUMBER
 IS
   new emp id NUMBER;
 BEGIN
   new emp id := employees seq.NEXTVAL;
   INSERT INTO employees (
      employee id,
      last name,
      first name,
      email,
      phone number,
      hire_date,
      job id,
      salary,
      commission pct,
```

manager id,

```
department id
  )
  VALUES (
    new_emp_id,
    hire_employee.last_name,
    hire employee.first name,
    hire employee.email,
    hire employee.phone number,
    SYSDATE,
    hire employee.job id,
    hire employee.salary,
    hire_employee.commission_pct,
    hire_employee.manager_id,
   hire_employee.department_id
  );
  number hired := number hired + 1;
  DBMS OUTPUT.PUT LINE ('The number of employees hired is '
                       || TO CHAR(number hired) );
  RETURN new emp id;
END hire employee;
PROCEDURE fire_employee (emp_id NUMBER) IS
BEGIN
 DELETE FROM employees WHERE employee id = emp id;
END fire_employee;
PROCEDURE fire employee (emp email VARCHAR2) IS
BEGIN
 DELETE FROM employees WHERE email = emp email;
END fire employee;
-- Define private function, available only inside package:
FUNCTION sal ok (
 jobid VARCHAR2,
 sal NUMBER
) RETURN BOOLEAN
IS
 min sal NUMBER;
 max sal NUMBER;
BEGIN
 SELECT MIN(salary), MAX(salary)
 INTO min sal, max sal
 FROM employees
 WHERE job_id = jobid;
 RETURN (sal >= min sal) AND (sal <= max sal);
END sal_ok;
PROCEDURE raise salary (
 emp id NUMBER,
 amount NUMBER
)
IS
 sal NUMBER(8,2);
  jobid VARCHAR2(10);
BEGIN
 SELECT job_id, salary INTO jobid, sal
 FROM employees
 WHERE employee_id = emp_id;
  IF sal_ok(jobid, sal + amount) THEN -- Invoke private function
```

```
UPDATE employees
      SET salary = salary + amount
      WHERE employee_id = emp_id;
    ELSE
      RAISE invalid_salary;
    END IF;
  EXCEPTION
    WHEN invalid salary THEN
      DBMS OUTPUT.PUT LINE ('The salary is out of the specified range.');
  END raise salary;
  FUNCTION nth_highest_salary (
   n NUMBER
  ) RETURN EmpRecTyp
  ΤS
   emp rec EmpRecTyp;
  BEGIN
   OPEN desc salary;
    FOR i IN 1... LOOP
     FETCH desc salary INTO emp rec;
    END LOOP;
    CLOSE desc salary;
    RETURN emp rec;
  END nth highest salary;
BEGIN -- initialization part of package body
   INSERT INTO log (date of action, user id, package name)
   VALUES (SYSDATE, USER, 'EMP ADMIN');
  number hired := 0;
END emp_admin;
/
-- Invoke packages subprograms in anonymous block:
DECLARE
  new_emp_id NUMBER(6);
BEGIN
  new_emp_id := emp_admin.hire_employee (
    'Belden',
    'Enrique',
    'EBELDEN',
    '555.111.2222',
    'ST CLERK',
    2500,
    .1,
    101,
    110
  );
  DBMS_OUTPUT.PUT_LINE ('The employee id is ' || TO_CHAR(new_emp_id));
  emp_admin.raise_salary (new emp id, 100);
  DBMS OUTPUT.PUT LINE (
    'The 10th highest salary is '||
    TO CHAR (emp admin.nth highest salary(10).sal) ||
             ', belonging to employee: ' ||
             TO CHAR (emp admin.nth highest salary(10).emp id)
  );
  emp_admin.fire_employee(new_emp_id);
  -- You can also delete the newly added employee as follows:
  -- emp_admin.fire_employee('EBELDEN');
END;
/
```

#### Result is similar to:

```
The number of employees hired is 1
The employee id is 210
The 10th highest salary is 11500, belonging to employee: 168
```

## How STANDARD Package Defines the PL/SQL Environment

A package named STANDARD defines the PL/SQL environment. The package specification declares public types, variables, exceptions, subprograms, which are available automatically to PL/SQL programs. For example, package STANDARD declares function ABS, which returns the absolute value of its argument, as follows:

FUNCTION ABS (n NUMBER) RETURN NUMBER;

The contents of package STANDARD are directly visible to applications. You need not qualify references to its contents by prefixing the package name. For example, you might invoke ABS from a database trigger, stored subprogram, Oracle tool, or 3GL application, as follows:

```
abs diff := ABS(x - y);
```

If you declare your own version of ABS, your local declaration overrides the public declaration. You can still invoke the SQL function by specifying its full name:

```
abs_diff := STANDARD.ABS(x - y);
```

Most SQL functions are overloaded. For example, package STANDARD contains these declarations:

FUNCTION TO\_CHAR (right DATE) RETURN VARCHAR2; FUNCTION TO\_CHAR (left NUMBER) RETURN VARCHAR2; FUNCTION TO\_CHAR (left DATE, right VARCHAR2) RETURN VARCHAR2; FUNCTION TO CHAR (left NUMBER, right VARCHAR2) RETURN VARCHAR2;

PL/SQL resolves an invocation of TO\_CHAR by matching the number and data types of the formal and actual parameters.

This chapter explains how to handle PL/SQL compile-time warnings and PL/SQL runtime errors. The latter are called **exceptions**.

#### Note:

The language of warning and error messages depends on the NLS\_LANGUAGE parameter. For information about this parameter, see *Oracle Database Globalization Support Guide*.

#### Topics

- Compile-Time Warnings
- Overview of Exception Handling
- Internally Defined Exceptions
- Predefined Exceptions
- User-Defined Exceptions
- Redeclared Predefined Exceptions
- Raising Exceptions Explicitly
- Exception Propagation
- Unhandled Exceptions
- Retrieving Error Code and Error Message
- Continuing Execution After Handling Exceptions
- Retrying Transactions After Handling Exceptions
- Handling Errors in Distributed Queries

#### See Also:

- "Exception Handling in Triggers"
- "Handling FORALL Exceptions After FORALL Statement Completes"

#### 💙 Tip:

If you have problems creating or running PL/SQL code, check the Oracle Database trace files. The DIAGNOSTIC\_DEST initialization parameter specifies the current location of the trace files. You can find the value of this parameter by issuing SHOW PARAMETER DIAGNOSTIC\_DEST or query the V\$DIAG\_INFO view. For more information about diagnostic data, see Oracle Database Administrator's Guide.

# **Compile-Time Warnings**

While compiling stored PL/SQL units, the PL/SQL compiler generates warnings for conditions that are not serious enough to cause errors and prevent compilation—for example, using a deprecated PL/SQL feature.

To see warnings (and errors) generated during compilation, either query the static data dictionary view \* ERRORS or, in the SQL\*Plus environment, use the command SHOW ERRORS.

The message code of a PL/SQL warning has the form PLW-nnnnn.

Category	Description	Example
SEVERE	Condition might cause unexpected action or wrong results.	Aliasing problems with parameters
PERFORMANCE	Condition might cause performance problems.	Passing a VARCHAR2 value to a NUMBER column in an INSERT statement
INFORMATIONAL	Condition does not affect performance or correctness, but you might want to change it to make the code more maintainable.	Code that can never run

 Table 12-1
 Compile-Time Warning Categories

By setting the compilation parameter PLSQL WARNINGS, you can:

- Enable and disable all warnings, one or more categories of warnings, or specific warnings
- Treat specific warnings as errors (so that those conditions must be corrected before you can compile the PL/SQL unit)

You can set the value of PLSQL WARNINGS for:

Your Oracle database instance

Use the ALTER SYSTEM statement, described in Oracle Database SQL Language Reference.

Your session

Use the ALTER SESSION statement, described in Oracle Database SQL Language Reference.

A stored PL/SQL unit

Use an ALTER statement from "ALTER Statements" with its *compiler\_parameters\_clause*.

In any of the preceding ALTER statements, you set the value of PLSQL\_WARNINGS with this syntax:

PLSQL\_WARNINGS = 'value\_clause' [, 'value\_clause' ] ...

For the syntax of value clause, see Oracle Database Reference.

To display the current value of PLSQL\_WARNINGS, query the static data dictionary view ALL PLSQL OBJECT SETTINGS.

#### See Also:

- Oracle Database Reference for more information about the static data dictionary view ALL PLSQL OBJECT SETTINGS
- Oracle Database Error Messages Reference for the message codes of all PL/SQL warnings
- Oracle Database Reference for more information about the static data dictionary view \* ERRORS
- "PL/SQL Units and Compilation Parameters" for more information about PL/SQL units and compiler parameters

#### Example 12-1 Setting Value of PLSQL\_WARNINGS Compilation Parameter

This example shows several ALTER statements that set the value of PLSQL WARNINGS.

For the session, enable all warnings—highly recommended during development:

```
ALTER SESSION SET PLSQL WARNINGS='ENABLE:ALL';
```

For the session, enable **PERFORMANCE** warnings:

```
ALTER SESSION SET PLSQL WARNINGS='ENABLE:PERFORMANCE';
```

For the procedure loc var, enable PERFORMANCE warnings, and reuse settings:

```
ALTER PROCEDURE loc_var
COMPILE PLSQL_WARNINGS='ENABLE:PERFORMANCE'
REUSE SETTINGS;
```

For the session, enable SEVERE warnings, disable PERFORMANCE warnings, and treat PLW-06002 warnings as errors:

```
ALTER SESSION
SET PLSQL WARNINGS='ENABLE:SEVERE', 'DISABLE:PERFORMANCE', 'ERROR:06002';
```

For the session, disable all warnings:

```
ALTER SESSION SET PLSQL WARNINGS='DISABLE:ALL';
```

## DBMS\_WARNING Package

If you are writing PL/SQL units in a development environment that compiles them (such as SQL\*Plus), you can display and set the value of PLSQL\_WARNINGS by invoking subprograms in the DBMS WARNING package.

Example 12-2 uses an ALTER SESSION statement to disable all warning messages for the session and then compiles a procedure that has unreachable code. The procedure compiles without warnings. Next, the example enables all warnings for the session by invoking DBMS\_WARNING.set\_warning\_setting\_string and displays the value of PLSQL\_WARNINGS by

invoking DBMS\_WARNING.get\_warning\_setting\_string. Finally, the example recompiles the procedure, and the compiler generates a warning about the unreachable code.

#### Note:

Unreachable code could represent a mistake or be intentionally hidden by a debug flag.

DBMS\_WARNING subprograms are useful when you are compiling a complex application composed of several nested SQL\*Plus scripts, where different subprograms need different PLSQL\_WARNINGS settings. With DBMS\_WARNING subprograms, you can save the current PLSQL\_WARNINGS setting, change the setting to compile a particular set of subprograms, and then restore the setting to its original value.

#### See Also:

Oracle Database PL/SQL Packages and Types Reference for more information about the DBMS WARNING package

# Example 12-2 Displaying and Setting PLSQL\_WARNINGS with DBMS\_WARNING Subprograms

Disable all warning messages for this session:

```
ALTER SESSION SET PLSQL WARNINGS='DISABLE:ALL';
```

#### With warnings disabled, this procedure compiles with no warnings:

```
CREATE OR REPLACE PROCEDURE unreachable_code AUTHID DEFINER AS
  x CONSTANT BOOLEAN := TRUE;
BEGIN
    IF x THEN
        DBMS_OUTPUT.PUT_LINE('TRUE');
    ELSE
        DBMS_OUTPUT.PUT_LINE('FALSE');
    END IF;
END unreachable_code;
/
```

Enable all warning messages for this session:

CALL DBMS\_WARNING.set\_warning\_setting\_string ('ENABLE:ALL', 'SESSION');

Check warning setting:

SELECT DBMS\_WARNING.get\_warning\_setting\_string() FROM DUAL;

Result:

```
DBMS_WARNING.GET_WARNING_SETTING_STRING()
```

ENABLE:ALL

1 row selected.

#### Recompile procedure:

ALTER PROCEDURE unreachable code COMPILE;

#### Result:

SP2-0805: Procedure altered with compilation warnings

#### Show errors:

SHOW ERRORS

#### Result:

Errors for PROCEDURE UNREACHABLE\_CODE:

LINE/COL ERROR

------

7/5 PLW-06002: Unreachable code

# **Overview of Exception Handling**

Exceptions (PL/SQL runtime errors) can arise from design faults, coding mistakes, hardware failures, and many other sources. You cannot anticipate all possible exceptions, but you can write exception handlers that let your program to continue to operate in their presence.

Any PL/SQL block can have an exception-handling part, which can have one or more exception handlers. For example, an exception-handling part could have this syntax:

```
EXCEPTION

WHEN ex_name_1 THEN statements_1 -- Exception handler

WHEN ex_name_2 OR ex_name_3 THEN statements_2 -- Exception handler

WHEN OTHERS THEN statements_3 -- Exception handler

END;
```

In the preceding syntax example, *ex\_name\_n* is the name of an exception and *statements\_n* is one or more statements. (For complete syntax and semantics, see "Exception Handler".)

When an exception is raised in the executable part of the block, the executable part stops and control transfers to the exception-handling part. If  $ex\_name\_1$  was raised, then  $statements\_1$  run. If either  $ex\_name\_2$  or  $ex\_name\_3$  was raised, then  $statements\_2$  run. If any other exception was raised, then  $statements\_3$  run.

After an exception handler runs, control transfers to the next statement of the enclosing block. If there is no enclosing block, then:

- If the exception handler is in a subprogram, then control returns to the invoker, at the statement after the invocation.
- If the exception handler is in an anonymous block, then control transfers to the host environment (for example, SQL\*Plus)

If an exception is raised in a block that has no exception handler for it, then the exception propagates. That is, the exception reproduces itself in successive enclosing blocks until a block has a handler for it or there is no enclosing block (for more information, see "Exception Propagation"). If there is no handler for the exception, then PL/SQL returns an unhandled exception error to the invoker or host environment, which determines the outcome (for more information, see "Unhandled Exceptions").

#### Topics

- Exception Categories
- Advantages of Exception Handlers
- Guidelines for Avoiding and Handling Exceptions

## **Exception Categories**

The exception categories are:

#### Internally defined

The runtime system raises internally defined exceptions implicitly (automatically). Examples of internally defined exceptions are ORA-00060 (deadlock detected while waiting for resource) and ORA-27102 (out of memory).

An internally defined exception always has an error code, but does not have a name unless PL/SQL gives it one or you give it one.

For more information, see "Internally Defined Exceptions".

#### Predefined

A predefined exception is an internally defined exception that PL/SQL has given a name. For example, ORA-06500 (PL/SQL: storage error) has the predefined name STORAGE ERROR.

For more information, see "Predefined Exceptions".

#### User-defined

You can declare your own exceptions in the declarative part of any PL/SQL anonymous block, subprogram, or package. For example, you might declare an exception named insufficient funds to flag overdrawn bank accounts.

You must raise user-defined exceptions explicitly.

For more information, see "User-Defined Exceptions".

Table 12-2 summarizes the exception categories.

Table 12-2 Exception Categories

Category	Defin er	Has Error Code	Has Name	Raise d Impli citly	Raised Explicitly
Internally defined	Runti me syste m	Always	Only if you assign one	Yes	Optionally <sup>1</sup>
Predefined	Runti me syste m	Always	Always	Yes	Optionally <sup>1</sup>
User- defined	User	Only if you assign one	Always	No	Always

<sup>1</sup> For details, see "Raising Internally Defined Exception with RAISE Statement".

For a named exception, you can write a specific exception handler, instead of handling it with an OTHERS exception handler. A specific exception handler is more efficient than an OTHERS exception handler, because the latter must invoke a function to determine which exception it is handling. For details, see "Retrieving Error Code and Error Message".

## Advantages of Exception Handlers

Using exception handlers for error-handling makes programs easier to write and understand, and reduces the likelihood of unhandled exceptions.

Without exception handlers, you must check for every possible error, everywhere that it might occur, and then handle it. It is easy to overlook a possible error or a place where it might occur, especially if the error is not immediately detectable (for example, bad data might be undetectable until you use it in a calculation). Error-handling code is scattered throughout the program.

With exception handlers, you need not know every possible error or everywhere that it might occur. You need only include an exception-handling part in each block where errors might occur. In the exception-handling part, you can include exception handlers for both specific and unknown errors. If an error occurs anywhere in the block (including inside a sub-block), then an exception handler handles it. Error-handling code is isolated in the exception-handling parts of the blocks.

In Example 12-3, a procedure uses a single exception handler to handle the predefined exception NO DATA FOUND, which can occur in either of two SELECT INTO statements.

If multiple statements use the same exception handler, and you want to know which statement failed, you can use locator variables, as in Example 12-4.

You determine the precision of your error-handling code. You can have a single exception handler for all division-by-zero errors, bad array indexes, and so on. You can also check for errors in a single statement by putting that statement inside a block with its own exception handler.

#### Example 12-3 Single Exception Handler for Multiple Exceptions

```
CREATE OR REPLACE PROCEDURE select item (
 t column VARCHAR2,
 t name VARCHAR2
) AUTHID DEFINER
TS
 temp VARCHAR2(30);
BEGIN
 temp := t column; -- For error message if next SELECT fails
 -- Fails if table t name does not have column t column:
 SELECT COLUMN NAME INTO temp
 FROM USER TAB COLS
 WHERE TABLE NAME = UPPER(t name)
 AND COLUMN NAME = UPPER(t column);
 temp := t name; -- For error message if next SELECT fails
 -- Fails if there is no table named t_name:
 SELECT OBJECT NAME INTO temp
 FROM USER OBJECTS
```

```
WHERE OBJECT_NAME = UPPER(t_name)
AND OBJECT_TYPE = 'TABLE';
EXCEPTION
wHEN NO_DATA_FOUND THEN
DBMS_OUTPUT.PUT_LINE ('No Data found for SELECT on ' || temp);
WHEN OTHERS THEN
DBMS_OUTPUT.PUT_LINE ('Unexpected error');
RAISE;
END;
/
```

Invoke procedure (there is a DEPARTMENTS table, but it does not have a LAST NAME column):

```
BEGIN
select_item('departments', 'last_name');
END;
/
```

Result:

No Data found for SELECT on departments

Invoke procedure (there is no EMP table):

```
BEGIN
   select_item('emp', 'last_name');
END;
/
```

#### Result:

No Data found for SELECT on emp

#### Example 12-4 Locator Variables for Statements that Share Exception Handler

```
CREATE OR REPLACE PROCEDURE loc_var AUTHID DEFINER IS
  stmt no POSITIVE;
 name_
         VARCHAR2(100);
BEGIN
  stmt no := 1;
  SELECT table name INTO name
  FROM user tables
  WHERE table name LIKE 'ABC%';
  stmt no := 2;
  SELECT table_name INTO name_
  FROM user tables
  WHERE table name LIKE 'XYZ%';
EXCEPTION
  WHEN NO DATA FOUND THEN
    DBMS_OUTPUT.PUT_LINE ('Table name not found in query ' || stmt_no);
END;
/
CALL loc_var();
```

#### Result:

Table name not found in query 1

## Guidelines for Avoiding and Handling Exceptions

To make your programs as reliable and safe as possible:

• Use both error-checking code and exception handlers.

Use error-checking code wherever bad input data can cause an error. Examples of bad input data are incorrect or null actual parameters and queries that return no rows or more rows than you expect. Test your code with different combinations of bad input data to see what potential errors arise.

Sometimes you can use error-checking code to avoid raising an exception, as in Example 12-7.

• Add exception handlers wherever errors can occur.

Errors are especially likely during arithmetic calculations, string manipulation, and database operations. Errors can also arise from problems that are independent of your code—for example, disk storage or memory hardware failure—but your code still must take corrective action.

• Design your programs to work when the database is not in the state you expect.

For example, a table you query might have columns added or deleted, or their types might have changed. You can avoid problems by declaring scalar variables with <code>%TYPE</code> qualifiers and record variables to hold query results with <code>%ROWTYPE</code> qualifiers.

• Whenever possible, write exception handlers for named exceptions instead of using OTHERS exception handlers.

Learn the names and causes of the predefined exceptions. If you know that your database operations might raise specific internally defined exceptions that do not have names, then give them names so that you can write exception handlers specifically for them.

• Have your exception handlers output debugging information.

If you store the debugging information in a separate table, do it with an autonomous routine, so that you can commit your debugging information even if you roll back the work that the main subprogram did. For information about autonomous routines, see "AUTONOMOUS\_TRANSACTION Pragma".

• For each exception handler, carefully decide whether to have it commit the transaction, roll it back, or let it continue.

Regardless of the severity of the error, you want to leave the database in a consistent state and avoid storing bad data.

 Avoid unhandled exceptions by including an OTHERS exception handler at the top level of every PL/SQL program.

Make the last statement in the OTHERS exception handler either RAISE or an invocation of of a subroutine marked with SUPPRESSES\_WARNING\_6009 pragma. (If you do not follow this practice, and PL/SQL warnings are enabled, then you get PLW-06009.) For information about RAISE or an invocation of the RAISE\_APPLICATION\_ERROR, see "Raising Exceptions Explicitly".

# **Internally Defined Exceptions**

**Internally defined exceptions** (ORA-*n* errors) are described in *Oracle Database Error Messages Reference*. The runtime system raises them implicitly (automatically).

An internally defined exception does not have a name unless either PL/SQL gives it one (see "Predefined Exceptions") or you give it one.

If you know that your database operations might raise specific internally defined exceptions that do not have names, then give them names so that you can write exception handlers specifically for them. Otherwise, you can handle them only with OTHERS exception handlers.

To give a name to an internally defined exception, do the following in the declarative part of the appropriate anonymous block, subprogram, or package. (To determine the appropriate block, see "Exception Propagation".)

**1**. Declare the name.

An exception name declaration has this syntax:

exception\_name EXCEPTION;

For semantic information, see "Exception Declaration".

2. Associate the name with the error code of the internally defined exception.

The syntax is:

PRAGMA EXCEPTION\_INIT (exception\_name, error\_code)

For semantic information, see "EXCEPTION\_INIT Pragma".

#### Note:

An internally defined exception with a user-declared name is still an internally defined exception, not a user-defined exception.

Example 12-5 gives the name deadlock\_detected to the internally defined exception ORA-00060 (deadlock detected while waiting for resource) and uses the name in an exception handler.

Example 12-5 Naming Internally Defined Exception

```
DECLARE

deadlock_detected EXCEPTION;

PRAGMA EXCEPTION_INIT(deadlock_detected, -60);

BEGIN

...

EXCEPTION

WHEN deadlock_detected THEN

...

END;

/
```

# **Predefined Exceptions**

**Predefined exceptions** are internally defined exceptions that have predefined names, which PL/SQL declares globally in the package STANDARD. The runtime system raises predefined exceptions implicitly (automatically). Because predefined exceptions have names, you can write exception handlers specifically for them.

Table 12-3 lists the names and error codes of the predefined exceptions.

Exception Name	Oracle Error	Error Code
	ORA-06530	
	ORA-06592	
COLLECTION_IS_NULL	ORA-06531	-6531
CURSOR_ALREADY_OPEN	ORA-06511	-6511
DUP_VAL_ON_INDEX	ORA-00001	-1
INVALID_CURSOR	ORA-01001	-1001
INVALID_NUMBER	ORA-01722	-1722
LOGIN_DENIED	ORA-01017	-1017
NO_DATA_FOUND	ORA-01403	+100
NO_DATA_NEEDED	ORA-06548	-6548
NOT_LOGGED_ON	ORA-01012	-1012
PROGRAM_ERROR	ORA-06501	-6501
ROWTYPE_MISMATCH	ORA-06504	-6504
SELF_IS_NULL	ORA-30625	-30625
STORAGE_ERROR	ORA-06500	-6500
SUBSCRIPT_BEYOND_COUNT	ORA-06533	-6533
SUBSCRIPT_OUTSIDE_LIMIT	ORA-06532	-6532
SYS_INVALID_ROWID	ORA-01410	-1410
TIMEOUT_ON_RESOURCE	ORA-00051	-51
TOO_MANY_ROWS	ORA-01422	-1422
VALUE_ERROR	ORA-06502	-6502
ZERO_DIVIDE	ORA-01476	-1476

Table 12-3 PL/SQL Predefined Exceptions

Example 12-6 calculates a price-to-earnings ratio for a company. If the company has zero earnings, the division operation raises the predefined exception <code>ZERO\_DIVIDE</code> and the executable part of the block transfers control to the exception-handling part.

Example 12-7 uses error-checking code to avoid the exception that Example 12-6 handles.

In Example 12-8, the procedure opens a cursor variable for either the EMPLOYEES table or the DEPARTMENTS table, depending on the value of the parameter discrim. The anonymous block invokes the procedure to open the cursor variable for the EMPLOYEES table, but fetches from the DEPARTMENTS table, which raises the predefined exception ROWTYPE\_MISMATCH.

# See Also: "Raising Internally Defined Exception with RAISE Statement" Database Error Messages to find more information about individual exceptions by searching the Oracle Error number

#### Example 12-6 Anonymous Block Handles ZERO\_DIVIDE

```
DECLARE
stock_price NUMBER := 9.73;
net_earnings NUMBER := 0;
pe_ratio NUMBER;
BEGIN
pe_ratio := stock_price / net_earnings; -- raises ZERO_DIVIDE exception
DBMS_OUTPUT.PUT_LINE('Price/earnings ratio = ' || pe_ratio);
EXCEPTION
WHEN ZERO_DIVIDE THEN
DBMS_OUTPUT.PUT_LINE('Company had zero earnings.');
pe_ratio := NULL;
END;
/
```

#### Result:

Company had zero earnings.

#### Example 12-7 Anonymous Block Avoids ZERO\_DIVIDE

```
DECLARE
stock_price NUMBER := 9.73;
net_earnings NUMBER := 0;
pe_ratio NUMBER;
BEGIN
pe_ratio :=
CASE net_earnings
WHEN 0 THEN NULL
ELSE stock_price / net_earnings
END;
//
```

#### Example 12-8 Anonymous Block Handles ROWTYPE\_MISMATCH

```
CREATE OR REPLACE PACKAGE emp_dept_data AUTHID DEFINER AS
TYPE cv_type IS REF CURSOR;
PROCEDURE open_cv (
    cv IN OUT cv_type,
    discrim IN POSITIVE
);
END emp_dept_data;
/
CREATE OR REPLACE PACKAGE BODY emp_dept_data AS
PROCEDURE open_cv (
    cv IN OUT cv_type,
    discrim IN POSITIVE) IS
BEGIN
IF discrim = 1 THEN
```

```
OPEN cv FOR
    SELECT * FROM EMPLOYEES ORDER BY employee_id;
ELSIF discrim = 2 THEN
    OPEN cv FOR
    SELECT * FROM DEPARTMENTS ORDER BY department_id;
END IF;
END open_cv;
END emp_dept_data;
/
```

Invoke procedure open cv from anonymous block:

```
DECLARE
 emp rec EMPLOYEES%ROWTYPE;
 dept_rec DEPARTMENTS%ROWTYPE;
          Emp dept data.CV TYPE;
 CV
BEGIN
 emp_dept_data.open_cv(cv, 1); -- Open cv for EMPLOYEES fetch.
 FETCH cv INTO dept rec;
                               -- Fetch from DEPARTMENTS.
 DBMS OUTPUT.PUT (dept rec.DEPARTMENT ID);
 DBMS OUTPUT.PUT LINE (' ' || dept rec.LOCATION ID);
EXCEPTION
 WHEN ROWTYPE MISMATCH THEN
    BEGIN
       DBMS OUTPUT.PUT LINE
         ('Row type mismatch, fetching EMPLOYEES data ...');
       FETCH cv INTO emp_rec;
       DBMS_OUTPUT.PUT(emp_rec.DEPARTMENT_ID);
       DBMS OUTPUT.PUT LINE(' ' || emp rec.LAST NAME);
    END;
END;
/
```

#### Result:

```
Row type mismatch, fetching EMPLOYEES data ...
90 King
```

## **User-Defined Exceptions**

You can declare your own exceptions in the declarative part of any PL/SQL anonymous block, subprogram, or package.

An exception name declaration has this syntax:

exception\_name EXCEPTION;

For semantic information, see "Exception Declaration".

You must raise a user-defined exception explicitly. For details, see "Raising Exceptions Explicitly".

# **Redeclared Predefined Exceptions**

Oracle recommends against redeclaring predefined exceptions—that is, declaring a userdefined exception name that is a predefined exception name. (For a list of predefined exception names, see Table 12-3.)

If you redeclare a predefined exception, your local declaration overrides the global declaration in package STANDARD. Exception handlers written for the globally declared exception become unable to handle it—unless you qualify its name with the package name STANDARD.

Example 12-9 shows this.

#### Example 12-9 Redeclared Predefined Identifier

DROP TABLE t; CREATE TABLE t (c NUMBER);

In the following block, the INSERT statement implicitly raises the predefined exception INVALID NUMBER, which the exception handler handles.

```
DECLARE
  default_number NUMBER := 0;
BEGIN
  INSERT INTO t VALUES(TO_NUMBER('100.00', '9G999'));
EXCEPTION
  WHEN INVALID_NUMBER THEN
    DBMS_OUTPUT.PUT_LINE('Substituting default value for invalid number.');
    INSERT INTO t VALUES(default_number);
END;
/
```

Result:

```
Substituting default value for invalid number.
```

The following block redeclares the predefined exception INVALID\_NUMBER. When the INSERT statement implicitly raises the predefined exception INVALID\_NUMBER, the exception handler does not handle it.

```
DECLARE
  default_number NUMBER := 0;
  i NUMBER := 5;
  invalid_number EXCEPTION; -- redeclare predefined exception
BEGIN
  INSERT INTO t VALUES(TO_NUMBER('100.00', '9G999'));
EXCEPTION
  WHEN INVALID_NUMBER THEN
    DBMS_OUTPUT.PUT_LINE('Substituting default value for invalid number.');
    INSERT INTO t VALUES(default_number);
END;
/
```

#### Result:

DECLARE

```
ERROR at line 1:
ORA-01722: unable to convert string value containing '1' to a number
ORA-06512: at line 6
```

The exception handler in the preceding block handles the predefined exception INVALID NUMBER if you qualify the exception name in the exception handler:

```
DECLARE
  default_number NUMBER := 0;
  i NUMBER := 5;
  invalid_number EXCEPTION; -- redeclare predefined exception
BEGIN
  INSERT INTO t VALUES(TO_NUMBER('100.00', '9G999'));
  EXCEPTION
  WHEN STANDARD.INVALID_NUMBER THEN
    DBMS_OUTPUT.PUT_LINE('Substituting default value for invalid number.');
    INSERT INTO t VALUES(default_number);
  END;
/
```

#### Result:

Substituting default value for invalid number.

# **Raising Exceptions Explicitly**

To raise an exception explicitly, use either the RAISE statement or RAISE\_APPLICATION\_ERROR procedure.

#### Topics

- RAISE Statement
- RAISE\_APPLICATION\_ERROR Procedure

## **RAISE Statement**

The RAISE statement explicitly raises an exception. Outside an exception handler, you must specify the exception name. Inside an exception handler, if you omit the exception name, the RAISE statement reraises the current exception.

#### Topics

- Raising User-Defined Exception with RAISE Statement
- Raising Internally Defined Exception with RAISE Statement
- Reraising Current Exception with RAISE Statement

## Raising User-Defined Exception with RAISE Statement

In Example 12-10, the procedure declares an exception named <code>past\_due</code>, raises it explicitly with the <code>RAISE</code> statement, and handles it with an exception handler.

#### Example 12-10 Declaring, Raising, and Handling User-Defined Exception

```
CREATE PROCEDURE account status (
 due date DATE,
 today DATE
) AUTHID DEFINER
TS
 past due EXCEPTION; -- declare exception
BEGIN
 IF due date < today THEN
   RAISE past due; -- explicitly raise exception
 END IF;
EXCEPTION
 WHEN past due THEN -- handle exception
    DBMS OUTPUT.PUT LINE ('Account past due.');
END;
BEGIN
 account status (TO DATE('01-JUL-2010', 'DD-MON-YYYY'),
                 TO_DATE('09-JUL-2010', 'DD-MON-YYYY'));
END;
/
Result:
```

Account past due.

## Raising Internally Defined Exception with RAISE Statement

Although the runtime system raises internally defined exceptions implicitly, you can raise them explicitly with the RAISE statement if they have names. Table 12-3 lists the internally defined exceptions that have predefined names. "Internally Defined Exceptions" explains how to give user-declared names to internally defined exceptions.

An exception handler for a named internally defined exception handles that exception whether it is raised implicitly or explicitly.

In Example 12-11, the procedure raises the predefined exception INVALID\_NUMBER either explicitly or implicitly, and the INVALID NUMBER exception handler always handles it.

#### Example 12-11 Explicitly Raising Predefined Exception

```
DROP TABLE t;
CREATE TABLE t (c NUMBER);
CREATE PROCEDURE p (n NUMBER) AUTHID DEFINER IS
 default number NUMBER := 0;
BEGIN
 IF n < 0 THEN
   RAISE INVALID NUMBER; -- raise explicitly
 ELSE
   INSERT INTO t VALUES (TO NUMBER ('100.00', '9G999')); -- raise implicitly
 END IF;
EXCEPTION
 WHEN INVALID NUMBER THEN
   DBMS OUTPUT.PUT LINE('Substituting default value for invalid number.');
   INSERT INTO t VALUES (default_number);
END;
/
BEGIN
```

```
p(-1);
END;
/
```

Substituting default value for invalid number.

```
BEGIN
p(1);
END;
/
```

#### Result:

Substituting default value for invalid number.

## Reraising Current Exception with RAISE Statement

In an exception handler, you can use the RAISE statement to "reraise" the exception being handled. Reraising the exception passes it to the enclosing block, which can handle it further. (If the enclosing block cannot handle the reraised exception, then the exception propagates—see "Exception Propagation".) When reraising the current exception, you need not specify an exception name.

In Example 12-12, the handling of the exception starts in the inner block and finishes in the outer block. The outer block declares the exception, so the exception name exists in both blocks, and each block has an exception handler specifically for that exception. The inner block raises the exception, and its exception handler does the initial handling and then reraises the exception, passing it to the outer block for further handling.

#### Example 12-12 Reraising Exception

```
DECLARE
 salary_too_high EXCEPTION;
 current_salary NUMBER := 20000;
max_salary NUMBER := 10000;
 erroneous salary NUMBER;
BEGIN
 BEGIN
   IF current_salary > max_salary THEN
     RAISE salary_too_high; -- raise exception
   END IF:
 EXCEPTION
   WHEN salary too high THEN -- start handling exception
      erroneous salary := current salary;
      DBMS OUTPUT.PUT LINE('Salary ' || erroneous salary ||' is out of range.');
      DBMS OUTPUT.PUT LINE ('Maximum salary is ' || max salary || '.');
     RAISE; -- reraise current exception (exception name is optional)
 END;
EXCEPTION
                              -- finish handling exception
 WHEN salary too high THEN
   current_salary := max_salary;
   DBMS OUTPUT.PUT LINE (
      'Revising salary from ' || erroneous salary ||
      ' to ' || current salary || '.'
    );
```

```
END;
/
```

Salary 20000 is out of range. Maximum salary is 10000. Revising salary from 20000 to 10000.

## RAISE\_APPLICATION\_ERROR Procedure

You can invoke the RAISE\_APPLICATION\_ERROR procedure (defined in the DBMS\_STANDARD package) only from a stored subprogram or method. Typically, you invoke this procedure to raise a user-defined exception and return its error code and error message to the invoker.

The RAISE APPLICATION ERROR procedure is marked with SUPPRESSES WARNING 6009 pragma.

For semantic information, see "SUPPRESSES\_WARNING\_6009 Pragma".

To invoke RAISE APPLICATION ERROR, use this syntax:

RAISE APPLICATION ERROR (error code, message[, {TRUE | FALSE}]);

You must have assigned *error\_code* to the user-defined exception with the EXCEPTION\_INIT pragma. The syntax is:

PRAGMA EXCEPTION\_INIT (exception\_name, error\_code)

The *error\_code* is an integer in the range -20000..-20999 and the *message* is a character string of at most 2048 bytes.

For semantic information, see "EXCEPTION\_INIT Pragma".

The *message* is a character string of at most 2048 bytes.

If you specify TRUE, PL/SQL puts *error\_code* on top of the error stack. Otherwise, PL/SQL replaces the error stack with *error code*.

In Example 12-13, an anonymous block declares an exception named past\_due, assigns the error code -20000 to it, and invokes a stored procedure. The stored procedure invokes the RAISE\_APPLICATION\_ERROR procedure with the error code -20000 and a message, whereupon control returns to the anonymous block, which handles the exception. To retrieve the message associated with the exception, the exception handler in the anonymous block invokes the SQLERRM function, described in "Retrieving Error Code and Error Message".

#### Example 12-13 Raising User-Defined Exception with RAISE\_APPLICATION\_ERROR

```
CREATE OR REPLACE PROCEDURE account_status (
   due_date DATE,
   today DATE
) AUTHID DEFINER
IS
BEGIN
   IF due_date < today THEN -- explicitly raise exception
        RAISE_APPLICATION_ERROR(-20000, 'Account past due.');
   END IF;
END;
/</pre>
```

```
DECLARE

past_due EXCEPTION; -- declare exception

PRAGMA EXCEPTION_INIT (past_due, -20000); -- assign error code to exception

BEGIN

account_status (TO_DATE('01-JUL-2010', 'DD-MON-YYYY'),

TO_DATE('09-JUL-2010', 'DD-MON-YYYY')); -- invoke

procedure

EXCEPTION

WHEN past_due THEN -- handle exception

DBMS_OUTPUT.PUT_LINE(TO_CHAR(SQLERRM(-20000)));

END;

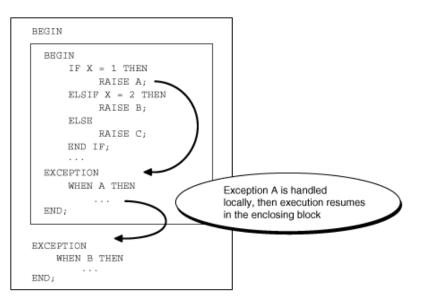

/
```

ORA-20000: Account past due.

# **Exception Propagation**

If an exception is raised in a block that has no exception handler for it, then the exception **propagates**. That is, the exception reproduces itself in successive enclosing blocks until either a block has a handler for it or there is no enclosing block. If there is no handler for the exception, then PL/SQL returns an unhandled exception error to the invoker or host environment, which determines the outcome (for more information, see "Unhandled Exceptions").

In Figure 12-1, one block is nested inside another. The inner block raises exception A. The inner block has an exception handler for A, so A does not propagate. After the exception handler runs, control transfers to the next statement of the outer block.

#### Figure 12-1 Exception Does Not Propagate

In Figure 12-2, the inner block raises exception B. The inner block does not have an exception handler for exception B, so B propagates to the outer block, which does have an exception handler for it. After the exception handler runs, control transfers to the host environment.

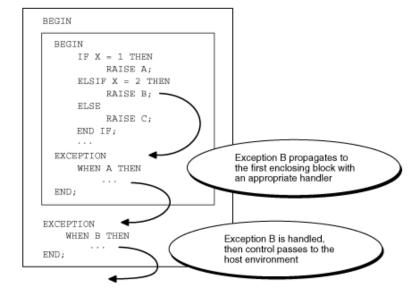

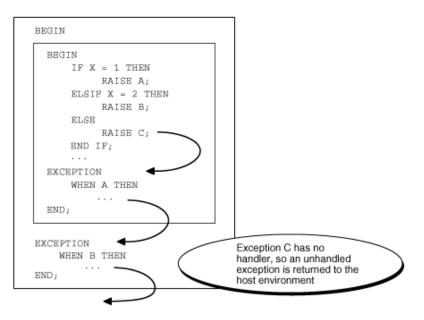

Figure 12-2 Exception Propagates from Inner Block to Outer Block

In Figure 12-3, the inner block raises exception C. The inner block does not have an exception handler for C, so exception C propagates to the outer block. The outer block does not have an exception handler for C, so PL/SQL returns an unhandled exception error to the host environment.

A user-defined exception can propagate beyond its scope (that is, beyond the block that declares it), but its name does not exist beyond its scope. Therefore, beyond its scope, a user-defined exception can be handled only with an OTHERS exception handler.

In Example 12-14, the inner block declares an exception named <code>past\_due</code>, for which it has no exception handler. When the inner block raises <code>past\_due</code>, the exception propagates to the outer block, where the name <code>past\_due</code> does not exist. The outer block handles the exception with an <code>OTHERS</code> exception handler.

If the outer block does not handle the user-defined exception, then an error occurs, as in Example 12-15.

#### Note:

Exceptions cannot propagate across remote subprogram invocations. Therefore, a PL/SQL block cannot handle an exception raised by a remote subprogram.

#### Topics

- Propagation of Exceptions Raised in Declarations
- Propagation of Exceptions Raised in Exception Handlers

#### Example 12-14 Exception that Propagates Beyond Scope is Handled

CREATE OR REPLACE PROCEDURE  ${\tt p}$  Authid definer as begin

```
DECLARE

past_due EXCEPTION;

PRAGMA EXCEPTION_INIT (past_due, -4910);

due_date DATE := trunc(SYSDATE) - 1;

todays_date DATE := trunc(SYSDATE);

BEGIN

IF due_date < todays_date THEN

RAISE past_due;

END IF;

END;

EXCEPTION

WHEN OTHERS THEN

ROLLBACK;

DUCE
```

ROLLBACK RAISE; END; /

#### Example 12-15 Exception that Propagates Beyond Scope is Not Handled

BEGIN

```
DECLARE

past_due EXCEPTION;

due_date DATE := trunc(SYSDATE) - 1;

todays_date DATE := trunc(SYSDATE);

BEGIN

IF due_date < todays_date THEN

RAISE past_due;

END IF;

END;
```

```
END;
/
Result:
BEGIN
*
ERROR at line 1:
ORA-06510: PL/SQL: unhandled user-defined exception
ORA-06512: at line 9
```

## Propagation of Exceptions Raised in Declarations

An exception raised in a declaration propagates immediately to the enclosing block (or to the invoker or host environment if there is no enclosing block). Therefore, the exception handler must be in an enclosing or invoking block, not in the same block as the declaration.

In Example 12-16, the VALUE\_ERROR exception handler is in the same block as the declaration that raises VALUE\_ERROR. Because the exception propagates immediately to the host environment, the exception handler does not handle it.

Example 12-17 is like Example 12-16 except that an enclosing block handles the VALUE\_ERROR exception that the declaration in the inner block raises.

#### Example 12-16 Exception Raised in Declaration is Not Handled

```
DECLARE
    credit_limit CONSTANT NUMBER(3) := 5000; -- Maximum value is 999
BEGIN
    NULL;
EXCEPTION
    WHEN VALUE_ERROR THEN
    DBMS_OUTPUT.PUT_LINE('Exception raised in declaration.');
END;
/
```

#### Result:

```
DECLARE
*
ERROR at line 1:
ORA-06502: PL/SQL: value or conversion error: number precision too large
ORA-06512: at line 2
```

#### Example 12-17 Exception Raised in Declaration is Handled by Enclosing Block

```
BEGIN
```

```
DECLARE
    credit_limit CONSTANT NUMBER(3) := 5000;
BEGIN
    NULL;
END;
EXCEPTION
    WHEN VALUE_ERROR THEN
    DBMS_OUTPUT.PUT_LINE('Exception raised in declaration.');
END;
//
```

Result:

Exception raised in declaration.

# Propagation of Exceptions Raised in Exception Handlers

An exception raised in an exception handler propagates immediately to the enclosing block (or to the invoker or host environment if there is no enclosing block). Therefore, the exception handler must be in an enclosing or invoking block.

In Example 12-18, when n is zero, the calculation 1/n raises the predefined exception ZERO\_DIVIDE, and control transfers to the ZERO\_DIVIDE exception handler in the same block. When the exception handler raises ZERO\_DIVIDE, the exception propagates immediately to the invoker. The invoker does not handle the exception, so PL/SQL returns an unhandled exception error to the host environment.

Example 12-19 is like Example 12-18 except that when the procedure returns an unhandled exception error to the invoker, the invoker handles it.

Example 12-20 is like Example 12-18 except that an enclosing block handles the exception that the exception handler in the inner block raises.

In Example 12-21, the exception-handling part of the procedure has exception handlers for user-defined exception <code>i\_is\_one</code> and predefined exception <code>ZERO\_DIVIDE</code>. When the <code>i\_is\_one</code> exception handler raises <code>ZERO\_DIVIDE</code>, the exception propagates immediately to the invoker (therefore, the <code>ZERO\_DIVIDE</code> exception handler does not handle it). The invoker does not handle the exception, so PL/SQL returns an unhandled exception error to the host environment.

Example 12-22 is like Example 12-21 except that an enclosing block handles the <code>ZERO\_DIVIDE</code> exception that the <code>i\_is\_one</code> exception handler raises.

#### Example 12-18 Exception Raised in Exception Handler is Not Handled

```
CREATE OR REPLACE PROCEDURE print reciprocal (n NUMBER) AUTHID DEFINER IS
BEGIN
  DBMS_OUTPUT.PUT LINE (1/n); -- handled
EXCEPTION
  WHEN ZERO DIVIDE THEN
    DBMS OUTPUT.PUT LINE('Error:');
    DBMS OUTPUT.PUT LINE (1/n || ' is undefined'); -- not handled
END;
/
BEGIN -- invoking block
  print reciprocal(0);
END;
/
Result:
Error:
BEGIN
ERROR at line 1:
ORA-01476: divisor is equal to zero
ORA-06512: at "HR.PRINT RECIPROCAL", line 7
```

```
ORA-01476: divisor is equal to zero ORA-06512: at line 2
```

#### Example 12-19 Exception Raised in Exception Handler is Handled by Invoker

```
CREATE OR REPLACE PROCEDURE print reciprocal (n NUMBER) AUTHID DEFINER IS
BEGIN
  DBMS OUTPUT.PUT LINE(1/n);
EXCEPTION
  WHEN ZERO DIVIDE THEN
    DBMS OUTPUT.PUT LINE('Error:');
    DBMS OUTPUT.PUT LINE(1/n || ' is undefined');
END;
/
BEGIN -- invoking block
 print reciprocal(0);
EXCEPTION
  WHEN ZERO_DIVIDE THEN -- handles exception raised in exception handler
    DBMS OUTPUT.PUT LINE('1/0 is undefined.');
END;
/
```

#### Result:

Error: 1/0 is undefined.

#### Example 12-20 Exception Raised in Exception Handler is Handled by Enclosing Block

```
CREATE OR REPLACE PROCEDURE print_reciprocal (n NUMBER) AUTHID DEFINER IS BEGIN
```

```
BEGIN
   DBMS_OUTPUT.PUT_LINE(1/n);
EXCEPTION
   WHEN ZERO_DIVIDE THEN
    DBMS_OUTPUT.PUT_LINE('Error in inner block:');
   DBMS_OUTPUT.PUT_LINE(1/n || ' is undefined.');
END;
EXCEPTION
```

```
WHEN ZERO_DIVIDE THEN -- handles exception raised in exception handler
   DBMS_OUTPUT.PUT('Error in outer block: ');
   DBMS_OUTPUT.PUT_LINE('1/0 is undefined.');
END;
/
BEGIN
   print_reciprocal(0);
END;
/
```

```
Error in inner block:
Error in outer block: 1/0 is undefined.
```

#### Example 12-21 Exception Raised in Exception Handler is Not Handled

```
CREATE OR REPLACE PROCEDURE descending reciprocals (n INTEGER) AUTHID DEFINER
IS
 i INTEGER;
 i is one EXCEPTION;
BEGIN
  i := n;
 LOOP
   IF i = 1 THEN
     RAISE i_is_one;
   ELSE
     DBMS OUTPUT.PUT LINE('Reciprocal of ' || i || ' is ' || 1/i);
   END IF;
   i := i - 1;
 END LOOP;
EXCEPTION
  WHEN i is one THEN
   DBMS OUTPUT.PUT LINE ('1 is its own reciprocal.');
    DBMS OUTPUT.PUT LINE('Reciprocal of ' || TO CHAR(i-1) ||
                       ' is ' || TO CHAR(1/(i-1)));
  WHEN ZERO DIVIDE THEN
    DBMS OUTPUT.PUT LINE('Error:');
    DBMS OUTPUT.PUT LINE(1/n || ' is undefined');
END;
/
BEGIN
  descending reciprocals(3);
END;
/
Result:
Reciprocal of 2 is .5
1 is its own reciprocal.
```

BEGIN

ERROR at line 1:

ORA-06512: at line 2

ORA-01476: divisor is equal to zero

ORA-06512: at "HR.DESCENDING\_RECIPROCALS", line 19 ORA-06510: PL/SQL: unhandled user-defined exception

```
CREATE OR REPLACE PROCEDURE descending reciprocals (n INTEGER) AUTHID DEFINER
IS
  i INTEGER;
  i is one EXCEPTION;
BEGIN
 BEGIN
   i := n;
   LOOP
     IF i = 1 THEN
      RAISE i is one;
     ELSE
       DBMS OUTPUT.PUT LINE ('Reciprocal of ' || i || ' is ' || 1/i);
     END IF;
     i := i - 1;
   END LOOP;
  EXCEPTION
   WHEN i is one THEN
     DBMS OUTPUT.PUT LINE('1 is its own reciprocal.');
     DBMS OUTPUT.PUT LINE('Reciprocal of ' || TO CHAR(i-1) ||
                         ' is ' || TO CHAR(1/(i-1)));
   WHEN ZERO DIVIDE THEN
     DBMS OUTPUT.PUT LINE('Error:');
     DBMS OUTPUT.PUT LINE(1/n || ' is undefined');
  END;
EXCEPTION
  WHEN ZERO DIVIDE THEN -- handles exception raised in exception handler
   DBMS OUTPUT.PUT LINE('Error:');
   DBMS OUTPUT.PUT LINE('1/0 is undefined');
END;
/
BEGIN
  descending reciprocals(3);
END;
/
Result:
Reciprocal of 2 is .5
```

#### Example 12-22 Exception Raised in Exception Handler is Handled by Enclosing Block

1 is its own reciprocal.

1/0 is undefined

Error:

# **Unhandled Exceptions**

If there is no handler for a raised exception, PL/SQL returns an unhandled exception error to the invoker or host environment, which determines the outcome.

If a stored subprogram exits with an unhandled exception, PL/SQL does not roll back database changes made by the subprogram.

The FORALL statement runs one DML statement multiple times, with different values in the VALUES and WHERE clauses. If one set of values raises an unhandled exception, then PL/SQL rolls back all database changes made earlier in the FORALL statement. For more information, see "Handling FORALL Exceptions Immediately" and "Handling FORALL Exceptions After FORALL Statement Completes".

#### 🛛 Tip:

Avoid unhandled exceptions by including an OTHERS exception handler at the top level of every PL/SQL program.

# Retrieving Error Code and Error Message

In an exception handler, for the exception being handled:

- You can retrieve the error code with the PL/SQL function SQLCODE, described in "SQLCODE Function".
- You can retrieve the error message with either:
  - The PL/SQL function SQLERRM, described in "SQLERRM Function"

This function returns a maximum of 512 bytes, which is the maximum length of an Oracle Database error message (including the error code, nested messages, and message inserts such as table and column names).

 The package function DBMS\_UTILITY.FORMAT\_ERROR\_STACK, described in Oracle Database PL/SQL Packages and Types Reference

This function returns the full error stack, up to 2000 bytes.

Oracle recommends using DBMS\_UTILITY.FORMAT\_ERROR\_STACK, except when using the FORALL statement with its SAVE EXCEPTIONS clause, as in Example 13-13.

A SQL statement cannot invoke SQLCODE or SQLERRM. To use their values in a SQL statement, assign them to local variables first, as in Example 12-23.

#### See Also:

- Oracle Database PL/SQL Packages and Types Reference for information about the DBMS\_UTILITY.FORMAT\_ERROR\_BACKTRACE function, which displays the call stack at the point where an exception was raised, even if the subprogram is called from an exception handler in an outer scope
- Oracle Database PL/SQL Packages and Types Reference for information about the UTL\_CALL\_STACK package, whose subprograms provide information about currently executing subprograms, including subprogram names

#### Example 12-23 Displaying SQLCODE and SQLERRM Values

```
DROP TABLE errors;
CREATE TABLE errors (
 code NUMBER,
 message VARCHAR2(64)
);
CREATE OR REPLACE PROCEDURE p AUTHID DEFINER AS
 name EMPLOYEES.LAST NAME%TYPE;
 v_code NUMBER;
 v errm VARCHAR2(64);
BEGIN
 SELECT last name INTO name
 FROM EMPLOYEES
 WHERE EMPLOYEE ID = -1;
EXCEPTION
 WHEN OTHERS THEN
   v code := SQLCODE;
   v errm := SUBSTR(SQLERRM, 1, 64);
   DBMS OUTPUT.PUT LINE
      ('Error code ' || v_code || ': ' || v_errm);
    /* Invoke another procedure,
       declared with PRAGMA AUTONOMOUS TRANSACTION,
       to insert information about errors. */
   INSERT INTO errors (code, message)
    VALUES (v code, v errm);
   RAISE:
END;
```

# Continuing Execution After Handling Exceptions

After an exception handler runs, control transfers to the next statement of the enclosing block (or to the invoker or host environment if there is no enclosing block). The exception handler cannot transfer control back to its own block.

For example, in Example 12-24, after the SELECT INTO statement raises ZERO\_DIVIDE and the exception handler handles it, execution cannot continue from the INSERT statement that follows the SELECT INTO statement.

If you want execution to resume with the INSERT statement that follows the SELECT INTO statement, then put the SELECT INTO statement in an inner block with its own ZERO\_DIVIDE exception handler, as in Example 12-25.

See Also: Example 13-13, where a bulk SQL operation continues despite exceptions

#### Example 12-24 Exception Handler Runs and Execution Ends

```
DROP TABLE employees temp;
CREATE TABLE employees temp AS
 SELECT employee id, salary, commission pct
 FROM employees;
DECLARE
 sal_calc NUMBER(8,2);
BEGIN
 INSERT INTO employees temp (employee id, salary, commission pct)
 VALUES (301, 2500, 0);
 SELECT (salary / commission pct) INTO sal calc
 FROM employees temp
 WHERE employee id = 301;
 INSERT INTO employees temp VALUES (302, sal_calc/100, .1);
 DBMS OUTPUT.PUT LINE ('Row inserted.');
EXCEPTION
 WHEN ZERO DIVIDE THEN
   DBMS OUTPUT.PUT LINE('Division by zero.');
END;
/
```

#### Result:

Division by zero.

#### Example 12-25 Exception Handler Runs and Execution Continues

```
DECLARE
 sal calc NUMBER(8,2);
BEGIN
 INSERT INTO employees temp (employee id, salary, commission pct)
 VALUES (301, 2500, 0);
 BEGIN
   SELECT (salary / commission pct) INTO sal calc
   FROM employees_temp
   WHERE employee id = 301;
 EXCEPTION
   WHEN ZERO DIVIDE THEN
     DBMS OUTPUT.PUT LINE ('Substituting 2500 for undefined number.');
     sal_calc := 2500;
 END :
 INSERT INTO employees_temp VALUES (302, sal_calc/100, .1);
 DBMS OUTPUT.PUT LINE ('Enclosing block: Row inserted.');
EXCEPTION
 WHEN ZERO DIVIDE THEN
```

```
DBMS OUTPUT.PUT LINE ('Enclosing block: Division by zero.');
END;
```

#### Result:

/

```
Substituting 2500 for undefined number.
Enclosing block: Row inserted.
```

# Retrying Transactions After Handling Exceptions

To retry a transaction after handling an exception that it raised, use this technique:

- 1. Enclose the transaction in a sub-block that has an exception-handling part.
- In the sub-block, before the transaction starts, mark a savepoint. 2.
- In the exception-handling part of the sub-block, put an exception handler that rolls back to 3. the savepoint and then tries to correct the problem.
- Put the sub-block inside a LOOP statement. 4.
- In the sub-block, after the COMMIT statement that ends the transaction, put an EXIT 5. statement.

If the transaction succeeds, the COMMIT and EXIT statements are processed.

If the transaction fails, control transfers to the exception-handling part of the sub-block, and after the exception handler runs, the loop repeats.

#### Example 12-26 Retrying Transaction After Handling Exception

```
DROP TABLE results;
CREATE TABLE results (
 res name VARCHAR(20),
 res answer VARCHAR2(3)
);
CREATE UNIQUE INDEX res_name_ix ON results (res_name);
INSERT INTO results (res_name, res_answer) VALUES ('SMYTHE', 'YES');
INSERT INTO results (res name, res answer) VALUES ('JONES', 'NO');
DECLARE
       VARCHAR2(20) := 'SMYTHE';
 name
 answer VARCHAR2(3) := 'NO';
 suffix NUMBER := 1;
BEGIN
 FOR i IN 1..5 LOOP -- Try transaction at most 5 times.
    DBMS OUTPUT.PUT('Try #' || i);
    BEGIN -- sub-block begins
       SAVEPOINT start_transaction;
       -- transaction begins
       DELETE FROM results WHERE res answer = 'NO';
       INSERT INTO results (res_name, res_answer) VALUES (name, answer);
       -- Nonunique name raises DUP_VAL_ON_INDEX.
```

```
-- If transaction succeeded:
       COMMIT:
       DBMS OUTPUT.PUT LINE(' succeeded.');
       EXIT;
    EXCEPTION
     WHEN DUP VAL ON INDEX THEN
       DBMS OUTPUT.PUT LINE(' failed; trying again.');
       ROLLBACK TO start_transaction; -- Undo changes.
       suffix := suffix + 1;
                                          -- Try to fix problem.
       name := name || TO CHAR(suffix);
    END; -- sub-block ends
 END LOOP;
END;
/
Result:
Try #1 failed; trying again.
```

Example 12-26 uses the preceding technique to retry a transaction whose INSERT statement raises the predefined exception DUP VAL ON INDEX if the value of res name is not unique.

# Handling Errors in Distributed Queries

Try #2 succeeded.

You can use a trigger or a stored subprogram to create a distributed query. This distributed query is decomposed by the local Oracle Database instance into a corresponding number of remote queries, which are sent to the remote nodes for execution. The remote nodes run the queries and send the results back to the local node. The local node then performs any necessary post-processing and returns the results to the user or application.

If a portion of a distributed statement fails, possibly from a constraint violation, then Oracle Database returns ORA-02055. Subsequent statements, or subprogram invocations, return ORA-02067 until a rollback or a rollback to savepoint is entered.

Design your application to check for any returned error messages that indicates that a portion of the distributed update has failed. If you detect a failure, rollback the entire transaction (or rollback to a savepoint) before allowing the application to proceed.

# 13 PL/SQL Optimization and Tuning

This chapter explains how the PL/SQL compiler optimizes your code and how to write efficient PL/SQL code and improve existing PL/SQL code.

#### Topics

- PL/SQL Optimizer
- Candidates for Tuning
- Minimizing CPU Overhead
- Bulk SQL and Bulk Binding
- Chaining Pipelined Table Functions for Multiple Transformations
- Overview of Polymorphic Table Functions
- Updating Large Tables in Parallel
- Collecting Data About User-Defined Identifiers
- Profiling and Tracing PL/SQL Programs
- Compiling PL/SQL Units for Native Execution

#### 🖍 See Also:

Oracle Database Development Guide for disadvantages of cursor variables

# PL/SQL Optimizer

Prior to Oracle Database 10g release 1, the PL/SQL compiler translated your source text to system code without applying many changes to improve performance. Now, PL/SQL uses an optimizer that can rearrange code for better performance.

The optimizer is enabled by default. In rare cases, if the overhead of the optimizer makes compilation of very large applications too slow, you can lower the optimization by setting the compilation parameter PLSQL\_OPTIMIZE\_LEVEL=1 instead of its default value 2. In even rarer cases, PL/SQL might raise an exception earlier than expected or not at all. Setting PLSQL\_OPTIMIZE\_LEVEL=1 prevents the code from being rearranged.

#### See Also:

   ALL PLSQL OBJECT SETTINGS

# Subprogram Inlining

One optimization that the compiler can perform is **subprogram inlining**.

Subprogram inlining replaces a subprogram invocation with a copy of the invoked subprogram (if the invoked and invoking subprograms are in the same program unit). To allow subprogram inlining, either accept the default value of the PLSQL\_OPTIMIZE\_LEVEL compilation parameter (which is 2) or set it to 3.

With PLSQL\_OPTIMIZE\_LEVEL=2, you must specify each subprogram to be inlined with the INLINE pragma:

PRAGMA INLINE (subprogram, 'YES')

If *subprogram* is overloaded, then the preceding pragma applies to every subprogram with that name.

With PLSQL\_OPTIMIZE\_LEVEL=3, the PL/SQL compiler seeks opportunities to inline subprograms. You need not specify subprograms to be inlined. However, you can use the INLINE pragma (with the preceding syntax) to give a subprogram a high priority for inlining, and then the compiler inlines it unless other considerations or limits make the inlining undesirable.

If a particular subprogram is inlined, performance almost always improves. However, because the compiler inlines subprograms early in the optimization process, it is possible for subprogram inlining to preclude later, more powerful optimizations.

If subprogram inlining slows the performance of a particular PL/SQL program, then use the PL/SQL hierarchical profiler to identify subprograms for which you want to turn off inlining. To turn off inlining for a subprogram, use the INLINE pragma:

PRAGMA INLINE (subprogram, 'NO')

The INLINE pragma affects only the immediately following declaration or statement, and only some kinds of statements.

When the INLINE pragma immediately precedes a declaration, it affects:

- Every invocation of the specified subprogram in that declaration
- Every initialization value in that declaration except the default initialization values of records

When the INLINE pragma immediately precedes one of these statements, the pragma affects every invocation of the specified subprogram in that statement:

Assignment

- CALL
- Conditional
- CASE
- CONTINUE WHEN
- EXECUTE IMMEDIATE
- EXIT WHEN
- LOOP
- RETURN

The INLINE pragma does not affect statements that are not in the preceding list.

Multiple pragmas can affect the same declaration or statement. Each pragma applies its own effect to the statement. If PRAGMA INLINE (*subprogram*, 'YES') and PRAGMA INLINE (*identifier*, 'NO') have the same *subprogram*, then 'NO' overrides 'YES'. One PRAGMA INLINE (*subprogram*, 'NO') overrides any number of occurrences of PRAGMA INLINE (*subprogram*, 'YES'), and the order of these pragmas is not important.

#### See Also:

- Oracle Database Development Guide for more information about PL/SQL hierarchical profiler
- Oracle Database Reference for information about the PLSQL\_OPTIMIZE\_LEVEL compilation parameter
- Oracle Database Reference for information about the static dictionary view ALL\_PLSQL\_OBJECT\_SETTINGS

#### Example 13-1 Specifying that Subprogram Is To Be Inlined

In this example, if  $PLSQL_OPTIMIZE_LEVEL=2$ , the INLINE pragma affects the procedure invocations p1(1) and p1(2), but not the procedure invocations p1(3) and p1(4).

PROCEDURE p1 (x PLS\_INTEGER) IS ...
PRAGMA INLINE (p1, 'YES');
x:= p1(1) + p1(2) + 17; -- These 2 invocations to p1 are inlined
...
x:= p1(3) + p1(4) + 17; -- These 2 invocations to p1 are not inlined
...

#### Example 13-2 Specifying that Overloaded Subprogram Is To Be Inlined

In this example, if PLSQL\_OPTIMIZE\_LEVEL=2, the INLINE pragma affects both functions named p2.

```
FUNCTION p2 (p boolean) return PLS_INTEGER IS ...
FUNCTION p2 (x PLS_INTEGER) return PLS_INTEGER IS ...
PRAGMA INLINE(p2, 'YES');
x := p2(true) + p2(3);
```

```
•••
```

#### Example 13-3 Specifying that Subprogram Is Not To Be Inlined

In this example, the INLINE pragma affects the procedure invocations p1(1) and p1(2), but not the procedure invocations p1(3) and p1(4).

```
PROCEDURE p1 (x PLS_INTEGER) IS ...
PRAGMA INLINE (p1, 'NO');
x:= p1(1) + p1(2) + 17; -- These 2 invocations to p1 are not inlined
...
x:= p1(3) + p1(4) + 17; -- These 2 invocations to p1 might be inlined
...
```

#### Example 13-4 PRAGMA INLINE ... 'NO' Overrides PRAGMA INLINE ... 'YES'

In this example, the second INLINE pragma overrides both the first and third INLINE pragmas.

```
PROCEDURE p1 (x PLS_INTEGER) IS ...
PRAGMA INLINE (p1, 'YES');
PRAGMA INLINE (p1, 'NO');
PRAGMA INLINE (p1, 'YES');
x:= p1(1) + p1(2) + 17; -- These 2 invocations to p1 are not inlined
...
```

# Candidates for Tuning

The following kinds of PL/SQL code are very likely to benefit from tuning:

Older code that does not take advantage of new PL/SQL language features.

#### 🖓 Tip:

Before tuning older code, benchmark the current system and profile the older subprograms that your program invokes (see "Profiling and Tracing PL/SQL Programs"). With the many automatic optimizations of the PL/SQL optimizer (described in "PL/SQL Optimizer"), you might see performance improvements before doing any tuning.

• Older dynamic SQL statements written with the DBMS SQL package.

If you know at compile time the number and data types of the input and output variables of a dynamic SQL statement, then you can rewrite the statement in native dynamic SQL, which runs noticeably faster than equivalent code that uses the DBMS\_SQL package (especially when it can be optimized by the compiler). For more information, see PL/SQL Dynamic SQL.

Code that spends much time processing SQL statements.

See "Tune SQL Statements".

Functions invoked in queries, which might run millions of times.

See "Tune Function Invocations in Queries".

Code that spends much time looping through query results.

See "Tune Loops".

Code that does many numeric computations.

See "Tune Computation-Intensive PL/SQL Code".

 Code that spends much time processing PL/SQL statements (as opposed to issuing database definition language (DDL) statements that PL/SQL passes directly to SQL).

# **Tune SQL Statements**

The most common cause of slowness in PL/SQL programs is slow SQL statements. To make SQL statements in a PL/SQL program as efficient as possible:

Use appropriate indexes.

For details, see Oracle Database Performance Tuning Guide.

• Use query hints to avoid unnecessary full-table scans.

For details, see Oracle Database SQL Language Reference.

- Collect current statistics on all tables, using the subprograms in the DBMS\_STATS package. For details, see Oracle Database Performance Tuning Guide.
- Analyze the execution plans and performance of the SQL statements, using:
  - EXPLAIN PLAN statement

For details, see Oracle Database Performance Tuning Guide.

- SQL Trace facility with TKPROF utility

For details, see Oracle Database Performance Tuning Guide.

• Use bulk SQL, a set of PL/SQL features that minimizes the performance overhead of the communication between PL/SQL and SQL.

For details, see "Bulk SQL and Bulk Binding".

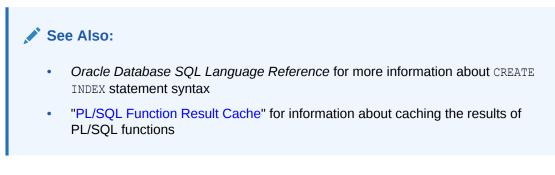

# Tune Function Invocations in Queries

Functions invoked in queries might run millions of times. Do not invoke a function in a query unnecessarily, and make the invocation as efficient as possible.

Create a function-based index on the table in the query. The CREATE INDEX statement might take a while, but the query can run much faster because the function value for each row is cached.

If the query passes a column to a function, then the query cannot use user-created indexes on that column, so the query might invoke the function for every row of the table (which might be very large). To minimize the number of function invocations, use a nested query. Have the inner query filter the result set to a small number of rows, and have the outer query invoke the function for only those rows.

#### Example 13-5 Nested Query Improves Performance

In this example, the two queries produce the same result set, but the second query is more efficient than the first. (In the example, the times and time difference are very small, because the EMPLOYEES table is very small. For a very large table, they would be significant.)

```
DECLARE
 starting_time TIMESTAMP WITH TIME ZONE;
 ending_time TIMESTAMP WITH TIME ZONE;
BEGIN
  -- Invokes SQRT for every row of employees table:
 SELECT SYSTIMESTAMP INTO starting time FROM DUAL;
 FOR item IN (
   SELECT DISTINCT (SQRT (department_id) ) col_alias
   FROM employees
   ORDER BY col alias
 )
 LOOP
   DBMS OUTPUT.PUT LINE ('Square root of dept. ID = ' || item.col alias);
 END LOOP;
 SELECT SYSTIMESTAMP INTO ending time FROM DUAL;
 DBMS OUTPUT.PUT LINE('Time = ' || TO CHAR(ending time - starting time));
 -- Invokes SQRT for every distinct department id of employees table:
 SELECT SYSTIMESTAMP INTO starting_time FROM DUAL;
 FOR item IN (
   SELECT SQRT (department_id) col alias
   FROM (SELECT DISTINCT department id FROM employees)
   ORDER BY col alias
  )
 LOOP
    IF item.col alias IS NOT NULL THEN
     DBMS_OUTPUT.PUT_LINE('Square root of dept. ID = ' || item.col_alias);
   END IF;
 END LOOP;
 SELECT SYSTIMESTAMP INTO ending time FROM DUAL;
```

```
DBMS_OUTPUT.PUT_LINE('Time = ' || TO_CHAR(ending_time - starting_time));
END;
```

#### Result is similar to:

```
Square root of dept. ID = 3.16227766016837933199889354443271853372

```

# Tune Subprogram Invocations

If a subprogram has OUT or IN OUT parameters, you can sometimes decrease its invocation overhead by declaring those parameters with the NOCOPY hint.

When OUT or IN OUT parameters represent large data structures such as collections, records, and instances of ADTs, copying them slows execution and increases memory use—especially for an instance of an ADT.

For each invocation of an ADT method, PL/SQL copies every attribute of the ADT. If the method is exited normally, then PL/SQL applies any changes that the method made to the attributes. If the method is exited with an unhandled exception, then PL/SQL does not change the attributes.

If your program does not require that an OUT or IN OUT parameter retain its pre-invocation value if the subprogram ends with an unhandled exception, then include the NOCOPY hint in the parameter declaration. The NOCOPY hint requests (but does not ensure) that the compiler pass the corresponding actual parameter by reference instead of value.

#### **Caution**:

Do not rely on NOCOPY (which the compiler might or might not obey for a particular invocation) to ensure that an actual parameter or ADT attribute retains its preinvocation value if the subprogram is exited with an unhandled exception. Instead, ensure that the subprogram handle all exceptions. See Also:
 "NOCOPY" for more information about NOCOPY hint
 Oracle Database Object-Relational Developer's Guide for information about using NOCOPY with member methods of ADTs

#### Example 13-6 NOCOPY Subprogram Parameters

In this example, if the compiler obeys the NOCOPY hint for the invocation of do\_nothing2, then the invocation of do nothing2 is faster than the invocation of do nothing1.

```
DECLARE
 TYPE EmpTabTyp IS TABLE OF employees%ROWTYPE;
 emp tab EmpTabTyp := EmpTabTyp(NULL); -- initialize
 t1 NUMBER;
 t2 NUMBER;
 t3 NUMBER;
 PROCEDURE get time (t OUT NUMBER) IS
 BEGIN
   t := DBMS_UTILITY.get_time;
 END;
 PROCEDURE do_nothing1 (tab IN OUT EmpTabTyp) IS
 BEGIN
   NULL;
 END;
 PROCEDURE do_nothing2 (tab IN OUT NOCOPY EmpTabTyp) IS
 BEGIN
   NULL;
 END;
BEGIN
 SELECT * INTO emp tab(1)
 FROM employees
 WHERE employee_id = 100;
 emp tab.EXTEND(49999, 1); -- Copy element 1 into 2..50000
 get time(t1);
 do_nothing1(emp_tab); -- Pass IN OUT parameter
 get time(t2);
 do_nothing2(emp_tab); -- Pass IN OUT NOCOPY parameter
 get time(t3);
 DBMS OUTPUT.PUT LINE ('Call Duration (secs)');
 DBMS OUTPUT.PUT LINE ('-----');
 DBMS OUTPUT.PUT LINE ('Just IN OUT: ' || TO CHAR((t2 - t1)/100.0));
 DBMS OUTPUT.PUT LINE ('With NOCOPY: ' || TO CHAR((t3 - t2))/100.0);
END;
/
```

## Tune Loops

Because PL/SQL applications are often built around loops, it is important to optimize both the loops themselves and the code inside them.

If you must loop through a result set more than once, or issue other queries as you loop through a result set, you might be able to change the original query to give you exactly the results you want. Explore the SQL set operators that let you combine multiple queries, described in *Oracle Database SQL Language Reference*.

You can also use subqueries to do the filtering and sorting in multiple stages—see "Processing Query Result Sets with Subqueries".

# Tune Computation-Intensive PL/SQL Code

These recommendations apply especially (but not only) to computation-intensive PL/SQL code.

#### Topics

- Use Data Types that Use Hardware Arithmetic
- Avoid Constrained Subtypes in Performance-Critical Code
- Minimize Implicit Data Type Conversion

### Use Data Types that Use Hardware Arithmetic

Avoid using data types in the NUMBER data type family (described in "NUMBER Data Type Family"). These data types are represented internally in a format designed for portability and arbitrary scale and precision, not for performance. Operations on data of these types use library arithmetic, while operations on data of the types PLS\_INTEGER, BINARY\_FLOAT and BINARY\_DOUBLE use hardware arithmetic.

For local integer variables, use PLS\_INTEGER, described in "PLS\_INTEGER and BINARY\_INTEGER Data Types". For variables used in performance-critical code, that can never have the value NULL, and do not need overflow checking, use SIMPLE\_INTEGER, described in "SIMPLE\_INTEGER Subtype of PLS\_INTEGER".

For floating-point variables, use BINARY\_FLOAT or BINARY\_DOUBLE, described in Oracle Database SQL Language Reference. For variables used in performance-critical code, that can never have the value NULL, and that do not need overflow checking, use SIMPLE\_FLOAT or SIMPLE\_DOUBLE, explained in "Additional PL/SQL Subtypes of BINARY\_FLOAT and BINARY\_DOUBLE".

#### Note:

BINARY\_FLOAT and BINARY\_DOUBLE and their subtypes are less suitable for financial code where accuracy is critical, because they do not always represent fractional values precisely, and handle rounding differently than the NUMBER types.

Many SQL numeric functions (described in Oracle Database SQL Language Reference) are overloaded with versions that accept BINARY\_FLOAT and BINARY\_DOUBLE parameters. You can

speed up computation-intensive code by passing variables of these data types to such functions, and by invoking the conversion functions TO\_BINARY\_FLOAT (described in Oracle Database SQL Language Reference) and TO\_BINARY\_DOUBLE (described in Oracle Database SQL Language Reference) when passing expressions to such functions.

### Avoid Constrained Subtypes in Performance-Critical Code

In performance-critical code, avoid constrained subtypes (described in "Constrained Subtypes"). Each assignment to a variable or parameter of a constrained subtype requires extra checking at run time to ensure that the value to be assigned does not violate the constraint.

#### See Also:

PL/SQL Predefined Data Types includes predefined constrained subtypes

# Minimize Implicit Data Type Conversion

At run time, PL/SQL converts between different data types implicitly (automatically) if necessary. For example, if you assign a PLS\_INTEGER variable to a NUMBER variable, then PL/SQL converts the PLS\_INTEGER value to a NUMBER value (because the internal representations of the values differ).

Whenever possible, minimize implicit conversions. For example:

• If a variable is to be either inserted into a table column or assigned a value from a table column, then give the variable the same data type as the table column.

### 🖓 Tip:

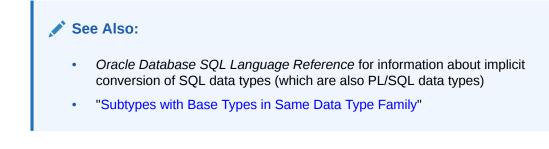

Declare the variable with the %TYPE attribute, described in "%TYPE Attribute".

- Make each literal the same data type as the variable to which it is assigned or the expression in which it appears.
- Convert values from SQL data types to PL/SQL data types and then use the converted values in expressions.

For example, convert NUMBER values to PLS\_INTEGER values and then use the PLS\_INTEGER values in expressions. PLS\_INTEGER operations use hardware arithmetic, so they are faster than NUMBER operations, which use library arithmetic. For more information about the PLS INTEGER data type, see "PLS\_INTEGER and BINARY\_INTEGER Data Types".

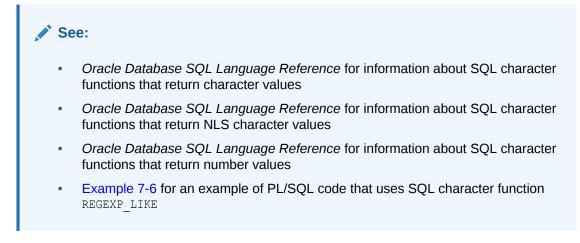

- Before assigning a value of one SQL data type to a variable of another SQL data type, explicitly convert the source value to the target data type, using a SQL conversion function (for information about SQL conversion functions, see *Oracle Database SQL Language Reference*).
- Overload your subprograms with versions that accept parameters of different data types and optimize each version for its parameter types. For information about overloaded subprograms, see "Overloaded Subprograms".

# Use SQL Character Functions

SQL has many highly optimized character functions, which use low-level code that is more efficient than PL/SQL code. Use these functions instead of writing PL/SQL code to do the same things.

# Put Least Expensive Conditional Tests First

PL/SQL stops evaluating a logical expression as soon as it can determine the result. Take advantage of this short-circuit evaluation by putting the conditions that are least expensive to evaluate first in logical expressions whenever possible. For example, test the values of PL/SQL variables before testing function return values, so that if the variable tests fail, PL/SQL need not invoke the functions:

IF boolean\_variable OR (number > 10) OR boolean\_function(parameter) THEN ...

# Bulk SQL and Bulk Binding

**Bulk SQL** minimizes the performance overhead of the communication between PL/SQL and SQL. The PL/SQL features that comprise bulk SQL are the FORALL statement and the BULK COLLECT clause. Assigning values to PL/SQL variables that appear in SQL statements is called **binding**.

PL/SQL and SQL communicate as follows: To run a SELECT INTO or DML statement, the PL/SQL engine sends the query or DML statement to the SQL engine. The SQL engine runs the query or DML statement and returns the result to the PL/SQL engine.

The FORALL statement sends DML statements from PL/SQL to SQL in batches rather than one at a time. The BULK COLLECT clause returns results from SQL to PL/SQL in batches rather than one at a time. If a query or DML statement affects four or more database rows, then bulk SQL can significantly improve performance.

Note: You cannot perform bulk SQL on remote tables.

PL/SQL binding operations fall into these categories:

Binding Category	When This Binding Occurs
In-bind	When an INSERT, UPDATE, or MERGE statement stores a PL/SQL or host variable in the database
Out-bind	When the RETURNING INTO clause of an INSERT, UPDATE, MERGE, or DELETE statement assigns a database value to a PL/SQL or host variable
DEFINE	When a SELECT or FETCH statement assigns a database value to a PL/SQL or host variable

For in-binds and out-binds, bulk SQL uses **bulk binding**; that is, it binds an entire collection of values at once. For a collection of *n* elements, bulk SQL uses a single operation to perform the equivalent of *n* SELECT INTO or DML statements. A query that uses bulk SQL can return any number of rows, without using a FETCH statement for each one.

### Note:

Parallel DML is disabled with bulk SQL.

#### Topics

- FORALL Statement
- BULK COLLECT Clause
- Using FORALL Statement and BULK COLLECT Clause Together
- Client Bulk-Binding of Host Arrays

# **FORALL Statement**

The FORALL statement, a feature of bulk SQL, sends DML statements from PL/SQL to SQL in batches rather than one at a time.

To understand the FORALL statement, first consider the FOR LOOP statement in Example 13-7. It sends these DML statements from PL/SQL to SQL one at a time:

```
DELETE FROM employees_temp WHERE department_id = 10;
DELETE FROM employees_temp WHERE department_id = 30;
DELETE FROM employees_temp WHERE department_id = 70;
```

Now consider the FORALL statement in Example 13-8. It sends the same three DML statements from PL/SQL to SQL as a batch.

A FORALL statement is usually much faster than an equivalent FOR LOOP statement. However, a FOR LOOP statement can contain multiple DML statements, while a FORALL statement can contain only one. The batch of DML statements that a FORALL statement sends to SQL differ only in their VALUES and WHERE clauses. The values in those clauses must come from existing, populated collections.

#### Note:

The DML statement in a FORALL statement can reference multiple collections, but performance benefits apply only to collection references that use the FORALL index variable as an index.

**Example 13-9** inserts the same collection elements into two database tables, using a FOR LOOP statement for the first table and a FORALL statement for the second table and showing how long each statement takes. (Times vary from run to run.)

In Example 13-10, the FORALL statement applies to a subset of a collection.

#### Topics

- Using FORALL Statements for Sparse Collections
- Unhandled Exceptions in FORALL Statements
- Handling FORALL Exceptions Immediately
- Handling FORALL Exceptions After FORALL Statement Completes
- Getting Number of Rows Affected by FORALL Statement

#### See Also:

- "FORALL Statement" for its complete syntax and semantics, including restrictions
- "Implicit Cursors" for information about implicit cursor attributes in general and other implicit cursor attributes that you can use with the FORALL statement

#### Example 13-7 DELETE Statement in FOR LOOP Statement

```
DROP TABLE employees_temp;
CREATE TABLE employees_temp AS SELECT * FROM employees;
DECLARE
TYPE NumList IS VARRAY(20) OF NUMBER;
depts NumList := NumList(10, 30, 70); -- department numbers
BEGIN
FOR i IN depts.FIRST..depts.LAST LOOP
```

```
DELETE FROM employees_temp
WHERE department_id = depts(i);
END LOOP;
END;
/
```

#### Example 13-8 DELETE Statement in FORALL Statement

```
DROP TABLE employees_temp;
CREATE TABLE employees_temp AS SELECT * FROM employees;
DECLARE
TYPE NumList IS VARRAY(20) OF NUMBER;
depts NumList := NumList(10, 30, 70); -- department numbers
BEGIN
FORALL i IN depts.FIRST..depts.LAST
DELETE FROM employees_temp
WHERE department_id = depts(i);
END;
/
```

# Example 13-9 Time Difference for INSERT Statement in FOR LOOP and FORALL Statements

```
DROP TABLE parts1;
CREATE TABLE parts1 (
 pnum INTEGER,
 pname VARCHAR2(15)
);
DROP TABLE parts2;
CREATE TABLE parts2 (
  pnum INTEGER,
  pname VARCHAR2(15)
);
DECLARE
  TYPE NumTab IS TABLE OF parts1.pnum%TYPE INDEX BY PLS INTEGER;
  TYPE NameTab IS TABLE OF parts1.pname%TYPE INDEX BY PLS INTEGER;
  pnums NumTab;
  pnames NameTab;
  iterations CONSTANT PLS INTEGER := 50000;
  t1 INTEGER;
  t2 INTEGER;
  t3 INTEGER;
BEGIN
  FOR j IN 1.. iterations LOOP -- populate collections
   pnums(j) := j;
   pnames(j) := 'Part No. ' || TO CHAR(j);
  END LOOP;
  t1 := DBMS_UTILITY.get_time;
  FOR i IN 1...iterations LOOP
    INSERT INTO parts1 (pnum, pname)
    VALUES (pnums(i), pnames(i));
  END LOOP;
  t2 := DBMS UTILITY.get time;
  FORALL i IN 1.. iterations
    INSERT INTO parts2 (pnum, pname)
    VALUES (pnums(i), pnames(i));
```

```
t3 := DBMS_UTILITY.get_time;
DBMS_OUTPUT.PUT_LINE('Execution Time (secs)');
DBMS_OUTPUT.PUT_LINE('-------');
DBMS_OUTPUT.PUT_LINE('FOR LOOP: ' || TO_CHAR((t2 - t1)/100));
DBMS_OUTPUT.PUT_LINE('FORALL: ' || TO_CHAR((t3 - t2)/100));
COMMIT;
END;
/
```

#### Result is similar to:

```
Execution Time (secs)
------
FOR LOOP: 5.97
FORALL: .07
```

PL/SQL procedure successfully completed.

#### Example 13-10 FORALL Statement for Subset of Collection

```
DROP TABLE employees_temp;
CREATE TABLE employees_temp AS SELECT * FROM employees;
DECLARE
TYPE NumList IS VARRAY(10) OF NUMBER;
depts NumList := NumList(5,10,20,30,50,55,57,60,70,75);
BEGIN
FORALL j IN 4..7
DELETE FROM employees_temp WHERE department_id = depts(j);
END;
/
```

### Using FORALL Statements for Sparse Collections

If the FORALL statement bounds clause references a sparse collection, then specify only existing index values, using either the INDICES OF or VALUES OF clause.

You can use INDICES OF for any collection except an associative array indexed by string. You can use VALUES OF only for a collection of PLS INTEGER elements indexed by PLS INTEGER.

A collection of PLS\_INTEGER elements indexed by PLS\_INTEGER can be an index collection; that is, a collection of pointers to elements of another collection (the indexed collection).

Index collections are useful for processing different subsets of the same collection with different FORALL statements. Instead of copying elements of the original collection into new collections that represent the subsets (which can use significant time and memory), represent each subset with an index collection and then use each index collection in the VALUES OF clause of a different FORALL statement.

See Also:

"Sparse Collections and SQL%BULK\_EXCEPTIONS"

#### Example 13-11 FORALL Statements for Sparse Collection and Its Subsets

This example uses a FORALL statement with the INDICES OF clause to populate a table with the elements of a sparse collection. Then it uses two FORALL statements with VALUES OF clauses to populate two tables with subsets of a collection.

```
DROP TABLE valid orders;
CREATE TABLE valid orders (
 cust_name VARCHAR2(32),
 amount NUMBER(10,2)
);
DROP TABLE big orders;
CREATE TABLE big orders AS
 SELECT * FROM valid orders
 WHERE 1 = 0;
DROP TABLE rejected orders;
CREATE TABLE rejected orders AS
 SELECT * FROM valid orders
 WHERE 1 = 0;
DECLARE
  SUBTYPE cust name IS valid orders.cust name%TYPE;
 TYPE cust typ IS TABLE OF cust name;
  cust_tab cust_typ; -- Collection of customer names
  SUBTYPE order amount IS valid orders.amount%TYPE;
  TYPE amount typ IS TABLE OF NUMBER;
  amount_tab amount_typ; -- Collection of order amounts
  TYPE index pointer t IS TABLE OF PLS INTEGER;
  /* Collections for pointers to elements of cust tab collection
     (to represent two subsets of cust_tab): */
 big order tab
                      index pointer t := index pointer t();
  rejected order tab index pointer t := index pointer t();
  PROCEDURE populate data collections IS
  BEGIN
    cust tab := cust typ(
      'Company1', 'Company2', 'Company3', 'Company4', 'Company5'
    );
    amount tab := amount typ(5000.01, 0, 150.25, 4000.00, NULL);
  END;
BEGIN
 populate_data_collections;
  DBMS OUTPUT.PUT LINE ('--- Original order data ---');
  FOR i IN 1..cust tab.LAST LOOP
   DBMS OUTPUT.PUT_LINE (
      'Customer #' || i || ', ' || cust tab(i) || ': $' || amount tab(i)
   );
 END LOOP;
  -- Delete invalid orders:
```

FOR i IN 1..cust\_tab.LAST LOOP

```
IF amount tab(i) IS NULL OR amount tab(i) = 0 THEN
     cust tab.delete(i);
     amount_tab.delete(i);
   END IF;
 END LOOP;
  -- cust tab is now a sparse collection.
 DBMS OUTPUT.PUT LINE ('--- Order data with invalid orders deleted ----');
 FOR i IN 1..cust_tab.LAST LOOP
   IF cust tab.EXISTS(i) THEN
     DBMS_OUTPUT.PUT_LINE (
       'Customer #' || i || ', ' || cust tab(i) || ': $' || amount tab(i)
     );
   END IF;
 END LOOP;
 -- Using sparse collection, populate valid orders table:
 FORALL i IN INDICES OF cust tab
   INSERT INTO valid orders (cust name, amount)
   VALUES (cust tab(i), amount tab(i));
 populate_data_collections; -- Restore original order data
 -- cust tab is a dense collection again.
  /* Populate collections of pointers to elements of cust tab collection
     (which represent two subsets of cust tab): */
  FOR i IN cust_tab.FIRST .. cust_tab.LAST LOOP
    IF amount_tab(i) IS NULL OR amount_tab(i) = 0 THEN
     rejected_order_tab.EXTEND;
     rejected_order_tab(rejected_order_tab.LAST) := i;
   END IF;
   IF amount tab(i) > 2000 THEN
     big order tab.EXTEND;
     big order tab(big order tab.LAST) := i;
   END IF;
 END LOOP;
 /* Using each subset in a different FORALL statement,
    populate rejected_orders and big_orders tables: */
 FORALL i IN VALUES OF rejected_order_tab
   INSERT INTO rejected orders (cust name, amount)
   VALUES (cust tab(i), amount tab(i));
 FORALL i IN VALUES OF big_order_tab
   INSERT INTO big orders (cust name, amount)
   VALUES (cust tab(i), amount tab(i));
END;
Result:
```

--- Original order data ---Customer #1, Company1: \$5000.01 Customer #2, Company2: \$0 Customer #3, Company3: \$150.25

```
Customer #4, Company4: $4000
Customer #5, Company5: $
--- Data with invalid orders deleted ---
Customer #1, Company1: $5000.01
Customer #3, Company3: $150.25
Customer #4, Company4: $4000
```

#### Verify that correct order details were stored:

SELECT cust\_name "Customer", amount "Valid order amount"
FROM valid\_orders
ORDER BY cust name;

#### Result:

Customer	Valid	order	amount
Companyl		I.	5000.01
Company3			150.25
Company4			4000

3 rows selected.

#### Query:

SELECT cust\_name "Customer", amount "Big order amount"
FROM big\_orders
ORDER BY cust\_name;

#### Result:

Customer	Big	order	amount
Companyl		5	5000.01
Company4			4000

2 rows selected.

#### Query:

```
SELECT cust_name "Customer", amount "Rejected order amount"
FROM rejected_orders
ORDER BY cust name;
```

#### Result:

Customer	Rejected	order	amount
Company2 Company5			0

2 rows selected.

### Unhandled Exceptions in FORALL Statements

In a FORALL statement without the SAVE EXCEPTIONS clause, if one DML statement raises an unhandled exception, then PL/SQL stops the FORALL statement and rolls back all changes made by previous DML statements.

For example, the FORALL statement in Example 13-8 processes these DML statements in this order, unless one of them raises an unhandled exception:

```
DELETE FROM employees_temp WHERE department_id = depts(10);
DELETE FROM employees_temp WHERE department_id = depts(30);
DELETE FROM employees_temp WHERE department_id = depts(70);
```

If the third statement raises an unhandled exception, then PL/SQL rolls back the changes that the first and second statements made. If the second statement raises an unhandled exception, then PL/SQL rolls back the changes that the first statement made and never runs the third statement.

You can handle exceptions raised in a FORALL statement in either of these ways:

- As each exception is raised (see "Handling FORALL Exceptions Immediately")
- After the FORALL statement completes execution, by including the SAVE EXCEPTIONS clause (see "Handling FORALL Exceptions After FORALL Statement Completes")

### Handling FORALL Exceptions Immediately

To handle exceptions raised in a FORALL statement immediately, omit the SAVE EXCEPTIONS clause and write the appropriate exception handlers.

If one DML statement raises a handled exception, then PL/SQL rolls back the changes made by that statement, but does not roll back changes made by previous DML statements.

In Example 13-12, the FORALL statement is designed to run three UPDATE statements. However, the second one raises an exception. An exception handler handles the exception, displaying the error message and committing the change made by the first UPDATE statement. The third UPDATE statement never runs.

For information about exception handlers, see PL/SQL Error Handling.

#### Example 13-12 Handling FORALL Exceptions Immediately

```
DROP TABLE emp_temp;
CREATE TABLE emp_temp (
 deptno NUMBER(2),
 job VARCHAR2(18)
);
CREATE OR REPLACE PROCEDURE p AUTHID DEFINER AS
 TYPE NumList IS TABLE OF NUMBER;
 depts
                NumList := NumList(10, 20, 30);
 error_message VARCHAR2(100);
BEGIN
 -- Populate table:
 INSERT INTO emp temp (deptno, job) VALUES (10, 'Clerk');
 INSERT INTO emp_temp (deptno, job) VALUES (20, 'Bookkeeper');

### Handling FORALL Exceptions After FORALL Statement Completes

To allow a FORALL statement to continue even if some of its DML statements fail, include the SAVE EXCEPTIONS clause. When a DML statement fails, PL/SQL does not raise an exception; instead, it saves information about the failure. After the FORALL statement completes, PL/SQL raises a single exception for the FORALL statement (ORA-24381).

In the exception handler for ORA-24381, you can get information about each individual DML statement failure from the implicit cursor attribute SQL%BULK EXCEPTIONS.

SQL%BULK\_EXCEPTIONS is like an associative array of information about the DML statements that failed during the most recently run FORALL statement.

SQL%BULK\_EXCEPTIONS.COUNT is the number of DML statements that failed. If SQL%BULK\_EXCEPTIONS.COUNT is not zero, then for each index value *i* from 1 through SQL%BULK EXCEPTIONS.COUNT:

- SQL%BULK EXCEPTIONS (i).ERROR INDEX is the number of the DML statement that failed.
- SQL%BULK EXCEPTIONS (i).ERROR CODE is the Oracle Database error code for the failure.

For example, if a FORALL SAVE EXCEPTIONS statement runs 100 DML statements, and the tenth and sixty-fourth ones fail with error codes ORA-12899 and ORA-19278, respectively, then:

- SQL%BULK EXCEPTIONS.COUNT = 2
- SQL%BULK EXCEPTIONS(1).ERROR INDEX = 10
- SQL%BULK EXCEPTIONS(1).ERROR CODE = 12899
- SQL%BULK EXCEPTIONS(2).ERROR INDEX = 64
- SQL%BULK EXCEPTIONS(2).ERROR CODE = 19278

#### Note:

After a FORALL statement without the SAVE EXCEPTIONS clause raises an exception, SQL%BULK EXCEPTIONS.COUNT = 1.

With the error code, you can get the associated error message with the SQLERRM function (described in "SQLERRM Function"):

SQLERRM(-(SQL%BULK\_EXCEPTIONS(i).ERROR\_CODE))

However, the error message that SQLERRM returns excludes any substitution arguments (compare the error messages in Example 13-12 and Example 13-13).

Example 13-13 is like Example 13-12 except:

- The FORALL statement includes the SAVE EXCEPTIONS clause.
- The exception-handling part has an exception handler for ORA-24381, the internally defined exception that PL/SQL raises implicitly when a bulk operation raises and saves exceptions. The example gives ORA-24381 the user-defined name dml errors.
- The exception handler for dml\_errors uses SQL%BULK\_EXCEPTIONS and SQLERRM (and some local variables) to show the error message and which statement, collection item, and string caused the error.

#### Example 13-13 Handling FORALL Exceptions After FORALL Statement Completes

```
CREATE OR REPLACE PROCEDURE p AUTHID DEFINER AS

TYPE NumList IS TABLE OF NUMBER;

depts NumList := NumList(10, 20, 30);

error_message VARCHAR2(100);

bad_stmt_no PLS_INTEGER;

bad_deptno emp_temp.deptno%TYPE;

bad_job emp_temp.job%TYPE;

dml_errors EXCEPTION;

PRAGMA EXCEPTION_INIT(dml_errors, -24381);

BEGIN

-- Populate table:

INSERT INTO emp_temp (deptno, job) VALUES (10, 'Clerk');

INSERT INTO emp_temp (deptno, job) VALUES (20, 'Bookkeeper');

INSERT INTO emp_temp (deptno, job) VALUES (30, 'Analyst');
```

```
COMMIT;
 -- Append 9-character string to each job:
 FORALL j IN depts.FIRST..depts.LAST SAVE EXCEPTIONS
   UPDATE emp temp SET job = job || ' (Senior)'
   WHERE deptno = depts(j);
EXCEPTION
 WHEN dml errors THEN
   FOR i IN 1... SQL%BULK_EXCEPTIONS.COUNT LOOP
     error message := SQLERRM(-(SQL%BULK EXCEPTIONS(i).ERROR CODE));
     DBMS_OUTPUT.PUT_LINE (error_message);
     bad stmt no := SQL%BULK EXCEPTIONS(i).ERROR INDEX;
     DBMS_OUTPUT.PUT_LINE('Bad statement #: ' || bad_stmt_no);
     bad deptno := depts(bad stmt no);
     DBMS OUTPUT.PUT LINE ('Bad department #: ' || bad deptno);
     SELECT job INTO bad_job FROM emp_temp WHERE deptno = bad_deptno;
     DBMS OUTPUT.PUT LINE ('Bad job: ' || bad job);
   END LOOP;
    COMMIT; -- Commit results of successful updates

Bad statement #: 2
Bad department #: 20
Bad job: Bookkeeper
```

PL/SQL procedure successfully completed.

#### Query:

SELECT \* FROM emp\_temp;

#### Result:

DEPTNO JOB ------10 Clerk (Senior)

20 Bookkeeper 30 Analyst **(Senior)** 

3 rows selected.

### Sparse Collections and SQL%BULK\_EXCEPTIONS

If the FORALL statement bounds clause references a sparse collection, then to find the collection element that caused a DML statement to fail, you must step through the elements one by one until you find the element whose index is SQL%BULK\_EXCEPTIONS (i).ERROR\_INDEX. Then, if the FORALL statement uses the VALUES OF clause to reference a collection of pointers into another collection, you must find the element of the other collection whose index is SQL%BULK\_EXCEPTIONS (i).ERROR\_INDEX.

### Getting Number of Rows Affected by FORALL Statement

After a FORALL statement completes, you can get the number of rows that each DML statement affected from the implicit cursor attribute SQL%BULK ROWCOUNT.

To get the total number of rows affected by the FORALL statement, use the implicit cursor attribute SQL%ROWCOUNT, described in "SQL%ROWCOUNT Attribute: How Many Rows Were Affected?".

SQL%BULK\_ROWCOUNT is like an associative array whose *i*th element is the number of rows affected by the *i*th DML statement in the most recently completed FORALL statement. The data type of the element is INTEGER.

#### Note:

If a server is Oracle Database 12c or later and its client is Oracle Database 11g release 2 or earlier (or the reverse), then the maximum number that SQL&BULK\_ROWCOUNT returns is 4,294,967,295.

**Example 13-14** uses SQL%BULK\_ROWCOUNT to show how many rows each DELETE statement in the FORALL statement deleted and SQL%ROWCOUNT to show the total number of rows deleted.

Example 13-15 uses SQL%BULK\_ROWCOUNT to show how many rows each INSERT SELECT construct in the FORALL statement inserted and SQL%ROWCOUNT to show the total number of rows inserted.

#### Example 13-14 Showing Number of Rows Affected by Each DELETE in FORALL

```
DROP TABLE emp_temp;
CREATE TABLE emp_temp AS SELECT * FROM employees;
DECLARE
TYPE NumList IS TABLE OF NUMBER;
depts NumList := NumList(30, 50, 60);
BEGIN
FORALL j IN depts.FIRST..depts.LAST
DELETE FROM emp_temp WHERE department_id = depts(j);
FOR i IN depts.FIRST..depts.LAST LOOP
DBMS_OUTPUT.PUT_LINE (
    'Statement #' || i || ' deleted ' ||
SQL*BULK ROWCOUNT(i) || ' rows.'
```

```
);
END LOOP;
DBMS_OUTPUT.PUT_LINE('Total rows deleted: ' || SQL%ROWCOUNT);
END;
/
```

#### Result:

Statement #1 deleted 6 rows. Statement #2 deleted 45 rows. Statement #3 deleted 5 rows. Total rows deleted: 56

# Example 13-15 Showing Number of Rows Affected by Each INSERT SELECT in FORALL

```
DROP TABLE emp by dept;
CREATE TABLE emp by dept AS
  SELECT employee_id, department_id
 FROM employees
 WHERE 1 = 0;
DECLARE
 TYPE dept tab IS TABLE OF departments.department id%TYPE;
  deptnums dept tab;
BEGIN
 SELECT department id BULK COLLECT INTO deptnums FROM departments;
 FORALL i IN 1...deptnums.COUNT
    INSERT INTO emp by dept (employee id, department id)
      SELECT employee_id, department_id
      FROM employees
      WHERE department id = deptnums(i)
      ORDER BY department_id, employee_id;
 FOR i IN 1...deptnums.COUNT LOOP
    -- Count how many rows were inserted for each department; that is,
    -- how many employees are in each department.
    DBMS OUTPUT.PUT LINE (
      'Dept '||deptnums(i)||': inserted '||
      SQL%BULK ROWCOUNT(i) || ' records'
   );
 END LOOP;
 DBMS OUTPUT.PUT LINE ('Total records inserted: ' || SQL%ROWCOUNT);
END;
/
```

#### Result:

```
Dept 10: inserted 1 records
Dept 20: inserted 2 records
Dept 30: inserted 6 records
Dept 40: inserted 1 records
Dept 50: inserted 45 records
Dept 60: inserted 5 records

Dept	280:	inserted	0	records	
Total records inserted: 106					

# **BULK COLLECT Clause**

The BULK COLLECT clause, a feature of bulk SQL, returns results from SQL to PL/SQL in batches rather than one at a time.

The BULK COLLECT clause can appear in:

- SELECT INTO statement
- FETCH statement
- RETURNING INTO clause of:
  - DELETE statement
  - INSERT statement
  - UPDATE statement
  - MERGE statement
  - EXECUTE IMMEDIATE statement

With the BULK COLLECT clause, each of the preceding statements retrieves an entire result set and stores it in one or more collection variables in a single operation (which is more efficient than using a loop statement to retrieve one result row at a time).

#### Note:

PL/SQL processes the BULK COLLECT clause similar to the way it processes a FETCH statement inside a LOOP statement. PL/SQL does not raise an exception when a statement with a BULK COLLECT clause returns no rows. You must check the target collections for emptiness, as in Example 13-22.

#### Topics

- SELECT INTO Statement with BULK COLLECT Clause
- FETCH Statement with BULK COLLECT Clause
- RETURNING INTO Clause with BULK COLLECT Clause

# SELECT INTO Statement with BULK COLLECT Clause

The SELECT INTO statement with the BULK COLLECT clause (also called the SELECT BULK COLLECT INTO statement) selects an entire result set into one or more collection variables.

For more information, see "SELECT INTO Statement".

#### **Caution**:

The SELECT BULK COLLECT INTO statement is vulnerable to aliasing, which can cause unexpected results. For details, see "SELECT BULK COLLECT INTO Statements and Aliasing".

**Example 13-16 uses a** SELECT BULK COLLECT INTO statement to select two database columns into two collections (nested tables).

**Example 13-17 uses a** SELECT BULK COLLECT INTO statement to select a result set into a nested table of records.

#### Topics

- SELECT BULK COLLECT INTO Statements and Aliasing
- Row Limits for SELECT BULK COLLECT INTO Statements
- Guidelines for Looping Through Collections

Example 13-16 Bulk-Selecting Two Database Columns into Two Nested Tables

```
DECLARE
 TYPE NumTab IS TABLE OF employees.employee id%TYPE;
 TYPE NameTab IS TABLE OF employees.last name%TYPE;
  enums NumTab;
 names NameTab;
 PROCEDURE print first n (n POSITIVE) IS
 BEGIN
    IF enums.COUNT = 0 THEN
     DBMS OUTPUT.PUT LINE ('Collections are empty.');
   ELSE
     DBMS OUTPUT.PUT LINE ('First ' || n || ' employees:');
     FOR i IN 1 .. n LOOP
        DBMS OUTPUT.PUT LINE (
         ' Employee #' || enums(i) || ': ' || names(i));
     END LOOP;
    END IF;
 END;
BEGIN
  SELECT employee_id, last_name
 BULK COLLECT INTO enums, names
 FROM employees
```

```
ORDER BY employee id;
```

```
print_first_n(3);
print_first_n(6);
END;
/
```

#### Result:

```
First 3 employees:
Employee #100: King
Employee #101: Yang
Employee #102: Garcia
First 6 employees:
Employee #100: King
Employee #101: Yang
Employee #102: Garcia
Employee #103: James
Employee #104: Miller
Employee #105: Williams
```

#### Example 13-17 Bulk-Selecting into Nested Table of Records

```
DECLARE
  CURSOR c1 IS
    SELECT first name, last name, hire date
    FROM employees;
  TYPE NameSet IS TABLE OF c1%ROWTYPE;
  stock managers NameSet; -- nested table of records
BEGIN
  -- Assign values to nested table of records:
  SELECT first name, last name, hire date
   BULK COLLECT INTO stock_managers
    FROM employees
   WHERE job id = 'ST MAN'
    ORDER BY hire date;
  -- Print nested table of records:
    FOR i IN stock managers.FIRST .. stock managers.LAST LOOP
      DBMS OUTPUT.PUT LINE (
        stock managers(i).hire date || ' ' ||
        stock managers(i).last name || ', ' ||
        stock managers(i).first name
     );
    END LOOP; END;
/
```

#### Result:

```
01-MAY-13 Kaufling, Payam
18-JUL-14 Weiss, Matthew
10-APR-15 Fripp, Adam
10-OCT-15 Vollman, Shanta
16-NOV-17 Mourgos, Kevin
```

### SELECT BULK COLLECT INTO Statements and Aliasing

#### In a statement of the form

SELECT column BULK COLLECT INTO collection FROM table ...

*column* and *collection* are analogous to IN NOCOPY and OUT NOCOPY subprogram parameters, respectively, and PL/SQL passes them by reference. As with subprogram parameters that are passed by reference, aliasing can cause unexpected results.

See Also:
"Subprogram Parameter Aliasing with Parameters Passed by Reference"

In Example 13-18, the intention is to select specific values from a collection, numbers1, and then store them in the same collection. The unexpected result is that all elements of numbers1 are deleted. For workarounds, see Example 13-19 and Example 13-20.

Example 13-19 uses a cursor to achieve the result intended by Example 13-18.

Example 13-20 selects specific values from a collection, numbers1, and then stores them in a different collection, numbers2. Example 13-20 runs faster than Example 13-19.

#### Example 13-18 SELECT BULK COLLECT INTO Statement with Unexpected Results

```
CREATE OR REPLACE TYPE numbers type IS
 TABLE OF INTEGER
CREATE OR REPLACE PROCEDURE p (i IN INTEGER) AUTHID DEFINER IS
 numbers1 numbers type := numbers type(1,2,3,4,5);
BEGIN
  DBMS OUTPUT.PUT LINE ('Before SELECT statement');
 DBMS OUTPUT.PUT LINE('numbers1.COUNT() = ' || numbers1.COUNT());
 FOR j IN 1...numbers1.COUNT() LOOP
   DBMS OUTPUT.PUT LINE('numbers1(' || j || ') = ' || numbers1(j));
 END LOOP;
 --Self-selecting BULK COLLECT INTO clause:
 SELECT a.COLUMN VALUE
 BULK COLLECT INTO numbers1
 FROM TABLE (numbers1) a
 WHERE a.COLUMN VALUE > p.i
 ORDER BY a.COLUMN VALUE;
  DBMS OUTPUT.PUT LINE('After SELECT statement');
  DBMS OUTPUT.PUT LINE('numbers1.COUNT() = ' || numbers1.COUNT());
```

```
END p;
/
Invoke p:
BEGIN
    p(2);
END;
/
Result:
Before SELECT statement
numbers1.COUNT() = 5
numbers1(1) = 1
numbers1(2) = 2
numbers1(3) = 3
numbers1(4) = 4
numbers1(5) = 5
```

After SELECT statement numbers1.COUNT() = 0

PL/SQL procedure successfully completed.

Invoke p:

BEGIN
 p(10);
END;
/

Result:

```
Before SELECT statement
numbers1.COUNT() = 5
numbers1(1) = 1
numbers1(2) = 2
numbers1(3) = 3
numbers1(4) = 4
numbers1(5) = 5
After SELECT statement
numbers1.COUNT() = 0
```

#### Example 13-19 Cursor Workaround for Example 13-18

```
CREATE OR REPLACE TYPE numbers type IS
 TABLE OF INTEGER
/
CREATE OR REPLACE PROCEDURE p (i IN INTEGER) AUTHID DEFINER IS
 numbers1 numbers_type := numbers_type(1,2,3,4,5);
 CURSOR c IS
    SELECT a.COLUMN VALUE
    FROM TABLE (numbers1) a
    WHERE a.COLUMN_VALUE > p.i
    ORDER BY a.COLUMN VALUE;
 BEGIN
    DBMS OUTPUT.PUT LINE('Before FETCH statement');
    DBMS_OUTPUT.PUT_LINE('numbers1.COUNT() = ' || numbers1.COUNT());
    FOR j IN 1...numbers1.COUNT() LOOP
     DBMS_OUTPUT.PUT_LINE('numbers1(' || j || ') = ' || numbers1(j));
    END LOOP;
```

```
OPEN c;
  FETCH c BULK COLLECT INTO numbers1;
  CLOSE c;
  DBMS OUTPUT.PUT LINE('After FETCH statement');
  DBMS OUTPUT.PUT LINE('numbers1.COUNT() = ' || numbers1.COUNT());
  IF numbers1.COUNT() > 0 THEN
    FOR j IN 1...numbers1.COUNT() LOOP
      DBMS_OUTPUT.PUT_LINE('numbers1(' || j || ') = ' || numbers1(j));
    END LOOP;
  END IF;
END p;
/
Invoke p:
BEGIN
 p(2);
END;
/
Result:
Before FETCH statement
numbers1.COUNT() = 5
numbers1(1) = 1
numbers1(2) = 2
numbers1(3) = 3
numbers1(4) = 4
numbers1(5) = 5
After FETCH statement
numbers1.COUNT() = 3
numbers1(1) = 3
numbers1(2) = 4
numbers1(3) = 5
Invoke p:
BEGIN
  p(10);
END;
/
Result:
Before FETCH statement
numbers1.COUNT() = 5
numbers1(1) = 1
numbers1(2) = 2
numbers1(3) = 3
numbers1(4) = 4
numbers1(5) = 5
After FETCH statement
numbers1.COUNT() = 0
Example 13-20 Second Collection Workaround for Example 13-18
CREATE OR REPLACE TYPE numbers type IS
```

```
TABLE OF INTEGER
/
CREATE OR REPLACE PROCEDURE p (i IN INTEGER) AUTHID DEFINER IS
```

```
numbers1 numbers type := numbers type(1,2,3,4,5);
numbers2 numbers_type := numbers_type(0,0,0,0,0);
BEGIN
 DBMS_OUTPUT.PUT_LINE('Before SELECT statement');
 DBMS OUTPUT.PUT LINE('numbers1.COUNT() = ' || numbers1.COUNT());
  FOR j IN 1...numbers1.COUNT() LOOP
   DBMS_OUTPUT.PUT_LINE('numbers1(' || j || ') = ' || numbers1(j));
 END LOOP;
 DBMS_OUTPUT.PUT_LINE('numbers2.COUNT() = ' || numbers2.COUNT());
 FOR j IN 1..numbers2.COUNT() LOOP
   DBMS OUTPUT.PUT LINE ('numbers2(' || j || ') = ' || numbers2(j));
 END LOOP;
 SELECT a.COLUMN VALUE
 BULK COLLECT INTO numbers2
                                 -- numbers2 appears here
 FROM TABLE(numbers1) a
                                -- numbers1 appears here
 WHERE a.COLUMN VALUE > p.i
 ORDER BY a.COLUMN_VALUE;
 DBMS OUTPUT.PUT LINE('After SELECT statement');
 DBMS OUTPUT.PUT LINE('numbers1.COUNT() = ' || numbers1.COUNT());
 IF numbers1.COUNT() > 0 THEN
    FOR j IN 1..numbers1.COUNT() LOOP
     DBMS_OUTPUT.PUT_LINE('numbers1(' || j || ') = ' || numbers1(j));
    END LOOP;
 END IF;
 DBMS_OUTPUT.PUT_LINE('numbers2.COUNT() = ' || numbers2.COUNT());
 IF numbers2.COUNT() > 0 THEN
   FOR j IN 1..numbers2.COUNT() LOOP
     DBMS OUTPUT.PUT_LINE('numbers2(' || j || ') = ' || numbers2(j));
   END LOOP;
 END IF;
END p;
Invoke p:
BEGIN
```

### END; /

p(2);

#### Result:

```
Before SELECT statement
numbers1.COUNT() = 5
numbers1(1) = 1
numbers1(2) = 2
numbers1(3) = 3
numbers1(4) = 4
numbers1(5) = 5
numbers2.COUNT() = 5
numbers2(1) = 0
numbers2(2) = 0
numbers2(3) = 0
```

```
numbers2(4) = 0
numbers2(5) = 0
After SELECT statement
numbers1.COUNT() = 5
numbers1(1) = 1
numbers1(2) = 2
numbers1(3) = 3
numbers1(4) = 4
numbers1(5) = 5
numbers2.COUNT() = 3
numbers2(1) = 3
numbers2(2) = 4
numbers2(3) = 5
```

PL/SQL procedure successfully completed.

Invoke p:

```
BEGIN
p(10);
END;
/
```

Result:

```
Before SELECT statement
numbers1.COUNT() = 5
numbers1(1) = 1
numbers1(2) = 2
numbers1(3) = 3
numbers1(4) = 4
numbers1(5) = 5
numbers2.COUNT() = 5
numbers2(1) = 0
numbers2(2) = 0
numbers2(3) = 0
numbers2(4) = 0
numbers2(5) = 0
After SELECT statement
numbers1.COUNT() = 5
numbers1(1) = 1
numbers1(2) = 2
numbers1(3) = 3
numbers1(4) = 4
numbers1(5) = 5
numbers2.COUNT() = 0
```

### Row Limits for SELECT BULK COLLECT INTO Statements

A SELECT BULK COLLECT INTO statement that returns a large number of rows produces a large collection. To limit the number of rows and the collection size, use one of these:

- ROWNUM pseudocolumn (described in Oracle Database SQL Language Reference)
- SAMPLE clause (described in Oracle Database SQL Language Reference)
- FETCH FIRST clause (described in Oracle Database SQL Language Reference)

Example 13-21 shows several ways to limit the number of rows that a SELECT BULK COLLECT INTO statement returns.

#### Example 13-21 Limiting Bulk Selection with ROWNUM, SAMPLE, and FETCH FIRST

```
DECLARE

TYPE SalList IS TABLE OF employees.salary%TYPE;

sals SalList;

BEGIN

SELECT salary BULK COLLECT INTO sals FROM employees

WHERE ROWNUM <= 50;

SELECT salary BULK COLLECT INTO sals FROM employees

SAMPLE (10);

SELECT salary BULK COLLECT INTO sals FROM employees

FETCH FIRST 50 ROWS ONLY;

END;

/
```

**Guidelines for Looping Through Collections** 

When a result set is stored in a collection, it is easy to loop through the rows and refer to different columns. This technique can be very fast, but also very memory-intensive. If you use it often:

 To loop once through the result set, use a cursor FOR LOOP (see "Processing Query Result Sets With Cursor FOR LOOP Statements").

This technique avoids the memory overhead of storing a copy of the result set.

 Instead of looping through the result set to search for certain values or filter the results into a smaller set, do the searching or filtering in the query of the SELECT INTO statement.

For example, in simple queries, use WHERE clauses; in queries that compare multiple result sets, use set operators such as INTERSECT and MINUS. For information about set operators, see *Oracle Database SQL Language Reference*.

- Instead of looping through the result set and running another query for each result row, use a subquery in the query of the SELECT INTO statement (see "Processing Query Result Sets with Subqueries").
- Instead of looping through the result set and running another DML statement for each result row, use the FORALL statement (see "FORALL Statement").

### FETCH Statement with BULK COLLECT Clause

The FETCH statement with the BULK COLLECT clause (also called the FETCH BULK COLLECT statement) fetches an entire result set into one or more collection variables.

For more information, see "FETCH Statement".

Example 13-22 uses a FETCH BULK COLLECT statement to fetch an entire result set into two collections (nested tables).

Example 13-23 uses a FETCH BULK COLLECT statement to fetch a result set into a collection (nested table) of records.

#### Example 13-22 Bulk-Fetching into Two Nested Tables

#### DECLARE

TYPE NameList IS TABLE OF employees.last\_name%TYPE; TYPE SalList IS TABLE OF employees.salary%TYPE;

```
CURSOR c1 IS
    SELECT last name, salary
    FROM employees
    WHERE salary > 10000
    ORDER BY last name;
  names NameList;
  sals SalList;
  TYPE RecList IS TABLE OF c1%ROWTYPE;
  recs RecList;
  v limit PLS INTEGER := 10;
  PROCEDURE print results IS
  BEGIN
    -- Check if collections are empty:
    IF names IS NULL OR names.COUNT = 0 THEN
      DBMS OUTPUT.PUT LINE('No results!');
    ELSE
      DBMS OUTPUT.PUT LINE('Result: ');
      FOR i IN names.FIRST .. names.LAST
      LOOP
        DBMS OUTPUT.PUT LINE (' Employee ' || names(i) || ': $' || sals(i));
      END LOOP;
    END IF;
  END;
BEGIN
  DBMS_OUTPUT.PUT_LINE ('--- Processing all results simultaneously ---');
  OPEN cl;
  FETCH c1 BULK COLLECT INTO names, sals;
  CLOSE c1;
  print results();
  DBMS OUTPUT.PUT LINE ('--- Processing ' || v limit || ' rows at a time
---');
  OPEN cl;
  LOOP
   FETCH c1 BULK COLLECT INTO names, sals LIMIT v limit;
   EXIT WHEN names.COUNT = 0;
   print results();
  END LOOP;
  CLOSE c1;
  DBMS OUTPUT.PUT LINE ('--- Fetching records rather than columns ---');
  OPEN c1;
  FETCH c1 BULK COLLECT INTO recs;
  FOR i IN recs.FIRST .. recs.LAST
  LOOP
    -- Now all columns from result set come from one record
    DBMS OUTPUT.PUT LINE (
     ' Employee ' || recs(i).last name || ': $' || recs(i).salary
   );
  END LOOP;
END;
/
```

```
--- Processing all results simultaneously ---
Result:
Employee Abel: $11000
Employee Cambrault: $11000
Employee Errazuriz: $12000
Employee Garcia: $17000
Employee Gruenberg: $12008
Employee Higgins: $12008
Employee King: $24000

### Example 13-23 Bulk-Fetching into Nested Table of Records

### Result:

01-MAY-13 Kaufling, Payam 18-JUL-14 Weiss, Matthew 10-APR-15 Fripp, Adam 10-OCT-15 Vollman, Shanta 16-NOV-17 Mourgos, Kevin

### Row Limits for FETCH BULK COLLECT Statements

A FETCH BULK COLLECT statement that returns a large number of rows produces a large collection. To limit the number of rows and the collection size, use the LIMIT clause.

In Example 13-24, with each iteration of the LOOP statement, the FETCH statement fetches ten rows (or fewer) into associative array empids (overwriting the previous values). Note the exit condition for the LOOP statement.

#### Example 13-24 Limiting Bulk FETCH with LIMIT

```
DECLARE
 TYPE numtab IS TABLE OF NUMBER INDEX BY PLS INTEGER;
 CURSOR c1 IS
   SELECT employee id
   FROM employees
   WHERE department id = 80
   ORDER BY employee id;
 empids numtab;
BEGIN
 OPEN cl;
 LOOP -- Fetch 10 rows or fewer in each iteration
   FETCH c1 BULK COLLECT INTO empids LIMIT 10;
   DBMS OUTPUT.PUT LINE ('----- Results from One Bulk Fetch ------');
   FOR i IN 1..empids.COUNT LOOP
     DBMS OUTPUT.PUT LINE ('Employee Id: ' || empids(i));
   END LOOP;
   EXIT WHEN c1%NOTFOUND;
 END LOOP;
 CLOSE cl;
END;
/
```

#### Result:

```
----- Results from One Bulk Fetch ------
Employee Id: 145
Employee Id: 146
Employee Id: 147
Employee Id: 148
Employee Id: 149
Employee Id: 150
Employee Id: 151

Employee Id: 175
```

Employee Id: 176 Employee Id: 177 Employee Id: 179

### **RETURNING INTO Clause with BULK COLLECT Clause**

The RETURNING INTO clause with the BULK COLLECT clause (also called the RETURNING BULK COLLECT INTO clause) can appear in an INSERT, UPDATE, MERGE, DELETE, OR EXECUTE IMMEDIATE statement. With the RETURNING BULK COLLECT INTO clause, the statement stores its result set in one or more collections.

For more information, see "RETURNING INTO Clause".

**Example 13-25 uses a** DELETE statement with the RETURNING BULK COLLECT INTO clause to delete rows from a table and return them in two collections (nested tables).

Example 13-26 uses the keywords OLD and NEW to return the values of employee salaries before and after an UPDATE statement with the RETURNING BULK COLLECT INTO clause.

#### Example 13-25 Returning Deleted Rows in Two Nested Tables

```
DROP TABLE emp temp;
CREATE TABLE emp_temp AS
SELECT * FROM employees
ORDER BY employee id;
DECLARE
  TYPE NumList IS TABLE OF employees.employee id%TYPE;
  enums NumList;
  TYPE NameList IS TABLE OF employees.last name%TYPE;
  names NameList;
BEGIN
  DELETE FROM emp temp
  WHERE department id = 30
  RETURNING employee id, last name
  BULK COLLECT INTO enums, names;
  DBMS OUTPUT.PUT LINE ('Deleted ' || SQL%ROWCOUNT || ' rows:');
  FOR i IN enums.FIRST .. enums.LAST
  T'OOD
    DBMS OUTPUT.PUT LINE ('Employee #' || enums(i) || ': ' || names(i));
  END LOOP;
END;
/
```

#### Result:

```
Deleted 6 rows:
Employee #114: Li
Employee #115: Khoo
Employee #116: Baida
Employee #117: Tobias
Employee #118: Himuro
Employee #119: Colmenares
```

```
Example 13-26 Returning NEW and OLD Values of Updated Rows
```

```
DROP TABLE emp temp;
CREATE TABLE emp temp AS
SELECT * FROM employees
ORDER BY employee id;
DECLARE
  TYPE SalList IS TABLE OF employees.salary%TYPE;
  old sals SalList;
  new sals SalList;
  TYPE NameList IS TABLE OF employees.last name%TYPE;
  names NameList;
BEGIN
  UPDATE emp temp SET salary = salary * 1.15
  WHERE salary < 2500
  RETURNING OLD salary, NEW salary, last name
  BULK COLLECT INTO old sals, new sals, names;
  DBMS OUTPUT.PUT LINE ('Updated ' || SQL%ROWCOUNT || ' rows: ');
  FOR i IN old sals.FIRST .. old sals.LAST
  LOOP
    DBMS OUTPUT.PUT LINE(names(i) || ': Old Salary $' || old sals(i) ||
            ', New Salary $' || new sals(i));
  END LOOP;
END;
/
```

Landry: Old Salary \$2400, New Salary \$2760 Markle: Old Salary \$2200, New Salary \$2530 Olson: Old Salary \$2100, New Salary \$2415 Gee: Old Salary \$2400, New Salary \$2760 Philtanker: Old Salary \$2200, New Salary \$2530

## Using FORALL Statement and BULK COLLECT Clause Together

In a FORALL statement, the DML statement can have a RETURNING BULK COLLECT INTO clause. For each iteration of the FORALL statement, the DML statement stores the specified values in the specified collections—without overwriting the previous values, as the same DML statement would do in a FOR LOOP statement.

In Example 13-27, the FORALL statement runs a DELETE statement that has a RETURNING BULK COLLECT INTO clause. For each iteration of the FORALL statement, the DELETE statement stores the employee\_id and department\_id values of the deleted row in the collections e\_ids and d ids, respectively.

Example 13-28 is like Example 13-27 except that it uses a FOR LOOP statement instead of a FORALL statement.

Example 13-27 DELETE with RETURN BULK COLLECT INTO in FORALL Statement

DROP TABLE emp\_temp; CREATE TABLE emp\_temp AS

```
SELECT * FROM employees
ORDER BY employee id, department id;
DECLARE
  TYPE NumList IS TABLE OF NUMBER;
  depts NumList := NumList(10,20,30);
  TYPE enum t IS TABLE OF employees.employee id%TYPE;
  e ids enum t;
  TYPE dept t IS TABLE OF employees.department id%TYPE;
  d ids dept t;
BEGIN
  FORALL j IN depts.FIRST..depts.LAST
   DELETE FROM emp temp
    WHERE department id = depts(j)
    RETURNING employee id, department id
    BULK COLLECT INTO e ids, d ids;
  DBMS OUTPUT.PUT LINE ('Deleted ' || SQL%ROWCOUNT || ' rows:');
  FOR i IN e ids.FIRST .. e ids.LAST
  LOOP
    DBMS OUTPUT.PUT LINE (
      'Employee #' || e_ids(i) || ' from dept #' || d_ids(i)
    );
  END LOOP;
END;
/
```

Deleted 9 rows: Employee #200 from dept #10 Employee #201 from dept #20 Employee #202 from dept #20 Employee #114 from dept #30 Employee #115 from dept #30 Employee #116 from dept #30 Employee #117 from dept #30 Employee #118 from dept #30

Example 13-28 DELETE with RETURN BULK COLLECT INTO in FOR LOOP Statement

```
DROP TABLE emp_temp;
CREATE TABLE emp_temp AS
SELECT * FROM employees
ORDER BY employee id, department id;
```

#### DECLARE

TYPE NumList IS TABLE OF NUMBER; depts NumList := NumList(10,20,30);

```
TYPE enum t IS TABLE OF employees.employee id%TYPE;
  e ids enum t;
  TYPE dept t IS TABLE OF employees.department id%TYPE;
  d ids dept t;
BEGIN
  FOR j IN depts.FIRST..depts.LAST LOOP
   DELETE FROM emp temp
    WHERE department id = depts(j)
   RETURNING employee id, department id
    BULK COLLECT INTO e_ids, d ids;
  END LOOP;
  DBMS OUTPUT.PUT LINE ('Deleted ' || SQL%ROWCOUNT || ' rows:');
  FOR i IN e ids.FIRST .. e ids.LAST
  LOOP
    DBMS OUTPUT.PUT LINE (
      'Employee #' || e_ids(i) || ' from dept #' || d_ids(i)
    );
  END LOOP;
END;
```

Deleted 6 rows: Employee #114 from dept #30 Employee #115 from dept #30 Employee #116 from dept #30 Employee #117 from dept #30 Employee #118 from dept #30

## Client Bulk-Binding of Host Arrays

Client programs (such as OCI and Pro\*C programs) can use PL/SQL anonymous blocks to bulk-bind input and output host arrays. This is the most efficient way to pass collections to and from the database server.

In the client program, declare and assign values to the host variables to be referenced in the anonymous block. In the anonymous block, prefix each host variable name with a colon (:) to distinguish it from a PL/SQL collection variable name. When the client program runs, the database server runs the PL/SQL anonymous block.

In Example 13-29, the anonymous block uses a FORALL statement to bulk-bind a host input array. In the FORALL statement, the DELETE statement refers to four host variables: scalars lower, upper, and emp\_id and array depts.

#### Example 13-29 Anonymous Block Bulk-Binds Input Host Array

```
BEGIN
FORALL i IN :lower..:upper
DELETE FROM employees
WHERE department_id = :depts(i);
```

END; /

# Chaining Pipelined Table Functions for Multiple Transformations

Chaining pipelined table functions is an efficient way to perform multiple transformations on data.

### Note:

You cannot run a pipelined table function over a database link. The reason is that the return type of a pipelined table function is a SQL user-defined type, which can be used only in a single database (as explained in *Oracle Database Object-Relational Developer's Guide*). Although the return type of a pipelined table function might appear to be a PL/SQL type, the database actually converts that PL/SQL type to a corresponding SQL user-defined type.

#### **Topics**

- Overview of Table Functions
- Creating Pipelined Table Functions
- Pipelined Table Functions as Transformation Functions
- Chaining Pipelined Table Functions
- Fetching from Results of Pipelined Table Functions
- Passing CURSOR Expressions to Pipelined Table Functions
- DML Statements on Pipelined Table Function Results
- NO\_DATA\_NEEDED Exception

## **Overview of Table Functions**

A **table function** is a user-defined PL/SQL function that returns a collection of rows (an associative array, nested table or varray).

You can select from this collection as if it were a database table by invoking the table function inside the TABLE clause in a SELECT statement. The TABLE operator is optional.

For example:

SELECT \* FROM TABLE(table\_function\_name(parameter\_list))

Alternatively, the same query can be written without the TABLE operator as follow:

SELECT \* FROM table\_function\_name(parameter\_list)

A table function can take a collection of rows as input (that is, it can have an input parameter that is a nested table, varray, or cursor variable). Therefore, output from table function tf1 can be input to table function tf2, and output from tf2 can be input to table function tf3, and so on.

To improve the performance of a table function, you can:

ORACLE

• Enable the function for parallel execution, with the PARALLEL ENABLE option.

Functions enabled for parallel execution can run concurrently.

• Stream the function results directly to the next process, with Oracle Streams.

Streaming eliminates intermediate staging between processes.

• **Pipeline the function results, with the PIPELINED option**.

A **pipelined table function** returns a row to its invoker immediately after processing that row and continues to process rows. Response time improves because the entire collection need not be constructed and returned to the server before the query can return a single result row. (Also, the function needs less memory, because the object cache need not materialize the entire collection.)

### Caution:

A pipelined table function always references the current state of the data. If the data in the collection changes after the cursor opens for the collection, then the cursor reflects the changes. PL/SQL variables are private to a session and are not transactional. Therefore, read consistency, well known for its applicability to table data, does not apply to PL/SQL collection variables.

### See Also:

- Chaining Pipelined Table Functions
- Oracle Database SQL Language Reference for more information about the TABLE clause of the SELECT statement
- Oracle Database Data Cartridge Developer's Guide for information about using pipelined and parallel table functions

# **Creating Pipelined Table Functions**

A pipelined table function must be either a standalone function or a package function.

#### **PIPELINED Option (Required)**

For a standalone function, specify the PIPELINED option in the CREATE FUNCTION statement (for syntax, see "CREATE FUNCTION Statement"). For a package function, specify the PIPELINED option in both the function declaration and function definition (for syntax, see "Function Declaration and Definition").

#### PARALLEL\_ENABLE Option (Recommended)

To improve its performance, enable the pipelined table function for parallel execution by specifying the PARALLEL ENABLE option.

#### AUTONOMOUS\_TRANSACTION Pragma

If the pipelined table function runs DML statements, then make it autonomous, with the AUTONOMOUS TRANSACTION pragma (described in "AUTONOMOUS\_TRANSACTION Pragma").

Then, during parallel execution, each instance of the function creates an independent transaction.

#### **DETERMINISTIC Option (Recommended)**

Multiple invocations of a pipelined table function, in either the same query or separate queries, cause multiple executions of the underlying implementation. If the function is deterministic, specify the DETERMINISTIC option, described in "DETERMINISTIC Clause".

#### Parameters

Typically, a pipelined table function has one or more cursor variable parameters. For information about cursor variables as function parameters, see "Cursor Variables as Subprogram Parameters".

### 🖍 See Also:

- "Cursor Variables" for general information about cursor variables
- "Subprogram Parameters" for general information about subprogram parameters

#### **RETURN Data Type**

The data type of the value that a pipelined table function returns must be a collection type defined either at schema level or inside a package (therefore, it cannot be an associative array type). The elements of the collection type must be SQL data types, not data types supported only by PL/SQL (such as PLS\_INTEGER). For information about collection types, see "Collection Types". For information about SQL data types, see *Oracle Database SQL Language Reference*.

You can use SQL data types ANYTYPE, ANYDATA, and ANYDATASET to dynamically encapsulate and access type descriptions, data instances, and sets of data instances of any other SQL type, including object and collection types. You can also use these types to create unnamed types, including anonymous collection types. For information about these types, see *Oracle Database PL/SQL Packages and Types Reference*.

#### **PIPE ROW Statement**

Inside a pipelined table function, use the PIPE ROW statement to return a collection element to the invoker without returning control to the invoker. See "PIPE ROW Statement" for its syntax and semantics.

#### **RETURN Statement**

As in every function, every execution path in a pipelined table function must lead to a RETURN statement, which returns control to the invoker. However, in a pipelined table function, a RETURN statement need not return a value to the invoker. See "RETURN Statement" for its syntax and semantics.

#### Example

#### Example 13-30 Creating and Invoking Pipelined Table Function

This example creates a package that includes a pipelined table function,  $f_1$ , and then selects from the collection of rows that  $f_1$  returns.

```
CREATE OR REPLACE PACKAGE pkg1 AUTHID DEFINER AS
  TYPE numset_t IS TABLE OF NUMBER;
  FUNCTION fl(x NUMBER) RETURN numset_t PIPELINED;
END pkg1;
/
```

Create a pipelined table function f1 that returns a collection of elements (1,2,3,...x).

```
CREATE OR REPLACE PACKAGE BODY pkg1 AS
FUNCTION f1(x NUMBER) RETURN numset_t PIPELINED IS
BEGIN
FOR i IN 1..x LOOP
PIPE ROW(i);
END LOOP;
RETURN;
END f1;
END pkg1;
/
```

```
SELECT * FROM TABLE(pkg1.f1(5));
```

```
Result:
```

```
COLUMN_VALUE

1

2

3

4

5
```

5 rows selected.

SELECT \* FROM pkg1.f1(2);

#### Result:

COLUMN\_VALUE 1 2

# Pipelined Table Functions as Transformation Functions

A pipelined table function with a cursor variable parameter can serve as a transformation function. Using the cursor variable, the function fetches an input row. Using the PIPE ROW statement, the function pipes the transformed row or rows to the invoker. If the FETCH and PIPE ROW statements are inside a LOOP statement, the function can transform multiple input rows.

In Example 13-31, the pipelined table function transforms each selected row of the employees table to two nested table rows, which it pipes to the SELECT statement that invokes it. The actual parameter that corresponds to the formal cursor variable parameter is a CURSOR expression; for information about these, see "Passing CURSOR Expressions to Pipelined Table Functions".

```
Example 13-31 Pipelined Table Function Transforms Each Row to Two Rows
```

```
CREATE OR REPLACE PACKAGE refcur pkg AUTHID DEFINER IS
 TYPE refcur t IS REF CURSOR RETURN employees%ROWTYPE;
 TYPE outrec typ IS RECORD (
   var num NUMBER(6),
   var char1 VARCHAR2(30),
   var char2 VARCHAR2(30)
 );
  TYPE outrecset IS TABLE OF outrec typ;
  FUNCTION f trans (p refcur t) RETURN outrecset PIPELINED;
END refcur_pkg;
CREATE OR REPLACE PACKAGE BODY refcur pkg IS
 FUNCTION f trans (p refcur t) RETURN outrecset PIPELINED IS
    out rec outrec typ;
    in rec p%ROWTYPE;
 BEGIN
    LOOP
     FETCH p INTO in rec; -- input row
     EXIT WHEN p%NOTFOUND;
     out rec.var num := in rec.employee id;
     out rec.var char1 := in rec.first name;
     out rec.var char2 := in rec.last name;
     PIPE ROW(out rec); -- first transformed output row
     out rec.var char1 := in rec.email;
     out rec.var char2 := in rec.phone number;
     PIPE ROW(out rec); -- second transformed output row
    END LOOP;
    CLOSE p;
   RETURN;
 END f trans;
END refcur pkg;
SELECT * FROM TABLE (
  refcur pkg.f trans (
    CURSOR (SELECT * FROM employees WHERE department id = 60)
```

# );

#### Result:

VAR_NUM	VAR_CHAR1	VAR_CHAR2
103 104 104 105 105 106 106	Alexander AJAMES Bruce BMILLER David DWILLIAMS Valli VJACKSON Diana DNGUYEN	James 1.590.555.0103 Miller 1.590.555.0104 Williams 1.590.555.0105 Jackson 1.590.555.0106 Nguyen 1.590.555.0107

10 rows selected.

## **Chaining Pipelined Table Functions**

To **chain** pipelined table functions tf1 and tf2 is to make the output of tf1 the input of tf2. For example:

SELECT \* FROM TABLE(tf2(CURSOR(SELECT \* FROM TABLE(tf1()))));

The rows that tf1 pipes out must be compatible actual parameters for the formal input parameters of tf2.

If chained pipelined table functions are enabled for parallel execution, then each function runs in a different process (or set of processes).

See Also:
"Passing CURSOR Expressions to Pipelined Table Functions"

## Fetching from Results of Pipelined Table Functions

You can associate a named cursor with a query that invokes a pipelined table function. Such a cursor has no special fetch semantics, and such a cursor variable has no special assignment semantics.

However, the SQL optimizer does not optimize across PL/SQL statements. Therefore, in Example 13-32, the first PL/SQL statement is slower than the second—despite the overhead of running two SQL statements in the second PL/SQL statement, and even if function results are piped between the two SQL statements in the first PL/SQL statement.

In Example 13-32, assume that f and g are pipelined table functions, and that each function accepts a cursor variable parameter. The first PL/SQL statement associates cursor variable r with a query that invokes f, and then passes r to g. The second PL/SQL statement passes CURSOR expressions to both f and g.

See Also: "Cursor Variables as Subprogram Parameters"

Example 13-32 Fetching from Results of Pipelined Table Functions

```
DECLARE
  r SYS_REFCURSOR;
  ...
  -- First PL/SQL statement (slower):
BEGIN
  OPEN r FOR SELECT * FROM TABLE(f(CURSOR(SELECT * FROM tab)));
  SELECT * BULK COLLECT INTO rec_tab FROM TABLE(g(r));
  -- NOTE: When g completes, it closes r.
END;
  -- Second PL/SQL statement (faster):
SELECT * FROM TABLE(g(CURSOR(SELECT * FROM
  TABLE(f(CURSOR(SELECT * FROM tab))))));
/
```

# Passing CURSOR Expressions to Pipelined Table Functions

As Example 13-32 shows, the actual parameter for the cursor variable parameter of a pipelined table function can be either a cursor variable or a CURSOR expression, and the latter is more efficient.

### Note:

When a SQL SELECT statement passes a CURSOR expression to a function, the referenced cursor opens when the function begins to run and closes when the function completes.

### See Also:

"CURSOR Expressions" for general information about CURSOR expressions

Example 13-33 creates a package that includes a pipelined table function with two cursor variable parameters and then invokes the function in a SELECT statement, using CURSOR expressions for actual parameters.

Example 13-34 uses a pipelined table function as an aggregate function, which takes a set of input rows and returns a single result. The SELECT statement selects the function result. (For information about the pseudocolumn COLUMN\_VALUE, see Oracle Database SQL Language Reference.)

#### Example 13-33 Pipelined Table Function with Two Cursor Variable Parameters

```
CREATE OR REPLACE PACKAGE refcur pkg AUTHID DEFINER IS
 TYPE refcur t1 IS REF CURSOR RETURN employees%ROWTYPE;
 TYPE refcur t2 IS REF CURSOR RETURN departments%ROWTYPE;
 TYPE outrec typ IS RECORD (
   var num NUMBER(6),
   var char1 VARCHAR2(30),
   var char2 VARCHAR2(30)
 );
 TYPE outrecset IS TABLE OF outrec typ;
 FUNCTION g_trans (p1 refcur_t1, p2 refcur_t2) RETURN outrecset PIPELINED;
END refcur pkg;
CREATE OR REPLACE PACKAGE BODY refcur pkg IS
 FUNCTION g trans (
   pl refcur t1,
   p2 refcur t2
 ) RETURN outrecset PIPELINED
  ΤS
   out rec outrec typ;
   in rec1 p1%ROWTYPE;
   in rec2 p2%ROWTYPE;
 BEGIN
   LOOP
     FETCH p2 INTO in rec2;
     EXIT WHEN p2%NOTFOUND;
   END LOOP;
   CLOSE p2;
   LOOP
     FETCH p1 INTO in rec1;
     EXIT WHEN p1%NOTFOUND;
     -- first row
     out rec.var num := in recl.employee id;
     out rec.var char1 := in rec1.first name;
     out rec.var char2 := in rec1.last name;
     PIPE ROW(out rec);
     -- second row
     out rec.var num := in rec2.department id;
     out rec.var char1 := in rec2.department name;
     out rec.var char2 := TO CHAR(in rec2.location id);
     PIPE ROW(out rec);
   END LOOP;
   CLOSE p1;
   RETURN;
 END g trans;
END refcur pkg;
/
SELECT * FROM TABLE (
 refcur pkg.g trans (
```

```
CURSOR (SELECT * FROM employees WHERE department_id = 60),
CURSOR (SELECT * FROM departments WHERE department_id = 60)
)
);
```

```

```

This query shows how the table function can be invoked without the optional TABLE operator.

```
SELECT w.column_value "weighted result"
FROM pkg_gpa.weighted_average (
    CURSOR (SELECT weight, grade FROM gradereport)
    ) w;
```

#### Result:

```
weighted result
-----
3.5
```

```
1 row selected.
```

# DML Statements on Pipelined Table Function Results

The "table" that a pipelined table function returns cannot be the target table of a DELETE, INSERT, UPDATE, or MERGE statement. However, you can create a view of such a table and create INSTEAD OF triggers on the view. For information about INSTEAD OF triggers, see "INSTEAD OF DML Triggers".

### See Also:

Oracle Database SQL Language Reference for information about the CREATE VIEW statement

# NO\_DATA\_NEEDED Exception

You must understand the predefined exception NO\_DATA\_NEEDED in two cases:

You include an OTHERS exception handler in a block that includes a PIPE ROW statement

Your code that feeds a PIPE ROW statement must be followed by a clean-up procedure

Typically, the clean-up procedure releases resources that the code no longer needs.

When the invoker of a pipelined table function needs no more rows from the function, the PIPE ROW statement raises NO\_DATA\_NEEDED. If the pipelined table function does not handle NO\_DATA\_NEEDED, as in Example 13-35, then the function invocation terminates but the invoking statement does not terminate. If the pipelined table function handles NO\_DATA\_NEEDED, its exception handler can release the resources that it no longer needs, as in Example 13-36.

In Example 13-35, the pipelined table function pipe\_rows does not handle the NO\_DATA\_NEEDED exception. The SELECT statement that invokes pipe\_rows needs only four rows. Therefore, during the fifth invocation of pipe\_rows, the PIPE ROW statement raises the exception NO\_DATA\_NEEDED. The fifth invocation of pipe\_rows terminates, but the SELECT statement does not terminate.

If the exception-handling part of a block that includes a PIPE ROW statement includes an OTHERS exception handler to handle unexpected exceptions, then it must also include an exception handler for the expected NO\_DATA\_NEEDED exception. Otherwise, the OTHERS exception handler handles the NO\_DATA\_NEEDED exception, treating it as an unexpected error. The following exception handler reraises the NO\_DATA\_NEEDED exception, instead of treating it as a irrecoverable error:

```
EXCEPTION

WHEN NO_DATA_NEEDED THEN

RAISE;

WHEN OTHERS THEN

-- (Put error-logging code here)

RAISE_APPLICATION_ERROR(-20000, 'Irrecoverable error.');

END;
```

In Example 13-36, assume that the package External Source contains these public items:

- Procedure Init, which allocates and initializes the resources that Next Row needs
- Function Next\_Row, which returns some data from a specific external source and raises the user-defined exception Done (which is also a public item in the package) when the external source has no more data
- Procedure Clean Up, which releases the resources that Init allocated

The pipelined table function get\_external\_source\_data pipes rows from the external source by invoking External Source.Next Row until either:

The external source has no more rows.

In this case, the External\_Source.Next\_Row function raises the user-defined exception External Source.Done.

get external source data needs no more rows.

In this case, the PIPE ROW statement in get\_external\_source\_data raises the NO DATA NEEDED exception.

In either case, an exception handler in block b in get\_external\_source\_data invokes External Source.Clean Up, which releases the resources that Next Row was using.

#### Example 13-35 Pipelined Table Function Does Not Handle NO\_DATA\_NEEDED

```
CREATE TYPE t IS TABLE OF NUMBER
/
CREATE OR REPLACE FUNCTION pipe_rows RETURN t PIPELINED AUTHID DEFINER IS
```

```
n NUMBER := 0;
BEGIN
LOOP
n := n + 1;
PIPE ROW (n);
END LOOP;
END pipe_rows;
/
SELECT COLUMN_VALUE
FROM TABLE(pipe_rows())
wHERE ROWNUM < 5
/
```

4 rows selected.

#### Example 13-36 Pipelined Table Function Handles NO\_DATA\_NEEDED

```
CREATE OR REPLACE FUNCTION get_external_source_data
  RETURN t PIPELINED AUTHID DEFINER IS
BEGIN
                                  -- Initialize.
  External Source.Init();
  <<b>>> BEGIN
   LOOP
                                  -- Pipe rows from external source.
     PIPE ROW (External Source.Next Row());
   END LOOP;
  EXCEPTION
    WHEN External Source.Done THEN -- When no more rows are available,
     External_Source.Clean_Up(); -- clean up.
    WHEN NO DATA NEEDED THEN -- When no more rows are needed,
     External_Source.Clean_Up(); -- clean up.
                                   -- Optional, equivalent to RETURN.
     RAISE NO DATA NEEDED;
  END b;
END get external source data;
```

# **Overview of Polymorphic Table Functions**

Polymorphic table functions (PTF) are table functions whose operands can have more than one type. The return type is determined by the PTF invocation arguments list. The actual arguments to the table type usually determines the row output shape, but not always.

#### Introduction to Polymorphic Table Functions

Polymorphic Table Functions (PTF) are user-defined functions that can be invoked in the FROM clause of a SQL query block. They are capable of processing tables whose row type is not declared at definition time and producing a result table whose row type may or may not be declared at definition time. Polymorphic table functions leverage dynamic SQL capabilities to create powerful and complex custom functions. This is useful for applications demanding an interface with generic extensions which work for arbitrary input tables or queries.

A PTF author creates an interface to a procedural mechanism that defines a table. The PTF author defines, documents, and implements the PTF.

The query author can only describe the published interface and invoke the PTF function in queries.

The database is the PTF conductor. It manages the compilation and execution states of the PTF. The database and the PTF author can see a family of related SQL invoked procedures, called the PTF component procedures, and possibly additional private data (such as variables and cursors).

#### **Types of Polymorphic Table Functions**

The polymorphic table function type is specified based on their formal arguments list semantics:

- If an input TABLE argument has Row Semantics, the input is a single row.
- If an input TABLE argument has Table Semantics, the input is a set of rows. When a Table Semantics PTF is called from a query, the table argument can optionally be extended with either a PARTITION BY clause or an ORDER BY clause or both.

# Polymorphic Table Function Definition

The PTF author defines, documents, and implements the Polymorphic Table Function (PTF).

A PTF has two parts:

1. The PL/SQL package which contains the client interface for the PTF implementation.

2. The standalone or package function naming the PTF and its associated implementation package.

# Polymorphic Table Function Implementation

The Polymorphic Table Function (PTF) implementation client interface is a set of subprograms with fixed names that every PTF must provide.

#### Steps to Implement a Polymorphic Table Function

- 1. Create the implementation package containing the DESCRIBE function (required) and the OPEN, FETCH ROWS, and CLOSE procedures (optional).
- 2. Create the function specification naming the PTF. The function can be created at the toplevel after the package has been created, or as a package function in the implementation package (the package created in the first step). Polymorphic table functions do not have a function definition (a FUNCTION BODY), the definition is encapsulated in the associated implementation package.

The function definition specifies :

- The Polymorphic Table Function (PTF) name
- Exactly one formal argument of type TABLE and any number of non TABLE arguments
- The return type of the PTF as TABLE
- The type of PTF function (row or table semantics )
- The PTF implementation package name

### See Also:

- PIPELINED Clause for the standalone or package polymorphic table function creation syntax and semantic

## Polymorphic Table Function Invocation

A polymorphic table function is invoked by specifying its name followed by the argument list in the FROM clause of a SQL query block.

The PTF arguments can be the standard scalar arguments that can be passed to a regular table function, but PTF's can additionally take a table argument. A table argument is either a WITH clause query or a schema-level object that is allowed in a FROM clause (such as tables, views, or table functions).

#### Syntax

table\_argument ::= table [ PARTITION BY column\_list ] [ORDER BY order\_column\_list]

column\_list ::= identifier | ( identifier[, identifier...])

order\_column\_list ::= order\_column\_name | (order\_column\_name [, order\_column\_name...])

order\_column\_name ::= identifier [ ASC | DESC ][ NULLS FIRST | NULLS LAST ]

#### **Semantics**

Each identifier is a column in the corresponding table.

The PTF has Table Semantics.

Query can optionally partition and order Table Semantics PTF input. This is disallowed for Row Semantics PTF input.

A polymorphic table function (PTF) cannot be the target of a DML statement. Any table argument of a PTF is passed in by name.

For example, the noop PTF can be used in a query such as :

```
SELECT *
FROM noop(emp);
```

or

```
WITH e AS
(SELECT * FROM emp NATURAL JOIN dept)
SELECT t.* FROM noop(e) t;
```

The input table argument must be a basic table name.

The name resolution rules of the table identifier are (in priority order) as follows :

- 1. Identifier is resolved as a column name (such as a correlated column from an outer query block).
- 2. Identifier is resolved as a Common Table Expression (CTE) name in the current or some outer query-block. CTE is commonly known as the WITH clause.
- **3.** Identifier is resolved as a schema-level table, view, or table-function (regular or polymorphic, and defined either at the schema-level or inside a package).

Many types of table expressions otherwise allowed in the FROM clause cannot be directly used as a table argument for a PTF (such as ANSI Joins, bind-variables, in-line views, CURSOR operators, TABLE operators). To use such table expressions as a PTF argument, these table expressions must be passed indirectly into a PTF by wrapping them in a CTE and then passing the CTE name into the PTF.

A PTF can be used as a table reference in the FROM clause and thus can be part of the ANSI Join and LATERAL syntax. Additionally, a PTF can be the source table for PIVOT/UNPIVOT and MATCH\_RECOGNIZE. Some table modification clauses that are meant for tables and views (such as SAMPLING, PARTITION, CONTAINERS) are disallowed for PTF.

Direct function composition of PTF is allowed (such as nested PTF cursor expression invocation or PTF(TF()) nesting). However, nested PTF is disallowed (such as PTF(PTF()) nesting).

The scalar arguments of a PTF can be any SQL scalar expression. While the constant scalar values are passed as-is to the DESCRIBE function, all other values are passed as NULLs. This is usually not a problem for the PTF implementation if these values are not row shape determining, but otherwise the DESCRIBE function can raise an error; typically the documentation accompanying the PTF will state which scalar parameters, if any, are shape defining and thus must have constant non-null values. Note, that during query execution (during OPEN, FETCH\_ROWS, CLOSE) the expressions are evaluated and their actual values are passed to these PTF execution procedures. The return type is determined by the PTF invocation arguments list.

Query arguments are passed to PTF using a WITH clause.

The TABLE operator is optional when the table function arguments list or empty list () appears.

### Variadic Pseudo-Operators

A variadic pseudo-operator operates with a variable number of operands.

Starting with Oracle Database Release 18c, we introduce the concept of variadic pseudooperator into the SQL expression language to support Polymorphic Table Functions (PTF). A pseudo-operator can be used to pass list of identifiers (such as column name) to a PTF. A pseudo-operator can only appear as arguments to PTFs, and are parsed by the SQL compiler like other SQL operators or PL/SQL function invocation. A pseudo-operator has a variable number of arguments but must have at least one. The pseudo-operator does not have any execution function associated with it, and they are completely removed from the SQL cursor after the PTF compilation is finished. During SQL compilation, the pseudo-operators are converted to corresponding DBMS\_TF types and then passed to the DESCRIBE method. There is no output type associated with these operators. It is not possible to embed a pseudooperator inside a general SQL expression.

### COLUMNS Pseudo-Operator

You can use the COLUMNS pseudo-operator to specify arguments to a Polymorphic Table Function (PTF) invocation in the FROM clause of a SQL query block.

The COLUMNS pseudo-operator arguments specify the list of column names, or the list of column names with associated types.

#### Syntax

column\_operator ::= COLUMNS ( column\_list )

column\_list ::= column\_name\_list | column\_type\_list

column\_name\_list ::= identifier [, identifier ... ]

column\_type\_list::= identifier column\_type [, identifier column\_type...]

#### Semantics

The COLUMNS pseudo-operator can only appear as an argument to a PTF. It cannot appear in any other SQL expression than the PTF expression itself.

The column\_type must be a scalar type.

# Polymorphic Table Function Compilation and Execution

The database fulfills the Polymorphic Table Functions (PTF) conductor role. As such, it is responsible for the PTF compilation, execution and its related states.

The database manages :

- The compilation state : This is the immutable state that is generated by DESCRIBE which is needed before execution.
- The execution state: This is the state used by the execution procedures of a Table semantics PTF.

### See Also:

 Oracle Database PL/SQL Packages and Types Reference for more information about how the database manages the compilation and execution states of the PTFs

# Polymorphic Table Function Optimization

A polymorphic table function (PTF) provides an efficient and scalable mechanism to extend the analytical capabilities of the database.

The key benefits are:

Minimal data-movement: Only columns of interest are passed to PTF

- Predicates/Projections/Partitioning are/is pushed into underlying table/query (where semantically possible)
- Bulk data transfer into and out of PTF
- Parallelism is based on type of PTF and query specified partitioning (if any)

## Skip\_col Polymorphic Table Function Example

This PTF example demonstrates Row Semantics, Describe Only, package table function, and overloading features.

See Also: Oracle Database PL/SQL Packages and Types Reference for more Polymorphic Table Function (PTF) examples

### Example 13-37 Skip\_col Polymorphic Table Function Example

The skip\_col Polymorphic Table Function (PTF) returns all the columns in a table except the columns specified in the PTF input argument. The skip\_col PTF skips columns based on column names (overload 1) or columns data type (overload 2).

Live SQL:

You can view and run this example on Oracle Live SQL at 18c Skip\_col Polymorphic Table Function

Create the implementation package named skip\_col\_pkg containing the DESCRIBE function for the skip\_col polymorphic table function (PTF). The DESCRIBE function is invoked to determine the row shape produced by the PTF. It returns a DBMS\_TF.DESCRIBE\_T table. It is overloaded. The FETCH\_ROWS procedure is not required because it does need to produce associated new column values for a given subset of rows.

```
END skip col pkg;
```

Create the implementation package body which contains the polymorphic table function definition.

```
CREATE PACKAGE BODY skip col pkg AS
/* OVERLOAD 1: Skip by name
* Package PTF name: skip col pkg.skip col
 * Standalone PTF name: skip col by name
* PARAMETERS:
* tab - The input table
* col - The name of the columns to drop from the output
 * DESCRIPTION:
   This PTF removes all the input columns listed in col from the output
*
   of the PTF.
*/
FUNCTION describe(tab IN OUT DBMS TF.TABLE T,
                  col DBMS TF.COLUMNS T)
           RETURN DBMS TF.DESCRIBE T
 AS
   new cols DBMS TF.COLUMNS NEW T;
   col id PLS INTEGER := 1;
 BEGIN
   FOR i IN 1 .. tab.column.count() LOOP
     FOR j IN 1 .. col.count() LOOP
       tab.column(i).PASS THROUGH := tab.column(i).DESCRIPTION.NAME !=
col(j);
       EXIT WHEN NOT tab.column(i).PASS THROUGH;
     END LOOP;
   END LOOP;
   RETURN NULL;
 END;
/* OVERLOAD 2: Skip by type
 * Package PTF name: skip col pkg.skip col
 * Standalone PTF name: skip col by type
 * PARAMETERS:
           - Input table
    tab
 *
    type name - A string representing the type of columns to skip
    flip - 'False' [default] => Match columns with given type name
                otherwise => Ignore columns with given type name
* DESCRIPTION:
*
   This PTF removes the given type of columns from the given table.
*/
```

```
FUNCTION describe(tab
                         IN OUT DBMS TF.TABLE T,
                    type_name VARCHAR2,
flip VARCHAR2 DEFAULT 'False')
           RETURN DBMS TF.DESCRIBE T
 AS
    typ CONSTANT VARCHAR2(1024) := UPPER(TRIM(type name));
 BEGIN
    FOR i IN 1 .. tab.column.count() LOOP
       tab.column(i).PASS THROUGH :=
         CASE UPPER(SUBSTR(flip, 1, 1))
           WHEN 'F' THEN DBMS TF.column type name(tab.column(i).DESCRIPTION)!
=typ
                         DBMS TF.column type name(tab.column(i).DESCRIPTION)
          ELSE
=typ
         END /* case */;
    END LOOP;
   RETURN NULL;
 END;
END skip_col_pkg;
```

Create a standalone polymorphic table function named skip\_col\_by\_name for overload 1. Specify exactly one formal argument of type TABLE, specify the return type of the PTF as TABLE, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is skip\_col\_pkg.

```
CREATE FUNCTION skip_col_by_name(tab TABLE,
col COLUMNS)
RETURN TABLE PIPELINED ROW POLYMORPHIC USING skip col pkg;
```

Create a standalone polymorphic table function named skip\_col\_by\_type for overload 2. Specify exactly one formal argument of type TABLE, specify the return type of the PTF as TABLE, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is skip\_col\_pkg.

```
CREATE FUNCTION skip_col_by_type(tab TABLE,
type_name VARCHAR2,
flip VARCHAR2 DEFAULT 'False')
RETURN TABLE PIPELINED ROW POLYMORPHIC USING skip col pkg;
```

Invoke the package skip\_col PTF (overload 1) to report from the SCOTT.DEPT table only columns whose type is not NUMBER.

SELECT \* FROM skip\_col\_pkg.skip\_col(scott.dept, 'number');

DNAME LOC ACCOUNTING NEW YORK RESEARCH DALLAS SALES CHICAGO OPERATIONS BOSTON

The same result can be achieved by invoking the standalone skip\_col\_by\_type PTF to report from the SCOTT.DEPT table only columns whose type is not NUMBER.

```
SELECT * FROM skip_col_by_type(scott.dept, 'number');

DNAME LOC

ACCOUNTING NEW YORK

RESEARCH DALLAS

SALES CHICAGO

OPERATIONS BOSTON
```

Invoke the package skip\_col PTF (overload 2) to report from the SCOTT.DEPT table only columns whose type is NUMBER.

SELECT \* FROM skip\_col\_pkg.skip\_col(scott.dept, 'number', flip => 'True');

```
DEPTNO
10
20
30
40
```

The same result can be achieved by invoking the standalone skip\_col\_by\_type PTF to report from the SCOTT.DEPT table only columns whose type is NUMBER.

```
SELECT * FROM skip col by type(scott.dept, 'number', flip => 'True');
```

Invoke the package skip\_col PTF to report all employees in department 20 from the SCOTT.EMP table all columns except COMM, HIREDATE and MGR.

```
SELECT *
FROM skip_col_pkg.skip_col(scott.emp, COLUMNS(comm, hiredate, mgr))
WHERE deptno = 20;
```

## To\_doc Polymorphic Table Function Example

EMDNO ENAME TOP

The to\_doc PTF example combines a list of specified columns into a single document column.

#### Example 13-38 To\_doc Polymorphic Table Function Example

The to\_doc PTF combines a list of columns into a document column constructed like a JSON object.

Create the implementation package to\_doc\_p containing the DESCRIBE function and FETCH ROWS procedure for the to\_doc polymorphic table function (PTF).

The PTF parameters are :

- tab : The input table (The tab parameter is of type DBMS\_TF.TABLE\_T, a table descriptor record type)
- cols (optional) : The list of columns to convert to document. (The cols parameter is type DBMS TF.COLUMNS T, a column descriptor record type)

```
CREATE PACKAGE to_doc_p AS

FUNCTION describe(tab IN OUT DBMS_TF.TABLE_T,

cols IN DBMS_TF.COLUMNS_T DEFAULT NULL)

RETURN DBMS_TF.DESCRIBE_T;

PROCEDURE fetch_rows;
```

END to\_doc\_p;

Create the package containing the DESCRIBE function and FETCH\_ROWS procedure. The FETCH\_ROWS procedure is required to produce a new column named DOCUMENT in the output rowset. The DESCRIBE function indicates the read columns by annotating them in the input table descriptor, TABLE\_T. Only the indicated read columns will be fetched and thus available for processing during FETCH\_ROWS. The PTF invocation in a query can use the COLUMNS pseudooperator to indicate which columns the query wants the PTF to read, and this information is passed to the DESCRIBE function which then in turn sets the COLUMN\_T.FOR\_READ boolean flag. Only scalar SQL data types are allowed for the read columns. The COLUMN\_T.PASS\_THROUGH boolean flag indicates columns that are passed from the input table of the PTF to the output, without any modifications.

```
CREATE PACKAGE BODY to_doc_p AS

FUNCTION describe(tab IN OUT DBMS_TF.TABLE_T,

cols IN DBMS_TF.COLUMNS_T DEFAULT NULL)

RETURN DBMS_TF.DESCRIBE_T AS

BEGIN

FOR i IN 1 .. tab.column.count LOOP

CONTINUE WHEN NOT DBMS_TF.SUPPORTED_TYPE(tab.column(i).DESCRIPTION.TYPE);

IF cols IS NULL THEN

tab.column(i).FOR_READ := TRUE;

tab.column(i).PASS_THROUGH := FALSE;

CONTINUE;

END IF;
```

```
FOR j IN 1 .. cols.count LOOP
        IF (tab.column(i).DESCRIPTION.NAME = cols(j)) THEN
            tab.column(i).FOR READ := TRUE;
            tab.column(i).PASS THROUGH := FALSE;
        END IF;
      END LOOP;
 END LOOP;
 RETURN DBMS TF.describe t(new columns => DBMS TF.COLUMNS NEW T(1 =>
                              DBMS TF.COLUMN_METADATA_T(name
=> ' DOCUMENT ' ) ) );
END;
PROCEDURE fetch rows AS
     rst DBMS TF.ROW SET T;
     col DBMS TF.TAB VARCHAR2 T;
     rct PLS INTEGER;
BEGIN
      DBMS TF.GET_ROW_SET(rst, row_count => rct);
      FOR rid IN 1 .. rct LOOP
           col(rid) := DBMS TF.ROW TO CHAR(rst, rid);
     END LOOP;
      DBMS TF.PUT COL(1, col);
END;
```

END to\_doc\_p;

Create the standalone to\_doc PTF. Specify exactly one formal argument of type TABLE, specify the return type of the PTF as TABLE, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is to\_doc\_p.

```
CREATE FUNCTION to_doc(
tab TABLE,
cols COLUMNS DEFAULT NULL)
RETURN TABLE
PIPELINED ROW POLYMORPHIC USING to_doc_p;
```

Invoke the to\_doc PTF to display all columns of table SCOTT.DEPT as one combined DOCUMENT column.

```
SELECT * FROM to doc(scott.dept);
```

DOCUMENT

{"DEPTNO":10, "DNAME":"ACCOUNTING", "LOC":"NEW YORK"}
{"DEPTNO":20, "DNAME":"RESEARCH", "LOC":"DALLAS"}
{"DEPTNO":30, "DNAME":"SALES", "LOC":"CHICAGO"}
{"DEPTNO":40, "DNAME":"OPERATIONS", "LOC":"BOSTON"}

For all employees in departments 10 and 30, display the DEPTNO, ENAME and DOCUMENT columns ordered by DEPTNO and ENAME. Invoke the to\_doc PTF with the COLUMNS pseudo-operator to

select columns EMPNO, JOB, MGR, HIREDATE, SAL and COMM of table SCOTT.EMP . The PTF combines these columns into the DOCUMENT column.

```
SELECT deptno, ename, document
FROM
     to doc(scott.emp, COLUMNS(empno,job,mgr,hiredate,sal,comm))
WHERE deptno IN (10, 30)
ORDER BY 1, 2;
DEPTNO ENAME
              DOCUMENT
_____
_____
               {"EMPNO":7782, "JOB":"MANAGER", "MGR":7839, "HIREDATE":"09-JUN-81",
   10 CLARK
"SAL":2450}
   10 KING
              {"EMPNO":7839, "JOB":"PRESIDENT", "HIREDATE":"17-NOV-81", "SAL":5000}
   10 MILLER
               {"EMPNO":7934, "JOB":"CLERK", "MGR":7782, "HIREDATE":"23-JAN-82",
"SAL":1300}
   30 ALLEN
              {"EMPNO":7499, "JOB":"SALESMAN", "MGR":7698, "HIREDATE":"20-FEB-81",
"SAL":1600, "COMM":300}
   30 BLAKE {"EMPNO":7698, "JOB":"MANAGER", "MGR":7839, "HIREDATE":"01-MAY-81",
"SAL":2850}
   30 JAMES
              {"EMPNO":7900, "JOB":"CLERK", "MGR":7698, "HIREDATE":"03-DEC-81",
"SAL":950}
   30 MARTIN
              {"EMPNO":7654, "JOB":"SALESMAN", "MGR":7698, "HIREDATE":"28-SEP-81",
"SAL":1250, "COMM":1400}
   30 TURNER {"EMPNO":7844, "JOB":"SALESMAN", "MGR":7698, "HIREDATE":"08-SEP-81",
"SAL":1500, "COMM":0}
   30 WARD {"EMPNO":7521, "JOB":"SALESMAN", "MGR":7698, "HIREDATE":"22-FEB-81",
"SAL":1250, "COMM":500}
```

With the subquery named E, display the DOC\_ID and DOCUMENT columns. Report all clerk employees, their salary, department and department location. Use the to\_doc PTF to combine the NAME, SAL, DEPTNO and LOC columns into the DOCUMENT column.

Use a subquery block to display c1, c2, c3 column values converted into the DOCUMENT column.

```
WITH t(c1,c2,c3) AS (
   SELECT NULL, NULL, NULL FROM dual
   UNION ALL
   SELECT 1, NULL, NULL FROM dual
   UNION ALL
   SELECT NULL, 2, NULL FROM dual
   UNION ALL
   SELECT 0, NULL, 3 FROM dual)
```

```
SELECT *
    FROM to_doc(t);
DOCUMENT
------
{}
{"c1":1}
{"c2":2}
{"c1":0, "c3":3}
```

For all employees in department 30, display the values of the member with property names ENAME and COMM. The PTF invocation reporting from the SCOTT.EMP table produces the DOCUMENT column which can be used as input to the JSON\_VALUE function. This function selects a scalar value from some JSON data.

```
SELECT JSON_VALUE(document, '$.ENAME') ename,
    JSON_VALUE(document, '$.COMM') comm
FROM to_doc(scott.emp)
WHERE JSON_VALUE(document, '$.DEPTNO') = 30;
ENAME COMM
------
ALLEN 300
WARD 500
MARTIN 1400
BLAKE
TURNER 0
JAMES
```

# Implicit\_echo Polymorphic Table Function Example

The implicit\_echo PTF example demonstrates that the USING clause is optional when the Polymorphic Table Function and the DESCRIBE function are defined in the same package.

#### Example 13-39 Implicit\_echo Polymorphic Table Function Example

The implicit\_echo PTF, takes in a table and a column and produces a new column with the same value.

This PTF returns the column in the input table tab, and adds to it the column listed in cols but with the column names prefixed with "ECHO\_".

Create the implementation package implicit\_echo\_package containing the DESCRIBE function, implicit echo polymorphic table function (PTF) and FETCH ROWS procedure.

```
CREATE PACKAGE implicit_echo_package AS

prefix DBMS_ID := '"ECHO_';

FUNCTION DESCRIBE(tab IN OUT DBMS_TF.TABLE_T,

cols IN DBMS_TF.COLUMNS_T)

RETURN DBMS_TF.DESCRIBE_T;

PROCEDURE FETCH_ROWS;

-- PTF FUNCTION: WITHOUT USING CLAUSE --

FUNCTION implicit echo(tab TABLE, cols COLUMNS)
```

RETURN TABLE PIPELINED ROW POLYMORPHIC;

```
END implicit echo package;
```

Create the package containing the DESCRIBE function containing the input table parameter and the column parameter to be read. This function is invoked to determine the type of rows produced by the Polymorphic Table Function. The function returns a table DBMS\_TF.DESCRIBE\_T. The FETCH\_ROWS procedure is required to produce the indicated read column along with a new column prefixed with "ECHO\_" in the output rowset. The implicit\_echo is the PTF function and contains two arguments, tab and cols, whose values are obtained from the query and this information is passed to the DESCRIBE function. The Row semantics specifies a PTF type but without the USING clause. This function is invoked from the SQL query.

Create the implementation package body implicit\_echo\_package which contains the PTF definition.

```
CREATE PACKAGE BODY implicit echo package AS
FUNCTION DESCRIBE (tab IN OUT DBMS TF. TABLE T,
                 cols IN DBMS TF.COLUMNS T)
         RETURN DBMS TF.DESCRIBE T
AS
  new cols DBMS TF.COLUMNS NEW T;
  col id PLS INTEGER := 1;
BEGIN
 FOR i in 1 .. tab.column.COUNT LOOP
   FOR j in 1 .. cols.COUNT LOOP
     IF (tab.column(i).description.name = cols(j)) THEN
       IF (NOT DBMS TF.SUPPORTED TYPE(tab.column(i).description.type)) THEN
            RAISE APPLICATION ERROR (-20102, 'Unsupported column type['||
                                    tab.column(i).description.type||']');
      END IF;
       tab.column(i).for read := TRUE;
       new cols(col id) := tab.column(i).description;
       new cols(col id).name := prefix||
REGEXP REPLACE (tab.column(i).description.name,
'^"|"$');
                            := col id + 1;
      col id
      EXIT;
    END IF;
    END LOOP;
 END LOOP;
/* VERIFY ALL COLUMNS WERE FOUND */
 IF (col id - 1 != cols.COUNT) then
```

```
END implicit_echo_package;
```

Invoke the PTF to display ENAME column of table SCOTT.EMP and display it along with another column ECHO ENAME having the same value.

```
SELECT ENAME, ECHO_ENAME
FROM implicit echo (SCOTT.EMP, COLUMNS(SCOTT.ENAME));
```

ENAME ECHO ENAME \_\_\_\_\_ SMITH ALLEN SMITH ALLEN WARD WARD JONES JONES MARTIN MARTIN BLAKE BLAKE CLARK CLARK SCOTT SCOTT KING KING TURNER TURNER ADAMS ADAMS JAMES JAMES FORD FORD MILLER MILLER

# Updating Large Tables in Parallel

The DBMS\_PARALLEL\_EXECUTE package lets you incrementally update the data in a large table in parallel, in two high-level steps:

- 1. Group sets of rows in the table into smaller chunks.
- 2. Apply the desired UPDATE statement to the chunks in parallel, committing each time you have finished processing a chunk.

This technique is recommended whenever you are updating a lot of data. Its advantages are:

- You lock only one set of rows at a time, for a relatively short time, instead of locking the entire table.
- You do not lose work that has been done if something fails before the entire operation finishes.

- You reduce rollback space consumption.
- You improve performance.

### See Also:

# Profiling and Tracing PL/SQL Programs

To help you isolate performance problems in large PL/SQL programs, PL/SQL provides these tools, implemented as PL/SQL packages.

Tool	Package	Description
		Computes the time that your PL/SQL program spends at each line and in each subprogram.
		You must have CREATE privileges on the units to be profiled.
		Saves runtime statistics in database tables, which you can query.
Trace	DBMS_TRACE	Traces the order in which subprograms run.
interface	_	You can specify the subprograms to trace and the tracing level.
		Saves runtime statistics in database tables, which you can query.

Table 13-1 Profiling and Tracing Tools Summary	Table 13-1	Profiling and	Tracing T	ools Summary
--	------------	---------------	-----------	--------------

Tool	Package	Description
PL/SQL hierarchical profiler	DBMS_HPROF	Reports the dynamic execution program profile of your PL/SQL program, organized by subprogram invocations. Accounts for SQL and PL/SQL execution times separately.
		Requires no special source or compile-time preparation.
		Generates reports in HTML. Provides the option of storing profiler data and results in relational format in database tables for custom report generation (such as third-party tools offer).
SQL trace	DBMS_APPLICATION_INFO	Uses the DBMS_APPLICATION_INFO package with Oracle Trace and the SQL trace facility to record names of executing modules or transactions in the database for later use when tracking the performance of various modules and debugging.
PL/SQL Basic Block Coverage	DBMS_PLSQL_CODE_COVERAGE	Collects and analyzes basic block coverage data.
Call Stack Utilities	UTL_CALL_STACK	Provides information about currently executing subprograms (such as subprogram names, unit names, owner names, edition names, and error stack information) that you can use to create more revealing error logs and application execution traces.

# Compiling PL/SQL Units for Native Execution

You can usually speed up PL/SQL units by compiling them into native code (processordependent system code), which is stored in the SYSTEM tablespace.

You can natively compile any PL/SQL unit of any type, including those that Oracle Database supplies.

Natively compiled program units work in all server environments, including shared server configuration (formerly called "multithreaded server") and Oracle Real Application Clusters (Oracle RAC).

On most platforms, PL/SQL native compilation requires no special set-up or maintenance. On some platforms, the DBA might want to do some optional configuration.

# See Also:

- Oracle Database Administrator's Guide for information about configuring a database
- Platform-specific configuration documentation for your platform

You can test to see how much performance gain you can get by enabling PL/SQL native compilation.

If you have determined that PL/SQL native compilation will provide significant performance gains in database operations, Oracle recommends compiling the entire database for native mode, which requires DBA privileges. This speeds up both your own code and calls to the PL/SQL packages that Oracle Database supplies.

# Topics

- Determining Whether to Use PL/SQL Native Compilation
- How PL/SQL Native Compilation Works
- Dependencies, Invalidation, and Revalidation
- Setting Up a New Database for PL/SQL Native Compilation\*
- Compiling the Entire Database for PL/SQL Native or Interpreted Compilation\*

\* Requires DBA privileges.

# Determining Whether to Use PL/SQL Native Compilation

Whether to compile a PL/SQL unit for native or interpreted mode depends on where you are in the development cycle and on what the program unit does.

While you are debugging program units and recompiling them frequently, interpreted mode has these advantages:

- You can use PL/SQL debugging tools on program units compiled for interpreted mode (but not for those compiled for native mode).
- Compiling for interpreted mode is faster than compiling for native mode.

After the debugging phase of development, in determining whether to compile a PL/SQL unit for native mode, consider:

- PL/SQL native compilation provides the greatest performance gains for computationintensive procedural operations. Examples are data warehouse applications and applications with extensive server-side transformations of data for display.
- PL/SQL native compilation provides the least performance gains for PL/SQL subprograms that spend most of their time running SQL.
- When many program units (typically over 15,000) are compiled for native execution, and are simultaneously active, the large amount of shared memory required might affect system performance.

# How PL/SQL Native Compilation Works

Without native compilation, the PL/SQL statements in a PL/SQL unit are compiled into an intermediate form, system code, which is stored in the catalog and interpreted at run time.

With PL/SQL native compilation, the PL/SQL statements in a PL/SQL unit are compiled into native code and stored in the catalog. The native code need not be interpreted at run time, so it runs faster.

Because native compilation applies only to PL/SQL statements, a PL/SQL unit that uses only SQL statements might not run faster when natively compiled, but it does run at least as fast as the corresponding interpreted code. The compiled code and the interpreted code make the same library calls, so their action is the same.

The first time a natively compiled PL/SQL unit runs, it is fetched from the SYSTEM tablespace into shared memory. Regardless of how many sessions invoke the program unit, shared memory has only one copy it. If a program unit is not being used, the shared memory it is using might be freed, to reduce memory load.

Natively compiled subprograms and interpreted subprograms can invoke each other.

PL/SQL native compilation works transparently in an Oracle Real Application Clusters (Oracle RAC) environment.

The PLSQL\_CODE\_TYPE compilation parameter determines whether PL/SQL code is natively compiled or interpreted. For information about this compilation parameters, see "PL/SQL Units and Compilation Parameters".

# Dependencies, Invalidation, and Revalidation

Recompilation is automatic with invalidated PL/SQL modules. For example, if an object on which a natively compiled PL/SQL subprogram depends changes, the subprogram is invalidated. The next time the same subprogram is called, the database recompiles the subprogram automatically. Because the PLSQL\_CODE\_TYPE setting is stored inside the library unit for each subprogram, the automatic recompilation uses this stored setting for code type.

Explicit recompilation does not necessarily use the stored PLSQL\_CODE\_TYPE setting. For the conditions under which explicit recompilation uses stored settings, see "PL/SQL Units and Compilation Parameters".

# Setting Up a New Database for PL/SQL Native Compilation

If you have DBA privileges, you can set up a new database for PL/SQL native compilation by setting the compilation parameter PLSQL CODE TYPE to NATIVE. The performance benefits apply

to the PL/SQL packages that Oracle Database supplies, which are used for many database operations.

# Note:

If you compile the whole database as NATIVE, Oracle recommends that you set PLSQL CODE TYPE at the system level.

# Compiling the Entire Database for PL/SQL Native or Interpreted Compilation

If you have DBA privileges, you can recompile all PL/SQL modules in an existing database to NATIVE or INTERPRETED, using the dbmsupgnv.sql and dbmsupgin.sql scripts respectively during the process explained in this section. Before making the conversion, review "Determining Whether to Use PL/SQL Native Compilation".

# Note:

- If you compile the whole database as NATIVE, Oracle recommends that you set PLSQL CODE TYPE at the system level.
- If Database Vault is enabled, then you can run dbmsupgnv.sql only if the Database Vault administrator has granted you the DV PATCH ADMIN role.
- The conversion process described here affects only the current container's units. Units in other containers are not affected.

During the conversion to native compilation, TYPE specifications are not recompiled by dbmsupgnv.sql to NATIVE because these specifications do not contain executable code.

Package specifications seldom contain executable code so the runtime benefits of compiling to NATIVE are not measurable. You can use the TRUE command-line parameter with the dbmsupgnv.sql script to exclude package specs from recompilation to NATIVE, saving time in the conversion process.

When converting to interpreted compilation, the dbmsupgin.sql script does not accept any parameters and does not exclude any PL/SQL units.

# Note:

The following procedure describes the conversion to native compilation. If you must recompile all PL/SQL modules to interpreted compilation, make these changes in the steps.

- Skip the first step.
- Set the PLSQL\_CODE\_TYPE compilation parameter to INTERPRETED rather than NATIVE.
- Substitute dbmsupgin.sql for the dbmsupgnv.sql script.

1. Ensure that a test PL/SQL unit can be compiled. For example:

ALTER PROCEDURE my proc COMPILE PLSQL CODE TYPE=NATIVE REUSE SETTINGS;

- 2. Shut down application services, the listener, and the database.
  - Shut down all of the Application services including the Forms Processes, Web Servers, Reports Servers, and Concurrent Manager Servers. After shutting down all of the Application services, ensure that all of the connections to the database were terminated.
  - Shut down the TNS listener of the database to ensure that no new connections are made.
  - Shut down the database in normal or immediate mode as the user SYS. See Oracle Database Administrator's Guide.
- 3. Set PLSQL\_CODE\_TYPE to NATIVE in the compilation parameter file. If the database is using a server parameter file, then set this after the database has started.

The value of PLSQL\_CODE\_TYPE does not affect the conversion of the PL/SQL units in these steps. However, it does affect all subsequently compiled units, so explicitly set it to the desired compilation type.

- 4. Start up the database in upgrade mode, using the UPGRADE option. For information about SQL\*Plus STARTUP, see SQL\*Plus User's Guide and Reference.
- 5. Run this code to list the invalid PL/SQL units. You can save the output of the query for future reference with the SQL SPOOL statement:

```
-- To save the output of the query to a file:

SPOOL pre_update_invalid.log

SELECT 0.0WNER, 0.0BJECT_NAME, 0.0BJECT_TYPE

FROM DBA_OBJECTS 0, DBA_PLSQL_OBJECT_SETTINGS s

WHERE 0.0BJECT_NAME = s.NAME AND 0.STATUS='INVALID';

-- To stop spooling the output: SPOOL OFF
```

If any Oracle supplied units are invalid, try to validate them by recompiling them. For example:

ALTER PACKAGE SYS.DBMS\_OUTPUT COMPILE BODY REUSE SETTINGS;

If the units cannot be validated, save the spooled log for future resolution and continue.

 Run this query to determine how many objects are compiled NATIVE and INTERPRETED (to save the output, use the SQL SPOOL statement):

```
SELECT TYPE, PLSQL_CODE_TYPE, COUNT(*)
FROM DBA_PLSQL_OBJECT_SETTINGS
WHERE PLSQL_CODE_TYPE IS NOT NULL AND ORIGIN_CON_ID=SYS_CONTEXT('USERENV',
'CON_ID')
GROUP BY TYPE, PLSQL_CODE_TYPE
ORDER BY TYPE, PLSQL_CODE TYPE;
```

Any objects with a NULL plsql code type are special internal objects and can be ignored.

7. Run the SORACLE\_HOME/rdbms/admin/dbmsupgnv.sql script as the user SYS to update the plsql\_code\_type setting to NATIVE in the dictionary tables for all PL/SQL units. This process also invalidates the units. Use TRUE with the script to exclude package specifications; FALSE to include the package specifications.

This update must be done when the database is in UPGRADE mode. The script is guaranteed to complete successfully or rollback all the changes.

- 8. Shut down the database and restart in NORMAL mode.
- 9. Before you run the utlrp.sql script, Oracle recommends that no other sessions are connected to avoid possible problems. You can ensure this with this statement:

ALTER SYSTEM ENABLE RESTRICTED SESSION;

**10.** Run the <code>\$ORACLE\_HOME/rdbms/admin/utlrp.sql script</code> as the user <code>SYS</code>. This script recompiles all the PL/SQL modules using a default degree of parallelism. See the comments in the script for information about setting the degree explicitly.

If for any reason the script is terminated atypically, rerun the utlrp.sql script to recompile any remaining invalid PL/SQL modules.

- 11. After the compilation completes successfully, verify that there are no invalid PL/SQL units using the query in step 5. You can spool the output of the query to the post\_upgrade\_invalid.log file and compare the contents with the pre\_upgrade\_invalid.log file, if it was created previously.
- 12. Re-run the query in step 6. If recompiling with dbmsupgnv.sql, confirm that all PL/SQL units, except TYPE specifications and package specifications if excluded, are NATIVE. If recompiling with dbmsupgin.sql, confirm that all PL/SQL units are INTERPRETED.
- **13.** Disable the restricted session mode for the database, then start the services that you previously shut down. To disable restricted session mode, use this statement:

ALTER SYSTEM DISABLE RESTRICTED SESSION;

# ACCESSIBLE BY Clause

The ACCESSIBLE BY clause restricts access to a unit or subprogram by other units.

The **accessor list** explicitly lists those units which may have access. The accessor list can be defined on individual subprograms in a package. This list is checked in addition to the accessor list defined on the package itself (if any). This list may only restrict access to the subprogram – it cannot expand access. This code management feature is useful to prevent inadvertent use of internal subprograms. For example, it may not be convenient or feasible to reorganize a package into two packages: one for a small number of procedures requiring restricted access, and another one for the remaining units requiring public access.

The ACCESSIBLE BY clause may appear in the declarations of object types, object type bodies, packages, and subprograms.

The **ACCESSIBLE BY clause can appear in the following SQL statements:** 

- ALTER TYPE Statement
- CREATE FUNCTION Statement
- CREATE PROCEDURE Statement
- CREATE PACKAGE Statement
- CREATE TYPE Statement
- CREATE TYPE BODY Statement

# Topics

#### Syntax

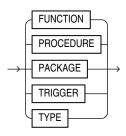

# accessible\_by\_clause ::=

accessor ::=

unit\_kind ::=

#### Semantics

accessible\_by\_clause

accessor

# [schema.]unit\_name

Specifies a stored PL/SQL unit that can invoke the entity.

Each accessor specifies another PL/SQL entity that may access the entity which includes the ACCESSIBLE BY clause.

When an ACCESSIBLE BY clause appears, only entities named in the clause may access the entity in which the clause appears.

An accessor may appear more than once in the ACCESSIBLE BY clause.

The **ACCESSIBLE BY clause can appear only once in the unit declaration**.

An entity named in an accessor is not required to exist.

When an entity with an ACCESSIBLE BY clause is invoked, it imposes an additional access check after all other checks have been performed. These checks are:

• The invoked unit must include an accessor with the same unit\_name and unit\_kind as the invoking unit.

- If the accessor includes a schema, the invoking unit must be in that schema.
- If the accessor does not include a *schema*, the invoker must be from the same schema as the invoked entity.

## unit\_kind

Specifies if the unit is a FUNCTION, PACKAGE, PROCEDURE, TRIGGER, or TYPE.

## **Usage Notes**

The *unit\_kind* is optional, but it is recommended to specify it to avoid ambiguity when units have the same name. For example, it is possible to define a trigger with the same name as a function.

The ACCESSIBLE BY clause allows access only when the call is direct. The check will fail if the access is through static SQL, DBMS SQL, or dynamic SQL.

Any call to the initialization procedure of a package specification or package body will be checked against the *accessor* list of the package specification.

A unit can always access itself. An item in a unit can reference another item in the same unit.

RPC calls to a protected subprogram will always fail, since there is no context available to check the validity of the call, at either compile-time or run-time.

Calls to a protected subprogram from a conditional compilation directive will fail.

#### Examples

## Example 14-1 Restricting Access to Top-Level Procedures in the Same Schema

This example shows that the top-level procedure top\_protected\_proc can only be called by procedure top\_trusted\_proc in the current schema. The user cannot call top\_proctected\_proc directly.

# Vive SQL: You can view and run this example on Oracle Live SQL at Restricting Access to TopLevel Procedures in the Same Schema PROCEDURE top\_protected\_proc ACCESSIBLE BY (PROCEDURE top\_trusted\_proc) AS BEGIN DBMS\_OUTPUT.PUT\_LINE('Processed top\_protected\_proc.'); END; PROCEDURE top\_trusted\_proc AS BEGIN DBMS\_OUTPUT.PUT\_LINE('top\_trusted\_proc calls top\_protected\_proc'); top\_protected\_proc; END;

EXEC top\_trusted\_proc;

```
top_trusted_proc calls top_protected_proc
Processed top_protected_proc.
```

EXEC top\_protected\_proc; BEGIN top protected proc; END;

PLS-00904: insufficient privilege to access object TOP\_PROTECTED\_PROC

## Example 14-2 Restricting Access to a Unit Name of Any Kind

This example shows that if the PL/SQL *unit\_kind* is not specified in the ACCESSIBLE BY clause, then a call from any unit kind is allowed if the unit name matches. There is no compilation error if the *unit\_kind* specified in the ACCESSIBLE BY clause does not match any existing objects. It is possible to define a trigger with the same name as a function. It is recommended to specify the *unit\_kind*.

# Live SQL:

You can view and run this example on Oracle Live SQL at Restricting Access to a Unit Name of Any Kind

```
PROCEDURE protected proc2
  ACCESSIBLE BY (top trusted f)
AS
BEGIN
  DBMS OUTPUT.PUT LINE('Processed protected proc2.');
END;
FUNCTION top protected f RETURN NUMBER
ACCESSIBLE BY (TRIGGER top_trusted_f ) AS
BEGIN
  RETURN 0.5;
END top_protected_f;
FUNCTION top trusted f RETURN NUMBER AUTHID DEFINER IS
  FUNCTION q RETURN NUMBER DETERMINISTIC IS
  BEGIN
     RETURN 0.5;
  END g;
BEGIN
  protected proc2;
  RETURN g() - DBMS_RANDOM.VALUE();
END top trusted f;
SELECT top trusted f FROM DUAL;
   .381773176
1 row selected.
Processed protected proc2.
```

# Example 14-3 Restricting Access to a Stored Procedure

This example shows a package procedure that can only be called by top\_trusted\_proc procedure. The ACCESSIBLE BY clause of a subprogram specification and body must match. A compilation error is raised if a call is made to an existing procedure with an ACCESSIBLE BY clause that does not include this procedure in its accessor list.

# Live SQL:

You can view and run this example on Oracle Live SQL at Restricting Access to a Stored Procedure

```
CREATE OR REPLACE PACKAGE protected pkg
AS
  PROCEDURE public proc;
  PROCEDURE private proc ACCESSIBLE BY (PROCEDURE top trusted proc);
END;
CREATE OR REPLACE PACKAGE BODY protected pkg
AS
  PROCEDURE public proc AS
 BEGIN
    DBMS OUTPUT.PUT LINE ('Processed protected pkg.public proc');
  END;
  PROCEDURE private proc ACCESSIBLE BY (PROCEDURE top trusted proc) AS
  BEGIN
    DBMS OUTPUT.PUT LINE ('Processed protected pkg.private proc');
  END;
END;
CREATE OR REPLACE PROCEDURE top trusted proc
AS
  BEGIN
     DBMS OUTPUT.PUT LINE ('top trusted proc calls protected pkg.private proc
');
     protected pkg.private proc;
  END;
Procedure created.
EXEC top trusted proc;
top trusted proc calls protected pkg.private proc
Processed protected pkg.private proc
EXEC protected pkg.private proc
PLS-00904: insufficient privilege to access object PRIVATE PROC
```

# AGGREGATE Clause

Identifies the function as an **aggregate function**, or one that evaluates a group of rows and returns a single row.

You can specify aggregate functions in the select list, HAVING clause, and ORDER BY clause.

When you specify a user-defined aggregate function in a query, you can treat it as an **analytic function** (one that operates on a query result set). To do so, use the <code>OVER analytic\_clause</code> syntax available for SQL analytic functions.

The AGGREGATE clause can appear in the CREATE FUNCTION Statement.

#### **Topics**

- Syntax
- Semantics
- Examples
- Related Topics

Syntax

aggregate\_clause ::=

## **Semantics**

aggregate\_clause

#### AGGREGATE USING

Specify the name of the implementation type of the function.

# [schema.] implementation\_type

The implementation type must be an ADT containing the implementation of the ODCIAggregate subprograms. If you do not specify *schema*, then the database assumes that the implementation type is in your schema.

# **Restriction on AGGREGATE USING**

You cannot specify the *aggregate\_clause* for a nested function.

If you specify this clause, then you can specify only one input argument for the function.

# Examples

• Example 13-34, "Pipelined Table Function as Aggregate Function"

# **Related Topics**

# Assignment Statement

The assignment statement sets the value of a data item to a valid value.

# Topics

- Syntax
- Semantics
- Examples
- Related Topics

# Syntax

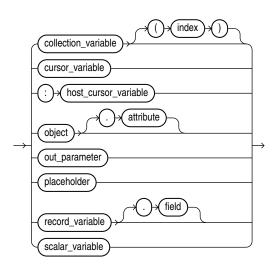

assignment\_statement ::=

(expression ::=)

# assignment\_statement\_target ::=

# placeholder ::=

## **Semantics**

## assignment\_statement

#### expression

Expression whose value is to be assigned to assignment statement target.

expression and assignment statement target must have compatible data types.

# Note:

Collections with elements of the same type might not have the same data type. For the syntax of collection type definitions, see "Collection Variable Declaration".

# assignment\_statement\_target

Data item to which the value of *expression* is to be assigned.

## collection\_variable

Name of a collection variable.

# index

Index of an element of *collection\_variable*. Without *index*, the entire collection variable is the assignment statement target.

index must be a numeric expression whose data type either is PLS\_INTEGER or can be implicitly converted to PLS\_INTEGER (for information about the latter, see "Predefined PLS\_INTEGER Subtypes").

#### cursor\_variable

Name of a cursor variable.

#### :host\_cursor\_variable

Name of a cursor variable declared in a PL/SQL host environment and passed to PL/SQL as a bind variable. Do not put space between the colon (:) and host cursor variable.

The data type of a host cursor variable is compatible with the return type of any PL/SQL cursor variable.

## object

Name of an instance of an abstract data type (ADT).

#### attribute

Name of an attribute of *object*. Without *attribute*, the entire ADT is the assignment statement target.

#### out\_parameter

Name of a formal OUT or IN OUT parameter of the subprogram in which the assignment statement appears.

#### record\_variable

Name of a record variable.

## field

Name of a field of *record\_variable*. Without *field*, the entire record variable is the assignment statement target.

## scalar\_variable

Name of a PL/SQL scalar variable.

## placeholder

## :host\_variable

Name of a variable declared in a PL/SQL host environment and passed to PL/SQL as a bind variable. Do not put space between the colon (:) and *host\_variable*.

## :indicator\_variable

Name of an indicator variable declared in a PL/SQL host environment and passed to PL/SQL as a bind variable. (An indicator variable indicates the value or condition of its associated host variable. For example, in the Oracle Precompiler environment, an indicator variable can a detect null or truncated value in an output host variable.) Do not put space between *host\_variable* and the colon (:) or between the colon and *indicator\_variable*. This is correct:

:host variable:indicator variable

# **Basic LOOP Statement**

With each iteration of the basic LOOP statement, its statements run and control returns to the top of the loop. The LOOP statement ends when a statement inside the loop transfers control outside the loop or raises an exception.

## **Topics**

- Syntax
- Semantics
- Examples
- Related Topics

## Syntax

basic\_loop\_statement ::=

# (statement ::=)

## Semantics

basic\_loop\_statement

# statement

To prevent an infinite loop, at least one statement must transfer control outside the loop. The statements that can transfer control outside the loop are:

- "CONTINUE Statement" (when it transfers control to the next iteration of an enclosing labeled loop)
- "EXIT Statement"
- "GOTO Statement"
- "RAISE Statement"

## label

A label that identifies *basic\_loop\_statement* (see "statement ::=" and "label"). CONTINUE, EXIT, and GOTO statements can reference this label.

Labels improve readability, especially when LOOP statements are nested, but only if you ensure that the label in the END LOOP statement matches a label at the beginning of the same LOOP statement (the compiler does not check).

# Examples

# Example 14-4 Nested, Labeled Basic LOOP Statements with EXIT WHEN Statements

In this example, one basic LOOP statement is nested inside the other, and both have labels. The inner loop has two EXIT WHEN statements; one that exits the inner loop and one that exits the outer loop.

```
DECLARE
 s PLS_INTEGER := 0;
 i PLS INTEGER := 0;
 j PLS INTEGER;
BEGIN
 <<outer loop>>
 LOOP
   i := i + 1;
   j := 0;
   <<inner_loop>>
   LOOP
     j := j + 1;
     s := s + i * j; -- Sum several products
     EXIT inner loop WHEN (j > 5);
     EXIT outer_loop WHEN ((i * j) > 15);
   END LOOP inner_loop;
 END LOOP outer loop;
 DBMS OUTPUT.PUT LINE
    ('The sum of products equals: ' || TO_CHAR(s));
END;
```

## Result:

The sum of products equals: 166

#### Example 14-5 Nested, Unabeled Basic LOOP Statements with EXIT WHEN Statements

An EXIT WHEN statement in an inner loop can transfer control to an outer loop only if the outer loop is labeled.

In this example, the outer loop is not labeled; therefore, the inner loop cannot transfer control to it.

```
DECLARE
    i PLS_INTEGER := 0;
    j PLS_INTEGER := 0;
BEGIN
    LOOP
    i := i + 1;
    DBMS_OUTPUT.PUT_LINE ('i = ' || i);
LOOP
    j := j + 1;
    DBMS_OUTPUT.PUT_LINE ('j = ' || j);
    EXIT WHEN (j > 3);
END LOOP;
```

```
DBMS_OUTPUT.PUT_LINE ('Exited inner loop');
EXIT WHEN (i > 2);
END LOOP;
DBMS_OUTPUT.PUT_LINE ('Exited outer loop');
END;
```

# Result:

```
i = 1
j = 1
j = 2
j = 3
j = 4
Exited inner loop
i = 2
j = 5
Exited inner loop
i = 3
j = 6
Exited inner loop
Exited outer loop
```

PL/SQL procedure successfully completed.

# Block

The **block**, which groups related declarations and statements, is the basic unit of a PL/SQL source program.

It has an optional declarative part, a required executable part, and an optional exceptionhandling part. Declarations are local to the block and cease to exist when the block completes execution. Blocks can be nested.

An anonymous block is an executable statement.

statement ::=

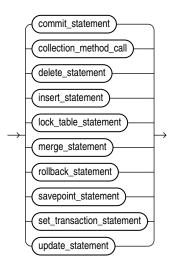

(plsql\_block ::=, procedure\_call ::=, sql\_statement ::=)

ORACLE<sup>®</sup>

# procedure\_call ::=

#### sql\_statement ::=

# **Semantics**

# plsql\_block

# label

Undeclared identifier, unique for the block.

# DECLARE

Starts the declarative part of the block.

## declare\_section

Contains local declarations, which exist only in the block and its sub-blocks and are not visible to enclosing blocks.

# Restrictions on declare\_section

- A declare\_section in create\_package, create\_package\_body, or compound\_trigger\_block cannot include PRAGMA AUTONOMOUS\_TRANSACTION.
- A declare\_section in trigger\_body or tps\_body cannot declare variables of the data type LONG or LONG RAW.

# subtype\_definition

Static expressions can be used in subtype declarations. See Static Expressions for more information.

# subtype

Name of the user-defined subtype that you are defining.

# base\_type

Base type of the subtype that you are defining. *base\_type* can be any scalar or user-defined PL/SQL datatype specifier such as CHAR, DATE, or RECORD.

# CHARACTER SET character\_set

Specifies the character set for a subtype of a character data type.

Restriction on CHARACTER SET character\_set

Do not specify this clause if *base type* is not a character data type.

# NOT NULL

Imposes the NOT NULL constraint on data items declared with this subtype. For information about this constraint, see "NOT NULL Constraint".

# constraint

Specifies a constraint for a subtype of a numeric data type.

Restriction on constraint

Do not specify *constraint* if *base\_type* is not a numeric data type.

# precision

Specifies the precision for a constrained subtype of a numeric data type.

Restriction on precision

Do not specify precision if base type cannot specify precision.

# scale

Specifies the scale for a constrained subtype of a numeric data type.

Restriction on scale

Do not specify *scale* if *base\_type* cannot specify scale.

# RANGE low\_value .. high\_value

Specifies the range for a constrained subtype of a numeric data type. The *low\_value* and *high value* must be numeric literals.

# Restriction on RANGE high\_value .. low\_value

Specify this clause only if *base\_type* is PLS\_INTEGER or a subtype of PLS\_INTEGER (either predefined or user-defined). (For a summary of the predefined subtypes of PLS\_INTEGER, see Table 4-3. For information about user-defined subtypes with ranges, see "Constrained Subtypes".)

body

## BEGIN

Starts the executable part of the block, which contains executable statements.

## EXCEPTION

Starts the exception-handling part of the block. When PL/SQL raises an exception, normal execution of the block stops and control transfers to the appropriate *exception\_handler*. After the exception handler completes, execution resumes with the statement following the block. For more information about exception-handling, see PL/SQL Error Handling.

## exception\_handler

See "Exception Handler".

END

Ends the block.

## name

The name of the block to which END applies—a label, function name, procedure name, or package name.

## statement

label

Undeclared identifier, unique for the statement.

# assignment\_statement

See "Assignment Statement".

# Restriction on pipe\_row\_statement

This statement can appear only in the body of a pipelined table function; otherwise, PL/SQL raises an exception.

raise\_statement

See "RAISE Statement".

## return\_statement

See "RETURN Statement".

select\_into\_statement

See "SELECT INTO Statement".

while\_loop\_statement

See "WHILE LOOP Statement".

procedure\_call

#### procedure

Name of the procedure that you are invoking.

# parameter [, parameter ]...

List of actual parameters for the procedure that you are invoking. The data type of each actual parameter must be compatible with the data type of the corresponding formal parameter. The mode of the formal parameter determines what the actual parameter can be:

Formal Parameter Mode	Actual Parameter
IN	Constant, initialized variable, literal, or expression
OUT	Variable whose data type is not defined as NOT NULL
IN OUT	Variable (typically, it is a string buffer or numeric accumulator)

If the procedure specifies a default value for a parameter, you can omit that parameter from the parameter list. If the procedure has no parameters, or specifies a default value for every parameter, you can either omit the parameter list or specify an empty parameter list.

# See Also:

"Positional, Named, and Mixed Notation for Actual Parameters"

#### sql\_statement

#### commit\_statement

SQL COMMIT statement. For syntax, see Oracle Database SQL Language Reference.

#### delete\_statement

SQL DELETE statement. For syntax, see Oracle Database SQL Language Reference. See also "DELETE Statement Extension".

## insert\_statement

SQL INSERT statement. For syntax, see Oracle Database SQL Language Reference. See also "INSERT Statement Extension".

# **Call Specification**

A **call specification** declares a Java method, C language subprogram, or JavaScript function (either exported by a Multilingual Engine (MLE) module or declared inline as part of the CREATE FUNCTION and CREATE PROCEDURE DDL statements) so that it can be invoked from PL/SQL. You can also use the SQL CALL statement to invoke such a method or subprogram.

The call specification tells the database which JavaScript function, Java method, or which named subprogram in which shared library, to invoke when an invocation is made. It also tells the database what type conversions to make for the arguments and return value.

A call specification can appear in the following SQL statements:

- ALTER TYPE Statement
- CREATE FUNCTION Statement
- CREATE PROCEDURE Statement
- CREATE TYPE Statement
- CREATE TYPE BODY Statement

# Topics

- Syntax
- Semantics
- Examples
- Related Topics

# **Prerequisites**

To invoke a call specification, you may need additional privileges, for example, EXECUTE privileges on a C library for a C call specification.

Syntax

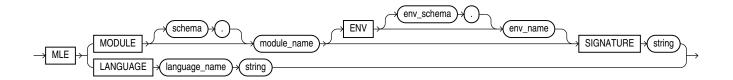

call\_spec ::=

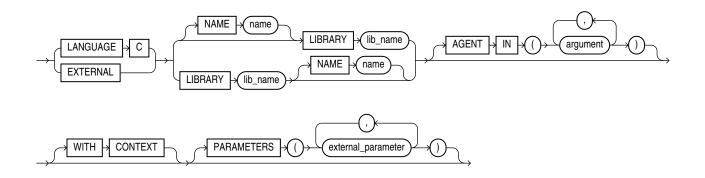

java\_declaration ::=

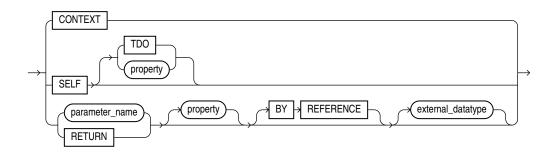

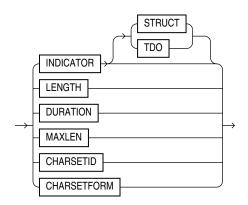

# c\_declaration ::=

#### external\_parameter ::=

# property ::=

# **Semantics**

#### call\_spec

Maps a C procedure, Java method name, or JavaScript function name, parameter types, and return type to their SQL counterparts.

Call specifications can appear in PL/SQL standalone subprograms, package specifications and bodies, and type specifications and bodies. They cannot appear inside PL/SQL blocks.

# java\_declaration

# string

Identifies the Java implementation of the method.

javascript\_declaration

# string

Identifies the JavaScript implementation of the function.

# c\_declaration

# LIBRARY *lib\_name*

Identifies a library created by the "CREATE LIBRARY Statement".

# EXTERNAL

Deprecated way of declaring a C subprogram, supported only for backward compatibility. Use EXTERNAL in a C call specification if it contains defaulted arguments or constrained PL/SQL types, otherwise use the LANGUAGE C syntax.

# Examples

# Example 14-6 External Function Example

The hypothetical following statement creates a PL/SQL standalone function  $get_val$  that registers the C subprogram  $c_get_val$  as an external function. (The parameters have been omitted from this example.)

```
CREATE FUNCTION get_val

( x_val IN NUMBER,

y_val IN NUMBER,

image IN LONG RAW )

RETURN BINARY_INTEGER AS LANGUAGE C

NAME "c_get_val"

LIBRARY c_utils

PARAMETERS (...);
```

# **CASE** Statement

The CASE statement chooses from a sequence of conditions and runs a corresponding statement.

The simple CASE statement evaluates a single expression and compares it to several potential values or expressions.

The searched CASE statement evaluates multiple Boolean expressions and chooses the first one whose value is TRUE.

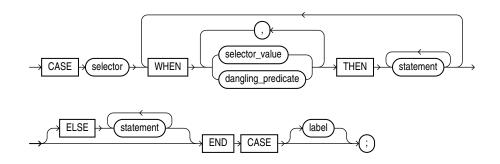

# Topics

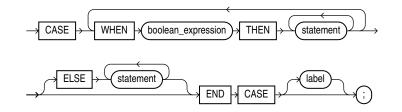

- Syntax
- Semantics
- Examples
- Related Topics

## **Syntax**

# simple\_case\_statement ::=

# searched\_case\_statement ::=

# (boolean\_expression ::=, statement ::=)

# Semantics

# simple\_case\_statement

## selector

Expression whose value is evaluated once and used to select one of several alternatives. *selector* can have any PL/SQL data type except BLOB, BFILE, or a user-defined type.

# WHEN { selector\_value | dangling\_predicate }

## [, ..., { selector\_value | dangling\_predicate } ] THEN statement

*selector\_value* can be an expression of any PL/SQL type except BLOB, BFILE, or a userdefined type.

The selector\_values and dangling\_predicates are evaluated sequentially. If the value of a selector\_value equals the value of selector or a dangling\_predicate is true, then the statement associated with that selector\_value or dangling\_predicate runs, and the CASE

statement ends. Any subsequent *selector\_values* and *dangling\_predicates* are not evaluated.

# Caution:

A statement can modify the database and invoke nondeterministic functions. There is no fall-through mechanism, as there is in the C switch statement.

# Note:

Currently, the dangling predicates IS JSON and IS OF are not supported.

# ELSE statement [statement ]...

The statements run if and only if no selector\_value has the same value as selector and no dangling predicate is true.

Without the ELSE clause, if no selector\_value has the same value as selector and no dangling predicate is true, the system raises the predefined exception CASE NOT FOUND.

# label

A label that identifies the statement (see "statement ::=" and "label").

#### searched\_case\_statement

#### WHEN boolean\_expression THEN statement

The boolean\_expressions are evaluated sequentially. If the value of a boolean\_expression is TRUE, the statement associated with that boolean\_expression runs, and the CASE statement ends. Subsequent boolean expressions are not evaluated.

# Caution:

A *statement* can modify the database and invoke nondeterministic functions. There is no fall-through mechanism, as there is in the C switch statement.

# ELSE statement [statement ]...

The statements run if and only if no boolean expression has the value TRUE.

Without the ELSE clause, if no *boolean\_expression* has the value TRUE, the system raises the predefined exception CASE\_NOT\_FOUND.

label

A label that identifies the statement (see "statement ::=" and "label").

#### Examples

# **CLOSE Statement**

The CLOSE statement closes a named cursor, freeing its resources for reuse.

After closing an explicit cursor, you can reopen it with the OPEN statement. You must close an explicit cursor before reopening it.

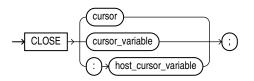

After closing a cursor variable, you can reopen it with the OPEN FOR statement. You need not close a cursor variable before reopening it.

## Topics

- Syntax
- Semantics
- Examples
- Related Topics

# Syntax

close\_statement ::=

ORACLE

#### **Semantics**

#### close\_statement

#### cursor

Name of an open explicit cursor.

#### cursor\_variable

Name of an open cursor variable.

#### :host\_cursor\_variable

Name of a cursor variable declared in a PL/SQL host environment and passed to PL/SQL as a bind variable. Do not put space between the colon (:) and host cursor variable.

#### Examples

# **Collection Method Invocation**

A collection method is a PL/SQL subprogram that either returns information about a collection or operates on a collection.

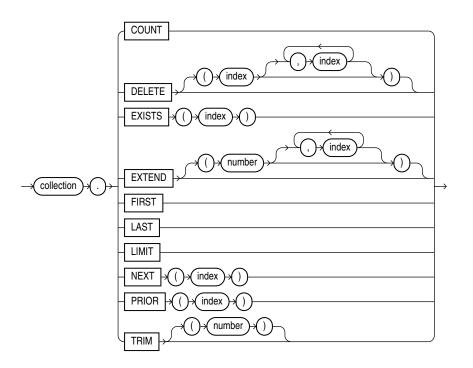

#### Topics

- Syntax
- Semantics
- Examples
- Related Topics

#### Syntax

#### collection\_method\_call ::=

#### **Semantics**

collection\_method\_call

#### collection

Name of the collection whose method you are invoking.

### COUNT

Function that returns the number of elements in the collection, explained in "COUNT Collection Method".

#### DELETE

Procedure that deletes elements from the collection, explained in "DELETE Collection Method".

#### **Restriction on DELETE**

If collection is a varray, you cannot specify indexes with DELETE.

#### index

Numeric expression whose data type either is PLS\_INTEGER or can be implicitly converted to PLS\_INTEGER (for information about the latter, see "s").

## EXISTS

Function that returns TRUE if the *index*th element of the collection exists and FALSE otherwise, explained in "EXISTS Collection Method".

#### EXTEND

Procedure that adds elements to the end of the collection, explained in "EXTEND Collection Method".

#### **Restriction on EXTEND**

You cannot use EXTEND if collection is an associative array.

### FIRST

Function that returns the first index in the collection, explained in "FIRST and LAST Collection Methods".

#### LAST

Function that returns the last index in the collection, explained in "FIRST and LAST Collection Methods".

#### LIMIT

Function that returns the maximum number of elements that the collection can have. If the collection has no maximum size, then LIMIT returns NULL. For an example, see "LIMIT Collection Method".

#### NEXT

Function that returns the index of the succeeding existing element of the collection, if one exists. Otherwise, NEXT returns NULL. For more information, see "PRIOR and NEXT Collection Methods".

#### PRIOR

Function that returns the index of the preceding existing element of the collection, if one exists. Otherwise, NEXT returns NULL. For more information, see "PRIOR and NEXT Collection Methods".

#### TRIM

Procedure that deletes elements from the end of a collection, explained in "TRIM Collection Method".

#### **Restriction on TRIM**

You cannot use TRIM if *collection* is an associative array.

#### number

Number of elements to delete from the end of a collection. **Default:** one.

"Collection Variable Declaration"

In other chapters:

"Collection Methods"

# **Collection Variable Declaration**

A **collection variable** is a composite variable whose internal components, called elements, have the same data type.

The value of a collection variable and the values of its elements can change.

You reference an entire collection by its name. You reference a collection element with the syntax collection(index).

PL/SQL has three kinds of collection types:

- Associative array (formerly called PL/SQL table or index-by table)
- Variable-size array (varray)
- Nested table

An associative array can be indexed by either a string type or PLS\_INTEGER. Varrays and nested tables are indexed by integers.

You can create a collection variable in either of these ways:

- Define a collection type and then declare a variable of that type.
- Use %TYPE to declare a collection variable of the same type as a previously declared collection variable.

#### Note:

This topic applies to collection types that you define inside a PL/SQL block or package, which differ from standalone collection types that you create with the "CREATE TYPE Statement".

In a PL/SQL block or package, you can define all three collection types. With the CREATE TYPE statement, you can create nested table types and VARRAY types, but not associative array types.

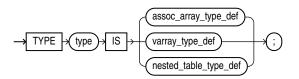

#### Topics

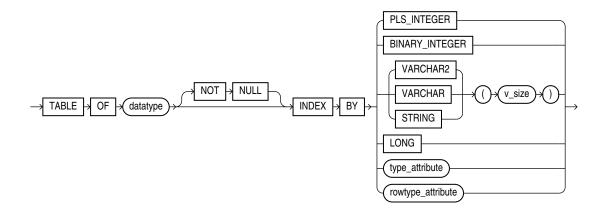

- Syntax
- Semantics
- Examples
- Related Topics

#### Syntax

#### collection\_type\_definition ::=

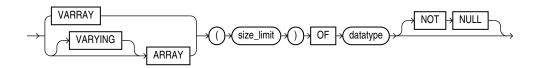

#### assoc\_array\_type\_def ::=

(datatype ::=, rowtype\_attribute ::=, type\_attribute ::=)

varray\_type\_def ::=

(datatype ::=)

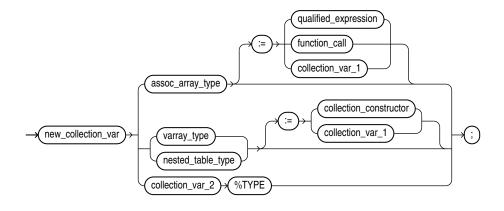

nested\_table\_type\_def ::=

### (datatype ::=)

## collection\_variable\_decl ::=

(collection\_constructor ::=, function\_call ::=, qualified\_expression ::=)

#### **Semantics**

collection\_type\_definition

#### type

Name of the collection type that you are defining.

#### assoc\_array\_type\_def

Type definition for an associative array.

#### Restriction on assoc\_array\_type\_def

Can appear only in the declarative part of a block, subprogram, package specification, or package body.

### datatype

Data type of the elements of the associative array. *datatype* can be any PL/SQL data type except REF CURSOR.

#### NOT NULL

Imposes the NOT NULL constraint on every element of the associative array. For information about this constraint, see "NOT NULL Constraint".

#### { PLS\_INTEGER | BINARY\_INTEGER }

Specifies that the data type of the indexes of the associative array is PLS INTEGER.

#### { VARCHAR2 | VARCHAR | STRING } (v\_size)

Specifies that the data type of the indexes of the associative array is VARCHAR2 (or its subtype VARCHAR or STRING) with length v size.

You can populate an element of the associative array with a value of any type that can be converted to VARCHAR2 with the TO\_CHAR function (described in Oracle Database SQL Language Reference).

# Caution:

Associative arrays indexed by strings can be affected by National Language Support (NLS) parameters. For more information, see "NLS Parameter Values Affect Associative Arrays Indexed by String".

### LONG

Specifies that the data type of the indexes of the associative array is LONG, which is equivalent to VARCHAR2 (32760).

# Note:

Oracle supports LONG only for backward compatibility with existing applications. For new applications, use VARCHAR2 (32760).

#### type\_attribute, rowtype\_attribute

Specifies that the data type of the indexes of the associative array is a data type specified with either %ROWTYPE or %TYPE. This data type must represent either PLS\_INTEGER, BINARY\_INTEGER, Or VARCHAR2 (*v\_size*).

#### varray\_type\_def

Type definition for a variable-size array.

#### size\_limit

Maximum number of elements that the varray can have. *size\_limit* must be an integer literal in the range from 1 through 2147483647.

#### datatype

Data type of the varray element. *datatype* can be any PL/SQL data type except REF CURSOR.

#### NOT NULL

Imposes the NOT NULL constraint on every element of the varray. For information about this constraint, see "NOT NULL Constraint".

#### nested\_table\_type\_def

Type definition for a nested table.

#### datatype

Data type of the elements of the nested table. *datatype* can be any PL/SQL data type except REF CURSOR or NCLOB.

If *datatype* is a scalar type, then the nested table has a single column of that type, called COLUMN VALUE.

If *datatype* is an ADT, then the columns of the nested table match the name and attributes of the ADT.

#### NOT NULL

Imposes the NOT NULL constraint on every element of the nested table. For information about this constraint, see "NOT NULL Constraint".

collection\_variable\_decl

#### new\_collection\_var

Name of the collection variable that you are declaring.

#### assoc\_array\_type

Name of a previously defined associative array type; the data type of new\_collection\_var.

#### varray\_type

Name of a previously defined VARRAY type; the data type of new collection var.

#### nested\_table\_type

Name of a previously defined nested table type; the data type of new\_collection\_var.

#### collection\_constructor

Collection constructor for the data type of *new\_collection\_var*, which provides the initial value of *new collection var*.

#### collection\_var\_1

Name of a previously declared collection variable of the same data type as *new collection var*, which provides the initial value of *new collection var*.

### Note:

collection\_var\_1 and new\_collection\_var must have the same data type, not only
elements of the same type.

#### collection\_var\_2

Name of a previously declared collection variable.

#### %TYPE

See "%TYPE Attribute".

# Comment

A comment is source program text that the PL/SQL compiler ignores. Its primary purpose is to document code, but you can also use it to disable obsolete or unfinished pieces of code (that is, you can turn the code into comments). PL/SQL has both single-line and multiline comments.

#### **Topics**

- Syntax
- Semantics
- Examples
- Related Topics

#### Syntax

comment ::=

#### **Semantics**

#### comment

--

Turns the rest of the line into a single-line comment. Any text that wraps to the next line is not part of the comment.

# Caution:

Do not put a single-line comment in a PL/SQL block to be processed dynamically by an Oracle Precompiler program. The Oracle Precompiler program ignores end-of-line characters, which means that a single-line comment ends when the block ends.

**/**\*

Begins a comment, which can span multiple lines.

\*/

Ends a comment.

text

Any text.

#### **Restriction on text**

In a multiline comment, *text* cannot include the multiline comment delimiter /\* or \*/. Therefore, one multiline comment cannot contain another multiline comment. However, a multiline comment can contain a single-line comment.

#### Examples

- Example 3-6, "Single-Line Comments"
- Example 3-7, "Multiline Comments"

#### **Related Topics**

"Comments"

# **COMPILE Clause**

The compile clause explicitly recompiles a stored unit that has become invalid, thus eliminating the need for implicit runtime recompilation and preventing associated runtime compilation errors and performance overhead.

The COMPILE clause can appear in the following SQL statements:

- ALTER FUNCTION Statement
- ALTER PACKAGE Statement
- ALTER PROCEDURE Statement
- ALTER LIBRARY Statement
- ALTER TYPE Statement
- ALTER TRIGGER Statement

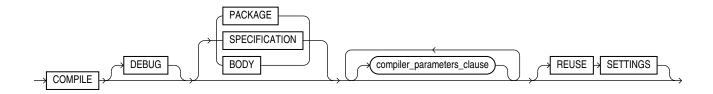

#### Topics

- Syntax
- Semantics
- Related Topics

#### Syntax

compile\_clause ::=

#### compiler\_parameters\_clause ::=

#### **Semantics**

compile\_clause

#### COMPILE

Recompiles the PL/SQL unit, whether it is valid or invalid. The PL/SQL unit can be a library, package, package specification, package body, trigger, procedure, function, type, type specification, or type body.

First, if any of the objects upon which the unit depends are invalid, the database recompiles them.

The database also invalidates any local objects that depend upon the unit.

If the database recompiles the unit successfully, then the unit becomes valid. Otherwise, the database returns an error and the unit remains invalid. You can see the associated compiler error messages with the SQL\*Plus command SHOW ERRORS.

During recompilation, the database drops all persistent compiler switch settings, retrieves them again from the session, and stores them after compilation. To avoid this process, specify the REUSE SETTINGS clause.

#### DEBUG

Has the same effect as PLSQL\_OPTIMIZE\_LEVEL=1—instructs the PL/SQL compiler to generate and store the code for use by the PL/SQL debugger. Oracle recommends using PLSQL OPTIMIZE LEVEL=1 instead of DEBUG.

#### PACKAGE

**(Default)** Recompiles both the package specification and (if it exists) the package body, whether they are valid or invalid. The recompilation of the package specification and body lead to the invalidation and recompilation of dependent objects as described for SPECIFICATION and BODY.

#### **Restriction on PACKAGE**

PACKAGE may only appear if compiling a package.

ORACLE<sup>®</sup>

#### SPECIFICATION

Recompiles only the package or type specification, whether it is valid or invalid. You might want to recompile a package or type specification to check for compilation errors after modifying the specification.

When you recompile a specification, the database invalidates any local objects that depend on the specification, such as procedures that invoke procedures or functions in the package. The body of a package also depends on its specification. If you subsequently reference one of these dependent objects without first explicitly recompiling it, then the database recompiles it implicitly at run time.

#### Restriction on SPECIFICATION

SPECIFICATION may only appear if compiling a package or type specification.

#### BODY

Recompiles only the package or type body, whether it is valid or invalid. You might want to recompile a package or type body after modifying it. Recompiling a body does not invalidate objects that depend upon its specification.

When you recompile a package or type body, the database first recompiles the objects on which the body depends, if any of those objects are invalid. If the database recompiles the body successfully, then the body becomes valid.

#### Restriction on BODY

BODY may only appear if compiling a package or type body.

#### **REUSE SETTINGS**

Prevents Oracle Database from dropping and reacquiring compiler switch settings. With this clause, Oracle preserves the existing settings and uses them for the recompilation of any parameters for which values are not specified elsewhere in this statement.

See also DEFAULT COLLATION Clause compilation semantics.

#### compiler\_parameters\_clause

Specifies a value for a PL/SQL compilation parameter in Table 2-2. The compile-time value of each of these parameters is stored with the metadata of the PL/SQL unit being compiled.

You can specify each parameter only once in each statement. Each setting is valid only for the PL/SQL unit being compiled and does not affect other compilations in this session or system. To affect the entire session or system, you must set a value for the parameter using the ALTER SESSION or ALTER SYSTEM statement.

If you omit any parameter from this clause and you specify REUSE SETTINGS, then if a value was specified for the parameter in an earlier compilation of this PL/SQL unit, the database uses that earlier value. If you omit any parameter and either you do not specify REUSE SETTINGS or no value was specified for the parameter in an earlier compilation, then the database obtains the value for that parameter from the session environment.

# **Constant Declaration**

A constant holds a value that does not change. A constant declaration specifies the name, data type, and value of the constant and allocates storage for it. The declaration can also impose the NOT NULL constraint.

#### **Topics**

- Syntax
- Semantics
- Examples
- Related Topics

#### **Syntax**

constant\_declaration ::=

#### (datatype ::=, expression ::=)

#### **Semantics**

constant\_declaration

#### constant

Name of the constant that you are declaring.

#### datatype

Data type for which a variable can be declared with an initial value.

#### NOT NULL

Imposes the NOT NULL constraint on the constant.

For information about this constraint, see "NOT NULL Constraint".

#### expression

Initial value for the constant. *expression* must have a data type that is compatible with *datatype*. When *constant\_declaration* is elaborated, the value of *expression* is assigned to *constant*.

# **CONTINUE** Statement

The CONTINUE statement exits the current iteration of a loop, either conditionally or unconditionally, and transfers control to the next iteration of either the current loop or an enclosing labeled loop.

If a CONTINUE statement exits a cursor FOR loop prematurely (for example, to exit an inner loop and transfer control to the next iteration of an outer loop), the cursor closes (in this context, CONTINUE works like GOTO).

The CONTINUE WHEN statement exits the current iteration of a loop when the condition in its WHEN clause is true, and transfers control to the next iteration of either the current loop or an enclosing labeled loop.

Each time control reaches the CONTINUE WHEN statement, the condition in its WHEN clause is evaluated. If the condition is not true, the CONTINUE WHEN statement does nothing.

#### **Restrictions on CONTINUE Statement**

- A CONTINUE statement must be inside a LOOP statement.
- A CONTINUE statement cannot cross a subprogram or method boundary.

#### **Topics**

- Syntax
- Semantics
- Examples
- Related Topics

#### **Syntax**

continue\_statement ::=

(boolean\_expression ::=)

#### Semantics

continue\_statement

label

Name that identifies either the current loop or an enclosing loop.

Without *label*, the CONTINUE statement transfers control to the next iteration of the current loop. With *label*, the CONTINUE statement transfers control to the next iteration of the loop that *label* identifies.

#### WHEN boolean\_expression

Without this clause, the CONTINUE statement exits the current iteration of the loop unconditionally. With this clause, the CONTINUE statement exits the current iteration of the loop if and only if the value of *boolean* expression is TRUE.

#### Examples

### Example 14-7 CONTINUE Statement in Basic LOOP Statement

In this example, the CONTINUE statement inside the basic LOOP statement transfers control unconditionally to the next iteration of the current loop.

```
DECLARE
 x NUMBER := 0;
BEGIN
 LOOP -- After CONTINUE statement, control resumes here
   DBMS OUTPUT.PUT LINE ('Inside loop: x = ' || TO CHAR(x));
   x := x + 1;
   IF x < 3 THEN
     CONTINUE;
   END IF;
   DBMS OUTPUT.PUT LINE
     ('Inside loop, after CONTINUE: x = ' || TO CHAR(x));
   EXIT WHEN x = 5;
 END LOOP;
 DBMS OUTPUT.PUT LINE (' After loop: x = ' || TO CHAR(x));
END;
/
```

#### Result:

```
Inside loop: x = 0
Inside loop: x = 1
Inside loop: x = 2
Inside loop; x = 3
Inside loop: x = 3
Inside loop; x = 4
Inside loop: x = 4
Inside loop; x = 5
```

#### Example 14-8 CONTINUE WHEN Statement in Basic LOOP Statement

In this example, the CONTINUE WHEN statement inside the basic LOOP statement transfers control to the next iteration of the current loop when x is less than 3.

```
DECLARE
x NUMBER := 0;
BEGIN
LOOP -- After CONTINUE statement, control resumes here
DBMS_OUTPUT.PUT_LINE ('Inside loop: x = ' || TO_CHAR(x));
x := x + 1;
CONTINUE WHEN x < 3;
DBMS_OUTPUT.PUT_LINE
   ('Inside loop, after CONTINUE: x = ' || TO_CHAR(x));
EXIT WHEN x = 5;
END LOOP;
DBMS_OUTPUT.PUT_LINE (' After loop: x = ' || TO_CHAR(x));
END;
/</pre>
```

#### Result:

```
Inside loop: x = 0
Inside loop: x = 1
Inside loop: x = 2
Inside loop, after CONTINUE: x = 3
Inside loop: x = 3
Inside loop, after CONTINUE: x = 4
Inside loop: x = 4
Inside loop, after CONTINUE: x = 5
After loop: x = 5
```

# **COVERAGE** Pragma

The COVERAGE pragma marks PL/SQL code which is infeasible to test for coverage. These marks improve coverage metric accuracy.

The COVERAGE pragma marks PL/SQL source code to indicate that the code may not be feasibly tested for coverage. The pragma marks a specific code section. Marking infeasible code improves the quality of coverage metrics used to assess how much testing has been achieved.

#### Topics

- Syntax
- Semantics
- Examples
- Related Topics

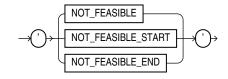

#### Syntax

coverage\_pragma ::=

-> PRAGMA -> COVERAGE +> (() -> (coverage\_pragma\_argument) +> ()) +> (;)

#### coverage\_pragma\_argument ::=

#### **Semantics**

#### coverage\_pragma

The COVERAGE pragma may appear before any declaration or statement.

#### coverage\_pragma\_argument

The COVERAGE pragma argument must have one of these values:

- 'NOT\_FEASIBLE'
- 'NOT\_FEASIBLE\_START'
- 'NOT\_FEASIBLE\_END'

When the COVERAGE pragma appear with the argument 'NOT\_FEASIBLE', it marks the entire basic block that includes the beginning of the first declaration or statement that follows the pragma.

A COVERAGE pragma with an argument of 'NOT\_FEASIBLE\_START' may appear before any declaration or any statement. It must be followed by the COVERAGE pragma with an argument of 'NOT\_FEASIBLE\_END'. The second pragma may appear before any declaration or any statement. It must appear in the same PL/SQL block as the first pragma and not in any nested subprogram definition.

An associated pair of COVERAGE pragmas marks basic blocks infeasible from the beginning of the basic block that includes the beginning of the first statement or declaration that follows the first pragma to the end of the basic block that includes the first statement or declaration that follows the second pragma.

A COVERAGE pragma whose range includes the definition or declaration of an inner subprogram does not mark the blocks of that subprogram as infeasible.

#### Examples

#### Example 14-9 Marking a Single Basic Block as Infeasible to Test for Coverage

This example shows the placement of the pragma COVERAGE preceding the assignments to z and zl basic blocks. These two basic blocks will be ignored for coverage calculation. The first COVERAGE pragma (marked 1) marks the first assignment to z infeasible; the second (marked 2)

marks the third assignment to z. In each case, the affected basic block runs from the identifier z to the following END IF.

```
IF (x>0) THEN
  y :=2;
ELSE
  PRAGMA COVERAGE ('NOT_FEASIBLE'); -- 1
  z:=3;
END IF;
IF (y>0) THEN
  z :=2;
ELSE
  PRAGMA COVERAGE ('NOT_FEASIBLE'); -- 2
  z :=3;
END IF;
```

#### Example 14-10 Marking a Line Range as Infeasible to Test for Coverage

This examples shows marking the entire line range as not feasible. A line range may contain more than one basic block. A line range is marked as not feasible for coverage using a pragma COVERAGE with a 'NOT\_FEASIBLE\_START' argument at the beginning of the range, and a pragma COVERAGE with a 'NOT\_FEASIBLE\_END' at the end of the range. The range paired COVERAGE pragmas mark all the blocks as infeasible.

```
PRAGMA COVERAGE ('NOT_FEASIBLE_START');
IF (x>0) THEN
  y :=2;
ELSE
  z:=3;
END IF;
IF (y>0) THEN
  z :=2;
ELSE
  z :=3;
END IF;
PRAGMA COVERAGE ('NOT FEASIBLE END');
```

# Example 14-11 Marking Entire Units or Individual Subprograms as Infeasible to Test for Coverage

This example shows marking the entire procedure foo as not feasible for coverage. A subprogram is marked as completely infeasible by marking all of its body infeasible.

```
CREATE PROCEDURE foo IS

PRAGMA COVERAGE ('NOT_FEASIBLE_START');

.....

BEGIN

....

PRAGMA COVERAGE ('NOT_FEASIBLE_END');

END;

/
```

#### Example 14-12 Marking Internal Subprogram as Infeasible to Test for Coverage

This example shows that the outer COVERAGE pragma pair has no effect on coverage inside procedure inner. The COVERAGE pragma (marked 1) inside the body of inner does mark the second assignment to x as infeasible. Notice that the entire body of procedure outer is marked infeasible even though the pragma with argument 'NOT\_FEASIBLE\_END' is not the last line. The pragma does mark the basic block that includes the statement that follows the pragma and that block does extend to the end of the procedure.

```
CREATE OR REPLACE PROCEDURE outer IS
  PRAGMA COVERAGE ('NOT FEASIBLE START');
  x NUMBER := 7;
  PROCEDURE inner IS
  BEGIN
     IF x < 6 THEN
        x := 19;
     ELSE
        PRAGMA COVERAGE ('NOT FEASIBLE'); -- 1
        x := 203;
     END IF;
  END;
BEGIN
  DBMS OUTPUT.PUT LINE ('X= ');
  PRAGMA COVERAGE ('NOT FEASIBLE END');
  DBMS OUTPUT.PUT LINE (x);
END;
/
```

# Cursor FOR LOOP Statement

The cursor FOR LOOP statement implicitly declares its loop index as a record variable of the row type that a specified cursor returns, and then opens a cursor.

With each iteration, the cursor FOR LOOP statement fetches a row from the result set into the record. When there are no more rows to fetch, the cursor FOR LOOP statement closes the cursor. The cursor also closes if a statement inside the loop transfers control outside the loop or raises an exception.

#### **Topics**

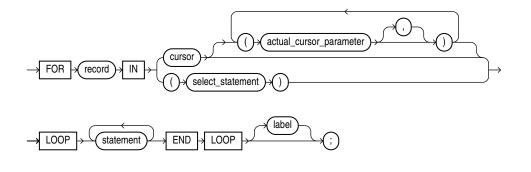

Syntax

- Semantics
- Examples
- Related Topics

#### Syntax

cursor\_for\_loop\_statement ::=

#### (statement ::=)

### **Semantics**

cursor\_for\_loop\_statement

#### record

Name for the loop index that the cursor FOR LOOP statement implicitly declares as a %ROWTYPE record variable of the type that *cursor* or *select* statement returns.

*record* is local to the cursor FOR LOOP statement. Statements inside the loop can reference *record* and its fields. They can reference virtual columns only by aliases. Statements outside the loop cannot reference *record*. After the cursor FOR LOOP statement runs, *record* is undefined.

#### cursor

Name of an explicit cursor (not a cursor variable) that is not open when the cursor FOR LOOP is entered.

#### actual\_cursor\_parameter

Actual parameter that corresponds to a formal parameter of *cursor*.

#### select\_statement

SQL SELECT statement (not PL/SQL SELECT INTO statement). For *select\_statement*, PL/SQL declares, opens, fetches from, and closes an implicit cursor. However, because *select\_statement* is not an independent statement, the implicit cursor is internal—you cannot reference it with the name SQL.

#### See Also:

Oracle Database SQL Language Reference for SELECT statement syntax

#### label

Label that identifies *cursor\_for\_loop\_statement* (see "statement ::=" and "label"). CONTINUE, EXIT, and GOTO statements can reference this label.

Labels improve readability, especially when LOOP statements are nested, but only if you ensure that the label in the END LOOP statement matches a label at the beginning of the same LOOP statement (the compiler does not check).

# **Cursor Variable Declaration**

A cursor variable is like an explicit cursor that is not limited to one query.

To create a cursor variable, either declare a variable of the predefined type SYS\_REFCURSOR or define a REF CURSOR type and then declare a variable of that type.

#### **Restrictions on Cursor Variables**

You cannot declare a cursor variable in a package specification.

That is, a package cannot have a public cursor variable (a cursor variable that can be referenced from outside the package).

- You cannot store the value of a cursor variable in a collection or database column.
- You cannot use comparison operators to test cursor variables for equality, inequality, or nullity.

 Using a cursor variable in a server-to-server remote procedure call (RPC) causes an error. However, you can use a cursor variable in a server-to-server RPC if the remote database is a non-Oracle database accessed through a Procedural Gateway.

#### Topics

- Syntax
- Semantics
- Examples
- Related Topics

#### Syntax

cursor\_variable\_declaration ::=

#### **Semantics**

ref\_cursor\_type\_definition

#### type

Name of the REF CURSOR type that you are defining.

#### RETURN

Specifies the data type of the value that the cursor variable returns.

Specify RETURN to define a strong REF CURSOR type. Omit RETURN to define a weak REF CURSOR type. For information about strong and weak REF CURSOR types, see "Creating Cursor Variables".

#### db\_table\_or\_view

Name of a database table or view, which must be accessible when the declaration is elaborated.

### cursor

Name of a previously declared explicit cursor.

#### cursor\_variable

Name of a previously declared cursor variable.

#### record

Name of a user-defined record.

#### record\_type

Name of a user-defined type that was defined with the data type specifier RECORD.

#### ref\_cursor\_type

Name of a user-defined type that was defined with the data type specifier REF CURSOR.

#### cursor\_variable\_declaration

### cursor\_variable

Name of the cursor variable that you are declaring.

#### type

Type of the cursor variable that you are declaring—either SYS\_REFCURSOR or the name of the REF CURSOR type that you defined previously.

SYS\_REFCURSOR is a weak type. For information about strong and weak REF CURSOR types, see "Creating Cursor Variables".

# **DEFAULT COLLATION Clause**

Collation (also called sort ordering) determines if a character string equals, precedes, or follows another string when the two strings are compared and sorted. Oracle Database collations order strings following rules for sorted text used in different languages.

The DEFAULT COLLATION clause can appear in the following SQL statements:

- CREATE FUNCTION Statement
- CREATE PROCEDURE Statement
- CREATE PACKAGE Statement
- CREATE TRIGGER Statement
- CREATE TYPE Statement

#### **Topics**

- Prerequisites
- Syntax
- Semantics
- Compilation Semantics
- Related Topics

#### Prerequisites

The COMPATIBLE initialization parameter must be set to at least 12.2.0, and MAX\_STRING\_SIZE must be set to EXTENDED for collation declarations to be allowed in these SQL statements.

#### Syntax

default\_collation\_clause ::=

DEFAULT COLLATION collation\_option

collation\_option ::=

 $\rightarrow$  USING\_NLS\_COMP  $\rightarrow$ 

#### **Semantics**

#### default\_collation\_clause

The *default\_collation\_clause* can appear in a package specification, a standalone type specification, and in standalone subprograms.

#### collation\_option

The default collation of a procedure, function, package, type, or trigger must be USING\_NLS\_COMP. The *default\_collation\_clause* explicitly declares the default collation of a PL/SQL unit to be USING\_NLS\_COMP. Without this clause, the unit inherits its default collation from the effective schema default collation. If the effective schema default collation is not USING NLS\_COMP, the unit is invalid.

The effective schema default collation is determined as follows:

- If the session parameter DEFAULT\_COLLATION is set, the effective schema default collation is the value of this parameter. The value of the parameter can be checked by querying SYS\_CONTEXT('USERENV', 'SESSION\_DEFAULT\_COLLATION'). The function returns NULL if DEFAULT\_COLLATION is not set. The value of the parameter DEFAULT\_COLLATION can be set with the statement: ALTER SESSION\_SET\_DEFAULT\_COLLATION = collation\_option;
- If the session parameter DEFAULT\_COLLATION is not set, the effective schema default collation is the declared default collation of the schema in which you create the PL/SQL unit. The default collation of a schema can be found in the static data dictionary \*\_USERS views. It can be set with the DDL statements CREATE USER and ALTER USER.

The session parameter DEFAULT\_COLLATION can be unset with the statement: ALTER SESSION SET DEFAULT COLLATION = NONE;

Package body and type body use the default collation of the corresponding specification. All character data containers and attributes in procedures, functions and methods, including parameters and return values, behave as if their data-bound collation were the pseudo-collation USING NLS COMP.

#### Restrictions on DEFAULT COLLATION

It cannot be specified for nested or packaged subprograms or for type methods.

#### **Compilation Semantics**

If the resulting default object collation is different from USING\_NLS\_COMP, the database object is created as invalid with a compilation error.

If the ALTER COMPILE statement is issued for a PL/SQL unit with the REUSE SETTINGS clause, the stored default collation of the database object being compiled is not changed.

If an ALTER COMPILE statement is issued without the REUSE SETTINGS clause, the stored default collation of the database object being compiled is discarded and the effective schema default collation for the object owner at the time of execution of the statement is stored as the default

collation of the object, unless the PL/SQL unit contains the DEFAULT COLLATION clause. If the resulting default collation is not USING NLS COMP, a compilation error is raised.

An ALTER COMPILE statement for a package or type body references the stored collation of the corresponding specification.

# **DELETE Statement Extension**

The PL/SQL extension to the *where\_clause* of the SQL DELETE statement lets you specify a CURRENT OF clause, which restricts the DELETE statement to the current row of the specified cursor.

For information about the CURRENT OF clause, see "UPDATE Statement Extensions".

## See Also:

Oracle Database SQL Language Reference for the syntax of the SQL DELETE statement

# **DEPRECATE** Pragma

The DEPRECATE pragma marks a PL/SQL element as deprecated. The compiler issues warnings for uses of pragma DEPRECATE or of deprecated elements.

The associated warnings tell users of a deprecated element that other code may need to be changed to account for the deprecation.

#### Topics

- Syntax
- Semantics
- DEPRECATE Pragma Compilation Warnings
- Examples

Related Topics

#### **Syntax**

deprecate\_pragma ::=

#### **Semantics**

#### deprecate\_pragma

The DEPRECATE pragma may only appear in the declaration sections of a package specification, an object specification, a top level procedure, or a top level function.

PL/SQL elements of these kinds may be deprecated:

- Subprograms
- Packages
- Variables
- Constants
- Types
- Subtypes
- Exceptions
- Cursors

The DEPRECATE pragma may only appear in the declaration section of a PL/SQL unit. It must appear immediately after the declaration of an item to be deprecated.

The DEPRECATE pragma applies to the PL/SQL element named in the declaration which precedes the pragma.

When the DEPRECATE pragma applies to a package specification, object specification, or subprogram, the pragma must appear immediately after the keyword IS or AS that terminates the declaration portion of the definition.

When the DEPRECATE pragma applies to a package or object specification, references to all the elements (of the kinds that can be deprecated) that are declared in the specification are also deprecated.

If the DEPRECATE pragma applies to a subprogram declaration, only that subprogram is affected; other overloads with the same name are not deprecated.

If the optional custom message appears in a use of the DEPRECATE pragma, the custom message will be added to the warning issued for any reference to the deprecated element.

The identifier in a DEPRECATE pragma must name the element in the declaration to which it applies.

Deprecation is inherited during type derivation. A child object type whose parent is deprecated is not deprecated. Only the attributes and methods that are inherited are deprecated.

When the base type is not deprecated but individual methods or attributes are deprecated, and when a type is derived from this type and the deprecated type or method is inherited, then references to these through the derived type will cause the compiler to issue a warning. A reference to a deprecated element appearing anywhere except in the unit with the deprecation pragma or its body, will cause the PL/SQL compiler to issue a warning for the referenced elements. A reference to a deprecated element in an anonymous block will not cause the compiler to issue a warning; only references in named entities will draw a warning.

When a deprecated entity is referenced in the definition of another deprecated entity then no warning will be issued.

When an older client code refers to a deprecated entity, it is invalidated and recompiled. No warning is issued.

There is no effect when SQL code directly references a deprecated element.

A reference to a deprecated element in a PL/SQL static SQL statement may cause the PL/SQL compiler to issue a warning. However, such references may not be detectable.

#### pls\_identifier

Identifier of the PL/SQL element being deprecated.

#### character\_literal

An optional compile-time warning message.

#### **DEPRECATE Pragma Compilation Warnings**

The PL/SQL compiler issues warnings when the DEPRECATE pragma is used and when deprecated items are referenced.

- 6019 The entity was deprecated and could be removed in a future release. Do not use the deprecated entity.
- 6020 The referenced entity was deprecated and could be removed in a future release. Do not use the deprecated entity. Follow the specific instructions in the warning if any are given.
- 6021 Misplaced pragma. The pragma DEPRECATE should follow immediately after the declaration of the entity that is being deprecated. Place the pragma immediately after the declaration of the entity that is being deprecated.
- 6022 This entity cannot be deprecated. Deprecation only applies to entities that may be declared in a package or type specification as well as to top-level procedure and function definitions. Remove the pragma.

The DEPRECATE pragma warnings may be managed with the PLSQL\_WARNINGS parameter or with the DBMS\_WARNING package.

#### **Examples**

#### Example 14-13 Enabling the Deprecation Warnings

This example shows how to set the PLSQL\_WARNINGS parameter to enable these warnings in a session.

```
ALTER SESSION SET PLSQL WARNINGS='ENABLE: (6019,6020,6021,6022)';
```

### Example 14-14 Deprecation of a PL/SQL Package

This example shows the deprecation of a PL/SQL package as a whole. Warnings will be issued for any reference to package pack1, and to the procedures foo and bar when used outside of the package and its body.

```
PACKAGE pack1 AS

PRAGMA DEPRECATE (pack1);

PROCEDURE foo;

PROCEDURE bar;

END pack1;
```

#### Example 14-15 Deprecation of a PL/SQL Package with a Custom Warning

This example shows the deprecation of a PL/SQL package. The compiler issues a custom warning message when a reference in another unit for the deprecated procedure foo is compiled.

# Live SQL:

You can view and run this example on Oracle Live SQL at Deprecation of a PL/SQL Package with a Custom Warning

```
PACKAGE pack5 AUTHID DEFINER AS
PRAGMA DEPRECATE(pack5 , 'Package pack5 has been deprecated, use new_pack5
instead.');
PROCEDURE foo;
PROCEDURE foo;
PROCEDURE bar;
END pack5;
```

A reference to procedure pack5.foo in another unit would draw a warning like this.

SP2-0810: Package Body created with compilation warnings

Errors for PACKAGE BODY PACK6:

4/10 PLW-06020: reference to a deprecated entity: PACK5 declared in unit PACK5[1,9].

Package pack5 has been deprecated, use new\_pack5 instead

#### Example 14-16 Deprecation of a PL/SQL Procedure

This example shows the deprecation of a single PL/SQL procedure foo in package pack7.

```
    Live SQL:
    You can view and run this example on Oracle Live SQL at Deprecation of a PL/SQL
    Procedure

PACKAGE pack7 AUTHID DEFINER AS
    PROCEDURE foo;
    PRAGMA DEPRECATE (foo, 'pack7.foo is deprecated, use pack7.bar instead.');
    PROCEDURE bar;
```

```
END pack7;
```

#### Example 14-17 Deprecation of an Overloaded Procedure

This example shows the DEPRECATE pragma applies only to a specific overload of a procedure name. Only the second declaration of proc1 is deprecated.

## 🖍 Live SQL:

You can view and run this example on Oracle Live SQL at Deprecation of an Overloaded Procedure

```
PACKAGE pack2 AS
  PROCEDURE proc1(n1 NUMBER, n2 NUMBER, n3 NUMBER);
  -- Only the overloaded procedure with 2 arguments is deprecated
  PROCEDURE proc1(n1 NUMBER, n2 NUMBER);
        PRAGMA DEPRECATE(proc1);
   END pack2;
```

#### Example 14-18 Deprecation of a Constant and of an Exception

```
Live SQL:
You can view and run this example on Oracle Live SQL at Deprecation of a Constant
and of an Exception
```

This example shows the deprecation of a constant and of an exception.

```
PACKAGE trans_data AUTHID DEFINER AS TYPE Transrec IS RECORD (
```

```
accounttype VARCHAR2(30) ,
    ownername VARCHAR2(30) ,
    balance REAL
);
    min_balance constant real := 10.0;
    PRAGMA DEPRECATE (min_balance , 'Minimum balance requirement has been
removed.');
    insufficient_funds EXCEPTION;
    PRAGMA DEPRECATE (insufficient_funds , 'Exception no longer raised.');
END trans_data;
```

# Example 14-19 Using Conditional Compilation to Deprecate Entities in Some Database Releases

This example shows the deprecation of procedure proc1 if the database release version is greater than 11.

# Live SQL: You can view and run this example on Oracle Live SQL at Using Conditional Compilation to Deprecate Entities in Some Database Releases

```
CREATE PACKAGE pack11 AUTHID DEFINER AS
$IF DBMS_DB_VERSION.VER_LE_11
$THEN
    PROCEDURE proc1;
$ELSE
    PROCEDURE proc1;
    PRAGMA DEPRECATE(proc1);
$END
PROCEDURE proc2;
PROCEDURE proc3;
END pack11;
```

## Example 14-20 Deprecation of an Object Type

This example shows the deprecation of an entire object type.

# 🖍 Live SQL:

You can view and run this example on Oracle Live SQL at Deprecation of an Object Type

```
TYPE type01 AS OBJECT(
    PRAGMA DEPRECATE (type01),
    y NUMBER,
    MEMBER PROCEDURE proc(x NUMBER),
    MEMBER PROCEDURE proc2(x NUMBER));
```

#### Example 14-21 Deprecation of a Member Function in an Object Type Specification

This example shows the deprecation of member function add2 in an object type specification.

/\* Live SQL: You can view and run this example on Oracle Live SQL at Deprecation of a Member Function in an Object Type Specification TYPE objdata AS OBJECT( n1 NUMBER , n2 NUMBER , n3 NUMBER , MEMBER FUNCTION add2 RETURN NUMBER , PRAGMA DEPRECATE (add2), MEMBER FUNCTION add\_all RETURN NUMBER );

#### Example 14-22 Deprecation of Inherited Object Types

This example shows that a reference to a deprecated entity x declared in unit type15\_basetype type body will cause the compiler to issue a warning.

# Live SQL: You can view and run this example on Oracle Live SQL at Deprecation of Inherited Object Types

```
TYPE type15 basetype AS OBJECT
(
 x1 NUMBER,
 x NUMBER,
 PRAGMA DEPRECATE (x),
 MEMBER PROCEDURE f0 ,
 PRAGMA DEPRECATE (f0),
 MEMBER PROCEDURE f1 ,
 PRAGMA DEPRECATE (f1),
 MEMBER PROCEDURE f2 ,
 PRAGMA DEPRECATE (f2),
 MEMBER PROCEDURE f3) NOT FINAL;
TYPE BODY type15 basetype AS
  MEMBER PROCEDURE f0
  IS
  BEGIN
    x := 1;
  END;
  MEMBER PROCEDURE f1
   IS
```

```
BEGIN
  x := 1;
END;
MEMBER PROCEDURE f2
IS
BEGIN
  x := 1;
END;
MEMBER PROCEDURE f3
IS
BEGIN
  x := 1;
END;
END;
```

References to the deprecated entities x, f0, and f2 in type15\_basetype type body will cause the compiler to issue a warning.

```
TYPE type15 subtype UNDER type15 basetype (
  y NUMBER ,
  MEMBER PROCEDURE fl(z NUMBER),
 MEMBER PROCEDURE fl(z NUMBER, ml NUMBER),
  PRAGMA DEPRECATE(f1),
  OVERRIDING MEMBER PROCEDURE f2
);
TYPE BODY type15 subtype AS
  MEMBER PROCEDURE fl(z NUMBER)
IS
BEGIN
  -- deprecation attribute inherited in derived type.
 x := 1;
 x1:= 2;
  SELF.f0;
END;
   MEMBER PROCEDURE fl(z NUMBER ,
                  m1 NUMBER)
   IS
   BEGIN
    NULL;
   END;
   OVERRIDING MEMBER PROCEDURE f2
   IS
   BEGIN
     /* refer to deprecated f2 in supertype */
     (SELF AS type15 basetype).f2;
     /* No warning for a reference to a not deprecated data member in the
supertype */
    x1 := 1;
   END;
END;
```

References to deprecated entities x, f1, and f0 in unit type15\_basetype will cause the compiler to issue a warning.

```
PROCEDURE test types3
AS
  e type15 subtype ;
  d type15 basetype ;
BEGIN
  e := type15 subtype (1 ,1 ,1);
  d := type15 basetype (1, 1);
  d.x := 2; -- warning issued
  d.f1; -- warning issued
  e.fl (4); -- overloaded in derived type. no warning. not deprecated in the
derived type.
  e.fl (1); -- no warning
  e.f0; -- f0 is deprecated in base type. deprecation is inherited.
warning issued
            -- warning issued for deprecated x in d.x and e.x
  DBMS OUTPUT.PUT LINE(to char(e.x) || to char(' ') || to char(d.x));
END;
```

### Example 14-23 Deprecation Only Applies to Top Level Subprogram

This examples shows that the DEPRECATE pragma may not be used to deprecate a nested procedure. The compiler issues a warning about the misuse of the pragma on the entity. The pragma has no effect.

```
    Live SQL:
    You can view and run this example on Oracle Live SQL at Deprecation Only Applies
    to Top Level Subprogram

PROCEDURE foo
IS
    PROCEDURE inner_foo
    IS
    PRAGMA DEPRECATE (inner_foo, 'procedure inner_foo is deprecated');
    BEGIN
    DEMS OUTPUT.PUT LINE('Executing inner foo');
```

```
BEGIN
   DBMS_OUTPUT.PUT_LINE('Executing foo');
END;
```

#### Example 14-24 Misplaced DEPRECATE Pragma

The DEPRECATE pragma must appear immediately after the declaration of the deprecated item. A warning about the misplaced pragma will be issued and the pragma will have no effect.

END;

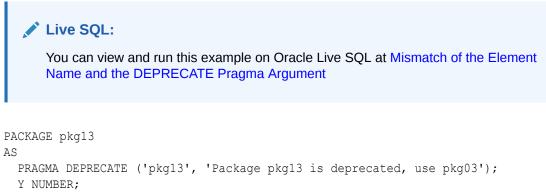

# Live SQL:

You can view and run this example on Oracle Live SQL at Misplaced DEPRECATE Pragma

```
PROCEDURE bar
IS
BEGIN
    PRAGMA DEPRECATE(bar);
    DBMS_OUTPUT.PUT_LINE('Executing bar.');
END;
```

#### Example 14-25 Mismatch of the Element Name and the DEPRECATE Pragma Argument

This example shows that if the argument for the pragma does not match the name in the declaration, the pragma is ignored and the compiler does not issue a warning.

END pkg13;

If an identifier is applied with a mismatched name, then the compiler issues a warning about the pragma being misplaced. The pragma has no effect.

```
CREATE PACKAGE pkg17
IS
PRAGMA DEPRECATE ("pkg17");
END pkg17;
```

## **DETERMINISTIC Clause**

The deterministic option marks a function that returns predictable results and has no side effects.

Function-based indexes, virtual column definitions that use PL/SQL functions, and materialized views that have query-rewrite enabled require special function properties. The DETERMINISTIC clause asserts that a function has those properties.

The DETERMINISTIC option can appear in the following statements:

- Function Declaration and Definition
- CREATE FUNCTION Statement
- CREATE PACKAGE Statement
- CREATE TYPE BODY Statement

#### Topics

- Syntax
- Semantics
- Usage Notes
- Related Topics

## **Syntax**

deterministic\_clause ::=

 $\rightarrow$  Deterministic  $\rightarrow$ 

**Semantics** 

deterministic\_clause

## DETERMINISTIC

A function is deterministic if the DETERMINISTIC clause appears in either a declaration or the definition of the function.

The DETERMINISTIC clause may appear at most once in a function declaration and at most once in a function definition.

A deterministic function must return the same value on two distinct invocations if the arguments provided to the two invocations are the same.

A DETERMINISTIC function may not have side effects.

A DETERMINISTIC function may not raise an unhandled exception.

If a function with a DETERMINISTIC clause violates any of these semantic rules, the results of its invocation, its value, and the effect on its invoker are all undefined.

## **Usage Notes**

The DETERMINISTIC clause is an assertion that the function obeys the semantic rules. If the function does not, neither the compiler, SQL execution, or PL/SQL execution may diagnose the problem and wrong results may be silently produced.

You must specify this keyword if you intend to invoke the function in the expression of a function-based index, in a virtual column definition, or from the query of a materialized view that is marked REFRESH FAST or ENABLE QUERY REWRITE. When the database encounters a deterministic function, it tries to use previously calculated results when possible rather than reexecuting the function. If you change the function, then you must manually rebuild all dependent function-based indexes and materialized views.

Do not specify DETERMINISTIC for a function whose result depends on the state of session variables or schema objects, because results might vary across invocations.

Do not specify this clause to define a function that uses package variables or that accesses the database in any way that might affect the return result of the function.

Specifying this clause for polymorphic table function is not allowed.

When the DETERMINISTIC option appears, the compiler may use the mark to improve the performance of the execution of the function.

It is good programming practice to make functions that fall into these categories DETERMINISTIC:

- Functions used in a WHERE, ORDER BY, or GROUP BY clause
- Functions that MAP or ORDER methods of a SQL type
- Functions that help determine whether or where a row appears in a result set

## **Element Specification**

An element specification specifies each attribute of the ADT.

An element specification can appear in the following SQL statements :

- ALTER TYPE Statement
- CREATE TYPE Statement

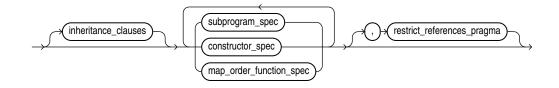

## Topics

- Syntax
- Semantics

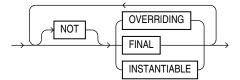

Syntax

element\_spec ::=

( subprogram\_spec ::= , constructor\_spec ::=, map\_order\_function\_spec ::=, restrict\_references\_pragma ::=)

inheritance\_clauses ::=

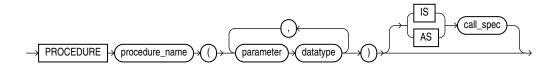

subprogram\_spec ::=

( procedure\_spec ::=, function\_spec ::= )

procedure\_spec ::=

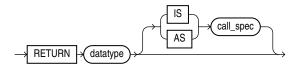

(call\_spec ::=)

function\_spec ::=

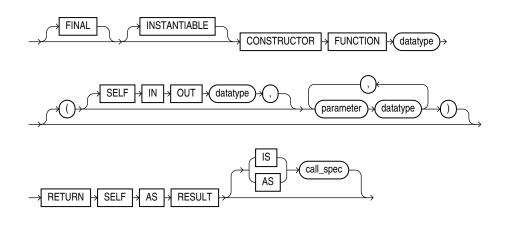

ORACLE

return\_clause ::=

(call\_spec ::=)

constructor\_spec ::=

(call\_spec ::=)

map\_order\_function\_spec ::=

(function\_spec ::=)

**Semantics** 

element\_spec

inheritance\_clauses

Specifies the relationship between supertypes and subtypes.

## [NOT] OVERRIDING

Specifies that this method overrides a MEMBER method defined in the supertype. This keyword is required if the method redefines a supertype method. **Default:** NOT OVERRIDING.

## [NOT] FINAL

Specifies that this method cannot be overridden by any subtype of this type. **Default:** NOT FINAL.

## [NOT] INSTANTIABLE

Specifies that the type does not provide an implementation for this method. **Default:** all methods are INSTANTIABLE.

## **Restriction on NOT INSTANTIABLE**

If you specify NOT INSTANTIABLE, then you cannot specify FINAL or STATIC.

## subprogram\_spec

Specifies a subprogram to be referenced as an ADT attribute. For each such subprogram, you must specify a corresponding method body in the ADT body.

#### Restriction on subprogram\_spec

You cannot define a STATIC method on a subtype that redefines a MEMBER method in its supertype, or vice versa.

#### MEMBER

A subprogram associated with the ADT that is referenced as an attribute. Typically, you invoke MEMBER methods in a selfish style, such as *object\_expression.method()*. This class of method has an implicit first argument referenced as SELF in the method body, which represents the object on which the method was invoked.

#### STATIC

A subprogram associated with the ADT. Unlike MEMBER methods, STATIC methods do not have any implicit parameters. You cannot reference SELF in their body. They are typically invoked as type name.method().

## **Restrictions on STATIC**

- You cannot map a MEMBER method in a Java class to a STATIC method in a SQLJ object type.
- For both MEMBER and STATIC methods, you must specify a corresponding method body in the type body for each procedure or function specification.

See Also: "Example 15-36"

#### procedure\_spec or function\_spec

Specifies the parameters and data types of the procedure or function. If this subprogram does not include the declaration of the procedure or function, then you must issue a corresponding CREATE TYPE BODY statement.

#### Restriction on procedure\_spec or function\_spec

If you are creating a subtype, then the name of the procedure or function cannot be the same as the name of any attribute, whether inherited or not, declared in the supertype chain.

#### return\_clause

The first form of the *return\_clause* is valid only for a function. The syntax shown is an abbreviated form.

See Also: "Collection Method Invocation" for information about method invocation and methods

## constructor\_spec

Creates a user-defined constructor, which is a function that returns an initialized instance of an ADT. You can declare multiple constructors for a single ADT, if the parameters of each constructor differ in number, order, or data type.

- User-defined constructor functions are always FINAL and INSTANTIABLE, so these keywords are optional.
- The parameter-passing mode of user-defined constructors is always SELF IN OUT. Therefore you need not specify this clause unless you want to do so for clarity.
- RETURN SELF AS RESULT specifies that the runtime type of the value returned by the constructor is runtime type of the SELF argument.

## See Also:

*Oracle Database Object-Relational Developer's Guide* for more information about and examples of user-defined constructors and "Example 15-34"

## map\_order\_function\_spec

You can declare either one MAP method or one ORDER method in a type specification, regardless of how many MEMBER or STATIC methods you declare. If you declare either method, then you can compare object instances in SQL.

If you do not declare either method, then you can compare object instances only for equality or inequality. Instances of the same type definition are equal only if each pair of their corresponding attributes is equal. You must not specify a comparison method to determine the equality of two ADTs.

You cannot declare either MAP or ORDER methods for subtypes. However, a subtype can override a MAP method if the supertype defines a NOT FINAL MAP method. A subtype cannot override an ORDER method at all.

You can specify either MAP or ORDER when mapping a Java class to a SQL type. However, the MAP or ORDER methods must map to MEMBER functions in the Java class.

If neither a MAP nor an ORDER method is specified, then only comparisons for equality or inequality can be performed. Therefore object instances cannot be ordered. Instances of the same type definition are equal only if each pair of their corresponding attributes is equal. No comparison method must be specified to determine the equality of two ADTs.

Use MAP if you are performing extensive sorting or hash join operations on object instances. MAP is applied once to map the objects to scalar values, and then the database uses the scalars during sorting and merging. A MAP method is more efficient than an ORDER method, which must invoke the method for each object comparison. You must use a MAP method for hash joins. You cannot use an ORDER method because the hash mechanism hashes on the object value.

## See Also:

*Oracle Database Object-Relational Developer's Guide* for more information about object value comparisons

## MAP MEMBER

Specifies a MAP member function (MAP method) that returns the relative position of a given instance in the ordering of all instances of the object. A MAP method is called implicitly and induces an ordering of object instances by mapping them to values of a predefined scalar type. PL/SQL uses the ordering to evaluate Boolean expressions and to perform comparisons.

If the argument to the MAP method is NULL, then the MAP method returns NULL and the method is not invoked.

An object specification can contain only one MAP method, which must be a function. The result type must be a predefined SQL scalar type, and the MAP method can have no arguments other than the implicit SELF argument.

## Note:

If *type\_name* is to be referenced in queries containing sorts (through an ORDER BY, GROUP BY, DISTINCT, or UNION clause) or containing joins, and you want those queries to be parallelized, then you must specify a MAP member function.

A subtype cannot define a new MAP method, but it can override an inherited MAP method.

## ORDER MEMBER

ORACLE

Specifies an ORDER member function (ORDER method) that takes an instance of an object as an explicit argument and the implicit SELF argument and returns either a negative, zero, or positive integer. The negative, positive, or zero indicates that the implicit SELF argument is less than, equal to, or greater than the explicit argument.

If either argument to the ORDER method is NULL, then the ORDER method returns NULL and the method is not invoked.

When instances of the same ADT definition are compared in an ORDER BY clause, the ORDER method function is invoked.

An object specification can contain only one ORDER method, which must be a function having the return type NUMBER.

A subtype can neither define nor override an ORDER method.

#### Restriction on map\_order\_function\_spec

You cannot add an ORDER method to a subtype.

#### restrict\_references\_pragma

Deprecated clause, described in "RESTRICT\_REFERENCES Pragma".

#### Restriction on restrict\_references\_pragma

This clause is not valid when dropping a method.

## **EXCEPTION\_INIT** Pragma

The EXCEPTION INIT pragma associates a user-defined exception name with an error code.

The EXCEPTION\_INIT pragma can appear only in the same declarative part as its associated exception, anywhere after the exception declaration.

#### Topics

- Syntax
- Semantics
- Usage Notes
- Examples
- Related Topics

#### Syntax

exception\_init\_pragma ::=

**Semantics** 

exception\_init\_pragma

exception

Name of a previously declared user-defined exception.

## error\_code

Error code to be associated with *exception*. *error\_code* can be either 100 (the numeric code for "no data found" that "SQLCODE Function" returns) or any negative integer greater than -1000000 except -1403 (another numeric code for "no data found").

If two EXCEPTION\_INIT pragmas assign different error codes to the same user-defined exception, then the later pragma overrides the earlier pragma.

#### **Usage Notes**

The EXCEPTION\_INIT pragma should only be used to associate an exception with an error number that is already meaningfully defined by Oracle. Note that any error number may be used by Oracle in the future, which can create conflicts with unrelated application use of that number.

Negative integers greater than -65536 are only partially supported. Currently, if left unhandled beyond the current layer of entry into PL/SQL, the exception is converted to ORA-6515 and the original exception is not recognized in the outer PL/SQL layer or client program.

Application-declared exceptions that are only raised and caught locally within a layer of entry into PL/SQL do not need the EXCEPTION\_INIT pragma. The RAISE\_APPLICATION\_ERROR procedure and associated -20000 to -20999 range of error numbers should be used by application-declared exceptions that are intended to be recognizable in outer PL/SQL layers or in the client program.

## Examples

- Example 12-5, "Naming Internally Defined Exception"
- Example 12-13, "Raising User-Defined Exception with RAISE\_APPLICATION\_ERROR"
- Example 13-13, "Handling FORALL Exceptions After FORALL Statement Completes"

## **Related Topics**

In this chapter:

- "Exception Declaration"
- "Exception Handler"
- "SQLCODE Function"
- "SQLERRM Function"

In other chapters:

- "Internally Defined Exceptions"
- "RAISE\_APPLICATION\_ERROR Procedure"

## **Exception Declaration**

An exception declaration declares the name of a user-defined exception.

You can use the EXCEPTION\_INIT pragma to assign this name to an internally defined exception.

**Topics** 

- Syntax
- Semantics
- Examples
- Related Topics

Syntax

exception\_declaration ::=

EXCEPTION exception

## Semantics

exception\_declaration

#### exception

Name of the exception that you are declaring.

#### **Restriction on exception**

You can use *exception* only in an EXCEPTION\_INIT pragma, RAISE statement, RAISE APPLICATION ERROR invocation, or exception handler.

## Caution:

Oracle recommends against using a predefined exception name for *exception*. For details, see "Redeclared Predefined Exceptions". For a list of predefined exception names, see Table 12-3.

#### Examples

- Example 12-5, "Naming Internally Defined Exception"
- Example 12-9, "Redeclared Predefined Identifier"
- Example 12-10, "Declaring, Raising, and Handling User-Defined Exception"

#### **Related Topics**

In this chapter:

- "EXCEPTION\_INIT Pragma"
- "Exception Handler"
- "RAISE Statement"

In other chapters:

- "Internally Defined Exceptions"
- "User-Defined Exceptions"

# **Exception Handler**

An exception handler processes a raised exception.

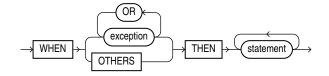

Exception handlers appear in the exception-handling parts of anonymous blocks, subprograms, triggers, and packages.

**Topics** 

- Syntax
- Semantics
- Examples
- Related Topics

## Syntax

exception\_handler ::=

## (statement ::=)

#### **Semantics**

exception\_handler

#### exception

Name of either a predefined exception (see Table 12-3) or a user-defined exception (see "Exception Declaration").

If PL/SQL raises a specified exception, then the associated statements run.

## OTHERS

Specifies all exceptions not explicitly specified in the exception handling part of the block. If PL/SQL raises such an exception, then the associated statements run.

## Note:

Oracle recommends that the last statement in the OTHERS exception handler be either RAISE or an invocation of a subroutine marked with pragma SUPPRESSES WARNING 6009.

If you do not follow this practice, and PL/SQL warnings are enabled, you get  ${\tt PLW-06009}.$ 

In the exception handling part of a block, the WHEN OTHERS exception handler is optional. It can appear only once, as the last exception handler in the exception handling part of the block.

## Examples

- Example 12-3, "Single Exception Handler for Multiple Exceptions"
- Example 12-4, "Locator Variables for Statements that Share Exception Handler"
- Example 12-6, "Anonymous Block Handles ZERO\_DIVIDE"
- Example 12-7, "Anonymous Block Avoids ZERO\_DIVIDE"
- Example 12-10, "Declaring, Raising, and Handling User-Defined Exception"
- Example 12-14, "Exception that Propagates Beyond Scope is Handled"
- Example 12-24, "Exception Handler Runs and Execution Ends"
- Example 12-25, "Exception Handler Runs and Execution Continues"
- Example 13-12, "Handling FORALL Exceptions Immediately"
- Example 13-13, "Handling FORALL Exceptions After FORALL Statement Completes"

## **Related Topics**

# **EXECUTE IMMEDIATE Statement**

The EXECUTE IMMEDIATE statement builds and runs a dynamic SQL statement in a single operation.

Native dynamic SQL uses the EXECUTE IMMEDIATE statement to process most dynamic SQL statements.

## **Caution:**

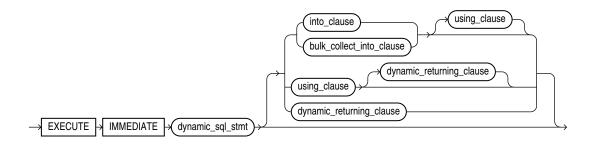

When using dynamic SQL, beware of SQL injection, a security risk. For more information about SQL injection, see "SQL Injection".

## Topics

- Syntax
- Semantics
- Examples
- Related Topics

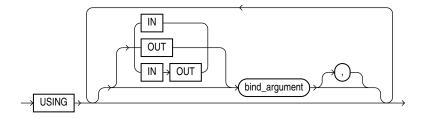

## Syntax

execute\_immediate\_statement ::=

(bulk\_collect\_into\_clause ::=, dynamic\_returning\_clause ::=, into\_clause ::=)

using\_clause ::=

### **Semantics**

execute\_immediate\_statement

## dynamic\_sql\_stmt

String literal, string variable, or string expression that represents a SQL statement. Its type must be either CHAR, VARCHAR2, or CLOB.

## Note:

If dynamic\_sql\_statement is a SELECT statement, and you omit both into\_clause and bulk\_collect\_into\_clause, then execute\_immediate\_statement never runs.

For example, this statement never increments the sequence:

EXECUTE IMMEDIATE 'SELECT S.NEXTVAL FROM DUAL'

#### into\_clause

Specifies the variables or record in which to store the column values that the statement returns. For more information about this clause, see "RETURNING INTO Clause".

## Restriction on into\_clause

Use if and only if *dynamic\_sql\_stmt* returns a single row.

#### bulk\_collect\_into\_clause

Specifies one or more collections in which to store the rows that the statement returns. For more information about this clause, see "RETURNING INTO Clause".

#### Restriction on bulk\_collect\_into\_clause

Use if and only if *dynamic* sql stmt can return multiple rows.

#### dynamic\_returning\_clause

Returns the column values of the rows affected by the dynamic SQL statement, in either individual variables or records. For more information about this clause, see "RETURNING INTO Clause".

#### Restriction on dynamic\_returning\_clause

Use if and only if *dynamic* sql stmt has a RETURNING INTO clause.

#### using\_clause

Specifies bind variables, using positional notation.

## Note:

If you repeat placeholder names in *dynamic\_sql\_statement*, be aware that the way placeholders are associated with bind variables depends on the kind of dynamic SQL statement. For details, see "Repeated Placeholder Names in Dynamic SQL Statements."

## Restrictions on using\_clause

- Use if and only if *dynamic sql stmt* includes placeholders for bind variables.
- If dynamic\_sql\_stmt has a RETURNING INTO clause (static\_returning\_clause), then using\_clause can contain only IN bind variables. The bind variables in the RETURNING INTO clause are OUT bind variables by definition.

## IN, OUT, IN OUT

Parameter modes of bind variables. An IN bind variable passes its value to *dynamic\_sql\_stmt*. An OUT bind variable stores a value that *dynamic\_sql\_stmt* returns. An IN OUT bind variable passes its initial value to *dynamic\_sql\_stmt* and stores a value that *dynamic\_sql\_stmt* returns. Default: IN.

For DML a statement with a RETURNING clause, you can place OUT bind variables in the RETURNING INTO clause without specifying the parameter mode, which is always OUT.

## bind\_argument

An expression whose value replaces its corresponding placeholder in <code>dynamic\_sql\_stmt</code> at run time.

Every placeholder in *dynamic\_sql\_stmt* must be associated with a *bind\_argument* in the USING clause or RETURNING INTO clause (or both) or with a define variable in the INTO clause.

You can run *dynamic\_sql\_stmt* repeatedly using different values for the bind variables. You incur some overhead, because EXECUTE IMMEDIATE prepares the dynamic string before every execution.

## Note:

Bind variables can be evaluated in any order. If a program determines order of evaluation, then at the point where the program does so, its behavior is undefined.

## Restrictions on bind\_argument

- bind argument cannot be an associative array indexed by string.
- bind argument cannot be the reserved word NULL.

To pass the value NULL to the dynamic SQL statement, use an uninitialized variable where you want to use NULL, as in Example 8-7.

## Examples

• Example 8-1, "Invoking Subprogram from Dynamic PL/SQL Block"

- Example 8-7, "Uninitialized Variable Represents NULL in USING Clause"
- Example 8-10, "Repeated Placeholder Names in Dynamic PL/SQL Block"

## **Related Topics**

•

In this chapter:

"RETURNING INTO Clause"

In other chapters:

- "EXECUTE IMMEDIATE Statement"
- "DBMS\_SQL Package"

## **EXIT Statement**

The EXIT statement exits the current iteration of a loop, either conditionally or unconditionally, and transfers control to the end of either the current loop or an enclosing labeled loop.

The EXIT WHEN statement exits the current iteration of a loop when the condition in its WHEN clause is true, and transfers control to the end of either the current loop or an enclosing labeled loop.

Each time control reaches the EXIT WHEN statement, the condition in its WHEN clause is evaluated. If the condition is not true, the EXIT WHEN statement does nothing. To prevent an infinite loop, a statement inside the loop must make the condition true.

## **Restriction on EXIT Statement**

An EXIT statement must be inside a LOOP statement.

## **Topics**

- Syntax
- Semantics
- Examples
- Related Topics

Syntax

exit\_statement ::=

(boolean\_expression ::=)

Semantics

exit\_statement

label

Name that identifies either the current loop or an enclosing loop.

Without *label*, the EXIT statement transfers control to the end of the current loop. With *label*, the EXIT statement transfers control to the end of the loop that *label* identifies.

## WHEN boolean\_expression

Without this clause, the EXIT statement exits the current iteration of the loop unconditionally. With this clause, the EXIT statement exits the current iteration of the loop if and only if the value of *boolean expression* is TRUE.

#### **Examples**

#### Example 14-26 Basic LOOP Statement with EXIT Statement

In this example, the EXIT statement inside the basic LOOP statement transfers control unconditionally to the end of the current loop.

```
DECLARE
  x NUMBER := 0;
BEGIN
  LOOP
   DBMS_OUTPUT.PUT_LINE ('Inside loop: x = ' || TO_CHAR(x));
   x := x + 1;
   IF x > 3 THEN
   EXIT;
   END IF;
END LOOP;
   -- After EXIT, control resumes here
   DBMS_OUTPUT.PUT_LINE(' After loop: x = ' || TO_CHAR(x));
END;
//
```

#### Result:

```
Inside loop: x = 0
Inside loop: x = 1
Inside loop: x = 2
Inside loop: x = 3
After loop: x = 4
```

#### Example 14-27 Basic LOOP Statement with EXIT WHEN Statement

In this example, the EXIT WHEN statement inside the basic LOOP statement transfers control to the end of the current loop when x is greater than 3.

```
DECLARE
x NUMBER := 0;
BEGIN
LOOP
DBMS_OUTPUT.PUT_LINE('Inside loop: x = ' || TO_CHAR(x));
x := x + 1; -- prevents infinite loop
EXIT WHEN x > 3;
END LOOP;
-- After EXIT statement, control resumes here
DBMS_OUTPUT.PUT_LINE('After loop: x = ' || TO_CHAR(x));
END;
/
```

Result:

```
Inside loop: x = 0
Inside loop: x = 1
Inside loop: x = 2
Inside loop: x = 3
After loop: x = 4
```

## **Related Topics**

- "Basic LOOP Statement"
- "CONTINUE Statement"

## **Explicit Cursor Declaration and Definition**

An **explicit cursor** is a named pointer to a private SQL area that stores information for processing a specific query or DML statement—typically, one that returns or affects multiple rows.

You can use an explicit cursor to retrieve the rows of a result set one at a time.

Before using an explicit cursor, you must declare and define it. You can either declare it first (with *cursor\_declaration*) and then define it later in the same block, subprogram, or package (with *cursor\_definition*) or declare and define it at the same time (with *cursor\_definition*).

An explicit cursor declaration and definition are also called a **cursor specification** and **cursor body**, respectively.

## Note:

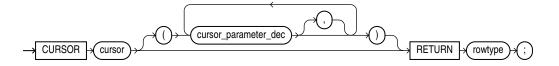

An explicit cursor declared in a package specification is affected by the AUTHID clause of the package. For more information, see "CREATE PACKAGE Statement".

#### Topics

- Syntax
- Semantics
- Examples
- Related Topics

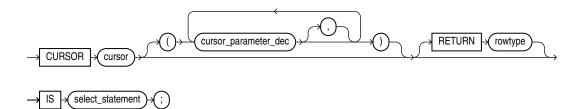

#### Syntax

cursor\_declaration ::=

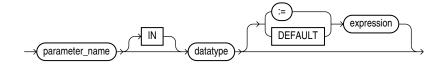

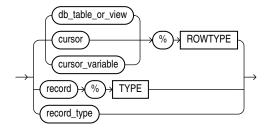

## cursor\_definition ::=

cursor\_parameter\_dec ::=

rowtype ::=

#### **Semantics**

#### cursor\_declaration

#### cursor

Name of the explicit cursor that you are declaring now and will define later in the same block, subprogram, or package. *cursor* can be any identifier except the reserved word SQL. Oracle recommends against giving a cursor the same name as a database table.

Explicit cursor names follow the same scoping rules as variables (see "Scope and Visibility of Identifiers").

#### cursor\_definition

Either defines an explicit cursor that was declared earlier or both declares and defines an explicit cursor.

## cursor

Either the name of the explicit cursor that you previously declared and are now defining or the name of the explicit cursor that you are both declaring and defining. *cursor* can be any identifier except the reserved word SQL. Oracle recommends against giving a cursor the same name as a database table.

### select\_statement

A SQL SELECT statement (not a PL/SQL SELECT INTO statement). If the cursor has formal parameters, each parameter must appear in *select\_statement*. The *select\_statement* can also reference other PL/SQL variables in its scope.

## Restriction on select\_statement

This select statement cannot have a WITH clause.

💉 See:
Oracle Database SQL Language Reference for SELECT statement syntax

#### cursor\_parameter\_dec

A cursor parameter declaration.

#### parameter

The name of the formal cursor parameter that you are declaring. This name can appear anywhere in *select statement* that a constant can appear.

#### IN

Whether or not you specify IN, a formal cursor parameter has the characteristics of an IN subprogram parameter, which are summarized in Table 9-1. When the cursor opens, the value of the formal parameter is that of either its actual parameter or default value.

## datatype

The data type of the parameter.

## Restriction on datatype

This *datatype* cannot have constraints (for example, NOT NULL, or precision and scale for a number, or length for a string).

#### expression

Specifies the default value for the formal cursor parameter. The data types of *expression* and the formal cursor parameter must be compatible.

If an OPEN statement does not specify an actual parameter for the formal cursor parameter, then the statement evaluates *expression* and assigns its value to the formal cursor parameter.

If an OPEN statement does specify an actual parameter for the formal cursor parameter, then the statement assigns the value of the actual parameter to the formal cursor parameter and does not evaluate *expression*.

## rowtype

Data type of the row that the cursor returns. The columns of this row must match the columns of the row that *select statement* returns.

### db\_table\_or\_view

Name of a database table or view, which must be accessible when the declaration is elaborated.

## cursor

Name of a previously declared explicit cursor.

#### cursor\_variable

Name of a previously declared cursor variable.

## record

Name of a previously declared record variable.

## record\_type

Name of a user-defined type that was defined with the data type specifier RECORD.

# Expression

An expression is an arbitrarily complex combination of operands (variables, constants, literals, operators, function invocations, and placeholders) and operators.

The simplest expression is a single variable.

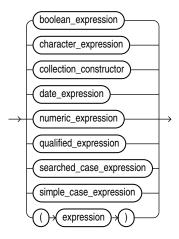

The PL/SQL compiler determines the data type of an expression from the types of the operands and operators that comprise the expression. Every time the expression is evaluated, a single value of that type results.

#### **Semantics**

### boolean\_expression

Expression whose value is TRUE, FALSE, or NULL. For more information, see "BOOLEAN Expressions".

NOT, AND, OR

See "Logical Operators".

## boolean\_constant

Name of a constant of type BOOLEAN.

## boolean\_function\_call

Invocation of a previously defined function that returns a BOOLEAN value. For more semantic information, see "*function\_call*".

## boolean\_variable

Name of a variable of type BOOLEAN.

## conditional\_predicate

See "Conditional Predicates for Detecting Triggering DML Statement".

## other\_boolean\_form

## collection

Name of a collection variable.

## **EXISTS**

Collection method (function) that returns TRUE if the *index*th element of *collection* exists and FALSE otherwise. For more information, see "EXISTS Collection Method".

## **Restriction on EXISTS**

You cannot use EXISTS if collection is an associative array.

## index

Numeric expression whose data type either is PLS\_INTEGER or can be implicitly converted to PLS\_INTEGER (for information about the latter, see "Predefined PLS\_INTEGER Subtypes").

## IS [NOT] NULL

See "IS [NOT] NULL Operator".

## **BETWEEN** expression AND expression

See "BETWEEN Operator".

IN expression [, expression ]...

See "IN Operator".

LIKE pattern

See "LIKE Operator".

relational\_operator

See "Relational Operators".

## SQL

Implicit cursor associated with the most recently run SELECT or DML statement. For more information, see "Implicit Cursors".

## %FOUND, %ISOPEN, %NOTFOUND

Cursor attributes explained in "Implicit Cursor Attribute" and "Named Cursor Attribute".

#### character\_expression

Expression whose value has a character data type (that is, a data type in the CHAR family, described in "CHAR Data Type Family").

#### character\_constant

Name of a constant that has a character data type.

## character\_function\_call

Invocation of a previously defined function that returns a value that either has a character data type or can be implicitly converted to a character data type. For more semantic information, see "*function\_call*".

## character\_literal

Literal of a character data type.

#### character\_variable

Name of a variable that has a character data type.

Concatenation operator, which appends one string operand to another. For more information, see "Concatenation Operator".

## collection\_constructor

Constructs a collection of the specified type with elements that have the specified values.

For more information, see "Collection Constructors".

### collection\_type

Name of a previously declared nested table type or VARRAY type (not an associative array type).

#### value

Valid value for an element of a collection of collection type.

If *collection\_type* is a varray type, then it has a maximum size, which the number of values cannot exceed. If *collection type* is a nested table type, then it has no maximum size.

If you specify no values, then the constructed collection is empty but not null (for the difference between *empty* and *null*, see "Collection Types").

## date\_expression

Expression whose value has a date data type (that is, a data type in the DATE family, described in "DATE Data Type Family").

#### date\_constant

Name of a constant that has a date data type.

## date\_function\_call

Invocation of a previously defined function that returns a value that either has a date data type or can be implicitly converted to a date data type. For more semantic information, see "*function\_call*".

#### date\_literal

Literal whose value either has a date data type or can be implicitly converted to a date data type.

### date\_variable

Name of a variable that has a date data type.

#### +, -

Addition and subtraction operators.

## numeric\_expression

Expression whose value has a date numeric type (that is, a data type in the DATE family, described in "NUMBER Data Type Family").

## +, -, /, \*, \*\*

Addition, subtraction, division, multiplication, and exponentiation operators.

numeric\_subexpression

## collection

Name of a collection variable.

## COUNT, FIRST, LAST, LIMIT, NEXT, PRIOR

Collection methods explained in "Collection Method Invocation".

## named\_cursor%ROWCOUNT

See "Named Cursor Attribute".

#### numeric\_constant

Name of a constant that has a numeric data type.

#### numeric\_function\_call

Invocation of a previously defined function that returns a value that either has a numeric data type or can be implicitly converted to a numeric data type. For more semantic information, see "*function\_call*".

#### numeric\_literal

Literal of a numeric data type.

#### numeric\_variable

Name of variable that has a numeric data type.

## SQL%ROWCOUNT

Cursor attribute explained in "Implicit Cursor Attribute".

## SQL%BULK\_ROWCOUNT]

Cursor attribute explained in "SQL%BULK\_ROWCOUNT".

#### exponent

Numeric expression.

function\_call

## function

Name of a previously defined function.

## parameter [, parameter ]...

List of actual parameters for the function being called. The data type of each actual parameter must be compatible with the data type of the corresponding formal parameter. The mode of the formal parameter determines what the actual parameter can be:

Formal Parameter Mode	Actual Parameter
IN	Constant, initialized variable, literal, or expression
OUT	Variable whose data type is not defined as NOT NULL
IN OUT	Variable (typically, it is a string buffer or numeric accumulator)

If the function specifies a default value for a parameter, you can omit that parameter from the parameter list. If the function has no parameters, or specifies a default value for every parameter, you can either omit the parameter list or specify an empty parameter list.

## See Also:

"Positional, Named, and Mixed Notation for Actual Parameters"

## searched\_case\_expression

## WHEN boolean\_expression THEN result

The boolean\_expressions are evaluated sequentially. If a boolean\_expression has the value TRUE, then the result associated with that boolean\_expression is returned. Subsequent boolean expressions are not evaluated.

## ELSE result

The result is returned if and only if no boolean expression has the value TRUE.

If you omit the ELSE clause, the searched case expression returns NULL.

See Also:
"Searched CASE Statement"

## simple\_case\_expression

## selector

An expression of any PL/SQL type except BLOB, BFILE, or a user-defined type. The *selector* is evaluated once.

## WHEN selector\_value THEN result

The *selector\_values* are evaluated sequentially. If a *selector\_value* matches the value of *selector*, then the *result* associated with that *selector\_value* is returned. Subsequent *selector\_values* are not evaluated.

A *selector\_value* can be of any PL/SQL type except BLOB, BFILE, an ADT, a PL/SQL record, an associative array, a varray, or a nested table.

## ELSE result

The result is returned if and only if no selector value has the same value as selector.

If you omit the ELSE clause, the simple case expression returns NULL.

## Note:

If you specify the literal <code>NULL</code> for every <code>result</code> (including the <code>result</code> in the <code>ELSE</code> clause), then error PLS-00617 occurs.

## **FETCH Statement**

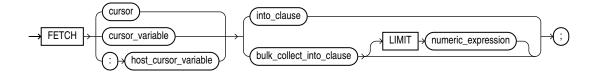

The FETCH statement retrieves rows of data from the result set of a multiple-row query—one row at a time, several rows at a time, or all rows at once—and stores the data in variables, records, or collections.

## **Topics**

- Syntax
- Semantics
- Examples
- Related Topics

## Syntax

fetch\_statement ::=

(bulk\_collect\_into\_clause ::=, into\_clause ::=, numeric\_expression ::=)

#### **Semantics**

#### fetch\_statement

#### cursor

Name of an open explicit cursor. To open an explicit cursor, use the "OPEN Statement".

If you try to fetch from an explicit cursor before opening it or after closing it, PL/SQL raises the predefined exception INVALID CURSOR.

#### cursor\_variable

Name of an open cursor variable. To open a cursor variable, use the "OPEN FOR Statement". The cursor variable can be a formal subprogram parameter (see "Cursor Variables as Subprogram Parameters").

If you try to fetch from a cursor variable before opening it or after closing it, PL/SQL raises the predefined exception INVALID CURSOR.

#### :host\_cursor\_variable

Name of a cursor variable declared in a PL/SQL host environment, passed to PL/SQL as a bind variable, and then opened. To open a host cursor variable, use the "OPEN FOR Statement". Do not put space between the colon (:) and host cursor variable.

The data type of a host cursor variable is compatible with the return type of any PL/SQL cursor variable.

## into\_clause

To have the FETCH statement retrieve one row at a time, use this clause to specify the variables or record in which to store the column values of a row that the cursor returns. For more information about *into clause*, see "*into\_clause* ::=".

## bulk\_collect\_into\_clause [ LIMIT numeric\_expression ]

Use *bulk\_collect\_into\_clause* to specify one or more collections in which to store the rows that the FETCH statement returns. For more information about *bulk\_collect\_into\_clause*, see "*bulk\_collect\_into\_clause* ::=".

To have the FETCH statement retrieve all rows at once, omit LIMIT numeric expression.

To limit the number of rows that the FETCH statement retrieves at once, specify LIMIT *numeric expression*.

## Restrictions on *bulk\_collect\_into\_clause*

- You cannot use bulk collect into clause in client programs.
- When the FETCH statement requires implicit data type conversions, bulk\_collect\_into\_clause can have only one collection or host\_array.

## Examples

# FOR LOOP Statement

With each iteration of the FOR LOOP statement, its statements run, its index is either incremented or decremented, and control returns to the top of the loop.

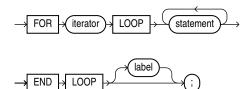

The FOR LOOP statement ends when its index reaches a specified value, or when a statement inside the loop transfers control outside the loop or raises an exception. An index is also called an iterand. Statements outside the loop cannot reference the iterand. After the FOR LOOP statement runs, the iterand is undefined.

## **Topics**

- Syntax
- Semantics
- Examples
- Related Topics

Syntax

for\_loop\_statement ::=

(Iterator, statement ::=)

**Semantics** 

for\_loop\_statement

iterator

See iterator

statement

An EXIT, EXIT WHEN, CONTINUE, or CONTINUE WHEN in the *statements* can cause the loop or the current iteration of the loop to end early. See "*statement* ::=" for the list of all possible statements.

#### label

A label that identifies *for\_loop\_statement* (see "*label*"). CONTINUE, EXIT, and GOTO statements can reference this label.

Labels improve readability, especially when LOOP statements are nested, but only if you ensure that the label in the END LOOP statement matches a label at the beginning of the same LOOP statement (the compiler does not check).

### Examples

- Example 5-20, "Simple Step Filter Using FOR LOOP Stepped Range Iterator"
- Example 5-16, "FOR LOOP Statement Range Iteration Control"
- Example 5-17, "Reverse FOR LOOP Statement Range Iteration Control"

- Example 5-12, "FOR LOOP Statement Index with Same Name as Variable"
- Example 5-13, "FOR LOOP Statement References Variable with Same Name as Index"
- Example 5-14, "Nested FOR LOOP Statements with Same Index Name"

## Example 14-28 EXIT WHEN Statement in FOR LOOP Statement

Suppose that you must exit a FOR LOOP statement immediately if a certain condition arises. You can put the condition in an EXIT WHEN statement inside the FOR LOOP statement.

In this example, the FOR LOOP statement is processed 10 times unless the FETCH statement inside it fails to return a row, in which case it ends immediately.

```
DECLARE
v_employees employees%ROWTYPE;
CURSOR c1 is SELECT * FROM employees;
BEGIN
OPEN c1;
-- Fetch entire row into v_employees record:
FOR i IN 1..10 LOOP
FETCH c1 INTO v_employees;
EXIT WHEN c1%NOTFOUND;
-- Process data here
END LOOP;
CLOSE c1;
END;
/
```

#### Example 14-29 EXIT WHEN Statement in Inner FOR LOOP Statement

Now suppose that the FOR LOOP statement that you must exit early is nested inside another FOR LOOP statement. If, when you exit the inner loop early, you also want to exit the outer loop, then label the outer loop and specify its name in the EXIT WHEN statement.

```
DECLARE
v_employees employees%ROWTYPE;
CURSOR c1 is SELECT * FROM employees;
```

```
BEGIN
OPEN c1;
-- Fetch entire row into v_employees record:
<<outer_loop>>
FOR i IN 1..10 LOOP
-- Process data here
FOR j IN 1..10 LOOP
FETCH c1 INTO v_employees;
EXIT outer_loop WHEN c1%NOTFOUND;
-- Process data here
END LOOP;
END LOOP outer_loop;
CLOSE c1;
END;
/
```

## Example 14-30 CONTINUE WHEN Statement in Inner FOR LOOP Statement

If you want to exit the inner loop early but complete the current iteration of the outer loop, then label the outer loop and specify its name in the CONTINUE WHEN statement.

```
DECLARE
 v employees employees%ROWTYPE;
 CURSOR c1 is SELECT * FROM employees;
BEGIN
 OPEN c1;
  -- Fetch entire row into v_employees record:
 <<outer_loop>>
 FOR i IN 1..10 LOOP
   -- Process data here
   FOR j IN 1..10 LOOP
     FETCH c1 INTO v employees;
      CONTINUE outer loop WHEN c1%NOTFOUND;
      -- Process data here
   END LOOP;
 END LOOP outer_loop;
 CLOSE c1;
END;
/
```

- "EXIT Statement"
- "FETCH Statement"
- "FORALL Statement"
- "OPEN Statement"
- "WHILE LOOP Statement"

 "Overview of Exception Handling" for information about exceptions, which can also cause a loop to end immediately if a certain condition arises

# **FORALL Statement**

The FORALL statement runs one DML statement multiple times, with different values in the VALUES and WHERE clauses.

The different values come from existing, populated collections or host arrays. The FORALL statement is usually much faster than an equivalent FOR LOOP statement.

## Semantics

## forall\_statement

## index

Name for the implicitly declared integer variable that is local to the FORALL statement. Statements outside the FORALL statement cannot reference *index*. Statements inside the FORALL statement can reference *index* as an index variable, but cannot use it in expressions or change its value. After the FORALL statement runs, *index* is undefined.

### dml\_statement

A static or dynamic INSERT, UPDATE, DELETE, or MERGE statement that references at least one collection in its VALUES or WHERE clause. Performance benefits apply only to collection references that use *index* as an index.

Every collection that *dml\_statement* references must have indexes that match the values of *index*. If you apply the DELETE, EXTEND, or TRIM method to one collection, apply it to the other collections also, so that all collections have the same set of indexes. If any collection lacks a referenced element, PL/SQL raises an exception.

## Restriction on *dml\_statement*

If *dml\_statement* is a dynamic SQL statement, then values in the USING clause (bind variables for the dynamic SQL statement) must be simple references to the collection, not expressions. For example, *collection(i)* is valid, but UPPER(*collection(i)*) is invalid.

## SAVE EXCEPTIONS

Lets the FORALL statement continue even if some of its DML statements fail. For more information, see "Handling FORALL Exceptions After FORALL Statement Completes".

## bounds\_clause

Specifies the collection element indexes that provide values for the variable *index*. For each value, the SQL engine runs *dml* statement once.

## lower\_bound .. upper\_bound

Both *lower\_bound* and *upper\_bound* are numeric expressions that PL/SQL evaluates once, when the FORALL statement is entered, and rounds to the nearest integer if necessary. The resulting integers must be the lower and upper bounds of a valid range of consecutive index numbers. If an element in the range is missing or was deleted, PL/SQL raises an exception.

## INDICES OF collection [ BETWEEN lower\_bound AND upper\_bound ]

Specifies that the values of *index* correspond to the indexes of the elements of *collection*. The indexes need not be consecutive.

Both *lower\_bound* and *upper\_bound* are numeric expressions that PL/SQL evaluates once, when the FORALL statement is entered, and rounds to the nearest integer if necessary. The resulting integers are the lower and upper bounds of a valid range of index numbers, which need not be consecutive.

#### **Restriction on collection**

If collection is an associative array, it must be indexed by PLS INTEGER.

## VALUES OF index\_collection

Specifies that the values of *index* are the elements of *index\_collection*, a collection of PLS\_INTEGER elements that is indexed by PLS\_INTEGER. The indexes of *index\_collection* need not be consecutive. If *index\_collection* is empty, PL/SQL raises an exception and the FORALL statement does not run.

# **Formal Parameter Declaration**

A formal parameter declaration specifies the name and data type of the parameter, and (optionally) its mode and default value.

A formal parameter declaration can appear in the following:

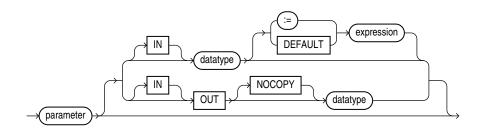

- "Function Declaration and Definition"
- "Procedure Declaration and Definition"
- "CREATE FUNCTION Statement"
- "CREATE PROCEDURE Statement"

#### **Topics**

- Syntax
- Semantics
- Examples
- Related Topics

#### Syntax

parameter\_declaration ::=

#### **Semantics**

### parameter\_declaration

#### parameter

Name of the formal parameter that you are declaring, which you can reference in the executable part of the subprogram.

## IN, OUT, IN OUT

Mode that determines the behavior of the parameter, explained in "Subprogram Parameter Modes". Default: IN.

## Note:

Avoid using OUT and IN OUT for function parameters. The purpose of a function is to take zero or more parameters and return a single value. Functions must be free from side effects, which change the values of variables not local to the subprogram.

## NOCOPY

Requests that the compiler pass the corresponding actual parameter by reference instead of value (for the difference, see "Subprogram Parameter Passing Methods"). Each time the subprogram is invoked, the optimizer decides, silently, whether to obey or disregard NOCOPY.

## Caution:

NOCOPY increases the likelihood of aliasing. For details, see "Subprogram Parameter Aliasing with Parameters Passed by Reference".

The compiler ignores NOCOPY in these cases:

- The actual parameter must be implicitly converted to the data type of the formal parameter.
- The actual parameter is the element of a collection.
- The actual parameter is a scalar variable with the NOT NULL constraint.
- The actual parameter is a scalar numeric variable with a range, size, scale, or precision constraint.
- The actual and formal parameters are records, one or both was declared with <code>%ROWTYPE</code> or <code>%TYPE</code>, and constraints on corresponding fields differ.
- The actual and formal parameters are records, the actual parameter was declared (implicitly) as the index of a cursor FOR LOOP statement, and constraints on corresponding fields differ.
- The subprogram is invoked through a database link or as an external subprogram.

## Note:

The preceding list might change in a subsequent release.

## datatype

Data type of the formal parameter that you are declaring. The data type can be a constrained subtype, but cannot include a constraint (for example, NUMBER(2) or VARCHAR2(20).

If *datatype* is a constrained subtype, the corresponding actual parameter inherits the NOT NULL constraint of the subtype (if it has one), but not the size (see Example 9-10).

## Caution:

The data type REF CURSOR increases the likelihood of subprogram parameter aliasing, which can have unintended results. For more information, see "Subprogram Parameter Aliasing with Cursor Variable Parameters".

#### expression

Default value of the formal parameter that you are declaring. The data type of *expression* must be compatible with *datatype*.

If a subprogram invocation does not specify an actual parameter for the formal parameter, then that invocation evaluates *expression* and assigns its value to the formal parameter.

If a subprogram invocation does specify an actual parameter for the formal parameter, then that invocation assigns the value of the actual parameter to the formal parameter and does not evaluate *expression*.

## Examples

- Example 3-26, "Assigning Value to Variable as IN OUT Subprogram Parameter"
- Example 9-9, "Formal Parameters and Actual Parameters"
- Example 9-14, "Parameter Values Before, During, and After Procedure Invocation"
- Example 9-15, "OUT and IN OUT Parameter Values After Exception Handling"
- Example 9-20, "Procedure with Default Parameter Values"
- Example 9-21, "Function Provides Default Parameter Value"
- Example 9-22, "Adding Subprogram Parameter Without Changing Existing Invocations"

#### **Related Topics**

In this chapter:

- "Function Declaration and Definition"
- "Procedure Declaration and Definition"

In other chapters:

"Subprogram Parameters"

- "Tune Subprogram Invocations"
- "CREATE FUNCTION Statement"
- "CREATE PROCEDURE Statement"

# **Function Declaration and Definition**

Before invoking a function, you must declare and define it. You can either declare it first (with *function\_declaration*) and then define it later in the same block, subprogram, or package (with *function\_definition*) or declare and define it at the same time (with *function\_definition*).

A **function** is a subprogram that returns a value. The data type of the value is the data type of the function. A function invocation (or call) is an expression, whose data type is that of the function.

A function declaration is also called a function specification or function spec.

## Note:

This topic applies to nested functions.

For information about standalone functions, see "CREATE FUNCTION Statement".

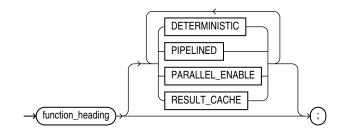

For information about package functions, see "CREATE PACKAGE Statement".

#### Topics

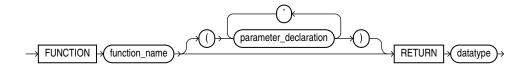

- Syntax
- Semantics
- Examples
- Related Topics

#### Syntax

function\_declaration ::=

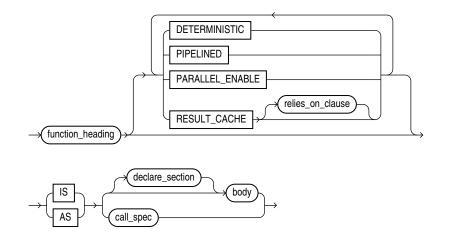

## function\_heading ::=

**ORACLE**<sup>®</sup>

( datatype ::= , parameter\_declaration ::= )

## function\_definition ::=

( body ::= , declare\_section ::= , pipelined\_clause ::= , deterministic\_clause ::= , parallel\_enable\_clause ::= , result\_cache\_clause ::= , call\_spec ::= )

## Semantics

## function\_declaration

Declares a function, but does not define it. The definition must appear later in the same block, subprogram, or package as the declaration.

## function\_heading

The function heading specifies the function name and its parameter list.

#### function\_name

Name of the function that you are declaring or defining.

#### **RETURN** datatype

Specifies the data type of the value that the function returns, which can be any PL/SQL data type (see PL/SQL Data Types).

## **Restriction on datatype**

You cannot constrain this data type (with NOT NULL, for example). If *datatype* is a constrained subtype, then the returned value does not inherit the constraints of the subtype (see "Formal Parameters of Constrained Subtypes").

#### function\_definition

Either defines a function that was declared earlier or both declares and defines a function.

#### declare\_section

Declares items that are local to the function, can be referenced in body, and cease to exist when the function completes execution.

body

Required executable part and optional exception-handling part of the function. In the executable part, at least one execution path must lead to a RETURN statement; otherwise, a runtime error occurs.

#### **Examples**

• Example 9-2, "Declaring, Defining, and Invoking a Simple PL/SQL Function"

## **Related Topics**

- Formal Parameter Declaration
- Procedure Declaration and Definition
- PL/SQL Subprograms

## **GOTO Statement**

The GOTO statement transfers control to a labeled block or statement.

If a GOTO statement exits a cursor FOR LOOP statement prematurely, the cursor closes.

## **Restrictions on GOTO Statement**

- A GOTO statement cannot transfer control into an IF statement, CASE statement, LOOP statement, or sub-block.
- A GOTO statement cannot transfer control from one IF statement clause to another, or from one CASE statement WHEN clause to another.
- A GOTO statement cannot transfer control out of a subprogram.
- A GOTO statement cannot transfer control into an exception handler.
- A GOTO statement cannot transfer control from an exception handler back into the current block (but it can transfer control from an exception handler into an enclosing block).

#### **Topics**

- Syntax
- Semantics
- Examples
- Related Topics

#### Syntax

goto\_statement ::=

**Semantics** 

goto\_statement

label

Identifies either a block or a statement (see "plsql\_block ::=", "statement ::=", and "label").

If *label* is not in the current block, then the GOTO statement transfers control to the first enclosing block in which *label* appears.

## **Examples**

Example 14-31 GOTO Statement

A label can appear before a statement.

```
DECLARE
   p VARCHAR2(30);
   n PLS_INTEGER := 37;
BEGIN
   FOR j in 2..ROUND(SQRT(n)) LOOP
    IF n MOD j = 0 THEN
        p := ' is not a prime number';
        GOTO print_now;
    END IF;
END LOOP;
   p := ' is a prime number';
```

#### <<pre><<pre>now>>

```
DBMS_OUTPUT.PUT_LINE(TO_CHAR(n) || p);
END;
/
```

## Result:

37 is a prime number

#### Example 14-32 Incorrect Label Placement

A label can only appear before a block or before a statement.

```
DECLARE

done BOOLEAN;

BEGIN

FOR i IN 1..50 LOOP

IF done THEN

GOTO end_loop;

END IF;

<cend_loop>>

END LOOP;

END;

/
```

Result:

END LOOP; \* ERROR at line 9: ORA-06550: line 9, column 3: PLS-00103: Encountered the symbol "END" when expecting one of the following: ( begin case declare exit for goto if loop mod null raise return select update while with <an identifier> <a double-quoted delimited-identifier> <a bind variable> << continue close current delete fetch lock insert open rollback savepoint set sql run commit forall merge pipe purge

#### Example 14-33 GOTO Statement Goes to Labeled NULL Statement

A label can appear before a NULL statement.

```
DECLARE

done BOOLEAN;

BEGIN

FOR i IN 1..50 LOOP

IF done THEN

GOTO end_loop;

END IF;

<<end_loop>>

NULL;

END LOOP;

END;

/
```

#### Example 14-34 GOTO Statement Transfers Control to Enclosing Block

A GOTO statement can transfer control to an enclosing block from the current block.

```
DECLARE
 v last name VARCHAR2(25);
 v emp id NUMBER(6) := 120;
BEGIN
 <<get name>>
  SELECT last name INTO v last name
 FROM employees
 WHERE employee id = v emp id;
 BEGIN
   DBMS OUTPUT.PUT LINE (v last name);
   v emp id := v emp id + 5;
    IF v emp id < 120 THEN
     GOTO get name;
   END IF;
 END;
END;
/
```

#### Result:

Weiss

## Example 14-35 GOTO Statement Cannot Transfer Control into IF Statement

The GOTO statement transfers control into an IF statement, causing an error.

```
DECLARE
valid BOOLEAN := TRUE;
BEGIN
GOTO update_row;
IF valid THEN
<<update_row>>
NULL;
END IF;
END;
/
```

Result:

```
GOTO update_row;
*
ERROR at line 4:
ORA-06550: line 4, column 3:
PLS-00375: illegal GOTO statement; this GOTO cannot branch to label
'UPDATE_ROW'
ORA-06550: line 6, column 12:
PL/SQL: Statement ignored
```

## **Related Topics**

- "Block"
- "GOTO Statement"

# **IF** Statement

The IF statement either runs or skips a sequence of one or more statements, depending on the value of a BOOLEAN expression.

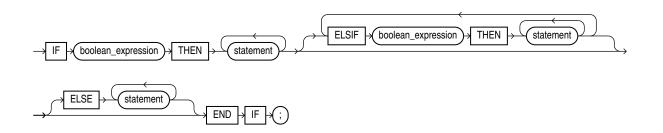

## **Topics**

- Syntax
- Semantics
- Examples
- Related Topics

## Syntax

if\_statement ::=

( boolean\_expression ::= , statement ::= )

## Semantics

## boolean\_expression

Expression whose value is TRUE, FALSE, or NULL.

The first *boolean\_expression* is always evaluated. Each other *boolean\_expression* is evaluated only if the values of the preceding expressions are FALSE.

If a *boolean\_expression* is evaluated and its value is TRUE, the statements after the corresponding THEN run. The succeeding expressions are not evaluated, and the statements associated with them do not run.

## ELSE

If no boolean expression has the value TRUE, the statements after ELSE run.

## Examples

- Example 5-1, "IF THEN Statement"
- Example 5-2, "IF THEN ELSE Statement"
- Example 5-3, "Nested IF THEN ELSE Statements"
- Example 5-4, "IF THEN ELSIF Statement"

# Implicit Cursor Attribute

An implicit cursor has attributes that return information about the most recently run SELECT or DML statement that is not associated with a named cursor.

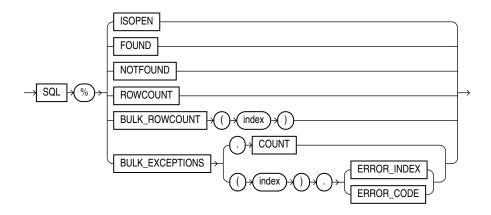

Note:You can use cursor attributes only in procedural statements, not in SQL statements.

## Topics

- Syntax
- Semantics
- Examples
- Related Topics

#### Syntax

## implicit\_cursor\_attribute ::=

#### **Semantics**

#### %ISOPEN

SQL%ISOPEN always has the value FALSE.

#### %FOUND

SQL%FOUND has one of these values:

- If no SELECT or DML statement has run, NULL.
- If the most recent SELECT or DML statement returned a row, TRUE.
- If the most recent SELECT or DML statement did not return a row, FALSE.

### %NOTFOUND

SQL%NOTFOUND has one of these values:

- If no SELECT or DML statement has run, NULL.
- If the most recent SELECT or DML statement returned a row, FALSE.
- If the most recent SELECT or DML statement did not return a row, TRUE.

## %ROWCOUNT

SQL%ROWCOUNT has one of these values:

- If no SELECT or DML statement has run, NULL.
- If a SELECT or DML statement has run, the number of rows fetched so far.

## SQL%BULK\_ROWCOUNT

Composite attribute that is like an associative array whose *i*th element is the number of rows affected by the *i*th DML statement in the most recently completed FORALL statement. For more information, see "Getting Number of Rows Affected by FORALL Statement".

## **Restriction on SQL%BULK\_ROWCOUNT**

You cannot assign the value of SQL%BULK ROWCOUNT (*index*) to another collection.

## SQL%BULK\_EXCEPTIONS

Composite attribute that is like an associative array of information about the DML statements that failed during the most recently run FORALL statement. SQL%BULK\_EXCEPTIONS.COUNT is the number of DML statements that failed. If SQL%BULK\_EXCEPTIONS.COUNT is not zero, then for each index value *i* from 1 through SQL%BULK\_EXCEPTIONS.COUNT:

- SQL%BULK EXCEPTIONS (*i*).ERROR INDEX is the number of the DML statement that failed.
- SQL%BULK EXCEPTIONS (*i*).ERROR CODE is the Oracle Database error code for the failure.

Typically, this attribute appears in an exception handler for a FORALL statement that has a SAVE EXCEPTIONS clause. For more information, see "Handling FORALL Exceptions After FORALL Statement Completes".

## Examples

## **INLINE** Pragma

The INLINE pragma specifies whether a subprogram invocation is to be inlined.

Inlining replaces a subprogram invocation with a copy of the invoked subprogram (if the invoked and invoking subprograms are in the same program unit).

## Note:

The INLINE pragma affects only the immediately following declaration or statement, and only some kinds of statements. For details, see "Subprogram Inlining".

#### Topics

- Syntax
- Semantics
- Examples
- Related Topics

## Syntax

inline\_pragma ::=

#### **Semantics**

## subprogram

Name of a subprogram. If *subprogram* is overloaded, then the INLINE pragma applies to every subprogram with that name.

## YES

If PLSQL OPTIMIZE LEVEL=2, 'YES' specifies that the subprogram invocation is to be inlined.

If PLSQL\_OPTIMIZE\_LEVEL=3, 'YES' specifies that the subprogram invocation has a high priority for inlining.

## NO

Specifies that the subprogram invocation is not to be inlined.

#### Examples

- Example 13-1, "Specifying that Subprogram Is To Be Inlined"
- Example 13-2, "Specifying that Overloaded Subprogram Is To Be Inlined"
- Example 13-3, "Specifying that Subprogram Is Not To Be Inlined"
- Example 13-4, "PRAGMA INLINE ... 'NO' Overrides PRAGMA INLINE ... 'YES'"

# Invoker's Rights and Definer's Rights Clause

Specifies the AUTHID property of a stored PL/SQL subprogram. The AUTHID property affects the name resolution and privilege checking of SQL statements that the unit issues at run time.

The invoker\_rights\_clause can appear in the following SQL statements :

- ALTER TYPE Statement
- CREATE FUNCTION Statement
- CREATE PACKAGE Statement
- CREATE PROCEDURE Statement
- CREATE TYPE Statement
- CREATE TYPE BODY Statement

#### Topics

- Syntax
- Semantics
- Related Topics

#### Syntax

invoker\_rights\_clause ::=

#### Semantics

#### invoker\_rights\_clause

When it appears in the package declaration, it specifies the AUTHID property of functions and procedures in the package, and of the explicit cursors declared in the package specification.

When it appears in a standalone function declaration, it specifies the AUTHID property of the function.

When it appears in a standalone procedure declaration, it specifies the AUTHID property of the procedure.

The invoker\_rights\_clause can appear only once in a subprogram declaration.

When it appears in an ADT, it specifies the AUTHID property of the member functions and procedures of the ADT.

## Restrictions on invoker\_rights\_clause

The following restrictions apply for types:

- This clause is valid only for ADTs, not for a nested table or VARRAY type.
- You can specify this clause for clarity if you are creating a subtype. However, a subtype inherits the AUTHID property of its supertype, so you cannot specify a different value than was specified for the supertype.
- If the supertype was created with AUTHID DEFINER, then you must create the subtype in the same schema as the supertype.
- You cannot specify the AUTHID property of SQL macros. They behave like IR units.

## **Related Topics**

In this book:

- "Invoker's Rights and Definer's Rights (AUTHID Property)"for information about the AUTHID property
- "Subprogram Properties"

## **INSERT Statement Extension**

The PL/SQL extension to the SQL INSERT statement lets you specify a record name in the values\_clause of the single\_table\_insert instead of specifying a column list in the insert\_into\_clause

Effectively, this form of the INSERT statement inserts the record into the table; actually, it adds a row to the table and gives each column of the row the value of the corresponding record field.

## See Also:

### Syntax

insert\_into\_clause ::=

values\_clause ::=

**Semantics** 

insert\_into\_clause

## dml\_table\_expression\_clause

Typically a table name. For complete information, see *Oracle Database SQL Language Reference*.

## t\_alias

An alias for dml\_table\_expression\_clause.

### values\_clause

#### record

Name of a record variable of type RECORD or %ROWTYPE. *record* must represent a row of the item explained by *dml\_table\_expression\_clause*. That is, for every column of the row, the record must have a field with a compatible data type. If a column has a NOT NULL constraint, then its corresponding field cannot have a NULL value.

# Iterator

The iterator specifies an iterand and the iteration controls.

An iterator can appear in the following statements:

- FOR LOOP Statement
- Qualified Expression

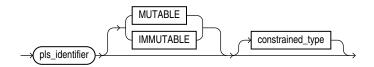

#### **Syntax**

iterator ::=

(iterand\_decl ::=, iteration\_ctl\_seq ::=)

## iterand\_decl ::=

## iteration\_ctl\_seq ::=

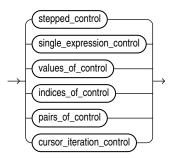

qual\_iteration\_ctl ::=

(iteration\_control ::=, pred\_clause\_seq ::=)

## iteration\_control ::=

( stepped\_control ::=, single\_expression\_control ::= , values\_of\_control ::=, indices\_of\_control ::=, pairs\_of\_control ::=, cursor\_iteration\_control ::=)

pred\_clause\_seq ::=

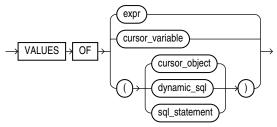

stepped\_control ::=

single\_expression\_control ::=

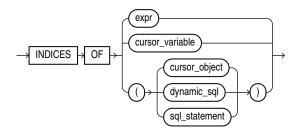

values\_of\_control ::=

(dynamic\_sql ::=)

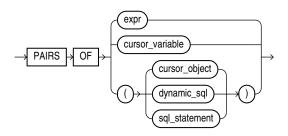

## indices\_of\_control ::=

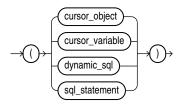

## (dynamic\_sql ::=)

pairs\_of\_control ::=

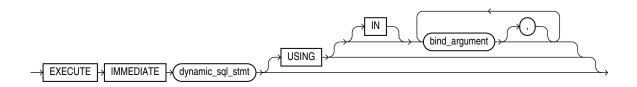

(dynamic\_sql ::=)

## cursor\_iteration\_control ::=

(dynamic\_sql ::=)

dynamic\_sql ::=

## Semantics

## iterator

The iterator specifies an iterand and the iteration controls.

Statements outside the loop cannot reference *iterator*. Statements inside the loop can reference *iterator*, but cannot change its value. After the FOR LOOP statement runs, *iterator* is undefined.

## iterand\_decl

An iterand type can be implicitly or explicitly declared. You cannot explicitly initialize an iterand.

An iterand type is implicitly declared when no type declaration follows the iterand in the loop header. The implicit type is determined by the first iteration control.

## Table 14-1 Iterand Implicit Type Defaults

Iteration Control	Implicit Iterand Type
stepped control	PLS_INTEGER
single expression	PLS_INTEGER
cursor control	CURSOR%ROWTYPE
VALUES OF control	collection element type
INDICES OF control	collection index type
PAIRS OF control	The first iterand denotes the index type of collection and the second iterand denotes the element type of collection

## pls\_identifier

The iterand name for the implicitly declared variable that is local to the FOR LOOP statement.

## [MUTABLE | IMMUTABLE ]

The mutability property of an iterand determines whether or not it can be assigned in the loop body. If all iteration controls specified in an iterator are cursor controls, the iterand is mutable by default. Otherwise, the iterand is immutable. The default mutability property of an iterand can be changed in the iterand declaration by specifying the MUTABLE or IMMUTABLE keyword after the iterand variable. The mutability property keywords are not reserved and could be used as type names. Such usage would be ambiguous. Therefore, you must explicitly specify the mutability property of an iterand in the iterand declaration if its type is named mutable or immutable. Iterand for INDICES OF iteration control and the index iterand for PAIRS OF iteration control cannot be made mutable.

## constrained\_type

An iterand is explicitly declared when the iterand type is specified in the loop header. Any constraint defined for a type is considered when assigning values to the iterand. The values generated by the iteration controls must be assignment compatible with the iterand type. Usual conversion rules apply. Exceptions are raised for all constraint violations.

## iteration\_ctl\_seq

Multiple iteration controls may be chained together by separating them with commas.

## Restriction on *iteration\_ctl\_seq*:

Because two iterands are required for the pairs of iterand, pairs of iteration controls may not be mixed with other kinds of iteration controls.

## qual\_iteration\_ctl

The qualified iteration control specifies the REVERSE option and the optional stopping and skipping predicates clauses.

## [REVERSE]

When the optional keyword REVERSE is specified, the order of values in the sequence is reversed.

You can use this option with a collection vector value expression. In that case, specifying REVERSE generates values from LAST to FIRST rather than from FIRST to LAST.

Restrictions on REVERSE:

- You cannot use this option when a pipelined function is specified in the iteration control.
- You cannot use this option with single expression iteration control since it generates a single value and therefore the keyword does not have any sensible meaning for this control.
- You cannot use this option when the iteration control specifies a SQL statement. This creates a sequence of records returned by the query. You can specify an ORDER BY clause on the SQL statement to sort the rows in the appropriate order.
- You cannot use this option when the collection is a cursor, cursor variable, dynamic SQL, or is an expression that calls a pipelined table function.

## iteration\_control

An iteration control provides a sequence of values to the iterand.

#### pred\_clause\_seq

An iteration control may be modified with an optional stopping predicate clause followed by an optional skipping predicate clause. The expressions in the predicates must have a BOOLEAN type.

#### [WHILE boolean\_expression]

A stopping predicate clause can cause the iteration control to be exhausted. The *boolean\_expression* is evaluated at the beginning of each iteration of the loop. If it fails to evaluate to TRUE, the iteration control is exhausted.

## [WHEN boolean\_expression]

A skipping predicate clause can cause the loop body to be skipped for some values. The *boolean\_expression* is evaluated. If it fails to evaluate to TRUE, the iteration control skips to the next value.

#### stepped\_control

## lower\_bound .. upper\_bound [ BY step ]

Without REVERSE, the value of *iterand* starts at *lower\_bound* and increases by *step* with each iteration of the loop until it reaches *upper bound*.

With REVERSE, the value of *iterand* starts at *upper\_bound* and decreases by *step* with each iteration of the loop until it reaches *lower\_bound*. If *upper\_bound* is less than *lower\_bound*, then the *statements* never run.

The default value for *step* is one if this optional BY clause is not specified.

*lower\_bound* and *upper\_bound* must evaluate to numbers (either numeric literals, numeric variables, or numeric expressions). If a bound does not have a numeric value, then PL/SQL raises the predefined exception VALUE\_ERROR. PL/SQL evaluates *lower\_bound* and *upper\_bound* once, when the FOR LOOP statement is entered, and stores them as temporary PLS INTEGER values, rounding them to the nearest integer if necessary.

If lower bound equals upper bound, the statements run only once.

The step value must be greater than zero.

#### single\_expression\_control

A single expression iteration control generates a single value. If REPEAT is specified, the expression will be evaluated repeatedly generating a sequence of values until a stopping clause causes the iteration control to be exhausted.

#### Restrictions on single\_expression\_control:

REVERSE is not allowed for a single expression iteration control.

#### values\_of\_control

The element type of a collection must be assignment compatible with the iterand.

#### indices\_of\_control

The index type of a collection must be assignment compatible with the iterand.

The iterand used with an INDICES OF iteration control cannot be mutable.

#### pairs\_of\_control

The PAIRS OF iteration control requires two iterands. You cannot mix the PAIRS OF iteration control with other kinds of controls. The first iterand is the index iterand and the second is the value iterand. Each iterand may be followed by an explicit type.

The element type of the collection must be assignment compatible with the value iterand. The index type of the collection must be assignment compatible with the index iterand.

The index iterand used with a PAIRS OF iteration control cannot be mutable.

#### cursor\_iteration\_control

Cursor iteration controls generate the sequence of records returned by an explicit or implicit cursor. The cursor definition is the controlling expression.

#### Restrictions on cursor\_iteration\_control:

You cannot use **REVERSE** with a cursor iteration control.

#### cursor\_object

A *cursor\_object* is an explicit PL/SQL cursor object.

## sql\_statement

A *sql\_statement* is an implicit PL/SQL cursor object created for a SQL statement specified directly in the iteration control.

#### cursor\_variable

Name of a previously declared variable of a REF CURSOR object.

## dynamic\_sql

## EXECUTE IMMEDIATE dynamic\_sql\_stmt [ USING [ IN ] (bind\_argument [,] )+]

You can use a dynamic query in place of an implicit cursor definition in a cursor or collection iteration control. Such a construct cannot provide a default type; if it is used as the first iteration control, an explicit type must be specified for the iterand, or for the value iterand for a pairs of control.

The optional USING clause is the only clause allowed with the dynamic SQL. It can only possibly have IN one or more bind variable, each separated by a comma.

## dynamic\_sql\_stmt

String literal, string variable, or string expression that represents a SQL statement. Its type must be either CHAR, VARCHAR2, or CLOB.

## Caution:

When using dynamic SQL, beware of SQL injection, a security risk. For more information about SQL injection, see "SQL Injection".

# Named Cursor Attribute

Every named cursor (explicit cursor or cursor variable) has four attributes, each of which returns information about the execution of a DML statement.

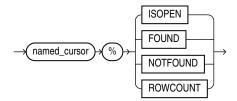

Note: You can use cursor attributes only in procedural statements, not in SQL statements.

## Topics

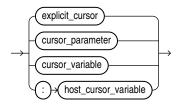

- Syntax
- Semantics
- Examples
- Related Topics

## Syntax

named\_cursor\_attribute ::=

## named\_cursor ::=

## Semantics

## named\_cursor\_attribute

## %ISOPEN

named\_cursor%ISOPEN has the value TRUE if the cursor is open, and FALSE if it is not open.

## %FOUND

named cursor%FOUND has one of these values:

- If the cursor is not open, INVALID CURSOR
- If cursor is open but no fetch was tried, NULL.
- If the most recent fetch returned a row, TRUE.
- If the most recent fetch did not return a row, FALSE.

## %NOTFOUND

named cursor%NOTFOUND has one of these values:

- If cursor is not open, INVALID CURSOR.
- If cursor is open but no fetch was tried, NULL.
- If the most recent fetch returned a row, FALSE.
- If the most recent fetch did not return a row, TRUE.

#### %ROWCOUNT

named cursor%ROWCOUNT has one of these values:

- If cursor is not open, INVALID CURSOR.
- If cursor is open, the number of rows fetched so far.

named\_cursor

#### explicit\_cursor

Name of an explicit cursor.

#### cursor\_parameter

Name of a formal cursor parameter.

#### cursor\_variable

Name of a cursor variable.

## :host\_cursor\_variable

Name of a cursor variable that was declared in a PL/SQL host environment and passed to PL/SQL as a bind variable. Do not put space between the colon (:) and *host cursor variable*.

#### **Examples**

- Example 7-14, "%ISOPEN Explicit Cursor Attribute"
- Example 7-15, "%FOUND Explicit Cursor Attribute"

# **NULL Statement**

The NULL statement is a "no-op" (no operation)—it only passes control to the next statement.

The NULL statement and the BOOLEAN value NULL are not related.

**Topics** 

- Syntax
- Examples
- Related Topics

Note:

Syntax

null\_statement ::=

## Examples

- Example 5-30, "NULL Statement Showing No Action"
- Example 5-31, "NULL Statement as Placeholder During Subprogram Creation"

## **Related Topics**

"NULL Statement"

## **OPEN** Statement

The OPEN statement opens an explicit cursor, allocates database resources to process the associated query, identifies the result set, and positions the cursor before the first row of the result set.

If the query has a FOR UPDATE clause, the OPEN statement locks the rows of the result set.

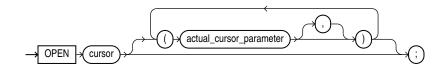

**Topics** 

- Syntax
- Semantics
- Examples
- Related Topics

## Syntax

#### open\_statement ::=

## Semantics

#### cursor

Name of an explicit cursor that is not open.

## actual\_cursor\_parameter

List of actual parameters for the cursor that you are opening. An actual parameter can be a constant, initialized variable, literal, or expression. The data type of each actual parameter must be compatible with the data type of the corresponding formal parameter.

You can specify actual cursor parameters with either positional notation or named notation. For information about these notations, see "Positional, Named, and Mixed Notation for Actual Parameters".

If the cursor specifies a default value for a parameter, you can omit that parameter from the parameter list. If the cursor has no parameters, or specifies a default value for every parameter, you can either omit the parameter list or specify an empty parameter list.

## Examples

- Example 7-11, "Explicit Cursor that Accepts Parameters"
- Example 7-12, "Cursor Parameters with Default Values"

#### **Related Topics**

- "CLOSE Statement"
- "Explicit Cursor Declaration and Definition"
- "FETCH Statement"
- "OPEN FOR Statement"

In other chapters:

- "Opening and Closing Explicit Cursors"
- "Explicit Cursors that Accept Parameters"

# **OPEN FOR Statement**

The OPEN FOR statement associates a cursor variable with a query, allocates database resources to process the query, identifies the result set, and positions the cursor before the first row of the result set.

If the query has a FOR UPDATE clause, then the OPEN FOR statement locks the rows of the result set.

Topics

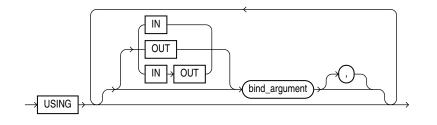

- Syntax
- Semantics
- Examples
- Related Topics

**Syntax** 

open\_for\_statement ::=

#### using\_clause ::=

## Semantics

open\_for\_statement

#### cursor\_variable

Name of a cursor variable. If *cursor\_variable* is the formal parameter of a subprogram, then it must not have a return type. For information about cursor variables as subprogram parameters, see "Cursor Variables as Subprogram Parameters".

#### :host\_cursor\_variable

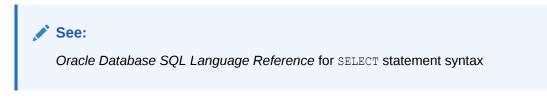

Name of a cursor variable that was declared in a PL/SQL host environment and passed to PL/SQL as a bind variable. Do not put space between the colon (:) and *host\_cursor\_variable*.

The data type of a host cursor variable is compatible with the return type of any PL/SQL cursor variable.

#### select\_statement

SQL SELECT statement (not a PL/SQL SELECT INTO statement). Typically, *select\_statement* returns multiple rows.

## dynamic\_string

String literal, string variable, or string expression of the data type CHAR, VARCHAR2, or CLOB, which represents a SQL SELECT statement. Typically, *dynamic\_statement* represents a SQL SELECT statement that returns multiple rows.

## using\_clause

Specifies bind variables, using positional notation.

## Note:

If you repeat placeholder names in *dynamic\_sql\_statement*, be aware that the way placeholders are associated with bind variables depends on the kind of dynamic SQL statement. For details, see "Repeated Placeholder Names in Dynamic SQL Statements."

## Restriction on using\_clause

Use if and only if <code>select\_statement</code> or <code>dynamic\_sql\_stmt</code> includes placeholders for bind variables.

## IN, OUT, IN OUT

Parameter modes of bind variables. An IN bind variable passes its value to the select\_statement or dynamic\_string. An OUT bind variable stores a value that dynamic\_string returns. An IN OUT bind variable passes its initial value to dynamic\_string and stores a value that dynamic string returns. Default: IN.

## bind\_argument

Expression whose value replaces its corresponding placeholder in *select\_statement* or *dynamic string* at run time. You must specify a *bind argument* for every placeholder.

## Note:

Bind variables can be evaluated in any order. If a program determines order of evaluation, then at the point where the program does so, its behavior is undefined.

## **Restrictions on** *bind\_argument*

- *bind argument* cannot be an associative array indexed by string.
- bind argument cannot be the reserved word NULL.

To pass the value NULL to the dynamic SQL statement, use an uninitialized variable where you want to use NULL, as in Example 8-7.

## Examples

- "Opening and Closing Cursor Variables"
- "OPEN FOR, FETCH, and CLOSE Statements"

# PARALLEL\_ENABLE Clause

Enables the function for parallel execution, making it safe for use in concurrent sessions of parallel DML evaluations.

Indicates that the function can run from a parallel execution server of a parallel query operation.

The PARALLEL ENABLE clause can appear in the following SQL statements:

- CREATE FUNCTION Statement
- CREATE PACKAGE Statement
- CREATE TYPE BODY Statement

## Topics

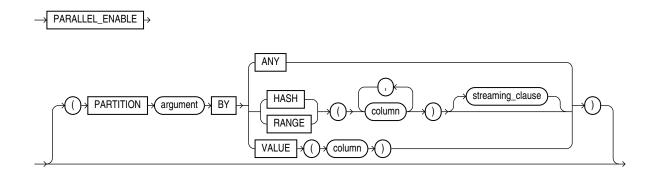

- Syntax
- Semantics

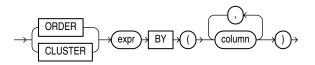

Related Topics

Syntax

parallel\_enable\_clause ::=

#### streaming\_clause ::=

## Semantics

#### parallel\_enable\_clause

The *parallel\_enable\_clause* can appear only once in the function.

The function must not use session state, such as package variables, because those variables are not necessarily shared among the parallel execution servers.

Use the optional PARTITION *argument* BY clause only with a function that has a REF CURSOR data type. This clause lets you define the partitioning of the inputs to the function from the REF CURSOR argument. Partitioning the inputs to the function affects the way the query is parallelized when the function is used as a table function in the FROM clause of the query.

## ANY

Indicates that the data can be partitioned randomly among the parallel execution servers

## Note:

You can partition weak cursor variable arguments to table functions only with ANY, not with RANGE, HASH, or VALUE.

## **RANGE or HASH**

Partitions data into specified columns that are returned by the REF CURSOR argument of the function.

### streaming\_clause

The optional *streaming clause* lets you order or cluster the parallel processing.

## ORDER BY | CLUSTER BY

ORDER BY or CLUSTER BY indicates that the rows on a parallel execution server must be locally ordered and have the same key values as specified by the *column* list.

## VALUE

Specifies direct-key partitioning, which is intended for table functions used when executing MapReduce workloads. The *column* must be of data type NUMBER. VALUE distributes row processing uniformly over the available reducers.

If the column has more reducer numbers than there are available reducers, then PL/SQL uses a modulus operation to map the reducer numbers in the column into the correct range.

When calculating the number of the reducer to process the corresponding row, PL/SQL treats a negative value as zero and rounds a positive fractional value to the nearest integer.

## See Also:

*Oracle Database Data Cartridge Developer's Guide* for information about using parallel table functions

#### expr

*expr* identifies the REF CURSOR parameter name of the table function on which partitioning was specified, and on whose columns you are specifying ordering or clustering for each concurrent session in a parallel query execution.

#### Restriction on parallel\_enable\_clause

You cannot specify the *parallel\_enable\_clause* for a nested function or SQL macro.

#### **Related Topics**

In this chapter:

Function Declaration and Definition

In other chapters:

- Overview of Table Functions
- Creating Pipelined Table Functions

# **PIPE ROW Statement**

The PIPE ROW statement, which can appear only in the body of a pipelined table function, returns a table row (but not control) to the invoker of the function.

## Note:

- If a pipelined table function is part of an autonomous transaction, then it must COMMIT or ROLLBACK before each PIPE ROW statement, to avoid an error in the invoking subprogram.
- To improve performance, the PL/SQL runtime system delivers the piped rows to the invoker in batches.

## Topics

- Syntax
- Semantics
- Examples
- Related Topics

#### Syntax

pipe\_row\_statement ::=

## Semantics

#### pipe\_row\_statement

#### row

Row (table element) that the function returns to its invoker, represented by an expression whose type is that of the table element.

If the expression is a record variable, it must be explicitly declared with the data type of the table element. It cannot be declared with a data type that is only structurally identical to the element type. For example, if the element type has a name, then the record variable cannot be declared explicitly with %TYPE or %ROWTYPE or implicitly with %ROWTYPE in a cursor FOR LOOP statement.

## Examples

- Example 13-30, "Creating and Invoking Pipelined Table Function"
- Example 13-31, "Pipelined Table Function Transforms Each Row to Two Rows"
- Example 13-33, "Pipelined Table Function with Two Cursor Variable Parameters"
- Example 13-34, "Pipelined Table Function as Aggregate Function"

- Example 13-35, "Pipelined Table Function Does Not Handle NO\_DATA\_NEEDED"
- Example 13-36, "Pipelined Table Function Handles NO\_DATA\_NEEDED"

#### **Related Topics**

In this chapter:

"Function Declaration and Definition"

In other chapters:

"Creating Pipelined Table Functions"

## **PIPELINED** Clause

Instructs the database to iteratively return the results of a **table function** or **polymorphic table function** .

Use only with a table function, to specify that it is pipelined. A pipelined table function returns a row to its invoker immediately after processing that row and continues to process rows. To return a row (but not control) to the invoker, the function uses the "PIPE ROW Statement".

A table function returns a collection type.

A polymorphic table function is a table function whose return type is determined by the arguments.

You query both kinds of table functions by using the TABLE keyword before the function name in the FROM clause of the query. For example:

SELECT \* FROM TABLE(function\_name(...))

The TABLE operator is optional when the table function arguments list or empty list () appears. For example:

```
SELECT * FROM function_name()
```

the database then returns rows as they are produced by the function.

The PIPELINED option can appear in the following SQL statements:

- CREATE FUNCTION Statement
- CREATE PACKAGE Statement
- CREATE PACKAGE BODY Statement

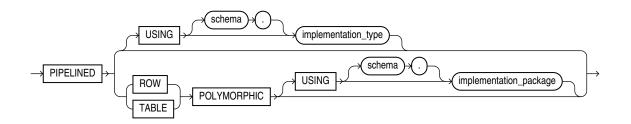

#### Topics

- Syntax
- Semantics
- Examples
- Related Topics

## Syntax

pipelined\_clause ::=

## Semantics

pipelined\_clause

The *pipelined\_clause* can appear only once in the function.

## PIPELINED

To make a pipelined function, include the *pipelined\_clause* in the function definition. If you declare the pipelined function before defining it, you must specify the <code>PIPELINED</code> option in the function declaration.

## { IS | USING }

- If you specify the keyword PIPELINED alone (PIPELINED IS ...), then the PL/SQL function body must use the PIPE keyword. This keyword instructs the database to return single elements of the collection out of the function, instead of returning the whole collection as a single value.
- You can specify the PIPELINED USING *implementation\_type* clause to predefine an interface containing the start, fetch, and close operations. The implementation type must implement the ODCITable interface and must exist at the time the table function is created. This clause is useful for table functions implemented in external languages such as C++ and Java.

If the return type of the function is ANYDATASET, then you must also define a describe method (ODCITableDescribe) as part of the implementation type of the function.

## [schema.] implementation\_type

The implementation type must be an ADT containing the implementation of the ODCIAggregate subprograms. If you do not specify *schema*, then the database assumes that the implementation type is in your schema.

## **Restriction on PIPELINED**

You cannot specify PIPELINED for a nested function or a SQL macro.

## Note:

You cannot run a pipelined table function over a database link. The reason is that the return type of a pipelined table function is a SQL user-defined type, which can be used only in a single database (as explained in *Oracle Database Object-Relational Developer's Guide*). Although the return type of a pipelined table function might appear to be a PL/SQL type, the database actually converts that PL/SQL type to a corresponding SQL user-defined type.

# PIPELINED [ ROW | TABLE ] POLYMORPHIC [ USING [schema.] implementation\_package ]

The polymorphic table function elaborator can appear in standalone function declaration or package function declaration.

## PIPELINED

Required when defining a polymorphic table function.

## ROW

Specify ROW when a single input argument of type TABLE determines new columns using any single row.

## TABLE

Specify TABLE when a single input argument of type TABLE determines the new columns using the current row and operates on an entire table or a logical partition of a table.

#### POLYMORPHIC

#### Restrictions on POLYMORPHIC

The following are not allowed for POLYMORPHIC table functions:

- PARALLEL\_ENABLE clause
- RESULT\_CACHE clause
- DETERMINISTIC option
- AUTHID property (Invoker's Rights and Definer's Rights Clause)

## [USING [schema.] implementation\_package]

References the polymorphic table function (PTF) implementation package. The specification must include DESCRIBE method. The specification of OPEN, FETCH\_ROWS and CLOSE methods is optional. The specification for the implementation package must already exist (unless the PTF and its implementation reside in the same package).

If a polymorphic table function and its implementation methods are defined in the same package, then the USING clause is optional.

## Procedure Declaration and Definition

Before invoking a procedure, you must declare and define it. You can either declare it first (with *procedure\_declaration*) and then define it later in the same block, subprogram, or package (with *procedure\_definition*) or declare and define it at the same time (with *procedure\_definition*).

A **procedure** is a subprogram that performs a specific action. A procedure invocation (or call) is a statement.

A procedure declaration is also called a procedure specification or procedure spec.

## Note:

For more information about standalone procedures, see "CREATE PROCEDURE Statement". For more information about package procedures, see "CREATE PACKAGE Statement".

#### Topics

- Syntax
- Semantics
- Examples
- Related Topics

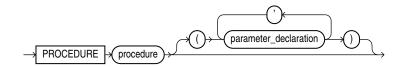

## Syntax

procedure\_declaration ::=

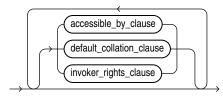

(procedure\_properties ::= )

procedure\_heading ::=

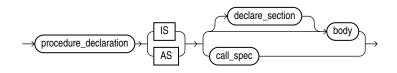

See "parameter\_declaration ::=".

procedure\_properties ::=

( accessible\_by\_clause ::= , default\_collation\_clause ::= , invoker\_rights\_clause ::= )

procedure\_definition ::=

( body ::= , declare\_section ::= , call\_spec ::= )

## Semantics

#### procedure\_declaration

Declares a procedure, but does not define it. The definition must appear later in the same block, subprogram, or package as the declaration.

## procedure\_heading

procedure

Name of the procedure that you are declaring or defining.

## procedure\_properties

Each procedure property can appear only once in the procedure declaration. The properties can appear in any order. Properties appear before the IS or AS keyword in the heading. The properties cannot appear in nested procedures. Only the ACCESSIBLE BY property can appear in package procedures.

Standalone procedures may have the following properties in their declaration.

- ACCESSIBLE BY Clause
- DEFAULT COLLATION Clause
- Invoker's Rights and Definer's Rights (AUTHID Property)

#### procedure\_definition

Either defines a procedure that was declared earlier or both declares and defines a procedure.

#### declare\_section

Declares items that are local to the procedure, can be referenced in body, and cease to exist when the procedure completes execution.

## body

Required executable part and optional exception-handling part of the procedure.

## Examples

• Example 9-1, "Declaring, Defining, and Invoking a Simple PL/SQL Procedure"

## **Related Topics**

## Qualified Expression

Using qualified expressions, you can declare and define a complex value in a compact form where the value is needed.

Qualified expressions appear in:

- Collection Variable Declaration
- Expression

#### Topics

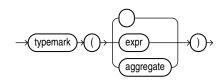

- Syntax
- Semantics

- Examples
- Related Topics

Syntax

qualified\_expression ::=

(typemark ::=, aggregate ::=)

typemark ::=

type\_name ::=

aggregate ::=

(positional\_choice\_list ::=, explicit\_choice\_list ::= others\_choice ::=)

positional\_choice\_list ::=

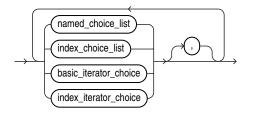

sequence\_iterator\_choice ::=

explicit\_choice\_list ::=

(named\_choice\_list ::=, indexed\_choice\_list ::=, basic\_iterator\_choice ::=, index\_iterator\_choice ::=)

named\_choice\_list ::=

Т identifier expr )→ =>

indexed\_choice\_list ::=

basic\_iterator\_choice ::=

(iterator ::=)

index\_iterator\_choice ::=

(iterator ::=)

others\_choice ::=

## Semantics

#### qualified\_expression

Qualified expressions for RECORD types are allowed in any context where an expression of RECORD type is allowed.

Qualified expressions for associative array types are allowed in any context where an expression of associative array type is allowed.

## typemark ( aggregate )

Specifies explicitly the type of the aggregate (qualified items).

#### typemark

Qualified expressions use an explicit type indication to provide the type of the qualified item. This explicit indication is known as a *typemark*.

## type\_name

## [identifier . ]identifier

Indicates the type of the qualified item.

#### aggregate

A qualified expression combines expression elements to create values of a RECORD type, or associative array type.

#### positional\_choice\_list

## expr[,]

Positional association is allowed for qualified expressions of RECORD type.

A positional association may not follow a named association in the same construct (and vice versa).

#### sequence\_iterator\_choice

#### FOR *iterator* SEQUENCE => *expr*

The sequence iterator choice association is a positional argument and may be intermixed freely with other positional arguments. All positional arguments must precede any non-positional arguments. Sequence iteration is not allowed for INDEX BY VARCHAR2 arrays.

#### explicit\_choice\_list

## named\_choice\_list | indexed\_choice\_list | basic\_iterator\_choice | index\_iterator\_choice

Named choices must use names of fields from the qualifying structure type. Index key values must be compatible with the index type for the qualifying vector type.

#### named\_choice\_list

A named choice applies only to structured types

## identifier => expr [ , ]

Named association is allowed for qualified expressions of RECORD type.

## indexed\_choice\_list

An index choice applies only to vector types.

## *expr* => *expr* [ , ]

Indexed choices (key-value pairs) is allowed for qualified expressions of associative array types. Both the key and the value may be expressions.

Using NULL as an index key value is not permitted with associative array type constructs.

## basic\_iterator\_choice

## FOR *iterator* => *expr*

The basic iterator choice association uses the iterand as an index.

## **Restrictions:**

The PAIRS OF iteration control may not be used with the basic iterator choice association.

## index\_iterator\_choice

## FOR iterator INDEX expr => expr

The index iterator choice association provides an index expression along with the value expression.

## others\_choice

You can use the OTHERS selector in aggregates for record types and aggregates for varrays. The OTHERS choice must be your final choice.

## Examples

- Assigning Values to RECORD Type Variables Using Qualified Expressions, "Assigning Values to RECORD Type Variables Using Qualified Expressions"
- Example 6-11, "Assigning Values to Associative Array Type Variables Using Qualified Expressions"
- Example 6-8, "Iterator Choice Association in Qualified Expressions"
- Example 6-9, "Index Iterator Choice Association in Qualified Expressions"

- Assigning Values to Record Variables

## **RAISE Statement**

The RAISE statement explicitly raises an exception.

Outside an exception handler, you must specify the exception name. Inside an exception handler, if you omit the exception name, the RAISE statement reraises the current exception.

**Topics** 

- Syntax
- Semantics
- Examples
- Related Topics

Syntax

raise\_statement ::=

#### **Semantics**

#### exception

Name of an exception, either predefined (see Table 12-3) or user-declared (see "Exception Declaration").

*exception* is optional only in an exception handler, where the default is the current exception (see "Reraising Current Exception with RAISE Statement").

## Examples

- Example 12-10, "Declaring, Raising, and Handling User-Defined Exception"
- Example 12-11, "Explicitly Raising Predefined Exception"
- Example 12-12, "Reraising Exception"

#### **Related Topics**

In this chapter:

- "Exception Declaration"
- "Exception Handler"

In other chapters:

"Raising Exceptions Explicitly"

## **Record Variable Declaration**

A **record variable** is a composite variable whose internal components, called fields, can have different data types. The value of a record variable and the values of its fields can change.

You reference an entire record variable by its name. You reference a record field with the syntax record.field.

You can create a record variable in any of these ways:

- Define a record type and then declare a variable of that type.
- Use %ROWTYPE to declare a record variable that represents either a full or partial row of a database table or view.
- Use %TYPE to declare a record variable of the same type as a previously declared record variable.

## **Topics**

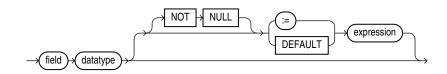

- Syntax
- Semantics
- Examples
- Related Topics

## Syntax

record\_type\_definition ::=

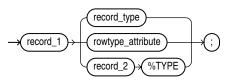

field\_definition ::=

( datatype ::= , expression ::= )

## record\_variable\_declaration ::=

ORACLE

(rowtype\_attribute ::=)

Semantics

record\_type\_definition

## record\_type

Name of the record type that you are defining.

field\_definition

## field

Name of the field that you are defining.

## datatype

Data type of the field that you are defining.

#### NOT NULL

Imposes the NOT NULL constraint on the field that you are defining.

For information about this constraint, see "NOT NULL Constraint".

#### expression

Expression whose data type is compatible with *datatype*. When *record\_variable\_declaration* is elaborated, the value of *expression* is assigned to *record\_field*. This value is the initial value of the field.

#### record\_variable\_declaration

#### record\_1

Name of the record variable that you are declaring.

#### record\_type

Name of a previously defined record type. record type is the data type of record 1.

#### rowtype\_attribute

See "%ROWTYPE Attribute".

#### record\_2

Name of a previously declared record variable.

## %TYPE

See "%TYPE Attribute".

## Examples

- Example 6-41, "RECORD Type Definition and Variable Declaration"
- Example 6-42, "RECORD Type with RECORD Field (Nested Record)"
- Example 6-43, "RECORD Type with Varray Field"

#### **Related Topics**

- "Collection Variable Declaration"
- "%ROWTYPE Attribute"

In other chapters:

"Record Topics"

# RESTRICT\_REFERENCES Pragma

The RESTRICT\_REFERENCES pragma asserts that a user-defined subprogram does not read or write database tables or package variables.

## Note:

The RESTRICT\_REFERENCES pragma is deprecated. Oracle recommends using DETERMINISTIC and PARALLEL ENABLE instead of RESTRICT REFERENCES.

Subprograms that read or write database tables or package variables are difficult to optimize, because any invocation of the subprogram might produce different results or encounter errors. If a statement in a user-defined subprogram violates an assertion made by RESTRICT\_REFERENCES, then the PL/SQL compiler issues an error message when it parses that statement, unless you specify TRUST.

Typically, this pragma is specified for functions. If a function invokes procedures, then specify this pragma for those procedures also.

## Restrictions on RESTRICT\_REFERENCES Pragma

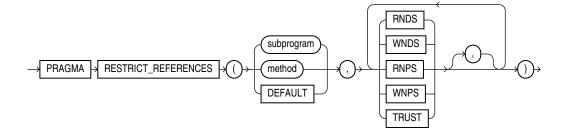

- This pragma can appear only in a package specification or ADT specification.
- Only one **RESTRICT** REFERENCES pragma can reference a given subprogram.

## Topics

- Syntax
- Semantics

#### **Syntax**

restrict\_references\_pragma ::=

#### **Semantics**

subprogram

Name of a user-defined subprogram, typically a function. If *subprogram* is overloaded, the pragma applies only to the most recent subprogram declaration.

#### method

Name of a MEMBER subprogram. See "CREATE TYPE Statement" for more information.

## DEFAULT

Applies the pragma to all subprograms in the package specification or ADT specification (including the system-defined constructor for ADTs).

If you also declare the pragma for an individual subprogram, it overrides the DEFAULT pragma for that subprogram.

## RNDS

Asserts that the subprogram reads no database state (does not query database tables).

## WNDS

Asserts that the subprogram writes no database state (does not modify tables).

## RNPS

Asserts that the subprogram reads no package state (does not reference the values of package variables)

## **Restriction on RNPS**

You cannot specify RNPS if the subprogram invokes the SQLCODE or SQLERRM function.

## WNPS

Asserts that the subprogram writes no package state (does not change the values of package variables).

## **Restriction on WNPS**

You cannot specify WNPS if the subprogram invokes the SQLCODE or SQLERRM function.

## TRUST

Asserts that the subprogram can be trusted not to violate the other specified assertions and prevents the PL/SQL compiler from checking the subprogram body for violations. Skipping these checks can improve performance.

If your PL/SQL subprogram invokes a C or Java subprogram, then you must specify TRUST for either the PL/SQL subprogram or the C or Java subprogram, because the PL/SQL compiler cannot check a C or Java subprogram for violations at run time.

## Note:

To invoke a subprogram from a parallelized DML statement, you must specify all four constraints—RNDS, WNDS, RNPS, and WNPS. No constraint implies another.

## See Also:

Oracle Database Development Guide for information about using PRAGMA RESTRICT REFERENCES in existing applications

## **RETURN Statement**

The RETURN statement immediately ends the execution of the subprogram or anonymous block that contains it.

In a function, the RETURN statement assigns a specified value to the function identifier and returns control to the invoker, where execution resumes immediately after the invocation (possibly inside the invoking statement). Every execution path in a function must lead to a RETURN statement (otherwise, the PL/SQL compiler issues compile-time warning PLW-05005).

In a procedure, the RETURN statement returns control to the invoker, where execution resumes immediately after the invocation.

In an anonymous block, the RETURN statement exits its own block and all enclosing blocks.

A subprogram or anonymous block can contain multiple RETURN statements.

## Note:

The RETURN statement differs from the RETURN clause in a function heading, which specifies the data type of the return value.

#### Topics

- Syntax
- Semantics
- Examples
- Related Topics

Syntax

return\_statement ::=

(expression ::=)

**Semantics** 

expression

Optional when the RETURN statement is in a pipelined table function. Required when the RETURN statement is in any other function. Not allowed when the RETURN statement is in a procedure or anonymous block.

The RETURN statement assigns the value of *expression* to the function identifier. Therefore, the data type of *expression* must be compatible with the data type in the RETURN clause of the function. For information about expressions, see "Expression".

## Examples

- Example 9-3, "Execution Resumes After RETURN Statement in Function"
- Example 9-4, "Function Where Not Every Execution Path Leads to RETURN Statement"
- Example 9-5, "Function Where Every Execution Path Leads to RETURN Statement"
- Example 9-6, "Execution Resumes After RETURN Statement in Procedure"

## **RETURNING INTO Clause**

The RETURNING INTO clause specifies the variables in which to store the values returned by the statement to which the clause belongs.

The variables can be either individual variables or collections. If the statement affects no rows, then the values of the variables are undefined.

The static RETURNING INTO clause belongs to a DELETE, INSERT, UPDATE, or MERGE statement. The dynamic RETURNING INTO clause belongs to the EXECUTE IMMEDIATE statement.

#### Note:

You cannot use the RETURNING INTO clause for remote or parallel deletes.

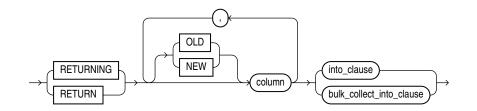

## **Topics**

- Syntax
- Semantics
- Examples
- Related Topics

#### Syntax

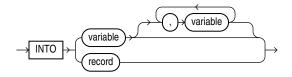

static\_returning\_clause ::=

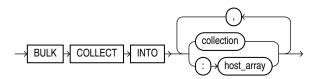

dynamic\_returning\_clause ::=

#### into\_clause ::=

bulk\_collect\_into\_clause ::=

#### **Semantics**

## static\_returning\_clause

## OLD | NEW

Given columns c1 and c2 in a table, you can specify OLD for column c1 (for example OLD c1). You can also specify OLD for a column referenced by a column expression (for example c1+OLD c2) or on a column referenced by an aggregate function (for example AVG(OLD c1)). When OLD is specified for a column, the column value before the execution of an associated INSERT, UPDATE, MERGE, or DELETE statement is returned. In the case of a column referenced by a column expression, what is returned is the result from evaluating the column expression using the column value before the DML statement is executed.

NEW can be explicitly specified for a column, a column referenced in an expression, or a column referenced by an aggregate function to return a column value after the INSERT, UPDATE, MERGE, or DELETE statement, or an expression result that uses the after execution value of a column.

When OLD and NEW are both omitted for a column or an expression, the post DML execution column value (pre-execution value for DELETE), or the expression result computed using the column values after DML execution, is returned.

Note that it is valid to specify OLD and NEW on constants (for example, OLD 1), however, the keywords are ignored. OLD and NEW are not currently supported on virtual columns.

## Note:

While UPDATE statements have both before and after update column values, INSERT statements have no OLD column value and DELETE statements have no NEW column value. Although using OLD and NEW in these cases is valid, nothing is returned.

#### column

Expression whose value is the name of a column of a database table.

## into\_clause

Specifies the variables or record in which to store the column values that the statement returns.

## Restriction on into\_clause

Use into\_clause in dynamic\_returning\_clause if and only if dynamic\_sql\_stmt (which appears in "EXECUTE IMMEDIATE Statement") returns a single row.

#### record

The name of a record variable in which to store the row that the statement returns. For each *select\_list* item in the statement, the record must have a corresponding, type-compatible field.

#### variable

Either the name of a scalar variable in which to store a column that the statement returns or the name of a host cursor variable that is declared in a PL/SQL host environment and passed to PL/SQL as a bind variable. Each *select\_list* item in the statement must have a corresponding, type-compatible variable. The data type of a host cursor variable is compatible with the return type of any PL/SQL cursor variable.

## bulk\_collect\_into\_clause

Specifies one or more existing collections or host arrays in which to store the rows that the statement returns. For each *select\_list* item in the statement, *bulk\_collect\_into\_clause* must have a corresponding, type-compatible *collection* or *host\_array*.

For the reason to use this clause, see "Bulk SQL and Bulk Binding".

#### Restrictions on bulk\_collect\_into\_clause

• Use the bulk\_collect\_into\_clause clause in dynamic\_returning\_clause if and only if dynamic\_sql\_stmt (which appears in "EXECUTE IMMEDIATE Statement") can return multiple rows.

- You cannot use bulk\_collect\_into\_clause in client programs.
- When the statement that includes bulk\_collect\_into\_clause requires implicit data type
  conversions, bulk\_collect\_into\_clause can have only one collection or host\_array.

#### collection

Name of a collection variable in which to store the rows that the statement returns.

#### **Restrictions on collection**

- collection cannot be the name of an associative array that is indexed by a string.
- When the statement requires implicit data type conversions, *collection* cannot be the name of a collection of a composite type.

## :host\_array

Name of an array declared in a PL/SQL host environment and passed to PL/SQL as a bind variable. Do not put space between the colon (:) and *host\_array*.

## Examples

- Example 6-58, "UPDATE Statement Assigns Values to Record Variable"
- Example 7-1, "Static SQL Statements"
- Example 13-25, "Returning Deleted Rows in Two Nested Tables"
- Example 13-26, "Returning NEW and OLD Values of Updated Rows"

## **RESULT\_CACHE Clause**

Indicates to store the function results into the server result cache.

The RESULT\_CACHE clause can appear in the following SQL statements:

- CREATE FUNCTION Statement
- CREATE TYPE BODY Statement

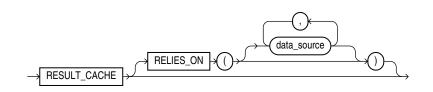

#### Topics

- Syntax
- Semantics
- Examples
- Related Topics

#### Syntax

#### result\_cache\_clause ::=

## Semantics

## result\_cache\_clause

result\_cache\_clause can appear only once in the function.

## **RESULT\_CACHE**

To make a function result-cached, include the RESULT\_CACHE clause in the function definition. If you declare the function before defining it, you must also include the RESULT\_CACHE option in the function declaration.

## **Restriction on RESULT\_CACHE**

- RESULT CACHE is disallowed on functions with OUT or IN OUT parameters.
- RESULT\_CACHE is disallowed on functions with IN or RETURN parameter of (or containing) these types:
  - BLOB
  - CLOB
  - NCLOB
  - REF CURSOR
  - Collection
  - Object
  - Record or PL/SQL collection that contains an unsupported return type
- RESULT\_CACHE is disallowed on function in an anonymous block.
- RESULT\_CACHE is disallowed on pipelined table function, nested function and SQL macro.

#### **RELIES\_ON**

Specifies the data sources on which the results of the function depend. Each *data\_source* is the name of either a database table or view.

## Note:

- This clause is deprecated. As of Oracle Database 12c, the database detects all data sources that are queried while a result-cached function is running, and RELIES ON clause does nothing.
- You cannot use **RELIES** ON clause in a function declared in an anonymous block.

#### Examples

Examples of Result-Cached Functions

#### **Related Topics**

Function Declaration and Definition

In other chapters:

PL/SQL Function Result Cache

In other books:

• Oracle Database Performance Tuning Guide

## %ROWTYPE Attribute

The &ROWTYPE attribute lets you declare a record that represents either a full or partial row of a database table or view.

For every visible column of the full or partial row, the record has a field with the same name and data type. If the structure of the row changes, then the structure of the record changes accordingly. Making an invisible column visible changes the structure of some records declared with the <code>%ROWTYPE</code> attribute.

The record fields do not inherit the constraints or initial values of the corresponding columns.

The %ROWTYPE attribute cannot be used if the referenced character column has a collation other than USING NLS COMP.

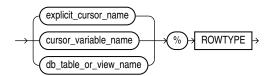

#### **Topics**

- Syntax
- Semantics
- Examples
- Related Topics

## Syntax

## rowtype\_attribute ::=

#### **Semantics**

#### rowtype\_attribute

#### explicit\_cursor\_name

Name of an explicit cursor. For every column selected by the query associated with *explicit cursor name*, the record has a field with the same name and data type.

#### cursor\_variable\_name

Name of a strong cursor variable. For every column selected by the query associated with *cursor variable name*, the record has a field with the same name and data type.

#### db\_table\_or\_view\_name

Name of a database table or view that is accessible when the declaration is elaborated. For every column of *db\_table\_or\_view\_name*, the record has a field with the same name and data type.

#### **Examples**

- Example 6-45, "%ROWTYPE Variable Represents Full Database Table Row"
- Example 6-46, "%ROWTYPE Variable Does Not Inherit Initial Values or Constraints"

## Scalar Variable Declaration

A scalar variable stores a value with no internal components. The value can change. A scalar variable declaration specifies the name and data type of the variable and allocates storage for it.

The declaration can also assign an initial value and impose the NOT NULL constraint.

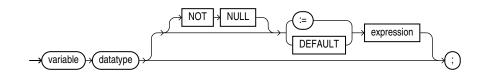

You reference a scalar variable by its name.

#### **Topics**

- Syntax
- Semantics
- Examples
- Related Topics

#### Syntax

## variable\_declaration ::=

## ( expression ::= )

## Semantics

#### variable\_declaration

#### variable

Name of the variable that you are declaring.

## datatype

Name of a scalar data type, including any qualifiers for size, precision, and character or byte semantics.

For information about scalar data types, see "PL/SQL Data Types".

## NOT NULL

Imposes the NOT NULL constraint on the variable. For information about this constraint, see "NOT NULL Constraint".

#### expression

Value to be assigned to the variable when the declaration is elaborated. *expression* and *variable* must have compatible data types.

## Examples

- Example 3-11, "Scalar Variable Declarations"
- Example 3-13, "Variable and Constant Declarations with Initial Values"

( bulk\_collect\_into\_clause ::=, into\_clause ::=, Oracle Database SQL Language Reference for select\_list syntax)

#### **Semantics**

select\_into\_statement

## **DISTINCT | UNIQUE**

Specify DISTINCT or UNIQUE if you want the database to return only one copy of each set of duplicate rows selected. These two keywords are synonymous. Duplicate rows are those with matching values for each expression in the select list.

## **Restrictions on DISTINCT and UNIQUE Queries**

- The total number of bytes in all select list expressions is limited to the size of a data block minus some overhead. This size is specified by the initialization parameter DB BLOCK SIZE.
- You cannot specify **DISTINCT** if the select\_list contains LOB columns.

## ALL

(Default) Causes the database to return all rows selected, including all copies of duplicates.

#### select\_list

If the <code>SELECT INTO</code> statement returns no rows, PL/SQL raises the predefined exception <code>NO\_DATA\_FOUND</code>. To guard against this exception, select the result of the aggregate function <code>COUNT(\*)</code>, which returns a single value even if no rows match the condition.

#### into\_clause

With this clause, the SELECT INTO statement retrieves one or more columns from a single row and stores them in either one or more scalar variables or one record variable. For more information, see "*into\_clause* ::=".

## bulk\_collect\_into\_clause

With this clause, the SELECT INTO statement retrieves an entire result set and stores it in one or more collection variables. For more information, see "*bulk\_collect\_into\_clause* ::=".

## rest\_of\_statement

Anything that can follow the keyword FROM in a SQL SELECT statement, described in Oracle Database SQL Language Reference.

## SERIALLY\_REUSABLE Pragma

The SERIALLY\_REUSABLE pragma specifies that the package state is needed for only one call to the server (for example, an OCI call to the database or a stored procedure invocation through a database link).

After this call, the storage for the package variables can be reused, reducing the memory overhead for long-running sessions.

This pragma is appropriate for packages that declare large temporary work areas that are used once in the same session.

The SERIALLY\_REUSABLE pragma can appear in the *declare\_section* of the specification of a bodiless package, or in both the specification and body of a package, but not in only the body of a package.

## SHARD\_ENABLE Clause

The SHARD\_ENABLE keyword indicates that a query referencing the defined function can be pushed down into the shards of a sharded database (SDB).

When using the SHARD\_ENABLE clause, the query optimizer takes the initiative to push the execution of the PL/SQL function to the shards.

The SHARD ENABLE clause can appear in the following SQL statement:

- CREATE FUNCTION Statement
- CREATE PACKAGE Statement

Queries with PL/SQL functions created with the SHARD\_ENABLE keyword will be pushed down, if possible, to the shards and executed as multishard queries. *If possible* refers to the fact that there may be other parts of the query that do not allow the pushdown. Therefore, the optimizer will make the pushdown decision.

Queries with PL/SQL functions created **without** the SHARD\_ENABLE keyword will not be pushed down to the shards and executed as cross shard queries on the coordinator.

#### Topics

- Syntax
- Semantics

- Usage Notes
- Related Topics

Syntax

shard\_enable\_clause ::=

SHARD\_ENABLE →

**Semantics** 

shard\_enable\_clause

#### Usage Notes

It is up to you to decide whether a function execution can be pushed to the shards. However, there are some instances where you should decide not to use shard enable:

- Functions referencing any session context variables that may be different on the shards and coordinator.
- Functions referencing any global variables that may be different on the shards and coordinator.
- Functions referencing any data local to the coordinator.

In some cases you may decide it is safe to push a function, even if it references a package global variable or reads data from a table.

Even if a PL/SQL function is marked with SHARD\_ENABLE clause, there are times when the evaluation needs to happen on the coordinator, meaning the function evaluation is not pushed to shards. Possible scenarios include:

- When the function is in SELECT list and there is a join between sharded tables and the join is not on a sharding key (note that a join between sharded and duplicated key is okay),
- When the function is in **SELECT** list and there is a join with a local (non-sharded) table,
- If such a function is present in WHERE clause and it takes input parameters as column of multiple sharded tables and there is no join on sharding key.

Pushing eligible functions down to shards to execute as multi shard queries rather than cross shard queries can result in significant performance improvement by:

- Distributing the computation by performing evaluation of PL/SQL functions on each shard.
- Reducing the size of the data returned from shards when the predicate involves a PL/SQL function, resulting in smaller inputs for joins on the coordinator.

# SHARING Clause

The SHARING clause applies only when creating an object in an application root in the context of an application maintenance. This type of object is called an application common object and it can be shared with the application PDBs that belong to the application root.

The SHARING clause can appear in the context of creating application common PL/SQL and SQL objects with these SQL statements.

Table 14-2	Summary of Possible Sharing Attributes by Application Common Object

# Table 14-2(Cont.) Summary of Possible Sharing Attributes by Application CommonObject Type

Topics

- Syntax
- Semantics
- Related Topics

**Syntax** 

sharing\_clause ::=

## **Semantics**

#### sharing\_clause

Specifies how the object is shared using one of the following sharing attributes:

- METADATA A metadata link shares the metadata, but its data is unique to each container. This type of object is referred to as a **metadata-linked application common object**.
- NONE The object is not shared and can only be accessed in the application root.

If you omit this clause during an application operation, then the database uses the value of the DEFAULT\_SHARING initialization parameter to determine the sharing attribute of the object. If the DEFAULT\_SHARING initialization parameter does not have a value, then the default is METADATA.

#### **Restrictions on SHARING clause**

The sharing clause may only appear during an application installation, upgrade or patch in an application root. You must issue an ALTER PLUGGABLE DATABASE APPLICATION ... BEGIN statement to start the operation and an ALTER PLUGGABLE DATABASE APPLICATION ... END statement to end the operation. The *sharing\_clause* is illegal outside this context and this implies the object is not shared.

You cannot change the sharing attribute of an object after it is created.

Generally, common objects cannot depend on local objects. The exceptions to this rule are :

- the common object being created is a synonym
- the common object being created depends on a local operator

If you try to create a common object that depends on local objects other than these two exceptions, it will result in the creation of a local object.

# SQL\_MACRO Clause

The SQL\_MACRO clause marks a function as a SQL macro which can be used as either a scalar expression or a table expression.

A TABLE macro is a function annotated as a SQL MACRO and defined as a TABLE type.

A SCALAR macro is a function annotated as a SQL MACRO and defined as a SCALAR type.

A SQL macro referenced in a view is always processed with the view owner's privileges.

The AUTHID property cannot be specified. When a SQL macro is invoked, the function body executes with definer's rights to construct the text to return. The resulting expression is evaluated with invoker's rights. The SQL macro owner must grant inherit privileges to the invoking function.

When a macro annotated function is used in PL/SQL, it works like a regular function returning character or CLOB type with no macro expansion.

Many SCALAR macros can instead be written as standard PL/SQL functions, which can be called directly from a SQL statement. The PL/SQL function is automatically converted into a semantically equivalent SQL expression by the SQL Transpiler. This converted SQL expression is used during execution, replacing the call to the original PL/SQL function.

Transpilation can improve performance by removing the need to switch between the SQL runtime and the PL/SQL runtime. Where possible, transpilation is performed automatically on any PL/SQL function called from a SQL statement (unless the feature has been explicitly disabled).

For more information about the SQL Transpiler, see Oracle Database SQL Tuning Guide.

The SQL\_MACRO annotation can appear in the following SQL statement:

## CREATE FUNCTION Statement

#### SQL Macro Usage Restrictions:

- A TABLE macro can only appear in FROM clause of a query table expression.
- A SCALAR macro cannot appear in FROM clause of a query table expression. It can appear wherever PL/SQL functions are allowed, for example in the select list, the WHERE clause, and the ORDER BY clause.
- A scalar macro cannot have table arguments.

- A SQL macro cannot appear in a virtual column expression, functional index, editioning view or materialized view.
- Type methods cannot be annotated with SQL MACRO.

#### Topics

- Syntax
- Semantics
- Examples
- Related Topics

## **Syntax**

## sql\_macro\_clause ::=

## Semantics

#### sql\_macro\_clause

The *sql\_macro\_clause* can appear only once in the function. To make a SQL macro function, include the *sql\_macro\_clause* in the function definition. If you declare the SQL macro function before defining it, you must specify the *sql\_macro\_clause* in the function declaration.

If SCALAR or TABLE is not specified, TABLE is the default.

## SCALAR

Specify SCALAR if the macro function can be used in scalar expressions.

## TABLE (Default)

Specify TABLE if the macro function can be used in table expressions.

#### **Restrictions on sql\_macro\_clause**

The SQL\_MACRO annotation is disallowed with RESULT\_CACHE, PARALLEL\_ENABLE, and PIPELINED. Although the DETERMINISTIC property cannot be specified, a SQL macro is always implicitly deterministic.

The SQL macro function must have a return type of VARCHAR2, CHAR, or CLOB.

## Examples

Example 14-36 Emp\_doc: Using a Scalar Macro to Convert Columns into a JSON or XML Document

The emp\_doc SQL macro converts employee fields into a document string (JSON or XML).

```
The macro is implemented as a tree of nested macros with the following call graph
structure.
emp_doc()
    ==> emp_json()
```

```
==> name_string()
==> email_string()
==> name_string()
==> date_string()
==> name_string()
==> name_string()
==> name_string()
==> date_string()
```

The date\_string function converts a date in a string formatted as a four digits year, month (01-12) and day of the month (1-31).

```
CREATE FUNCTION date_string(dat DATE)

RETURN VARCHAR2 SQL_MACRO(SCALAR) IS

BEGIN

RETURN q'{

TO_CHAR(dat, 'YYYY-MM-DD')

}';

END;

/
```

The name\_string function sets the first letter of each words in the first\_name and last\_name in uppercase and all other letters in lowercase. It concatenates the formatted first name with a space and the formatted last name, and removes leading and trailing spaces from the resulting string.

The email\_string sets the email address using the name\_string function with the first\_name and last\_name and replacing all spaces with a period, and appending a default domain name of example.com.

## The emp\_json SQL macro returns a JSON document string.

```
CREATE FUNCTION emp_json(first_name VARCHAR2 DEFAULT NULL,
last_name VARCHAR2 DEFAULT NULL,
hire_date DATE DEFAULT NULL,
phone_num VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2 SQL_MACRO(SCALAR) IS
BEGIN
RETURN q'{
JSON_OBJECT(
'name' : name_string(first_name, last_name),
```

```
'email' : email_string(first_name, last_name),
    'phone' : phone_num,
    'hire_date' : date_string(hire_date)
    ABSENT ON NULL)
  }';
END;
```

#### The emp\_xml SQL macro returns an XML document string.

```
CREATE FUNCTION emp xml(first name VARCHAR2 DEFAULT NULL,
                             last_name VARCHAR2 DEFAULT NULL,
                             hire date DATE DEFAULT NULL,
                             phone num VARCHAR2 DEFAULT NULL)
                    RETURN VARCHAR2 SQL MACRO(SCALAR) IS
BEGIN
   RETURN q'{
       XMLELEMENT ("xml",
                  CASE WHEN first name || last name IS NOT NULL THEN
                     XMLELEMENT("name", name string(first name, last name))
                  END,
                  CASE WHEN first_name || last_name IS NOT NULL THEN
                     XMLELEMENT("email", email_string(first_name, last_name))
                  END,
                  CASE WHEN hire date IS NOT NULL THEN
                     XMLELEMENT("hire_date", date_string(hire_date))
                  END,
                  CASE WHEN phone num IS NOT NULL THEN
                     XMLELEMENT ("phone", phone num)
                  END)
           }';
END;
/
```

The emp\_doc SQL macro returns employee fields into a JSON (default) or XML document string.

This query shows the emp\_doc SQL macro used in a scalar expression to list all employees in a JSON document string in department 30.

#### Result:

```
30
{"name":"Shelli","email":"shelli@example.com","hire_date":"2015-12-24"}
30 {"name":"Karen","email":"karen@example.com","hire_date":"2017-08-10"}
30 {"name":"Guy","email":"guy@example.com","hire_date":"2016-11-15"}
30
{"name":"Alexander","email":"alexander@example.com","hire_date":"2012-07"}
30 {"name":"Den","email":"den@example.com","hire_date":"2012-12-07"}
30 {"name":"Sigal","email":"sigal@example.com","hire_date":"2015-07-24"}
```

# This query shows the emp\_doc SQL macro used in a scalar expression to list all employees in a XML document string.

```
SELECT deptno,
```

```
emp_doc(first_name => ename, hire_date => hiredate, doc_type => 'xml') doc
FROM scott.emp
ORDER BY ename;
```

#### Result:

```
20 <xml><name>Adams</name><email>adams@example.com</email><hire date>1987-05-23</
hire date></xml>
30 <xml><name>Allen</name><email>allen@example.com</email><hire date>1981-02-20</
hire date></xml>

hire date></xml>
. . .
30 <xml><name>Ward</name><email>ward@example.com</email><hire date>1981-02-22</
hire date></xml>
VARIABLE surname VARCHAR2(100)
EXEC :surname := 'ellison'
WITH e AS (SELECT emp.*, :surname lname FROM emp WHERE deptno IN (10,20))
SELECT deptno,
       emp_doc(first_name => ename, last_name => lname, hire_date => hiredate) doc
```

```
ORDER BY ename;
```

#### Result:

FROM e

```
10 {"name":"Clark Ellison","email":"clark.ellison@example.com","hire_date":"1981-06-09"}
20 {"name":"Ford Ellison","email":"ford.ellison@example.com","hire_date":"1981-12-03"}
20 {"name":"Jones Ellison","email":"jones.ellison@example.com","hire_date":"1981-04-02"}
10 {"name":"King Ellison","email":"king.ellison@example.com","hire_date":"1981-11-17"}
10 {"name":"Miller
Ellison","email":"miller.ellison@example.com","hire_date":"1982-01-23"}
20 {"name":"Scott Ellison","email":"scott.ellison@example.com","hire_date":"1987-04-19"}
20 {"name":"Smith Ellison","email":"smith.ellison@example.com","hire_date":"1980-12-17"}
```

#### Example 14-37 Env: Using a Scalar Macro in a Scalar Expression

The env SQL macro provides a wrapper for the value of the parameter associated with the context namespace USERENV which describes the current session.

```
CREATE PACKAGE env AS
  FUNCTION current user RETURN VARCHAR2 SQL MACRO(SCALAR);
  FUNCTION current_edition_name RETURN VARCHAR2 SQL_MACRO(SCALAR);
  FUNCTION module RETURN VARCHAR2 SQL MACRO(SCALAR);
  FUNCTION action RETURN VARCHAR2 SQL_MACRO(SCALAR);
END;
CREATE PACKAGE BODY env AS
  FUNCTION current user RETURN VARCHAR2 SQL MACRO(SCALAR) IS
    BEGIN
       RETURN q'{SYS CONTEXT('userenv', 'SESSION USER')}';
    END;
  FUNCTION current edition name RETURN VARCHAR2 SQL MACRO(SCALAR) IS
    BEGIN
       RETURN q'{SYS CONTEXT('userenv', 'CURRENT EDITION NAME')}';
    END;
  FUNCTION module RETURN VARCHAR2 SQL_MACRO(SCALAR) IS
    BEGIN
       RETURN q'{SYS CONTEXT('userenv', 'MODULE')}';
    END;
  FUNCTION action RETURN VARCHAR2 SQL MACRO(SCALAR) IS
    BEGIN
       RETURN q'{SYS CONTEXT('userenv', 'ACTION')}';
    END;
END;
/
```

#### Select the current user info.

SELECT env.current\_user, env.module, env.action FROM DUAL;

#### Result:

SCOTT SQL\*PLUS

## Example 14-38 Budget : Using a Table Macro in a Table Expression

This example shows the SQL macro named budget used in a table expression to return the total salary in each department for employees for a given job title.

```
CREATE FUNCTION budget(job VARCHAR2) RETURN VARCHAR2 SQL_MACRO IS
BEGIN
    RETURN q'{SELECT deptno, SUM(sal) budget
        FROM scott.emp
        WHERE job = budget.job
        GROUP BY deptno}';
END;
```

This query shows the SQL macro budget used in a table expression.

```
SELECT * FROM budget('MANAGER');
```

Result:

DEPTNO	BUDGET
20	2975
30	2850
10	2450

### Example 14-39 Take: Using a Table Macro with a Polymorphic View

This example creates a table macro named take which returns the first n rows from table t.

```
CREATE FUNCTION take (n NUMBER, t DBMS_TF.table_t)
RETURN VARCHAR2 SQL_MACRO IS
BEGIN
RETURN 'SELECT * FROM t FETCH FIRST take.n ROWS ONLY';
END;
/
```

The query returns the first two rows from table dept.

```
SELECT * FROM take(2, dept);
```

Result:

DEPTNO DNAME LOC 10 ACCOUNTING NEW YORK 20 RESEARCH DALLAS

VAR row\_count NUMBER EXEC :row\_count := 5

WITH t AS (SELECT \* FROM emp NATURAL JOIN dept ORDER BY ename) SELECT ename, dname FROM take(:row\_count, t);

#### Result:

#### Example 14-40 Range : Using a Table Macro in a Table Expression

This example creates a SQL macro that generates an arithmetic progression of rows in the range [first, stop]. The first row start with the value *first*, and each subsequent row's value will be *step* more than the previous row's value.

The following combination of arguments will produce zero rows:

- step < 0 and first < stop</li>
- step = 0
- step > 0 and first > stop

```
/* PACKAGE NAME: GEN
* SQL TABLE MACROS:
* range(stop : number to generate starting from zero)
* range(first : starting number of the sequence (default=0),
* stop : generate numbers up to, but not including this number,
* step : difference between each number in the sequence (default=1) )
*/
CREATE PACKAGE gen IS
FUNCTION range(stop NUMBER)
RETURN VARCHAR2 SQL MACRO(TABLE);
```

```
FUNCTION range (first NUMBER DEFAULT 0, stop NUMBER, step NUMBER DEFAULT 1)
            RETURN VARCHAR2 SQL_MACRO(TABLE);
   FUNCTION tab(tab TABLE, replication_factor NATURAL)
            RETURN TABLE PIPELINED ROW POLYMORPHIC USING gen;
   FUNCTION describe(tab IN OUT DBMS TF.TABLE T, replication factor NATURAL)
            RETURN DBMS TF.DESCRIBE T;
  PROCEDURE fetch rows (replication factor NATURALN);
END gen;
CREATE PACKAGE BODY gen IS
  FUNCTION range(stop NUMBER)
          RETURN VARCHAR2 SQL MACRO (TABLE) IS
  BEGIN
     RETURN q'{SELECT ROWNUM-1 n FROM gen.tab(DUAL, stop)}';
  END;
   FUNCTION range (first NUMBER DEFAULT 0, stop NUMBER, step NUMBER DEFAULT 1)
           RETURN VARCHAR2 SQL MACRO (TABLE) IS
  BEGIN
      RETURN q'{
             SELECT first+n*step n FROM gen.range(ROUND((stop-first)/NULLIF(step,0)))
             }';
   END;
   FUNCTION describe(tab IN OUT DBMS TF.TABLE T, replication factor NATURAL)
            RETURN DBMS TF.DESCRIBE T AS
   BEGIN
      RETURN DBMS TF.DESCRIBE T(row replication => true);
  END;
  PROCEDURE fetch_rows(replication_factor NATURALN) as
 BEGIN
   DBMS TF.ROW REPLICATION (replication factor);
 END;
END gen;
1
```

The gen.get\_range SQL macro is used in table expressions.

This query returns a sequence of 5 rows starting at zero.

```
SELECT * FROM gen.range(5);
```

Result:

```
0
1
2
3
4
```

This query returns a sequence starting at 5, stopping at 10 (not included).

```
SELECT * FROM gen.range(5, 10);
```

Result:

5 6 7 8 9

This query returns a sequence starting at 0, stopping at 1, by increment of 0.1.

SELECT \* FROM gen.range(0, 1, step=>0.1);

Result:

0 .1 .2 .3 .4 .5 .6 .7 .8 .9

This query returns a sequence starting at 5, stopping at -6 (not included) by decrement of 2.

```
SELECT * FROM gen.range(+5,-6,-2);
```

# Result:

5 3 1 -1 -3 -5

# **SQLCODE** Function

In an exception handler, the SQLCODE function returns the numeric code of the exception being handled. (Outside an exception handler, SQLCODE returns 0.)

For an internally defined exception, the numeric code is the number of the associated Oracle Database error. This number is negative except for the error "no data found", whose numeric code is +100.

For a user-defined exception, the numeric code is either +1 (default) or the error code associated with the exception by the EXCEPTION INIT pragma.

A SQL statement cannot invoke SQLCODE.

If a function invokes SQLCODE, and you use the RESTRICT\_REFERENCES pragma to assert the purity of the function, then you cannot specify the constraints WNPS and RNPS.

- "Exception Handler"
- "RESTRICT\_REFERENCES Pragma"
- "SQLERRM Function"

In other chapters:

"Retrieving Error Code and Error Message"

# 🖍 See Also:

*Oracle Database Error Messages Reference* for a list of Oracle Database error messages and information about them, including their numbers

# **SQLERRM** Function

The SQLERRM function returns the error message associated with an error code.

# Note:

The language of the error message depends on the NLS\_LANGUAGE parameter. For information about this parameter, see *Oracle Database Globalization Support Guide*.

A SQL statement cannot invoke SQLERRM.

If a function invokes SQLERRM, and you use the RESTRICT\_REFERENCES pragma to assert the purity of the function, then you cannot specify the constraints WNPS and RNPS.

Note: DBMS\_UTILITY.FORMAT\_ERROR\_STACK is recommended over SQLERRM, unless you use the FORALL statement with its SAVE EXCEPTIONS clause. For more information, see "Retrieving Error Code and Error Message".

# Topics

- Syntax
- Semantics
- Examples
- Related Topics

# Syntax

sqlerrm\_function ::=

### **Semantics**

sqlerrm\_function

error\_code

Expression whose value is an Oracle Database error code.

Default: error code associated with the current value of SQLCODE.

Like SQLCODE, SQLERRM without *error\_code* is useful only in an exception handler. Outside an exception handler, or if the value of *error\_code* is zero, SQLERRM returns ORA-0000.

If the value of error code is +100, SQLERRM returns ORA-01403.

If the value of *error\_code* is a positive number other than +100, SQLERRM returns this message:

-error code: non-ORACLE exception

If the value of *error\_code* is a negative number whose absolute value is an Oracle Database error code, SQLERRM returns the error message associated with that error code. For example:

```
BEGIN
DBMS_OUTPUT.PUT_LINE('SQLERRM(-6511): ' || TO_CHAR(SQLERRM(-6511)));
END;
```

Result:

SQLERRM(-6511): ORA-06511: PL/SQL: cursor already open

If the value of *error\_code* is a negative number whose absolute value is not an Oracle Database error code, SQLERRM returns this message:

```
ORA-error_code: Message error_code not found; product=RDBMS;
facility=ORA
```

#### For example:

```
BEGIN
    DBMS_OUTPUT.PUT_LINE('SQLERRM(-50000): ' || TO_CHAR(SQLERRM(-50000)));
END;
/
```

#### Result:

```
SQLERRM(-50000): ORA-50000: Message 50000 not found; product=RDBMS;
facility=ORA
```

#### Examples

# SUPPRESSES\_WARNING\_6009 Pragma

The SUPPRESSES\_WARNING\_6009 pragma marks a subroutine to indicate that the PLW-06009 warning is suppressed at its call site in an OTHERS exception handler. The marked subroutine has the same effect as a RAISE statement and suppresses the PLW-06009 compiler warning.

The OTHERS exception handler does not issue the compiler warning PLW-06009 if an exception is raised explicitly using either a RAISE statement or the RAISE\_APPLICATION\_ERROR procedure as the last statement. Similarly, a call to a subroutine marked with the

SUPPRESSES\_WARNING\_6009 pragma, from the OTHERS exception handler, does not issue the PLW-06009 warning.

The SUPPRESSES WARNING 6009 pragma can appear in the following SQL statements :

- CREATE FUNCTION Statement
- CREATE PACKAGE Statement
- CREATE PACKAGE BODY Statement
- CREATE PROCEDURE Statement
- CREATE TYPE Statement
- CREATE TYPE BODY Statement

#### Topics

- Syntax
- Semantics
- Examples
- Related Topics

#### Syntax

suppresses\_warning\_6009\_pragma ::=

### **Semantics**

#### suppresses\_warning\_6009\_pragma

The SUPPRESSES\_WARNING\_6009 pragma applies to standalone subprograms, packaged subprograms and to the methods in an Abstract Data Type definition.

For a standalone subprogram, the SUPPRESSES\_WARNING\_6009 pragma may appear as the first item in the declaration block of a subprogram definition, immediately after the keyword IS or AS.

In a package specification, a package body and a type specification, the SUPPRESSES\_WARNING\_6009 pragma must appear immediately after the subprogram declaration.

If the subprogram has separate declaration and definition, the SUPPRESSES\_WARNING\_6009 pragma may be applied either to the subprogram declaration, or to the subprogram definition, or to both.

For overloaded subprograms, SUPPRESSES\_WARNING\_6009 pragma only applies to the marked overload.

When the SUPPRESSES\_WARNING\_6009 pragma is applied to a subprogram in a package specification, the subprogram is marked for use both in the package body and in the invokers of the package.

When the SUPPRESSES\_WARNING\_6009 pragma is applied to a subprogram in the definition of a package body, the subprogram is marked for use only in the package body even if the subprogram is declared in the package specification.

The SUPPRESSES\_WARNING\_6009 pragma applied to a subprogram in a base type object, is inherited in a derived type object unless there is an override without the pragma in the derived type object.

The SUPPRESSES\_WARNING\_6009 pragma may be terminated with a ", " when applied to a subprogram in a type specification. In all other contexts, the pragma is terminated by "; ".

The SUPPRESSES\_WARNING\_6009 pragma on the subprogram provides a hint to the compiler to suppress the warning PLW-06009 at its call site.

### pls\_identifier

Identifier of the PL/SQL element to which the pragma is applied.

The identifier is a parameter to the SUPPRESSES\_WARNING\_6009 pragma that must name the subprogram to which it is applied.

If the identifier in the SUPPRESSES\_WARNING\_6009 does not identify a subroutine in the declaration section, the pragma has no effect.

### Examples

# Example 14-41 Enabling the PLW-6009 Warning

This example shows how to set the PLSQL\_WARNINGS parameter to enable the PLW-6009 warning in a session for demonstration purpose.

ALTER SESSION SET PLSQL WARNINGS='ENABLE: (6009)';

# Example 14-42 SUPPRESSES\_WARNING\_6009 Pragma in a Procedure

This example shows a standalone procedure p1 marked with the SUPPRESSES\_WARNING\_6009 pragma. The p1 procedure is invoked from an OTHERS exception handler in procedure p2, which does not raise an exception explicitly.

The PLW-06009 warning is not issued when compiling procedure p2.

```
CREATE PROCEDURE p2
AUTHID DEFINER
IS
BEGIN
DBMS_OUTPUT.PUT_LINE('In procedure p2');
EXCEPTION
WHEN OTHERS THEN
```

```
p1;
END p2;
/
```

# Example 14-43 SUPPRESSES\_WARNING\_6009 Pragma in a Function

This example shows a standalone function f1 marked with the SUPPRESSES\_WARNING\_6009 pragma. This function is invoked from an OTHERS exception handler in function f2, which does not explicitly have a RAISE statement.

The PLW-06009 warning is not issued when compiling function f2.

```
CREATE FUNCTION f2(numval NUMBER) RETURN NUMBER
AUTHID DEFINER
IS
i NUMBER;
BEGIN
i := numval + 1;
RETURN i;
EXCEPTION
WHEN OTHERS THEN
RETURN f1(i);
END;
/
```

# Example 14-44 SUPPRESSES\_WARNING\_6009 Pragma in an Overloaded Subprogram in a Package Specification

This example shows an overloaded procedure p1, declared in a package specification. Only the second overload of p1 is marked with the SUPPRESSES\_WARNING\_6009 pragma. This marked overload is invoked from the OTHERS exception handler in procedure p6, which does not have an explicit RAISE statement.

```
CREATE PACKAGE pk1 IS

PROCEDURE p1(x NUMBER);

PROCEDURE p1;

PRAGMA SUPPRESSES_WARNING_6009(p1);
```

```
END;
/
CREATE OR REPLACE PACKAGE BODY pk1 IS
PROCEDURE p1 (x NUMBER) IS
BEGIN
DBMS_OUTPUT.PUT_LINE('In the first overload');
END;
PROCEDURE p1 IS
BEGIN
DBMS_OUTPUT.PUT_LINE('In the second overload');
RAISE_APPLICATION_ERROR(-20000, 'Unexpected error');
END;
END;
/
```

The procedure p6 invokes the p1 second overloaded procedure. The compiler does not issue a PLW-06009 warning when compiling procedure p6.

```
CREATE OR REPLACE PROCEDURE p6 AUTHID DEFINER IS
j NUMBER := 5;
BEGIN
j := j + 2;
EXCEPTION
WHEN OTHERS THEN
pk1.p1;
END;
/
```

# Example 14-45 SUPPRESSES\_WARNING\_6009 Pragma in a Forward Declaration in a Package Body

This example shows a forward declaration subprogram marked with the SUPPRESSES\_WARNING\_6009 pragma in a package body. This marked procedure pn is invoked from the OTHERS exception handler in procedure p5, which has no RAISE statement.

```
CREATE OR REPLACE PACKAGE pk2 IS
PROCEDURE p5;
END;
/
```

The compiler does not issue a PLW-06009 warning when creating the package body.

```
CREATE OR REPLACE PACKAGE BODY pk2 IS
PROCEDURE pn; /* Forward declaration */
PRAGMA SUPPRESSES_WARNING_6009(pn);
```

PROCEDURE p5 IS

```
BEGIN
	DBMS_OUTPUT.PUT_LINE('Computing');
EXCEPTION
	WHEN OTHERS THEN
	pn;
END;
PROCEDURE pn IS
BEGIN
	RAISE_APPLICATION_ERROR(-20000, 'Unexpected error');
END;
END;
/
```

# Example 14-46 SUPPRESSES\_WARNING\_6009 Pragma in Object Type Methods

This example shows the SUPPRESSES\_WARNING\_6009 pragma applied to a member method declared in the newid Abstract Data Type (ADT) definition. The marked procedure log\_error is invoked from the OTHERS exception handler in the type body, which does not have a RAISE statement.

```
CREATE OR REPLACE TYPE newid AUTHID DEFINER
AS OBJECT(
  ID1 NUMBER,
  MEMBER PROCEDURE incr,
  MEMBER PROCEDURE log_error,
  PRAGMA SUPPRESSES_WARNING_6009(log_error)
);
/
```

The compiler does not issue the PLW-06009 warning when compiling the type body.

```
CREATE OR REPLACE TYPE BODY newid
AS
 MEMBER PROCEDURE incr
  IS
  BEGIN
     DBMS OUTPUT.PUT LINE ('Computing value');
  EXCEPTION
     WHEN OTHERS THEN
        log error;
  END;
  MEMBER PROCEDURE log error
  IS
  BEGIN
    RAISE APPLICATION ERROR(-20000, 'Unexpected error');
  END;
END;
/
```

# %TYPE Attribute

The <code>%TYPE</code> attribute lets you declare a constant, variable, collection element, record field, or subprogram parameter to be of the same data type as a previously declared variable or column (without knowing what that type is).

The %TYPE attribute cannot be used if the referenced character column has a collation other than USING NLS COMP.

The item declared with <code>%TYPE</code> is the **referencing item**, and the previously declared item is the **referenced item**.

The referencing item inherits the following from the referenced item:

- Data type and size
- Constraints (unless the referenced item is a column)

The referencing item does not inherit the initial value of the referenced item.

If the declaration of the referenced item changes, then the declaration of the referencing item changes accordingly.

### Syntax

type\_attribute ::=

	collection_variable_name	
	- cursor_variable_name	
	- db_table_or_view_name + . + column_name	
$\rightarrow$	- object name	→%)→TYPE→
	- (record_variable_name)	
	scalar_variable_name	

# **Semantics**

type\_attribute

collection\_variable\_name

Name of a collection variable.

# Restriction on collection\_variable\_name

In a constant declaration, *collection* variable cannot be an associative array variable.

### cursor\_variable\_name

Name of a cursor variable.

# db\_table\_or\_view\_name

Name of a database table or view that is accessible when the declaration is elaborated.

### column\_name

Name of a column of db table or view.

# object\_name

Name of an instance of an ADT.

# record\_variable\_name

Name of a record variable.

### field\_name

Name of a field of record variable.

### scalar\_variable\_name

Name of a scalar variable.

### Examples

# **UDF** Pragma

The UDF pragma tells the compiler that the PL/SQL unit is a **user defined function** that is used primarily in SQL statements, which might improve its performance.

Syntax

udf\_pragma ::=

→	PRAGMA	┝{	UDF	<del>)</del> (;)
---	--------	----	-----	------------------

# **UPDATE Statement Extensions**

PL/SQL extends the <code>update\_set\_clause</code> and <code>where\_clause</code> of the SQL <code>UPDATE</code> statement as follows:

- In the *update\_set\_clause*, you can specify a record. For each selected row, the *upDATE* statement updates each column with the value of the corresponding record field.
- In the *where\_clause*, you can specify a CURRENT OF clause, which restricts the UPDATE statement to the current row of the specified cursor.

# See Also:

Oracle Database SQL Language Reference for the syntax of the SQL UPDATE statement

# Topics

- Syntax
- Semantics
- Examples
- Related Topics

# Syntax

update\_set\_clause ::=

where\_clause ::=

# **Semantics**

## update\_set\_clause

# record

Name of a record variable that represents a row of the item described by *dml\_table\_expression\_clause*. That is, for every column of the row, the record must have a field with a compatible data type. If a column has a NOT NULL constraint, then its corresponding field cannot have a NULL value.

# where\_clause

# for\_update\_cursor

Name of a FOR UPDATE cursor; that is, an explicit cursor associated with a SELECT FOR UPDATE statement.

# Examples

• Example 6-61, "Updating Rows with Records"

# **Related Topics**

- "SELECT FOR UPDATE and FOR UPDATE Cursors"

# WHILE LOOP Statement

The WHILE LOOP statement runs one or more statements while a condition is TRUE.

The WHILE LOOP statement ends when the condition becomes FALSE or NULL, or when a statement inside the loop transfers control outside the loop or raises an exception.

# **Topics**

- Syntax
- Semantics
- Examples
- Related Topics

#### Syntax

### while\_loop\_statement ::=

### ( boolean\_expression ::= , statement ::= )

### **Semantics**

while\_loop\_statement

### boolean\_expression

Expression whose value is TRUE, FALSE, or NULL.

*boolean\_expression* is evaluated at the beginning of each iteration of the loop. If its value is TRUE, the statements after LOOP run. Otherwise, control transfers to the statement after the WHILE LOOP statement.

### statement

To prevent an infinite loop, at least one statement must change the value of *boolean\_expression* to FALSE or NULL, transfer control outside the loop, or raise an exception. The statements that can transfer control outside the loop are:

- "CONTINUE Statement" (when it transfers control to the next iteration of an enclosing labeled loop)
- "EXIT Statement"
- "GOTO Statement"
- "RAISE Statement"

# label

Label that identifies *while\_loop\_statement* (see "*statement* ::=" and "*label*"). CONTINUE, EXIT, and GOTO statements can reference this label.

Labels improve readability, especially when LOOP statements are nested, but only if you ensure that the label in the END LOOP statement matches a label at the beginning of the same LOOP statement (the compiler does not check).

# Examples

# Example 14-47 WHILE LOOP Statements

The statements in the first WHILE LOOP statement never run, and the statements in the second WHILE LOOP statement run once.

```
DECLARE
  done BOOLEAN := FALSE;
BEGIN
  WHILE done LOOP
   DBMS_OUTPUT.PUT_LINE ('This line does not print.');
   done := TRUE; -- This assignment is not made.
  END LOOP;
```

```
WHILE NOT done LOOP
   DBMS_OUTPUT.PUT_LINE ('Hello, world!');
   done := TRUE;
   END LOOP;
END;
/
```

# Result:

Hello, world!

# **Related Topics**

# 15 SQL Statements for Stored PL/SQL Units

This chapter explains how to use the SQL statements that create, change, and drop stored PL/SQL units.

# **CREATE [ OR REPLACE ] Statements**

Each of these SQL statements creates a PL/SQL unit at schema level and stores it in the database:

- CREATE FUNCTION Statement
- CREATE LIBRARY Statement
- CREATE PACKAGE Statement
- CREATE PACKAGE BODY Statement
- CREATE PROCEDURE Statement
- CREATE TRIGGER Statement
- CREATE TYPE Statement
- CREATE TYPE BODY Statement

Each of these CREATE statements has an optional OR REPLACE clause. Specify OR REPLACE to recreate an existing PL/SQL unit—that is, to change its declaration or definition without dropping it, re-creating it, and regranting object privileges previously granted on it. If you redefine a PL/SQL unit, the database recompiles it.

# Caution:

A CREATE OR REPLACE statement does not issue a warning before replacing the existing PL/SQL unit.

None of these CREATE statements can appear in a PL/SQL block.

# ALTER Statements

To recompile an existing PL/SQL unit without re-creating it (without changing its declaration or definition), use one of these SQL statements:

- ALTER FUNCTION Statement
- ALTER LIBRARY Statement
- ALTER PACKAGE Statement
- ALTER PROCEDURE Statement
- ALTER TRIGGER Statement
- ALTER TYPE Statement

Reasons to use an ALTER statement are:

- To explicitly recompile a stored unit that has become invalid, thus eliminating the need for implicit runtime recompilation and preventing associated runtime compilation errors and performance overhead.
- To recompile a stored unit with different compilation parameters.
- To enable or disable a trigger.
- To specify the EDITIONABLE or NONEDITIONABLE property of a stored unit whose schema object type is not yet editionable in its schema.

The ALTER TYPE statement has additional uses.

# **DROP Statements**

To drop an existing PL/SQL unit from the database, use one of these SQL statements:

- DROP FUNCTION Statement
- DROP LIBRARY Statement
- DROP PACKAGE Statement
- DROP PROCEDURE Statement
- DROP TRIGGER Statement
- DROP TYPE Statement
- DROP TYPE BODY Statement

### **Related Topics**

- For instructions for reading the syntax diagrams in this chapter, see Oracle Database SQL Language Reference.
- For information about editioned and noneditioned objects, see *Oracle Database Development Guide*.
- For information about compilation parameters, see "PL/SQL Units and Compilation Parameters".

# **ALTER FUNCTION Statement**

The ALTER FUNCTION statement explicitly recompiles a standalone function.

Explicit recompilation eliminates the need for implicit runtime recompilation and prevents associated runtime compilation errors and performance overhead.

# Note:

This statement does not change the declaration or definition of an existing function. To redeclare or redefine a standalone function, use the "CREATE FUNCTION Statement" with the OR REPLACE clause.

### **Topics**

- Prerequisites
- Syntax

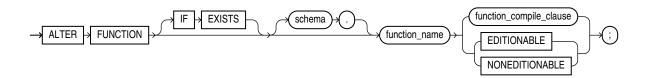

- Semantics
- Example
- Related Topics

# Prerequisites

If the function is in the SYS schema, you must be connected as SYSDBA. Otherwise, the function must be in your schema or you must have ALTER ANY PROCEDURE system privilege.

**Syntax** 

alter\_function ::=

function\_compile\_clause ::=

(compiler\_parameters\_clause ::=)

Semantics

alter\_function

# IF EXISTS

Recompiles the function if it exists. If no such function exists, the statement is ignored without error.

### schema

Name of the schema containing the function. Default: your schema.

### function\_name

Name of the function to be recompiled.

# { EDITIONABLE | NONEDITIONABLE }

Specifies whether the function becomes an editioned or noneditioned object if editioning is later enabled for the schema object type FUNCTION in *schema*. **Default:** EDITIONABLE. For information about altering editioned and noneditioned objects, see *Oracle Database Development Guide*.

# function\_compile\_clause

Recompiles the function, whether it is valid or invalid.

See compile\_clause semantics.

See also DEFAULT COLLATION Clause compilation semantics.

### Example

### Example 15-1 Recompiling a Function

To explicitly recompile the function get bal owned by the sample user oe, issue this statement:

ALTER FUNCTION oe.get\_bal COMPILE;

If the database encounters no compilation errors while recompiling get\_bal, then get\_bal becomes valid. The database can subsequently run it without recompiling it at run time. If recompiling get\_bal results in compilation errors, then the database returns an error, and get\_bal remains invalid.

The database also invalidates all objects that depend upon get\_bal. If you subsequently reference one of these objects without explicitly recompiling it first, then the database recompiles it implicitly at run time.

# **Related Topics**

- "CREATE FUNCTION Statement"
- "DROP FUNCTION Statement"

# ALTER LIBRARY Statement

The ALTER LIBRARY statement explicitly recompiles a library.

Explicit recompilation eliminates the need for implicit runtime recompilation and prevents associated runtime compilation errors and performance overhead.

# Note:

This statement does not change the declaration or definition of an existing library. To redeclare or redefine a library, use the "CREATE LIBRARY Statement" with the OR REPLACE clause.

#### **Topics**

- Prerequisites
- Syntax
- Semantics
- Example
- Related Topics

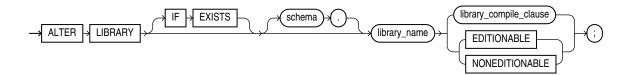

#### Prerequisites

If the library is in the SYS schema, you must be connected as SYSDBA. Otherwise, the library must be in your schema or you must have the ALTER ANY LIBRARY system privilege.

### Syntax

alter\_library ::=

# library\_compile\_clause ::=

# (compiler\_parameters\_clause ::=)

**Semantics** 

alter\_library

# **IF EXISTS**

Alters the library if it exists. If no such library exists, the statement is ignored without error.

### library\_name

Name of the library to be altered.

# { EDITIONABLE | NONEDITIONABLE }

Specifies whether the library becomes an editioned or noneditioned object if editioning is later enabled for the schema object type LIBRARY in *schema*. **Default:** EDITIONABLE. For information about altering editioned and noneditioned objects, see *Oracle Database Development Guide*.

### library\_compile\_clause

Recompiles the library.

See compile\_clause and compiler\_parameters\_clause semantics.

Example

### Example 15-2 Recompiling a Library

To explicitly recompile the library  $my_ext_lib$  owned by the sample user hr, issue this statement:

ALTER LIBRARY IF EXISTS hr.my ext lib COMPILE;

If the database encounters no compilation errors while recompiling  $my_ext_lib$ , then  $my_ext_lib$  becomes valid. The database can subsequently run it without recompiling it at run time. If recompiling  $my_ext_lib$  results in compilation errors, then the database returns an error, and  $my_ext_lib$  remains invalid.

The database also invalidates all objects that depend upon my\_ext\_lib. If you subsequently reference one of these objects without explicitly recompiling it first, then the database recompiles it implicitly at run time.

If my\_ext\_lib does not already exist in the schema, this statement is ignored without error due to the IF EXISTS clause. Note that the output message is the same whether or not the library exists (in this case, Library altered).

# **Related Topics**

- "CREATE LIBRARY Statement"
- "DROP LIBRARY Statement"

# ALTER PACKAGE Statement

The ALTER PACKAGE statement explicitly recompiles a package specification, body, or both. Explicit recompilation eliminates the need for implicit runtime recompilation and prevents associated runtime compilation errors and performance overhead.

Because all objects in a package are stored as a unit, the ALTER PACKAGE statement recompiles all package objects. You cannot use the ALTER PROCEDURE statement or ALTER FUNCTION statement to recompile individually a procedure or function that is part of a package.

# Note:

This statement does not change the declaration or definition of an existing package. To redeclare or redefine a package, use the "CREATE PACKAGE Statement", or the "CREATE PACKAGE BODY Statement" with the OR REPLACE clause.

### **Topics**

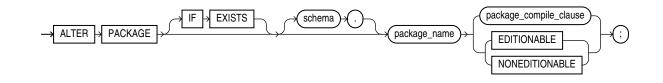

- Prerequisites
- Syntax
- Semantics
- Examples
- Related Topics

### Prerequisites

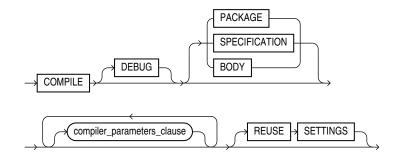

If the package is in the SYS schema, you must be connected as SYSDBA. Otherwise, the package must be in your schema or you must have ALTER ANY PROCEDURE system privilege.

# Syntax

alter\_package ::=

# package\_compile\_clause ::=

(compiler\_parameters\_clause ::=)

### **Semantics**

alter\_package

### **IF EXISTS**

Recompiles the package if it exists. If no such package exists, the statement is ignored without error.

# schema

Name of the schema containing the package. **Default:** your schema.

# package\_name

Name of the package to be recompiled.

# { EDITIONABLE | NONEDITIONABLE }

Specifies whether the package becomes an editioned or noneditioned object if editioning is later enabled for the schema object type PACKAGE in *schema*. **Default:** EDITIONABLE. For information about altering editioned and noneditioned objects, see *Oracle Database Development Guide*.

# package\_compile\_clause

Recompiles the package specification, body, or both.

See compile\_clause and compiler\_parameters\_clause semantics.

Examples

# Example 15-3 Recompiling a Package

This statement explicitly recompiles the specification and body of the hr.emp\_mgmt package.

See "CREATE PACKAGE Statement" for the example that creates this package.

ALTER PACKAGE emp\_mgmt COMPILE PACKAGE;

If the database encounters no compilation errors while recompiling the  $emp_mgmt$  specification and body, then  $emp_mgmt$  becomes valid. The user hr can subsequently invoke or reference all package objects declared in the specification of  $emp_mgmt$  without runtime recompilation. If

recompiling emp\_mgmt results in compilation errors, then the database returns an error and emp\_mgmt remains invalid.

The database also invalidates all objects that depend upon <code>emp\_mgmt</code>. If you subsequently reference one of these objects without explicitly recompiling it first, then the database recompiles it implicitly at run time.

To recompile the body of the emp mgmt package in the schema hr, issue this statement:

ALTER PACKAGE hr.emp\_mgmt COMPILE BODY;

If the database encounters no compilation errors while recompiling the package body, then the body becomes valid. The user hr can subsequently invoke or reference all package objects declared in the specification of  $emp\_mgmt$  without runtime recompilation. If recompiling the body results in compilation errors, then the database returns an error message and the body remains invalid.

Because this statement recompiles the body and not the specification of emp\_mgmt, the database does not invalidate dependent objects.

### **Related Topics**

- "CREATE PACKAGE Statement"
- "DROP PACKAGE Statement"

# ALTER PROCEDURE Statement

The ALTER PROCEDURE statement explicitly recompiles a standalone procedure.

Explicit recompilation eliminates the need for implicit runtime recompilation and prevents associated runtime compilation errors and performance overhead.

To recompile a procedure that is part of a package, recompile the entire package using the "ALTER PACKAGE Statement").

# Note:

This statement does not change the declaration or definition of an existing procedure. To redeclare or redefine a standalone procedure, use the "CREATE PROCEDURE Statement" with the OR REPLACE clause.

The ALTER PROCEDURE statement is very similar to the ALTER FUNCTION statement. See "ALTER FUNCTION Statement" for more information.

#### Topics

- Prerequisites
- Syntax
- Semantics
- Example
- Related Topics

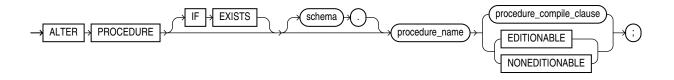

# Prerequisites

If the procedure is in the SYS schema, you must be connected as SYSDBA. Otherwise, the procedure must be in your schema or you must have ALTER ANY PROCEDURE system privilege.

# **Syntax**

alter\_procedure ::=

procedure\_compile\_clause ::=

# (compiler\_parameters\_clause ::=)

### **Semantics**

alter\_procedure

### **IF EXISTS**

Alters the procedure if it exists. If no such procedure exists, the statement is ignored without error.

### schema

Name of the schema containing the procedure. Default: your schema.

### procedure\_name

Name of the procedure to be altered.

### { EDITIONABLE | NONEDITIONABLE }

Specifies whether the procedure becomes an editioned or noneditioned object if editioning is later enabled for the schema object type PROCEDURE in *schema*. **Default:** EDITIONABLE. For information about altering editioned and noneditioned objects, see *Oracle Database Development Guide*.

### procedure\_compile\_clause

See compile\_clause and compiler\_parameters\_clause semantics.

# Example

# Example 15-4 Recompiling a Procedure

To explicitly recompile the procedure remove emp owned by the user hr, issue this statement:

ALTER PROCEDURE IF EXISTS hr.remove emp COMPILE;

If the database encounters no compilation errors while recompiling remove\_emp, then remove\_emp becomes valid. The database can subsequently run it without recompiling it at run time. If recompiling remove\_emp results in compilation errors, then the database returns an error and remove\_emp remains invalid.

The database also invalidates all dependent objects. These objects include any procedures, functions, and package bodies that invoke <code>remove\_emp</code>. If you subsequently reference one of these objects without first explicitly recompiling it, then the database recompiles it implicitly at run time.

If remove\_emp does not already exist in the schema, this statement is ignored without error due to the IF EXISTS clause. Note that the output message is the same whether or not the procedure exists (in this case, Procedure altered).

# **Related Topics**

- "CREATE PROCEDURE Statement"
- "DROP PROCEDURE Statement"

# ALTER TRIGGER Statement

The ALTER TRIGGER statement enables, disables, compiles, or renames a database trigger.

# Note:

This statement does not change the declaration or definition of an existing trigger. To redeclare or redefine a trigger, use the "CREATE TRIGGER Statement" with the OR REPLACE clause.

### **Topics**

- Prerequisites
- Syntax
- Semantics
- Examples
- Related Topics

# Prerequisites

If the trigger is in the SYS schema, you must be connected as SYSDBA. Otherwise, the trigger must be in your schema or you must have ALTER ANY TRIGGER system privilege.

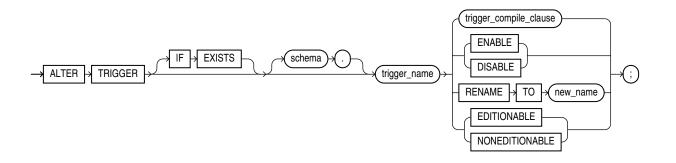

In addition, to alter a trigger on DATABASE, you must have the ADMINISTER DATABASE TRIGGER system privilege.

# Syntax

alter\_trigger ::=

trigger\_compile\_clause ::=

### (compiler\_parameters\_clause ::=)

**Semantics** 

alter\_trigger

# **IF EXISTS**

Enables, disables, compiles, or renames the trigger if it exists. If no such trigger exists, the statement is ignored without error.

# schema

Name of the schema containing the trigger. **Default:** your schema.

### trigger\_name

Name of the trigger to be altered.

# [ENABLE | DISABLE ]

Enables or disables the trigger.

### RENAME TO new\_name

Renames the trigger without changing its state.

When you rename a trigger, the database rebuilds the remembered source of the trigger in the \*\_SOURCE static data dictionary views. As a result, comments and formatting may change in the TEXT column of those views even though the trigger source did not change.

# { EDITIONABLE | NONEDITIONABLE }

Specifies whether the trigger becomes an editioned or noneditioned object if editioning is later enabled for the schema object type TRIGGER in *schema*. **Default:** EDITIONABLE. For information about altering editioned and noneditioned objects, see *Oracle Database Development Guide*.

# **Restriction on NONEDITIONABLE**

You cannot specify NONEDITIONABLE for a crossedition trigger.

# trigger\_compile\_clause

Recompiles the trigger, whether it is valid or invalid.

See compile\_clause and compiler\_parameters\_clause semantics.

### Examples

# Example 15-5 Disabling Triggers

The sample schema hr has a trigger named update\_job\_history created on the employees table. The trigger fires whenever an UPDATE statement changes an employee's job\_id. The trigger inserts into the job\_history table a row that contains the employee's ID, begin and end date of the last job, and the job ID and department.

When this trigger is created, the database enables it automatically. You can subsequently disable the trigger with this statement:

ALTER TRIGGER update\_job\_history DISABLE;

When the trigger is disabled, the database does not fire the trigger when an UPDATE statement changes an employee's job.

### Example 15-6 Enabling Triggers

After disabling the trigger, you can subsequently enable it with this statement:

ALTER TRIGGER update\_job\_history ENABLE;

After you reenable the trigger, the database fires the trigger whenever an UPDATE statement changes an employee's job. If an employee's job is updated while the trigger is disabled, then the database does not automatically fire the trigger for this employee until another transaction changes the job id again.

### **Related Topics**

In this chapter:

- "CREATE TRIGGER Statement"
- "DROP TRIGGER Statement"

In other chapters:

"Trigger Compilation, Invalidation, and Recompilation"

• "Trigger Enabling and Disabling"

# **ALTER TYPE Statement**

Use the ALTER TYPE statement to add or drop member attributes or methods. You can change the existing properties of an object type, and you can modify the scalar attributes of the type. You can also use this statement to recompile the specification or body of the type or to change the specification of an object type by adding new object member subprogram specifications.

The ALTER TYPE statement does one of the following to a type that was created with "CREATE TYPE Statement" and "CREATE TYPE BODY Statement":

• **Evolves** the type; that is, adds or drops member attributes or methods.

For more information about type evolution, see *Oracle Database Object-Relational Developer's Guide*.

- Changes the specification of the type by adding object member subprogram specifications.
- Recompiles the specification or body of the type.
- Resets the version of the type to 1, so that it is no longer considered to be evolved.

- Related Topics

### Prerequisites

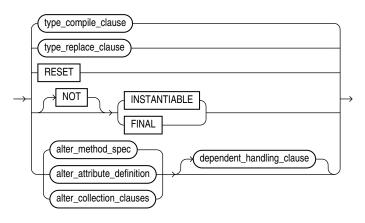

If the type is in the SYS schema, you must be connected as SYSDBA. Otherwise, the type must be in your schema and you must have CREATE TYPE or CREATE ANY TYPE system privilege, or you must have ALTER ANY TYPE system privileges.

### **Syntax**

alter\_type ::=

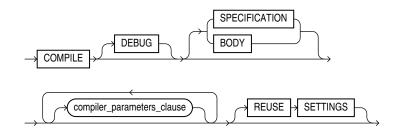

#### alter\_type\_clause ::=

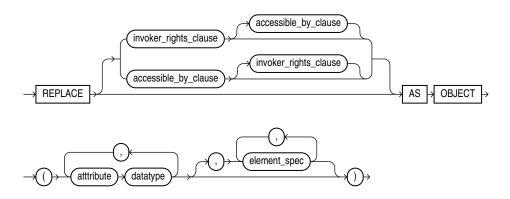

( type\_compile\_clause ::=, type\_replace\_clause ::=, alter\_attribute\_definition ::=, alter\_method\_spec ::=, alter\_collections\_clauses::=, dependent\_handling\_clause ::= )

type\_compile\_clause ::=

( compiler\_parameters\_clause ::= )

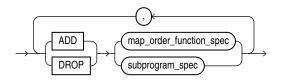

type\_replace\_clause ::=

( accessible\_by\_clause ::=, invoker\_rights\_clause ::=, element\_spec ::=)

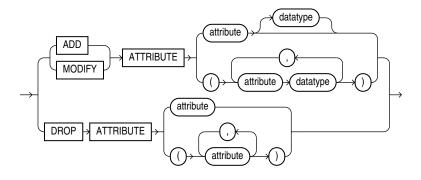

alter\_method\_spec ::=

( map\_order\_function\_spec ::=, subprogram\_spec ::= )

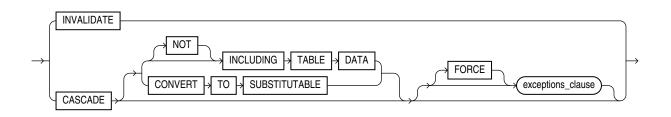

alter\_attribute\_definition ::=

alter\_collections\_clauses::=

exceptions\_clause ::=

### Semantics

# alter\_type

# **IF EXISTS**

Performs the action specified by the *alter\_type\_clause* on the type if it exists. If no such type exists, the statement is ignored without error.

# schema

Name of the schema containing the type. Default: your schema.

# type\_name

Name of an ADT, VARRAY type, or nested table type.

# Restriction on type\_name

You cannot evolve an editioned ADT.

The ALTER TYPE statement fails with ORA-22348 if either of the following is true:

• The type is an editioned ADT and the ALTER TYPE statement has no type compile clause.

(You can use the ALTER TYPE statement to recompile an editioned object type, but not for any other purpose.)

• The type has a dependent that is an editioned ADT and the ALTER TYPE statement has a CASCADE clause.

An **editioned object** is a schema object that has an editionable object type and was created by a user for whom editions are enabled.

# { EDITIONABLE | NONEDITIONABLE }

Specifies whether the type becomes an editioned or noneditioned object if editioning is later enabled for the schema object type TYPE in *schema*. **Default:** EDITIONABLE. For information about altering editioned and noneditioned objects, see *Oracle Database Development Guide*.

### alter\_type\_clause

# RESET

Resets the version of this type to 1, so that it is no longer considered to be evolved.

# Note:

Resetting the version of this type to 1 invalidates all of its dependents.

RESET is intended for evolved ADTs that are preventing their owners from being editionsenabled. For information about enabling editions for users, see *Oracle Database Development Guide*.

To see the version number of an ADT, select VERSION# from the static data dictionary view \* TYPE VERSIONS. For example:

```
SELECT Version#
FROM DBA_TYPE_VERSIONS
```

```
WHERE Owner = schema
AND Name = 'type_name'
AND Type = 'TYPE'
```

For an evolved ADT, the preceding query returns multiple rows with different version numbers. RESET deletes every row whose version number is less than the maximum version number, and resets the version number of the remaining rows to 1.

# **Restriction on RESET**

You cannot specify RESET if the type has any table dependents (direct or indirect).

# [NOT] INSTANTIABLE

Specify INSTANTIABLE if object instances of this type can be constructed.

Specify NOT INSTANTIABLE if no constructor (default or user-defined) exists for this type. You must specify these keywords for any type with noninstantiable methods and for any type that has no attributes (either inherited or specified in this statement).

# **Restriction on NOT INSTANTIABLE**

You cannot change a user-defined type from INSTANTIABLE to NOT INSTANTIABLE if the type has any table dependents.

# [NOT] FINAL

Specify FINAL if no further subtypes can be created for this type.

Specify NOT FINAL if further subtypes can be created under this type.

If you change the property from FINAL to NOT FINAL, or the reverse, then you must specify the CASCADE clause of the "*dependent\_handling\_clause*" to convert data in dependent columns and tables. Specifically:

- If you change a type from NOT FINAL to FINAL, then you must specify CASCADE [INCLUDING TABLE DATA]. You cannot defer data conversion with CASCADE NOT INCLUDING TABLE DATA.
- If you change a type from FINAL to NOT FINAL, then:
  - Specify CASCADE INCLUDING TABLE DATA if you want to create substitutable tables and columns of that type, but you are not concerned about the substitutability of the existing dependent tables and columns.

The database marks all existing dependent columns and tables NOT SUBSTITUTABLE AT ALL LEVELS, so you cannot insert the subtype instances of the altered type into these existing columns and tables.

 Specify CASCADE CONVERT TO SUBSTITUTABLE if you want to create substitutable tables and columns of the type and also store subtype instances of the altered type in existing dependent tables and columns.

The database marks all existing dependent columns and tables SUBSTITUTABLE AT ALL LEVELS except those that are explicitly marked NOT SUBSTITUTABLE AT ALL LEVELS.

# See Also:

Oracle Database Object-Relational Developer's Guide for a full discussion of ADT evolution

# **Restriction on FINAL**

You cannot change a user-defined type from NOT FINAL to FINAL if the type has any subtypes.

### type\_compile\_clause

(Default) Recompiles the type specification and body.

See compile\_clause and compiler\_parameters\_clause semantics.

# type\_replace\_clause

Starting with Oracle Database 12c Release 2 (12.2), the *type\_replace\_clause* is deprecated. Use the *alter\_method\_spec* clause instead. Alternatively, you can recreate the type using the CREATE OR REPLACE TYPE statement.

Adds member subprogram specifications.

# Restriction on type\_replace\_clause

This clause is valid only for ADTs, not for nested tables or varrays.

### attribute

Name of an object attribute. Attributes are data items with a name and a type specifier that form the structure of the object.

### element\_spec

Specifies elements of the redefined object.

# alter\_method\_spec

Adds a method to or drops a method from the type. The database disables any function-based indexes that depend on the type.

In one ALTER TYPE statement you can add or drop multiple methods, but you can reference each method only once.

# ADD

When you add a method, its name must not conflict with any existing attributes in its type hierarchy.

### DROP

When you drop a method, the database removes the method from the target type.

# **Restriction on DROP**

You cannot drop from a subtype a method inherited from its supertype. Instead you must drop the method from the supertype.

### alter\_attribute\_definition

Adds, drops, or modifies an attribute of an ADT. In one ALTER TYPE statement, you can add, drop, or modify multiple member attributes or methods, but you can reference each attribute or method only once.

# ADD ATTRIBUTE

Name of the attribute must not conflict with existing attributes or methods in the type hierarchy. The database adds the attribute to the end of the locally defined attribute list.

If you add the attribute to a supertype, then it is inherited by all of its subtypes. In subtypes, inherited attributes always precede declared attributes. Therefore, you might need to update the mappings of the implicitly altered subtypes after adding an attribute to a supertype.

### DROP ATTRIBUTE

When you drop an attribute from a type, the database drops the column corresponding to the dropped attribute and any indexes, statistics, and constraints referencing the dropped attribute.

You need not specify the data type of the attribute you are dropping.

### **Restrictions on DROP ATTRIBUTE**

- You cannot drop an attribute inherited from a supertype. Instead you must drop the attribute from the supertype.
- You cannot drop an attribute that is part of a partitioning, subpartitioning, or cluster key.

# **Caution**:

If you use the INVALIDATE option, then the compiler does not check dependents; therefore, this rule is not enforced. However, dropping such an attribute leaves the table in an unusable state.

- You cannot drop an attribute of a primary-key-based object identifier of an object table or a primary key of an index-organized table.
- You cannot drop all of the attributes of a root type. Instead you must drop the type. However, you can drop all of the locally declared attributes of a subtype.

### **MODIFY ATTRIBUTE**

Modifies the data type of an existing scalar attribute. For example, you can increase the length of a VARCHAR2 or RAW attribute, or you can increase the precision or scale of a numeric attribute.

## **Restriction on MODIFY ATTRIBUTE**

You cannot expand the size of an attribute referenced in a function-based index, domain index, or cluster key.

### alter\_collection\_clauses

These clauses are valid only for collection types.

# MODIFY LIMIT integer

Increases the number of elements in a varray. It is not valid for nested tables. Specify an integer greater than the current maximum number of elements in the varray.

### MODIFY ELEMENT TYPE datatype

Increases the precision, size, or length of a scalar data type of a varray or nested table. This clause is not valid for collections of ADTs.

- For a collection of NUMBER, you can increase the precision or scale.
- For a collection of RAW, you can increase the maximum size.
- For a collection of VARCHAR2 or NVARCHAR2, you can increase the maximum length.

#### dependent\_handling\_clause

Specifies how the database is to handle objects that are dependent on the modified type. If you omit this clause, then the ALTER TYPE statement terminates if the type has any dependent type or table.

#### INVALIDATE

Invalidates all dependent objects without any checking mechanism. Starting with Oracle Database 12c Release 2 (12.2), the INVALIDATE command is deprecated. Oracle recommends that you use the CASCADE clause instead.

## Caution:

The database does not validate the type change, so use this clause with caution. For example, if you drop an attribute that is a partitioning or cluster key, then the table becomes unusable.

### CASCADE

Propagates the type change to dependent types and tables. The database terminates the statement if any errors are found in the dependent types or tables unless you also specify FORCE.

If you change the property of the type between FINAL and NOT FINAL, then you must specify this clause to convert data in dependent columns and tables.

#### INCLUDING TABLE DATA

(**Default**) Converts data stored in all user-defined columns to the most recent version of the column type.

## Note:

You must specify this clause if your column data is in Oracle database version 8.0 image format. This clause is also required if you are changing the type property between FINAL and NOT FINAL

- For each attribute added to the column type, the database adds an attribute to the data and initializes it to null.
- For each attribute dropped from the referenced type, the database removes the corresponding attribute data from each row in the table.

If you specify INCLUDING TABLE DATA, then all of the tablespaces containing the table data must be in read/write mode.

If you specify NOT INCLUDING TABLE DATA, then the database upgrades the metadata of the column to reflect the changes to the type but does not scan the dependent column and update the data as part of this ALTER TYPE statement. However, the dependent column data remains accessible, and the results of subsequent queries of the data reflect the type modifications.

#### CONVERT TO SUBSTITUTABLE

Specify this clause if you are changing the type from FINAL to NOT FINAL and you want to create substitutable tables and columns of the type and also store subtype instances of the altered type in existing dependent tables and columns.

#### exceptions\_clause

#### FORCE

Specify FORCE if you want the database to ignore the errors from dependent tables and indexes and log all errors in the specified exception table. The exception table must have been created by running the DBMS UTILITY.CREATE ALTER TYPE ERROR TABLE procedure.

#### **Examples**

See "CREATE TYPE Statement" for examples creating the types referenced in these examples.

#### Example 15-7 Adding a Member Function

This example uses the ADT data typ1.

A method is added to data\_typ1 and its type body is modified to correspond. The date formats are consistent with the order date column of the oe.orders sample table.

```
ALTER TYPE data typ1
  ADD MEMBER FUNCTION qtr(der_qtr DATE)
  RETURN CHAR CASCADE;
CREATE OR REPLACE TYPE BODY data typ1 IS
 MEMBER FUNCTION prod (invent NUMBER) RETURN NUMBER IS
 BEGIN
 RETURN (year + invent);
 END;
    MEMBER FUNCTION qtr(der_qtr DATE) RETURN CHAR IS
    BEGIN
      IF (der qtr < TO DATE('01-APR', 'DD-MON')) THEN
        RETURN 'FIRST';
      ELSIF (der qtr < TO DATE('01-JUL', 'DD-MON')) THEN
        RETURN 'SECOND';
      ELSIF (der qtr < TO DATE('01-OCT', 'DD-MON')) THEN
        RETURN 'THIRD';
      ELSE
        RETURN 'FOURTH';
      END IF;
    END;
  END;
```

#### Example 15-8 Adding a Collection Attribute

This example adds the author attribute to the textdoc tab object column of the text table.

```
CREATE TABLE text (
	doc_id 		NUMBER,
	description textdoc_tab)
	NESTED TABLE description STORE AS text_store;
ALTER TYPE textdoc_typ
	ADD ATTRIBUTE (author VARCHAR2) CASCADE;
```

The CASCADE keyword is required because both the textdoc\_tab and text table are dependent on the textdoc\_typ type.

#### Example 15-9 Increasing the Number of Elements of a Collection Type

This example increases the maximum number of elements in the varray phone list typ demo.

```
ALTER TYPE phone_list_typ_demo
MODIFY LIMIT 10 CASCADE;
```

#### Example 15-10 Increasing the Length of a Collection Type

This example increases the length of the varray element type phone list typ.

```
ALTER TYPE phone_list_typ
MODIFY ELEMENT TYPE VARCHAR(64) CASCADE;
```

#### Example 15-11 Recompiling a Type

This example recompiles type cust address typ in the hr schema.

```
ALTER TYPE cust address typ2 COMPILE;
```

#### Example 15-12 Recompiling a Type Specification

This example compiles the type specification of link2.

```
CREATE TYPE link1 AS OBJECT
 (a NUMBER);
/
CREATE TYPE link2 AS OBJECT
 (a NUMBER,
 b link1,
    MEMBER FUNCTION p(c1 NUMBER) RETURN NUMBER);
/
CREATE TYPE BODY link2 AS
    MEMBER FUNCTION p(c1 NUMBER) RETURN NUMBER IS
    BEGIN
        dbms_output.put_line(c1);
        RETURN c1;
    END;
END;
/
```

In this example, both the specification and body of link2 are invalidated because link1, which is an attribute of link2, is altered.

ALTER TYPE link1 ADD ATTRIBUTE (b NUMBER) INVALIDATE;

You must recompile the type by recompiling the specification and body in separate statements:

ALTER TYPE link2 COMPILE SPECIFICATION;

ALTER TYPE link2 COMPILE BODY;

Alternatively, you can compile both specification and body at the same time:

ALTER TYPE link2 COMPILE;

#### Example 15-13 Evolving and Resetting an ADT

This example creates an ADT in the schema Usr, evolves that ADT, and then tries to enable editions for Usr, which fails.

Then the example resets the version of the ADT to 1 and succeeds in enabling editions for Usr. To show the version numbers of the newly created, evolved, and reset ADT, the example uses the static data dictionary view DBA\_TYPE\_VERSIONS.

```
-- Create ADT in schema Usr:
create type Usr.My ADT authid Definer is object(al number)
-- Show version number of ADT:
select Version#||Chr(10)||Text t
from DBA Type Versions
where Owner = 'USR'
and Type_Name = 'MY ADT'
/
Result:
Т
  _____
1
    My_ADT authid Definer is object(al number)
type
1 row selected.
-- Evolve ADT:
alter type Usr.My ADT add attribute (a2 number)
/
-- Show version number of evolved ADT:
select Version#||Chr(10)||Text t
from DBA_Type_Versions
where Owner = 'USR'
and Type_Name = 'MY_ADT'
/
Result:
Т
    _____
1
type
     My_ADT authid Definer is object(al number)
2
       My ADT authid Definer is object (al number)
type
2
           My ADT add attribute (a2 number)
alter type
3 rows selected.
```

```
-- Try to enable editions for Usr:
alter user Usr enable editions /
```

#### Result:

```
alter user Usr enable editions
*
ERROR at line 1:
ORA-38820: user has evolved object type
```

-- Reset version of ADT to 1:

```
alter type Usr.My_ADT reset
/
-- Show version number of reset ADT:
select Version#||Chr(10)||Text t
from DBA_Type_Versions
where Owner = 'USR'
and Type_Name = 'MY_ADT'
/
```

#### Result:

```
T

1

type My_ADT authid Definer is object(al number)

1

alter type My_ADT add attribute (a2 number)
```

#### 2 rows selected.

```
-- Try to enable editions for Usr:
alter user Usr enable editions
```

#### Result:

User altered.

#### **Related Topics**

## **CREATE FUNCTION Statement**

The CREATE FUNCTION statement creates or replaces a standalone function or a call specification.

A **standalone function** is a function (a subprogram that returns a single value) that is stored in the database.

## Note:

A standalone function that you create with the CREATE FUNCTION statement differs from a function that you declare and define in a PL/SQL block or package. For more information, see "Function Declaration and Definition" and CREATE PACKAGE Statement.

A **call specification** declares a Java method, a C function, or a JavaScript function so that it can be invoked from PL/SQL. You can also use the SQL CALL statement to invoke such a method or subprogram. The call specification tells the database which JavaScript function, Java method, or which named function in which shared library, to invoke when an invocation is made. It also tells the database what type conversions to make for the arguments and return value.

### Note:

To be callable from SQL statements, a stored function must obey certain rules that control side effects. See "Subprogram Side Effects".

#### Topics

- Prerequisites
- Syntax
- Semantics
- Examples
- Related Topics

#### **Prerequisites**

To create or replace a standalone function in your schema, you must have the CREATE PROCEDURE system privilege.

To create or replace a standalone function in another user's schema, you must have the CREATE ANY PROCEDURE system privilege.

To invoke a call specification, you may need additional privileges, for example, EXECUTE privileges on a C library for a C call specification.

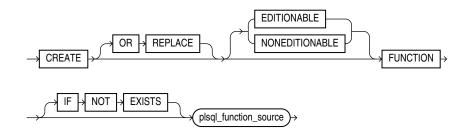

To embed a CREATE FUNCTION statement inside an Oracle precompiler program, you must terminate the statement with the keyword END-EXEC followed by the embedded SQL statement terminator for the specific language.

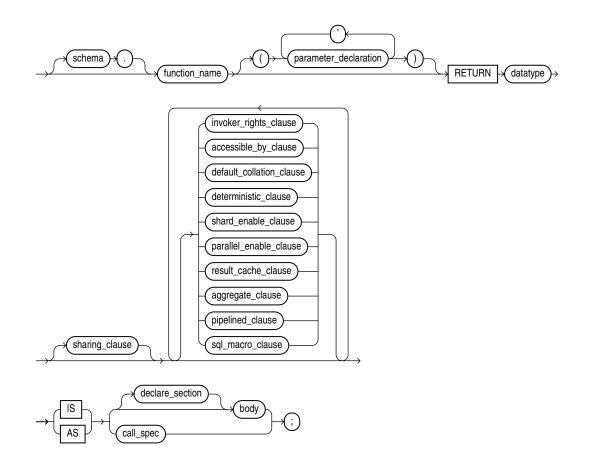

## Syntax

create\_function ::=

```
( sharing_clause ::= , invoker_rights_clause ::= , accessible_by_clause ::= ,
default_collation_clause ::= , deterministic_clause ::= , shard_enable_clause ::= ,
parallel_enable_clause ::= , result_cache_clause ::= , aggregate_clause ::= ,
pipelined_clause ::= , sql_macro_clause ::= , body ::= , call_spec ::= , datatype ::= ,
declare_section ::= , parameter_declaration ::= )
```

#### **Semantics**

create\_function

#### OR REPLACE

Re-creates the function if it exists, and recompiles it.

Users who were granted privileges on the function before it was redefined can still access the function without being regranted the privileges.

If any function-based indexes depend on the function, then the database marks the indexes DISABLED.

### [EDITIONABLE | NONEDITIONABLE ]

Specifies whether the function is an editioned or noneditioned object if editioning is enabled for the schema object type FUNCTION in *schema*. **Default:** EDITIONABLE. For information about editioned and noneditioned objects, see *Oracle Database Development Guide*.

#### **IF NOT EXISTS**

Creates the function if it does not already exist. If a function by the same name does exist, the statement is ignored without error and the original function body remains unchanged.

IF NOT EXISTS cannot be used in combination with OR REPLACE.

#### plsql\_function\_source

#### schema

Name of the schema containing the function. Default: your schema.

#### function\_name

Name of the function to be created.

## Note:

If you plan to invoke a stored subprogram using a stub generated by SQL\*Module, then the stored subprogram name must also be a legal identifier in the invoking host 3GL language, such as Ada or C.

#### **RETURN** datatype

For *datatype*, specify the data type of the return value of the function. The return value can have any data type supported by PL/SQL.

The data type cannot specify a length, precision, or scale. The database derives the length, precision, or scale of the return value from the environment from which the function is called.

If the return type is ANYDATASET and you intend to use the function in the FROM clause of a query, then you must also specify the PIPELINED clause and define a describe method (ODCITableDescribe) as part of the implementation type of the function.

You cannot constrain this data type (with NOT NULL, for example).

#### body

The required executable part of the function and, optionally, the exception-handling part of the function.

#### declare\_section

The optional declarative part of the function. Declarations are local to the function, can be referenced in *body*, and cease to exist when the function completes execution.

#### call\_spec

The reference to a call specification mapping a C procedure, Java method name, or JavaScript function name, parameter types, and return type to their SQL counterparts.

#### Examples

#### Example 15-14 Creating a Function

This statement creates the function get\_bal on the sample table oe.orders.

```
CREATE FUNCTION IF NOT EXISTS get_bal(acc_no IN NUMBER)
  RETURN NUMBER
  IS acc_bal NUMBER(11,2);
  BEGIN
    SELECT order_total
    INTO acc_bal
    FROM orders
    WHERE customer_id = acc_no;
    RETURN(acc_bal);
    END;
/
```

The get bal function returns the balance of a specified account.

When you invoke the function, you must specify the argument acc\_no, the number of the account whose balance is sought. The data type of acc\_no is NUMBER.

The function returns the account balance. The RETURN clause of the CREATE FUNCTION statement specifies the data type of the return value to be NUMBER.

The function uses a SELECT statement to select the balance column from the row identified by the argument acc\_no in the orders table. The function uses a RETURN statement to return this value to the environment in which the function is called.

The optional IF NOT EXISTS clause is used to ensure that the statement is idempotent. The resulting output message (in this case Function created.) is the same whether the function is created or the statement is ignored.

The function created in the preceding example can be used in a SQL statement. For example:

#### Example 15-15 Creating Aggregate Functions

The next statement creates an aggregate function called SecondMax to aggregate over number values. It assumes that the ADT SecondMaxImpl subprograms contains the implementations of the ODCIAggregate subprograms:

```
CREATE FUNCTION SecondMax (input NUMBER) RETURN NUMBER
PARALLEL_ENABLE AGGREGATE USING SecondMaxImpl;
```

## See Also:

17000

Oracle Database Data Cartridge Developer's Guide for the complete implementation of type and type body for SecondMaxImpl

Use such an aggregate function in a query like this statement, which queries the sample table hr.employees:

```
SELECT SecondMax(salary) "SecondMax", department_id
    FROM employees
    GROUP BY department_id
    HAVING SecondMax(salary) > 9000
    ORDER BY "SecondMax", department_id;
SecondMax DEPARTMENT_ID
    13500 80
```

#### Example 15-16 Package Procedure in a Function

90

This statement creates a function that uses a DBMS\_LOB.GETLENGTH procedure to return the length of a CLOB column.

```
CREATE OR REPLACE FUNCTION text_length(a CLOB)
    RETURN NUMBER DETERMINISTIC IS
BEGIN
    RETURN DBMS_LOB.GETLENGTH(a);
END;
```

#### Example 15-17 Creating Functions Using MLE Module and Inline Call Specifications

In this example, the same function is created in JavaScript twice. Once using an inline call specification and the other using an MLE module.

The following statement creates a JavaScript function with its declaration inline:

```
CREATE OR REPLACE FUNCTION hello_inline(
    "who" VARCHAR2
) RETURN VARCHAR2
AS MLE LANGUAGE JAVASCRIPT
{{
    return `Hello, ${who}`;
}};
/
```

You can then call the function, for example, in an anonymous block:

```
BEGIN
   DBMS_OUTPUT.PUT_LINE(hello_inline('Jane'));
END;
/
Hello, Jane
```

The following statements first create an MLE module that implements the hello function and then publish the function using a call specification:

```
CREATE OR REPLACE MLE MODULE hello_mod
LANGUAGE JAVASCRIPT AS
  export function hello(who){
   return `Hello, ${who}`;
  }
/
CREATE OR REPLACE FUNCTION hello(
  "p_who" VARCHAR2
) RETURN VARCHAR2
AS MLE MODULE hello_mod
SIGNATURE 'hello';
/
```

The following is the result of a call to the hello function:

```
BEGIN
   DBMS_OUTPUT.PUT_LINE(hello('Emma'));
END;
/
```

Hello, Emma

## **CREATE LIBRARY Statement**

The CREATE LIBRARY statement creates a **library**, which is a schema object associated with an operating-system shared library.

## Note:

The CREATE LIBRARY statement is valid only on platforms that support shared libraries and dynamic linking.

For instructions for creating an operating-system shared library, or DLL, see Oracle Database Development Guide.

You can use the name of the library schema object in the *call\_spec* of CREATE FUNCTION or CREATE PROCEDURE statements, or when declaring a function or procedure in a package or type, so that SQL and PL/SQL can invoke third-generation-language (3GL) functions and procedures.

#### Topics

- Prerequisites
- Syntax
- Semantics
- Examples
- Related Topics

#### Prerequisites

To create a library in your schema, you must have the CREATE LIBRARY system privilege. To create a library in another user's schema, you must have the CREATE ANY LIBRARY system privilege.

To create a library that is associated with a DLL in a directory object, you must have the EXECUTE object privilege on the directory object.

To create a library that is associated with a credential name, you must have the EXECUTE object privilege on the credential name.

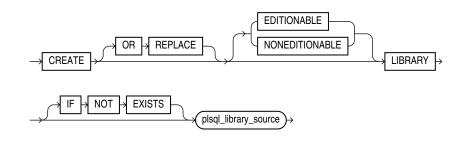

To use the library in the *call\_spec* of a CREATE FUNCTION statement, or when declaring a function in a package or type, you must have the EXECUTE object privilege on the library and the CREATE FUNCTION system privilege.

To use the library in the *call\_spec* of a CREATE PROCEDURE statement, or when declaring a procedure in a package or type, you must have the EXECUTE object privilege on the library and the CREATE PROCEDURE system privilege.

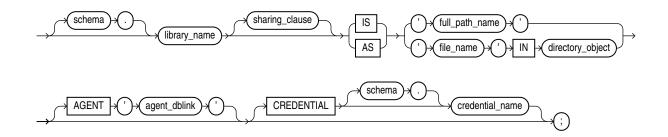

To run a procedure or function defined with the *call\_spec* (including a procedure or function defined within a package or type), you must have the EXECUTE object privilege on the procedure or function (but you do not need the EXECUTE object privilege on the library).

**Syntax** 

create\_library ::=

plsql\_library\_source ::=

(sharing\_clause ::=)

**Semantics** 

create\_library

#### OR REPLACE

Re-creates the library if it exists, and recompiles it.

Users who were granted privileges on the library before it was redefined can still access it without being regranted the privileges.

### [EDITIONABLE | NONEDITIONABLE ]

Specifies whether the library is an editioned or noneditioned object if editioning is enabled for the schema object type LIBRARY in *schema*. **Default:** EDITIONABLE. For information about editioned and noneditioned objects, see *Oracle Database Development Guide*.

ORACLE<sup>®</sup>

#### IF NOT EXISTS

Creates the library if it does not already exist. If a library by the same name does exist, the statement is ignored without error and the original library remains unchanged.

IF NOT EXISTS cannot be used in combination with OR REPLACE.

#### plsql\_library\_source

#### schema

Name of the schema containing the library. Default: your schema.

#### library\_name

Name that represents this library when a user declares a function or procedure with a *call spec*.

#### 'full\_path\_name'

String literal enclosed in single quotation marks, whose value your operating system recognizes as the full path name of a shared library.

The *full\_path\_name* is not interpreted during execution of the CREATE LIBRARY statement. The existence of the shared library is checked when someone invokes one of its subprograms.

#### 'file\_name' IN directory\_object

The *file\_name* is a string literal enclosed in single quotation marks, whose value is the name of a dynamic link library (DLL) in *directory\_object*. The string literal cannot exceed 2,000 bytes and cannot contain path delimiters. The compiler ignores *file\_name*, but at run time, *file\_name* is checked for path delimiters.

### directory\_object

The *directory\_object* is a directory object, created with the CREATE DIRECTORY statement (described in *Oracle Database SQL Language Reference*). If *directory\_object* does not exist or you do not have the EXECUTE object privilege on *directory\_object*, then the library is created with errors. If *directory\_object* is subsequently created, then the library becomes invalid. Other reasons that the library can become invalid are:

- directory object is dropped.
- directory object becomes invalid.
- Your EXECUTE object privilege on *directory* object is revoked.

If you create a library object in a PDB that has a predefined <code>PATH\_PREFIX</code>, the library must use a directory object. The directory object will enforce the rules of <code>PATH\_PREFIX</code> for the library object. Failure to use a directory object in the library object will raise a compilation error.

If a database is plugged into a CDB as a PDB with a predefined PATH\_PREFIX, attempts to use a library object that does not use a directory object result in an ORA-65394 error. The library object will not be invalidated, but to make it usable, you must recreate it using a directory object. See *Oracle Multitenant Administrator's Guide* for more information about CDB administration.

#### AGENT 'agent\_dblink'

Causes external procedures to run from a database link other than the server. Oracle Database uses the database link that *agent\_dblink* specifies to run external procedures. If you omit this clause, then the default agent on the server (extproc) runs external procedures.

#### CREDENTIAL [schema.]credential\_name

Specifies the credentials of the operating system user that the extproc agent impersonates when running an external subprogram that specifies the library. **Default:** Owner of the Oracle Database installation.

If credential\_name does not exist or you do not have the EXECUTE object privilege on credential\_name, then the library is created with errors. If credential\_name is subsequently created, then the library becomes invalid. Other reasons that the library can become invalid are:

- credential name is dropped.
- credential name becomes invalid.
- Your EXECUTE object privilege on credential name is revoked.

For information about using credentials, see Oracle Database Security Guide.

#### Examples

#### Example 15-18 Creating a Library

The following statement creates library ext lib, using a directory object:

```
CREATE LIBRARY IF NOT EXISTS ext_lib AS 'ddl_1' IN ddl_dir; /
```

The optional IF NOT EXISTS clause is used to ensure that the statement is idempotent. The resulting output message (in this case Library created) is the same whether the library is created or the statement is ignored.

The following statement re-creates library ext lib, using a directory object and a credential:

```
CREATE OR REPLACE LIBRARY ext_lib AS 'ddl_1' IN ddl_dir CREDENTIAL ddl_cred; /
```

The following statement creates library ext lib, using an explicit path:

```
CREATE LIBRARY ext_lib AS '/OR/lib/ext_lib.so';
/
```

The following statement re-creates library ext lib, using an explicit path:

```
CREATE OR REPLACE LIBRARY ext_lib IS '/OR/newlib/ext_lib.so'; /
```

#### Example 15-19 Specifying an External Procedure Agent

The following example creates a library app\_lib (using an explicit path) and specifies that external procedures run from the public database sales.hq.example.com:

```
CREATE LIBRARY app_lib as '${ORACLE_HOME}/lib/app_lib.so'
    AGENT 'sales.hq.example.com';
```

## See Also:

*Oracle Database SQL Language Reference* for information about creating database links

#### **Related Topics**

- "ALTER LIBRARY Statement"
- "DROP LIBRARY Statement"
- "CREATE FUNCTION Statement"
- "CREATE PROCEDURE Statement"

## **CREATE PACKAGE Statement**

The CREATE PACKAGE statement creates or replaces the specification for a stored **package**, which is an encapsulated collection of related procedures, functions, and other program objects stored as a unit in the database.

The **package specification** declares these objects. The **package body**, specified subsequently, defines these objects.

#### **Topics**

- Prerequisites
- Syntax
- Semantics
- Example
- Related Topics

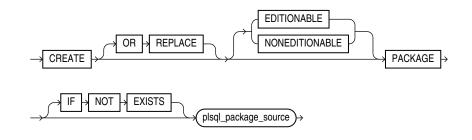

#### Prerequisites

To create or replace a package in your schema, you must have the CREATE PROCEDURE system privilege. To create or replace a package in another user's schema, you must have the CREATE ANY PROCEDURE system privilege.

To embed a CREATE PACKAGE statement inside an Oracle database precompiler program, you must terminate the statement with the keyword END-EXEC followed by the embedded SQL statement terminator for the specific language.

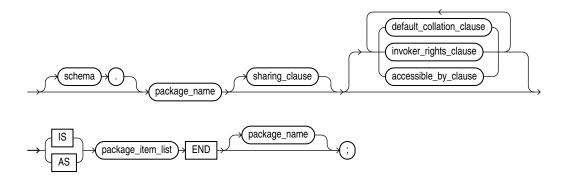

**Syntax** 

create\_package ::=

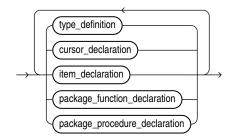

#### plsql\_package\_source ::=

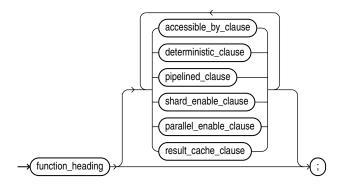

( sharing\_clause ::= , default\_collation\_clause ::= , invoker\_rights\_clause ::= , accessible\_by\_clause ::= , )

package\_item\_list ::=

(cursor\_declaration ::=, item\_declaration ::=, type\_definition ::=)

package\_function\_declaration ::=

( function\_heading ::= , accessible\_by\_clause ::= , deterministic\_clause ::= , pipelined\_clause ::= , shard\_enable\_clause ::= , parallel\_enable\_clause ::= , result\_cache\_clause ::=)

#### package\_procedure\_declaration ::=

( procedure\_heading ::=, accessible\_by\_clause ::=)

**Semantics** 

create\_package

### OR REPLACE

Re-creates the package if it exists, and recompiles it.

Users who were granted privileges on the package before it was redefined can still access the package without being regranted the privileges.

If any function-based indexes depend on the package, then the database marks the indexes DISABLED.

### [EDITIONABLE | NONEDITIONABLE ]

Specifies whether the package is an editioned or noneditioned object if editioning is enabled for the schema object type PACKAGE in *schema*. **Default:** EDITIONABLE. For information about editioned and noneditioned objects, see *Oracle Database Development Guide*.

#### **IF NOT EXISTS**

Creates the package if it does not already exist. If a package by the same name does exist, the statement is ignored without error and the original package remains unchanged.

IF NOT EXISTS cannot be used in combination with OR REPLACE.

#### plsql\_package\_source

#### schema

Name of the schema containing the package. Default: your schema.

#### package\_name

A package stored in the database. For naming conventions, see "Identifiers".

#### package\_item\_list

Defines every type in the package and declares every cursor and subprogram in the package. Except for polymorphic table functions, every declaration must have a corresponding definition in the package body. The headings of corresponding declarations and definitions must match word for word, except for white space. Package polymorphic table function must be declared in the same package as their implementation package.

#### Restriction on package\_item\_list

PRAGMA AUTONOMOUS\_TRANSACTION cannot appear here.

#### Example

#### Example 15-20 Creating the Specification for the emp\_mgmt Package

This statement creates the specification of the emp mgmt package.

```
CREATE PACKAGE IF NOT EXISTS emp_mgmt AS
FUNCTION hire (last_name VARCHAR2, job_id VARCHAR2,
    manager_id NUMBER, salary NUMBER,
    commission_pct NUMBER, department_id NUMBER)
    RETURN NUMBER;
FUNCTION create_dept(department_id NUMBER, location_id NUMBER)
    RETURN NUMBER;
PROCEDURE remove_emp(employee_id NUMBER);
PROCEDURE remove_dept(department_id NUMBER);
PROCEDURE increase_sal(employee_id NUMBER, salary_incr NUMBER);
PROCEDURE increase_comm(employee_id NUMBER, comm_incr NUMBER);
no_comm EXCEPTION;
no_sal EXCEPTION;
END emp_mgmt;
/
```

The specification for the emp mgmt package declares these public program objects:

- The functions hire and create dept
- The procedures remove\_emp, remove\_dept, increase\_sal, and increase\_comm
- The exceptions no comm and no sal

All of these objects are available to users who have access to the package. After creating the package, you can develop applications that invoke any of these public procedures or functions or raise any of the public exceptions of the package.

The optional IF NOT EXISTS clause is used to ensure that the statement is idempotent. The resulting output message (in this case Package created) is the same whether the package is created or the statement is ignored.

Before you can invoke this package's procedures and functions, you must define these procedures and functions in the package body. For an example of a CREATE PACKAGE BODY statement that creates the body of the emp\_mgmt package, see "CREATE PACKAGE BODY Statement".

#### **Related Topics**

In this chapter:

- "ALTER PACKAGE Statement"
- "CREATE PACKAGE Statement"
- "CREATE PACKAGE BODY Statement"

# CREATE PACKAGE BODY Statement

The CREATE PACKAGE BODY statement creates or replaces the body of a stored **package**, which is an encapsulated collection of related procedures, stored functions, and other program objects stored as a unit in the database.

The package body defines these objects. The package specification, defined in an earlier CREATE PACKAGE statement, declares these objects.

Packages are an alternative to creating procedures and functions as standalone schema objects.

#### Topics

- Prerequisites
- Syntax
- Semantics
- Examples
- Related Topics

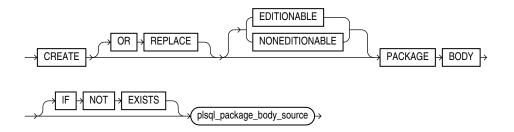

#### Prerequisites

To create or replace a package in your schema, you must have the CREATE PROCEDURE system privilege. To create or replace a package in another user's schema, you must have the CREATE ANY PROCEDURE system privilege. In both cases, the package body must be created in the same schema as the package.

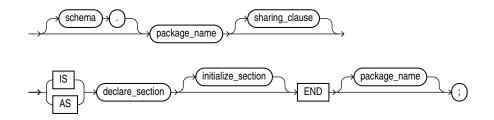

To embed a CREATE PACKAGE BODY statement inside an the database precompiler program, you must terminate the statement with the keyword END-EXEC followed by the embedded SQL statement terminator for the specific language.

**Syntax** 

create\_package\_body ::=

#### plsql\_package\_body\_source ::=

(sharing\_clause ::=, declare\_section ::=)

initialize\_section ::=

( statement ::= , exception\_handler ::= )

#### **Semantics**

create\_package\_body

#### OR REPLACE

Re-creates the package body if it exists, and recompiles it.

Users who were granted privileges on the package body before it was redefined can still access the package without being regranted the privileges.

#### [EDITIONABLE | NONEDITIONABLE ]

If you do not specify this property, then the package body inherits EDITIONABLE or NONEDITIONABLE from the package specification. If you do specify this property, then it must match that of the package specification.

#### **IF NOT EXISTS**

Creates the package body if it does not already exist. If a package body by the same name does exist, the statement is ignored without error and the original package body remains unchanged.

IF NOT EXISTS cannot be used in combination with OR REPLACE.

#### plsql\_package\_body\_source

schema

Name of the schema containing the package. **Default:** your schema.

#### package\_name

Name of the package to be created.

declare\_section

Has a definition for every cursor and subprogram declaration in the package specification. The headings of corresponding subprogram declarations and definitions must match word for word, except for white space.

Can also declare and define private items that can be referenced only from inside the package.

#### Restriction on declare\_section

PRAGMA AUTONOMOUS TRANSACTION cannot appear here.

#### initialize\_section

Initializes variables and does any other one-time setup steps.

#### **Examples**

#### Example 15-21 Creating the emp\_mgmt Package Body

This statement creates the body of the emp mgmt package created in "Example 15-20".

```
CREATE OR REPLACE PACKAGE BODY emp mgmt AS
   tot emps NUMBER;
  tot depts NUMBER;
FUNCTION hire
   (last_name VARCHAR2, job_id VARCHAR2,
   manager id NUMBER, salary NUMBER,
   commission pct NUMBER, department id NUMBER)
  RETURN NUMBER IS new empno NUMBER;
BEGIN
  SELECT employees seq.NEXTVAL
     INTO new empno
     FROM DUAL;
  INSERT INTO employees
     VALUES (new empno, 'First', 'Last', 'first.example@example.com',
              '(415)555-0100',
              TO DATE('18-JUN-2002', 'DD-MON-YYYY'),
              'IT PROG',9000000,00, 100,110);
      tot emps := tot emps + 1;
  RETURN (new empno);
END;
FUNCTION create_dept(department_id NUMBER, location_id NUMBER)
  RETURN NUMBER IS
     new deptno NUMBER;
   BEGIN
      SELECT departments_seq.NEXTVAL
        INTO new deptno
        FROM dual;
     INSERT INTO departments
        VALUES (new_deptno, 'department name', 100, 1700);
      tot depts := tot depts + 1;
     RETURN (new deptno);
  END;
PROCEDURE remove emp (employee id NUMBER) IS
  BEGIN
     DELETE FROM employees
     WHERE employees.employee id = remove_emp.employee_id;
      tot emps := tot emps - 1;
  END;
PROCEDURE remove dept(department id NUMBER) IS
  BEGIN
     DELETE FROM departments
     WHERE departments.department id = remove dept.department id;
      tot depts := tot depts - 1;
```

```
SELECT COUNT(*) INTO tot_emps FROM employees;
  END;
PROCEDURE increase_sal(employee_id NUMBER, salary_incr NUMBER) IS
  curr_sal NUMBER;
  BEGIN
     SELECT salary INTO curr sal FROM employees
     WHERE employees.employee id = increase sal.employee id;
     IF curr sal IS NULL
        THEN RAISE no sal;
     ELSE
        UPDATE employees
        SET salary = salary + salary incr
        WHERE employee id = employee id;
     END IF;
  END;
PROCEDURE increase comm (employee id NUMBER, comm incr NUMBER) IS
  curr comm NUMBER;
  BEGIN
     SELECT commission pct
     INTO curr comm
     FROM employees
     WHERE employees.employee id = increase comm.employee id;
     IF curr comm IS NULL
        THEN RAISE no comm;
     ELSE
        UPDATE employees
        SET commission pct = commission pct + comm incr;
     END IF;
   END;
END emp mgmt;
```

The package body defines the public program objects declared in the package specification:

- The functions hire and create\_dept
- The procedures remove emp, remove dept, increase sal, and increase comm

These objects are declared in the package specification, so they can be called by application programs, procedures, and functions outside the package. For example, if you have access to the package, you can create a procedure <code>increase\_all\_comms</code> separate from the <code>emp\_mgmt</code> package that invokes the <code>increase\_comm</code> procedure.

These objects are defined in the package body, so you can change their definitions without causing the database to invalidate dependent schema objects. For example, if you subsequently change the definition of hire, then the database need not recompile increase all comms before running it.

The package body in this example also declares private program objects, the variables tot\_emps and tot\_depts. These objects are declared in the package body rather than the package specification, so they are accessible to other objects in the package, but they are not accessible outside the package. For example, you cannot develop an application that explicitly changes the value of the variable tot\_depts. However, the function create\_dept is part of the package, so create\_dept can change the value of tot\_depts.

#### **Related Topics**

In this chapter:

"CREATE PACKAGE Statement"

In other chapters:

- "PL/SQL Packages"
- "Package Body"
- "Function Declaration and Definition"
- "Procedure Declaration and Definition"

# **CREATE PROCEDURE Statement**

The CREATE PROCEDURE statement creates or replaces a standalone procedure or a call specification.

A **standalone procedure** is a procedure (a subprogram that performs a specific action) that is stored in the database.

### Note:

A standalone procedure that you create with the CREATE PROCEDURE statement differs from a procedure that you declare and define in a PL/SQL block or package. For information, see "Procedure Declaration and Definition" or "CREATE PACKAGE Statement".

A **call specification** declares a Java method, a C function, or a JavaScript function so that it can be called from PL/SQL. You can also use the SQL CALL statement to invoke such a method or subprogram. The call specification tells the database which JavaScript function, Java method, or which named procedure in which shared library, to invoke when an invocation is made. It also tells the database what type conversions to make for the arguments and return value.

#### Topics

- Prerequisites
- Syntax
- Semantics
- Examples
- Related Topics

#### Prerequisites

To create or replace a standalone procedure in your schema, you must have the CREATE PROCEDURE system privilege. To create or replace a standalone procedure in another user's schema, you must have the CREATE ANY PROCEDURE system privilege.

To invoke a call specification, you may need additional privileges, for example, the EXECUTE object privilege on the C library for a C call specification.

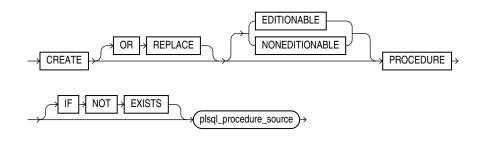

To embed a CREATE PROCEDURE statement inside an Oracle precompiler program, you must terminate the statement with the keyword END-EXEC followed by the embedded SQL statement terminator for the specific language.

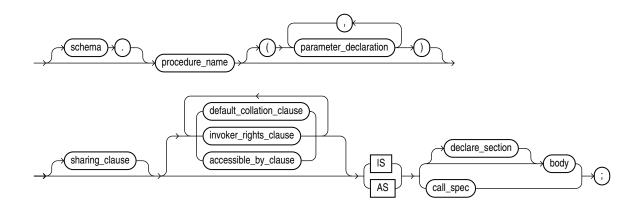

#### **Syntax**

create\_procedure ::=

plsql\_procedure\_source ::=

( sharing\_clause ::=, default\_collation\_clause ::=, invoker\_rights\_clause ::=, accessible\_by\_clause ::=, call\_spec ::=, body ::=, declare\_section ::=, parameter\_declaration ::=)

#### Semantics

create\_procedure

#### OR REPLACE

Re-creates the procedure if it exists, and recompiles it.

Users who were granted privileges on the procedure before it was redefined can still access the procedure without being regranted the privileges.

If any function-based indexes depend on the procedure, then the database marks the indexes DISABLED.

#### [EDITIONABLE | NONEDITIONABLE ]

Specifies whether the procedure is an editioned or noneditioned object if editioning is enabled for the schema object type PROCEDURE in *schema*. **Default:** EDITIONABLE. For information about editioned and noneditioned objects, see *Oracle Database Development Guide*.

#### **IF NOT EXISTS**

Creates the procedure if it does not already exist. If a procedure by the same name does exist, the statement is ignored without error and the original procedure remains unchanged.

IF NOT EXISTS cannot be used in combination with OR REPLACE.

#### plsql\_procedure\_source

#### schema

Name of the schema containing the procedure. **Default:** your schema.

#### procedure\_name

Name of the procedure to be created.

## Note:

If you plan to invoke a stored subprogram using a stub generated by SQL\*Module, then the stored subprogram name must also be a legal identifier in the invoking host 3GL language, such as Ada or C.

#### body

The required executable part of the procedure and, optionally, the exception-handling part of the procedure.

#### declare\_section

The optional declarative part of the procedure. Declarations are local to the procedure, can be referenced in body, and cease to exist when the procedure completes execution.

#### call\_spec

The reference to a call specification mapping a C procedure, Java method name, or JavaScript function name, parameter types, and return type to their SQL counterparts.

#### Examples

#### Example 15-22 Creating a Procedure

This statement creates the procedure remove emp in the schema hr.

```
CREATE PROCEDURE IF NOT EXISTS remove_emp (employee_id NUMBER) AS

tot_emps NUMBER;

BEGIN

DELETE FROM employees

WHERE employees.employee_id = remove_emp.employee_id;
```

```
tot_emps := tot_emps - 1;
END;
```

/

The remove\_emp procedure removes a specified employee. When you invoke the procedure, you must specify the employee id of the employee to be removed.

The procedure uses a DELETE statement to remove from the employees table the row of employee\_id.

The optional IF NOT EXISTS clause is used to ensure that the statement is idempotent. The resulting output message (in this case Procedure created) is the same whether the procedure is created or the statement is ignored.

#### Example 15-23 Creating an External Procedure

In this example, external procedure c\_find\_root expects a pointer as a parameter. Procedure find root passes the parameter by reference using the BY REFERENCE phrase.

```
CREATE PROCEDURE find_root
( x IN REAL )
IS LANGUAGE C
NAME c_find_root
LIBRARY c_utils
PARAMETERS ( x BY REFERENCE );
```

#### Example 15-24 Creating Procedures Using MLE Module and Inline Call Specifications

In this example, the same procedure is created in JavaScript twice. Once using an inline call specification and the other using an MLE module.

The following statement creates a JavaScript function with its declaration inline:

```
CREATE OR REPLACE PROCEDURE hello_inline(
    "who" VARCHAR2
)
AS MLE LANGUAGE JAVASCRIPT
{{
    console.log(`Hello, ${who}`);
}};
//
```

You can then call the procedure, as in the following:

```
EXEC hello inline('Angela');
```

#### Result:

Hello, Angela

The following statements first create an MLE module that implements the hello function and then publish the procedure using a call specification:

```
CREATE OR REPLACE MLE MODULE hello_mod
LANGUAGE JAVASCRIPT AS
  export function hello(who){
    console.log(`Hello, ${who}`);
  }
/
CREATE OR REPLACE PROCEDURE hello(
  "p_who" VARCHAR2
)
AS MLE MODULE hello_mod
SIGNATURE 'hello';
/
```

The following is an example of a call to the hello procedure:

EXEC hello('Chris');

#### Result:

Hello, Chris

## CREATE TRIGGER Statement

The CREATE TRIGGER statement creates or replaces a database trigger, which is either of these:

- A stored PL/SQL block associated with a table, a view, a schema, or the database
- An anonymous PL/SQL block or an invocation of a procedure implemented in PL/SQL or Java

The database automatically runs a trigger when specified conditions occur.

#### **Topics**

- Prerequisites
- Syntax
- Semantics
- Examples
- Related Topics

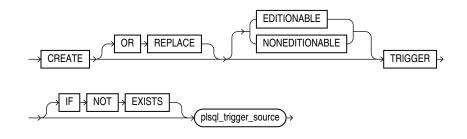

#### Prerequisites

- To create a trigger in your schema on a table in your schema or on your schema (SCHEMA), you must have the CREATE TRIGGER system privilege.
- To create a trigger in any schema on a table in any schema, or on another user's schema (*schema*.SCHEMA), you must have the CREATE ANY TRIGGER system privilege.
- In addition to the preceding privileges, to create a trigger on DATABASE, you must have the ADMINISTER DATABASE TRIGGER system privilege.
- To create a trigger on a pluggable database (PDB), you must be connected to that PDB and have the ADMINISTER DATABASE TRIGGER system privilege. For information about PDBs, see Oracle Database Administrator's Guide.
- In addition to the preceding privileges, to create a crossedition trigger, you must be enabled for editions. For information about enabling editions for a user, see *Oracle Database Development Guide*.

If the trigger issues SQL statements or invokes procedures or functions, then the owner of the trigger must have the privileges necessary to perform these operations. These privileges must be granted directly to the owner rather than acquired through roles.

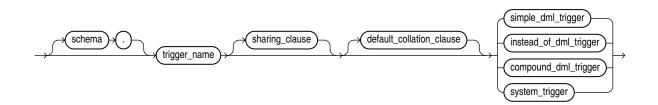

#### Syntax

create\_trigger ::=

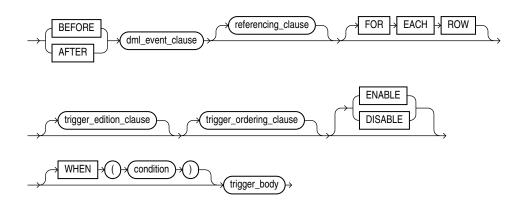

plsql\_trigger\_source ::=

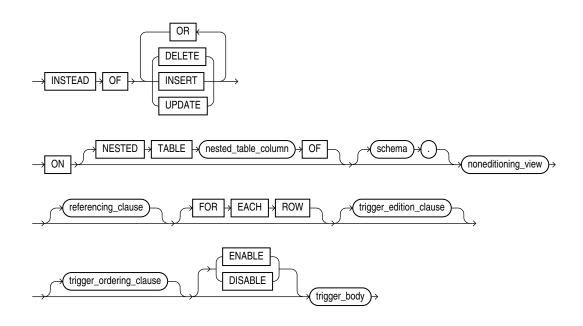

( sharing\_clause ::= , default\_collation\_clause ::= , compound\_dml\_trigger ::= , instead\_of\_dml\_trigger ::= , system\_trigger ::= )

trigger\_ordering\_clause ::=

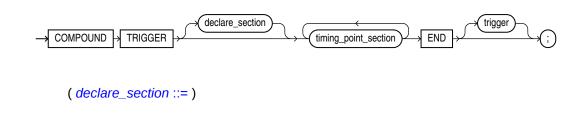

### trigger\_body ::=

## ( plsql\_block ::= ,

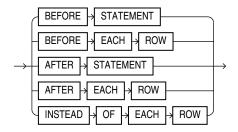

routine\_clause in Oracle Database SQL Language Reference )

## compound\_trigger\_block ::=

timing\_point\_section ::=

timing\_point ::=

#### tps\_body ::=

( exception\_handler ::= , statement ::= )

**Semantics** 

create\_trigger

**OR REPLACE** 

Re-creates the trigger if it exists, and recompiles it.

Users who were granted privileges on the trigger before it was redefined can still access the procedure without being regranted the privileges.

#### [EDITIONABLE | NONEDITIONABLE ]

Specifies whether the trigger is an editioned or noneditioned object if editioning is enabled for the schema object type TRIGGER in *schema*. **Default:** EDITIONABLE. For information about editioned and noneditioned objects, see *Oracle Database Development Guide*.

#### **Restriction on NONEDITIONABLE**

You cannot specify NONEDITIONABLE for a crossedition trigger.

#### **IF NOT EXISTS**

Creates the trigger if it does not already exist. If a trigger by the same name does exist, the statement is ignored without error and the original trigger remains unchanged.

IF NOT EXISTS cannot be used in combination with OR REPLACE.

#### Restrictions on create\_trigger

ORACLE

See "Trigger Restrictions".

plsql\_trigger\_source

#### schema

Name of the schema for the trigger to be created. **Default:** your schema.

#### trigger

Name of the trigger to be created.

Triggers in the same schema cannot have the same names. Triggers can have the same names as other schema objects—for example, a table and a trigger can have the same name —however, to avoid confusion, this is not recommended.

If a trigger produces compilation errors, then it is still created, but it fails on execution. A trigger that fails on execution effectively blocks all triggering DML statements until it is disabled, replaced by a version without compilation errors, or dropped. You can see the associated compiler error messages with the SQL\*Plus command SHOW ERRORS.

### Note:

If you create a trigger on a base table of a materialized view, then you must ensure that the trigger does not fire during a refresh of the materialized view. During refresh, the DBMS MVIEW procedure I AM A REFRESH returns TRUE.

#### simple\_dml\_trigger

Creates a simple DML trigger (described in "DML Triggers").

#### BEFORE

Causes the database to fire the trigger before running the triggering event. For row triggers, the trigger fires before each affected row is changed.

#### **Restrictions on BEFORE**

- You cannot specify a **BEFORE** trigger on a view unless it is an editioning view.
- In a BEFORE statement trigger, the trigger body cannot read :NEW or :OLD. (In a BEFORE row trigger, the trigger body can read and write the :OLD and :NEW fields.)

#### AFTER

Causes the database to fire the trigger after running the triggering event. For row triggers, the trigger fires after each affected row is changed.

#### **Restrictions on AFTER**

- You cannot specify an AFTER trigger on a view unless it is an editioning view.
- In an AFTER statement trigger, the trigger body cannot read :NEW or :OLD. (In an AFTER row trigger, the trigger body can read but not write the :OLD and :NEW fields.)

## Note:

When you create a materialized view log for a table, the database implicitly creates an AFTER row trigger on the table. This trigger inserts a row into the materialized view log whenever an INSERT, UPDATE, or DELETE statement modifies data in the associated table. You cannot control the order in which multiple row triggers fire. Therefore, do not write triggers intended to affect the content of the materialized view.

## See Also:

- Oracle Database SQL Language Reference for more information about materialized view logs
- Oracle Database Development Guide for information about editioning views

### FOR EACH ROW

Creates the trigger as a row trigger. The database fires a row trigger for each row that is affected by the triggering statement and meets the optional trigger constraint defined in the WHEN condition.

If you omit this clause, then the trigger is a statement trigger. The database fires a statement trigger only when the triggering statement is issued if the optional trigger constraint is met.

### [ENABLE | DISABLE ]

Creates the trigger in an enabled (default) or disabled state. Creating a trigger in a disabled state lets you ensure that the trigger compiles without errors before you enable it.

## Note:

DISABLE is especially useful if you are creating a crossedition trigger, which affects the online application being redefined if compilation errors occur.

### WHEN (condition)

Specifies a SQL condition that the database evaluates for each row that the triggering statement affects. If the value of *condition* is TRUE for an affected row, then *trigger\_body* runs for that row; otherwise, *trigger\_body* does not run for that row. The triggering statement runs regardless of the value of *condition*.

The condition can contain correlation names (see "referencing\_clause ::=").

In *condition*, do not put a colon (:) before the correlation name NEW, OLD, or PARENT (in this context, it is not a placeholder for a bind variable).

## See Also:

Oracle Database SQL Language Reference for information about SQL conditions

#### **Restrictions on WHEN (condition)**

- If you specify this clause, then you must also specify FOR EACH ROW.
- The *condition* cannot include a subquery or a PL/SQL expression (for example, an invocation of a user-defined function).

#### trigger\_body

The PL/SQL block or CALL subprogram that the database runs to fire the trigger. A CALL subprogram is either a PL/SQL subprogram or a Java subprogram in a PL/SQL wrapper.

If *trigger\_body* is a PL/SQL block and it contains errors, then the CREATE [OR REPLACE] statement fails.

#### Restriction on trigger\_body

The declare\_section cannot declare variables of the data type LONG or LONG RAW.

#### instead\_of\_dml\_trigger

Creates an INSTEAD OF DML trigger (described in "INSTEAD OF DML Triggers").

#### **Restriction on INSTEAD OF**

An INSTEAD OF trigger can read the :OLD and :NEW values, but cannot change them.

## Note:

- If the view is inherently updatable and has INSTEAD OF triggers, the triggers take precedence: The database fires the triggers instead of performing DML on the view.
- If the view belongs to a hierarchy, then the subviews do not inherit the trigger.
- The WITH CHECK OPTION for views is not enforced when inserts or updates to the view are done using INSTEAD OF triggers. The INSTEAD OF trigger body must enforce the check. For information about WITH CHECK OPTION, see Oracle Database SQL Language Reference.
- The database fine-grained access control lets you define row-level security policies on views. These policies enforce specified rules in response to DML operations. If an INSTEAD OF trigger is also defined on the view, then the database does not enforce the row-level security policies, because the database fires the INSTEAD OF trigger instead of running the DML on the view.

### DELETE

If the trigger is created on a noneditioning view, then DELETE causes the database to fire the trigger whenever a DELETE statement removes a row from the table on which the noneditioning view is defined.

If the trigger is created on a nested table column of a noneditioning view, then DELETE causes the database to fire the trigger whenever a DELETE statement removes an element from the nested table.

#### INSERT

If the trigger is created on a noneditioning view, then INSERT causes the database to fire the trigger whenever an INSERT statement adds a row to the table on which the noneditioning view is defined.

If the trigger is created on a nested table column of a noneditioning view, then INSERT causes the database to fire the trigger whenever an INSERT statement adds an element to the nested table.

## UPDATE

If the trigger is created on a noneditioning view, then UPDATE causes the database to fire the trigger whenever an UPDATE statement changes a value in a column of the table on which the noneditioning view is defined.

If the trigger is created on a nested table column of a noneditioning view, then UPDATE causes the database to fire the trigger whenever an UPDATE statement changes a value in a column of the nested table.

## nested\_table\_column

Name of the *nested\_table\_column* on which the trigger is to be created. The trigger fires only if the DML operates on the elements of the nested table. Performing DML operations directly on nested table columns does not cause the database to fire triggers defined on the table containing the nested table column. For more information, see "INSTEAD OF DML Triggers".

## See Also:

AS *subquery* clause of CREATE VIEW in Oracle Database SQL Language Reference for a list of constructs that prevent inserts, updates, or deletes on a view

## schema

Name of the schema containing the noneditioning view. Default: your schema.

#### noneditioning\_view

If you specify <code>nested\_table\_column</code>, then <code>noneditioning\_view</code> is the name of the noneditioning view that includes <code>nested\_table\_column</code>. Otherwise, <code>noneditioning\_view</code> is the name of the noneditioning view on which the trigger is to be created.

## FOR EACH ROW

For documentation only, because an INSTEAD OF trigger is always a row trigger.

ENABLE

(Default) Creates the trigger in an enabled state.

#### DISABLE

Creates the trigger in a disabled state, which lets you ensure that the trigger compiles without errors before you enable it.

## Note:

DISABLE is especially useful if you are creating a crossedition trigger, which affects the online application being redefined if compilation errors occur.

#### trigger\_body

The PL/SQL block or CALL subprogram that the database runs to fire the trigger. A CALL subprogram is either a PL/SQL subprogram or a Java subprogram in a PL/SQL wrapper.

If trigger\_body is a PL/SQL block and it contains errors, then the CREATE [OR REPLACE] statement fails.

## Restriction on trigger\_body

The declare section cannot declare variables of the data type LONG or LONG RAW.

#### compound\_dml\_trigger

Creates a compound DML trigger (described in "Compound DML Triggers").

#### ENABLE

(Default) Creates the trigger in an enabled state.

## DISABLE

Creates the trigger in a disabled state, which lets you ensure that the trigger compiles without errors before you enable it.

### Note:

DISABLE is especially useful if you are creating a crossedition trigger, which affects the online application being redefined if compilation errors occur.

## WHEN (condition)

Specifies a SQL condition that the database evaluates for each row that the triggering statement affects. If the value of *condition* is TRUE for an affected row, then *tps\_body* runs for that row; otherwise, *tps\_body* does not run for that row. The triggering statement runs regardless of the value of *condition*.

The condition can contain correlation names (see "referencing\_clause ::="). In condition, do not put a colon (:) before the correlation name NEW, OLD, or PARENT (in this context, it is not a placeholder for a bind variable).

## See Also:

Oracle Database SQL Language Reference for information about SQL conditions

**Restrictions on WHEN (condition)** 

- If you specify this clause, then you must also specify at least one of these timing points:
  - BEFORE EACH ROW
  - AFTER EACH ROW
  - INSTEAD OF EACH ROW
- The *condition* cannot include a subquery or a PL/SQL expression (for example, an invocation of a user-defined function).

#### system\_trigger

Defines a system trigger (described in "System Triggers").

## BEFORE

Causes the database to fire the trigger before running the triggering event.

#### AFTER

Causes the database to fire the trigger after running the triggering event.

## **INSTEAD OF**

Creates an INSTEAD OF trigger.

## **Restrictions on INSTEAD OF**

- The triggering event must be a CREATE statement.
- You can create at most one INSTEAD OF DDL trigger (non\_dml\_trigger).

For example, you can create an INSTEAD OF trigger on either the database or schema, but not on both the database and schema.

#### ddl\_event

One or more types of DDL SQL statements that can cause the trigger to fire.

You can create triggers for these events on DATABASE or SCHEMA unless otherwise noted. You can create BEFORE and AFTER triggers for any of these events, but you can create INSTEAD OF triggers only for CREATE events. The database fires the trigger in the existing user transaction.

## Note:

Some objects are created, altered, and dropped using PL/SQL APIs (for example, scheduler jobs are maintained by subprograms in the DBMS\_SCHEDULER package). Such PL/SQL subprograms do not fire DDL triggers.

The following *ddl\_event* values are valid:

• ALTER

Causes the database to fire the trigger whenever an ALTER statement modifies a database object in the data dictionary. An ALTER DATABASE statement does not fire the trigger.

• ANALYZE

Causes the database to fire the trigger whenever the database collects or deletes statistics or validates the structure of a database object.

## See Also:

Oracle Database SQL Language Reference for information about using the SQL statement ANALYZE to collect statistics

• ASSOCIATE STATISTICS

Causes the database to fire the trigger whenever the database associates a statistics type with a database object.

• AUDIT

Causes the database to fire the trigger whenever an AUDIT statement is issued.

COMMENT

Causes the database to fire the trigger whenever a comment on a database object is added to the data dictionary.

CREATE

Causes the database to fire the trigger whenever a CREATE statement adds a database object to the data dictionary. The CREATE DATABASE or CREATE CONTROLFILE statement does not fire the trigger.

• DISASSOCIATE STATISTICS

Causes the database to fire the trigger whenever the database disassociates a statistics type from a database object.

• DROP

Causes the database to fire the trigger whenever a DROP statement removes a database object from the data dictionary.

• GRANT

Causes the database to fire the trigger whenever a user grants system privileges or roles or object privileges to another user or to a role.

• NOAUDIT

Causes the database to fire the trigger whenever a NOAUDIT statement is issued.

• RENAME

Causes the database to fire the trigger whenever a RENAME statement changes the name of a database object.

• REVOKE

Causes the database to fire the trigger whenever a REVOKE statement removes system privileges or roles or object privileges from a user or role.

• TRUNCATE

Causes the database to fire the trigger whenever a TRUNCATE statement removes the rows from a table or cluster and resets its storage characteristics.

DDL

Causes the database to fire the trigger whenever any of the preceding DDL statements is issued.

#### database\_event

One of the following database events. You can create triggers for these events on either DATABASE or SCHEMA unless otherwise noted. For each of these triggering events, the database opens an autonomous transaction scope, fires the trigger, and commits any separate transaction (regardless of any existing user transaction).

AFTER STARTUP

Causes the database to fire the trigger whenever the database is opened. This event is valid only with DATABASE, not with SCHEMA.

• BEFORE SHUTDOWN

Causes the database to fire the trigger whenever an instance of the database is shut down. This event is valid only with DATABASE, not with SCHEMA.

• AFTER DB\_ROLE\_CHANGE

In an Oracle Data Guard configuration, causes the database to fire the trigger whenever a role change occurs from standby to primary or from primary to standby. This event is valid only with DATABASE, not with SCHEMA.

## Note:

You cannot create an AFTER DB ROLE CHANGE trigger on a PDB.

• AFTER SERVERERROR

Causes the database to fire the trigger whenever both of these conditions are true:

- A server error message is logged.
- Oracle relational database management system (RDBMS) determines that it is safe to fire error triggers.

Examples of when it is unsafe to fire error triggers include:

- \* RDBMS is starting up.
- \* A critical error has occurred.
- AFTER LOGON

Causes the database to fire the trigger whenever a client application logs onto the database.

BEFORE LOGOFF

Causes the database to fire the trigger whenever a client application logs off the database.

AFTER SUSPEND

Causes the database to fire the trigger whenever a server error causes a transaction to be suspended.

• AFTER CLONE

Can be specified only if PLUGGABLE DATABASE is specified. After the PDB is copied (cloned), the database fires the trigger in the new PDB and then deletes the trigger. If the trigger fails, then the copy operation fails.

• BEFORE UNPLUG

Can be specified only if PLUGGABLE DATABASE is specified. Before the PDB is unplugged, the database fires the trigger and then deletes it. If the trigger fails, then the unplug operation fails.

• [ BEFORE | AFTER ] SET CONTAINER

Causes the database to fire the trigger either before or after an ALTER SESSION SET CONTAINER statement runs.

## See Also:

"Triggers for Publishing Events" for more information about responding to database events through triggers

## [schema.]SCHEMA

Defines the trigger on the specified schema. **Default:** current schema. The trigger fires whenever any user connected as the specified schema initiates the triggering event.

## [PLUGGABLE] DATABASE

DATABASE defines the trigger on the root. In a multitenant container database (CDB), only a common user who is connected to the root can create a trigger on the entire database.

PLUGGABLE DATABASE defines the trigger on the PDB to which you are connected.

The trigger fires whenever any user of the specified database or PDB initiates the triggering event.

## Note:

If you are connected to a PDB, then specifying DATABASE is equivalent to specifying PLUGGABLE DATABASE unless you want to specify an option that applies only to a PDB (such as CLONE or UNPLUG).

## ENABLE

(Default) Creates the trigger in an enabled state.

## DISABLE

Creates the trigger in a disabled state, which lets you ensure that the trigger compiles without errors before you enable it.

#### WHEN (condition)

Specifies a SQL condition that the database evaluates. If the value of *condition* is TRUE, then *trigger\_body* runs for that row; otherwise, *trigger\_body* does not run for that row. The triggering statement runs regardless of the value of *condition*.

## See Also:

Oracle Database SQL Language Reference for information about SQL conditions

#### **Restrictions on WHEN (condition)**

- You cannot specify this clause for a STARTUP, SHUTDOWN, or DB ROLE CHANGE trigger.
- If you specify this clause for a SERVERERROR trigger, then condition must be ERRNO = error code.
- The *condition* cannot include a subquery, a PL/SQL expression (for example, an invocation of a user-defined function), or a correlation name.

## trigger\_body

The PL/SQL block or CALL subprogram that the database runs to fire the trigger. A CALL subprogram is either a PL/SQL subprogram or a Java subprogram in a PL/SQL wrapper.

If *trigger\_body* is a PL/SQL block and it contains errors, then the CREATE [OR REPLACE] statement fails.

#### Restrictions on trigger\_body

- The declare section cannot declare variables of the data type LONG or LONG RAW.
- The trigger body cannot specify either :NEW or :OLD.

#### dml\_event\_clause

Specifies the triggering statements for *simple\_dml\_trigger* or *compound\_dml\_trigger*. The database fires the trigger in the existing user transaction.

#### DELETE

Causes the database to fire the trigger whenever a DELETE statement removes a row from *table* or the table on which *view* is defined.

## INSERT

Causes the database to fire the trigger whenever an INSERT statement adds a row to *table* or the table on which *view* is defined.

### UPDATE [ OF column [, column ] ]

Causes the database to fire the trigger whenever an UPDATE statement changes a value in a specified column. **Default:** The database fires the trigger whenever an UPDATE statement changes a value in any column of *table* or the table on which *view* is defined.

If you specify a *column*, then you cannot change its value in the body of the trigger.

#### schema

Name of the schema that contains the database object on which the trigger is to be created. **Default:** your schema.

#### table

Name of the database table or object table on which the trigger is to be created.

#### Restriction on schema.table

ORACLE

You cannot create a trigger on a table in the schema SYS.

#### view

Name of the database view or object view on which the trigger is to be created.

## Note:

A compound DML trigger created on a noneditioning view is not really compound, because it has only one timing point section.

## referencing\_clause

Specifies correlation names, which refer to old, new, and parent values of the current row. **Defaults:** OLD, NEW, and PARENT.

If your trigger is associated with a table named OLD, NEW, or PARENT, then use this clause to specify different correlation names to avoid confusion between the table names and the correlation names.

If the trigger is defined on a nested table, then OLD and NEW refer to the current row of the nested table, and PARENT refers to the current row of the parent table. If the trigger is defined on a database table or view, then OLD and NEW refer to the current row of the database table or view, and PARENT is undefined.

## Restriction on referencing\_clause

The referencing\_clause is not valid if trigger\_body is CALL routine.

DML row-level triggers cannot reference fields of OLD/NEW/PARENT pseudorecords (correlation names) that correspond to columns with declared collation other than USING\_NLS\_COMP.

## trigger\_edition\_clause

Creates the trigger as a crossedition trigger.

The handling of DML changes during edition-based redefinition (EBR) of an online application can entail multiple steps. Therefore, it is likely, though not required, that a crossedition trigger is also a **compound trigger**.

#### Restrictions on trigger\_edition\_clause

- You cannot define a crossedition trigger on a view.
- You cannot specify NONEDITIONABLE for a crossedition trigger.

## FORWARD

**(Default)** Creates the trigger as a forward crossedition trigger. A forward crossedition trigger is intended to fire when DML changes are made in a database while an online application that uses the database is being patched or upgraded with EBR. The body of a crossedition trigger is designed to handle these DML changes so that they can be appropriately applied after the changes to the application code are completed.

## REVERSE

Creates the trigger as a reverse crossedition trigger, which is intended to fire when the application, after being patched or upgraded with EBR, makes DML changes. This trigger

propagates data to columns or tables used by the application before it was patched or upgraded.

## trigger\_ordering\_clause

## FOLLOWS | PRECEDES

Specifies the relative firing of triggers that have the same timing point. It is especially useful when creating crossedition triggers, which must fire in a specific order to achieve their purpose.

Use FOLLOWS to indicate that the trigger being created must fire after the specified triggers. You can specify FOLLOWS for a conventional trigger or for a forward crossedition trigger.

Use PRECEDES to indicate that the trigger being created must fire before the specified triggers. You can specify PRECEDES only for a reverse crossedition trigger.

The specified triggers must exist, and they must have been successfully compiled. They need not be enabled.

If you are creating a noncrossedition trigger, then the specified triggers must be all of the following:

- Noncrossedition triggers
- · Defined on the same table as the trigger being created
- Visible in the same edition as the trigger being created

If you are creating a crossedition trigger, then the specified triggers must be all of the following:

- Crossedition triggers
- Defined on the same table or editioning view as the trigger being created, unless you specify FOLLOWS or PRECEDES.

If you specify FOLLOWS, then the specified triggers must be forward crossedition triggers, and if you specify PRECEDES, then the specified triggers must be reverse crossedition triggers. However, the specified triggers need not be on the same table or editioning view as the trigger being created.

• Visible in the same edition as the trigger being created

In the following definitions, A, B, C, and D are either noncrossedition triggers or forward crossedition triggers:

- If B specifies A in its FOLLOWS clause, then B directly follows A.
- If C directly follows B, and B directly follows A, then C indirectly follows A.
- If D directly follows C, and C indirectly follows A, then D indirectly follows A.
- If B directly or indirectly follows A, then B explicitly follows A (that is, the firing order of B and A is explicitly specified by one or more FOLLOWS clauses).

In the following definitions, A, B, C, and D are reverse crossedition triggers:

• If A specifies B in its PRECEDES clause, then A directly precedes B.

- If A directly precedes B, and B directly precedes C, then A indirectly precedes C.
- If A directly precedes B, and B indirectly precedes D, then A indirectly precedes D.
- If A directly or indirectly precedes B, then A **explicitly precedes** B (that is, the firing order of A and B is explicitly specified by one or more **PRECEDES** clauses).

Belongs to *compound\_dml\_trigger*.

#### compound\_trigger\_block

If the trigger is created on a noneditioning view, then *compound\_trigger\_block* must have only the INSTEAD OF EACH ROW section.

If the trigger is created on a table or editioning view, then timing point sections can be in any order, but no section can be repeated. The *compound\_trigger\_block* cannot have an INSTEAD OF EACH ROW section.

## Restriction on compound\_trigger\_block

The declare\_section of compound\_trigger\_block cannot include PRAGMA AUTONOMOUS TRANSACTION.

#### timing\_point

#### **BEFORE STATEMENT**

Specifies the BEFORE STATEMENT section of a *compound\_dml\_trigger* on a table or editioning view. This section causes the database to fire the trigger before running the triggering event.

#### **Restriction on BEFORE STATEMENT**

This section cannot specify :NEW or :OLD.

## **BEFORE EACH ROW**

Specifies the BEFORE EACH ROW section of a *compound\_dml\_trigger* on a table or editioning view. This section causes the database to fire the trigger before running the triggering event. The trigger fires before each affected row is changed.

This section can read and write the :OLD and :NEW fields.

## AFTER STATEMENT

Specifies the AFTER STATEMENT section of *compound\_dml\_trigger* on a table or editioning view. This section causes the database to fire the trigger after running the triggering event.

## **Restriction on AFTER STATEMENT**

This section cannot specify :NEW or :OLD.

## AFTER EACH ROW

Specifies the AFTER EACH ROW section of a *compound\_dml\_trigger* on a table or editioning view. This section causes the database to fire the trigger after running the triggering event. The trigger fires after each affected row is changed.

This section can read but not write the :OLD and :NEW fields.

## INSTEAD OF EACH ROW

Specifies the INSTEAD OF EACH ROW section (the only timing point section) of a *compound\_dml\_trigger* on a noneditioning view. The database runs *tps\_body* instead of running the triggering DML statement. For more information, see "INSTEAD OF DML Triggers".

## **Restriction on INSTEAD OF EACH ROW**

- This section can appear only in a *compound dml trigger* on a noneditioning view.
- This section can read but not write the :OLD and :NEW values.

## tps\_body

The PL/SQL block or CALL subprogram that the database runs to fire the trigger. A CALL subprogram is either a PL/SQL subprogram or a Java subprogram in a PL/SQL wrapper.

If *tps\_body* is a PL/SQL block and it contains errors, then the CREATE [OR REPLACE] statement fails.

## Restriction on *tps\_body*

The declare section cannot declare variables of the data type LONG or LONG RAW.

## Examples

**DML** Triggers

# **CREATE TYPE Statement**

The CREATE TYPE statement specifies the name of the type and its attributes, methods, and other properties.

The CREATE TYPE statement creates or replaces the specification of one of these:

- Abstract Data Type (ADT)
- Standalone varying array (varray) type

- Standalone nested table type
- Incomplete object type

An **incomplete type** is a type created by a forward type definition. It is called incomplete because it has a name but no attributes or methods. It can be referenced by other types, allowing you to define types that refer to each other. However, you must fully specify the type before you can use it to create a table or an object column or a column of a nested table type.

The CREATE TYPE BODY statement contains the code for the methods that implement the type.

## Note:

- If you create a type whose specification declares only attributes but no methods, then you need not specify a type body.
- A standalone collection type that you create with the CREATE TYPE statement differs from a collection type that you define with the keyword TYPE in a PL/SQL block or package. For information about the latter, see "Collection Variable Declaration".
- With the CREATE TYPE statement, you can create nested table and VARRAY types, but not associative arrays. In a PL/SQL block or package, you can define all three collection types.

## Topics

- Prerequisites
- Syntax
- Semantics
- Examples
- Related Topics

## Prerequisites

To create a type in your schema, you must have the CREATE TYPE system privilege. To create a type in another user's schema, you must have the CREATE ANY TYPE system privilege. You can acquire these privileges explicitly or be granted them through a role.

To create a subtype, you must have the UNDER ANY TYPE system privilege or the UNDER object privilege on the supertype.

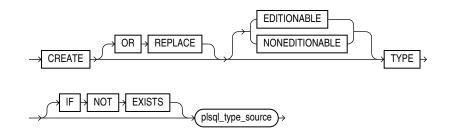

The owner of the type must be explicitly granted the EXECUTE object privilege to access all other types referenced in the definition of the type, or the type owner must be granted the EXECUTE ANY TYPE system privilege. The owner cannot obtain these privileges through roles.

If the type owner intends to grant other users access to the type, then the owner must be granted the EXECUTE object privilege on the referenced types with the GRANT OPTION or the EXECUTE ANY TYPE system privilege with the ADMIN OPTION. Otherwise, the type owner has insufficient privileges to grant access on the type to other users.

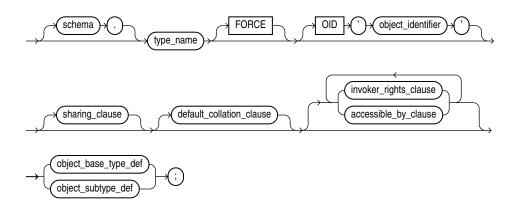

#### Syntax

create\_type ::=

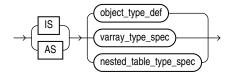

## plsql\_type\_source ::=

(sharing\_clause ::=, default\_collation\_clause ::=, accessible\_by\_clause ::=, invoker\_rights\_clause ::=, object\_base\_type\_def ::=, object\_subtype\_def ::=)

object\_base\_type\_def ::=

(object\_type\_def ::=, nested\_table\_type\_spec ::=, varray\_type\_spec ::=)

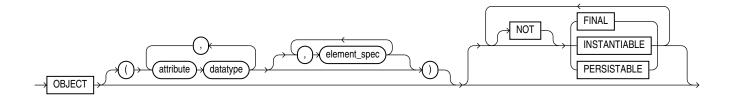

object\_subtype\_def ::=

( datatype ::=, element\_spec ::=)

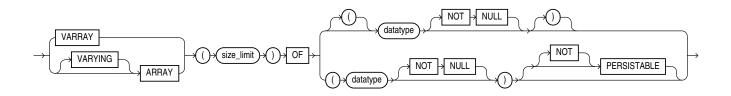

ORACLE

## object\_type\_def ::=

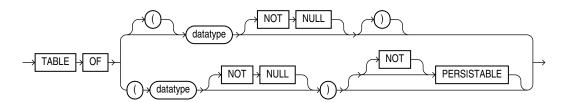

( datatype ::=, element\_spec ::=)

varray\_type\_spec ::=

(datatype ::=)

nested\_table\_type\_spec ::=

(datatype ::=)

**Semantics** 

create\_type

#### **OR REPLACE**

Re-creates the type if it exists, and recompiles it.

Users who were granted privileges on the type before it was redefined can still access the type without being regranted the privileges.

If any function-based indexes depend on the type, then the database marks the indexes DISABLED.

## [EDITIONABLE | NONEDITIONABLE ]

Specifies whether the type is an editioned or noneditioned object if editioning is enabled for the schema object type TYPE in *schema*. **Default:** EDITIONABLE. For information about editioned and noneditioned objects, see *Oracle Database Development Guide*.

## IF NOT EXISTS

Creates the type if it does not already exist. If a type by the same name does exist, the statement is ignored without error and the original type remains unchanged.

IF NOT EXISTS cannot be used in combination with OR REPLACE.

#### plsql\_type\_source

## schema

Name of the schema containing the type. Default: your schema.

#### type\_name

Name of an ADT, a nested table type, or a VARRAY type.

If creating the type results in compilation errors, then the database returns an error. You can see the associated compiler error messages with the SQL\*Plus command SHOW ERRORS.

The database implicitly defines a constructor method for each user-defined type that you create. A **constructor** is a system-supplied procedure that is used in SQL statements or in PL/SQL code to construct an instance of the type value. The name of the constructor method is the name of the user-defined type. You can also create a user-defined constructor using the *constructor spec* syntax.

The parameters of the ADT constructor method are the data attributes of the ADT. They occur in the same order as the attribute definition order for the ADT. The parameters of a nested table or varray constructor are the elements of the nested table or the varray.

## FORCE

If *type\_name* exists and has type dependents, but not table dependents, FORCE forces the statement to replace the type. (If *type\_name* has table dependents, the statement fails with or without FORCE.)

## Note:

If type t1 has type dependent t2, and type t2 has table dependents, then type t1 also has table dependents.

## See Also:

Oracle Database Object-Relational Developer's Guide

#### OID 'object\_identifier'

Establishes type equivalence of identical objects in multiple databases. See Oracle Database Object-Relational Developer's Guide for information about this clause.

#### object\_base\_type\_def

Creates a schema-level ADT. Such ADTs are sometimes called **root** ADTs.

IS | AS

The keyword IS or AS is required when creating an ADT.

## object\_subtype\_def

Creates a subtype of an existing type.

## UNDER supertype

The existing supertype must be an ADT. The subtype you create in this statement inherits the properties of its supertype. It must either override some of those properties or add properties to distinguish it from the supertype.

💉 See Also:	
"Example 15-26, Creating a Subtype" and "Example 15-27, Creating a Type Hierarchy"	

## attribute

Name of an ADT attribute. An ADT attribute is a data item with a name and a type specifier that forms the structure of the ADT. You must specify at least one attribute for each ADT. The name must be unique in the ADT, but can be used in other ADTs.

If you are creating a subtype, then the attribute name cannot be the same as any attribute or method name declared in the supertype chain.

## datatype

The data type of an ADT attribute. This data type must be stored in the database; that is, either a predefined data type or a user-defined standalone collection type.

## Restrictions on *datatype*

- You cannot impose the NOT NULL constraint on an attribute.
- You cannot specify attributes of type ROWID, LONG, or LONG RAW.
- You cannot specify a data type of UROWID for an ADT.
- If you specify an object of type REF, then the target object must have an object identifier.
- If you are creating a collection type for use as a nested table or varray column of a table, then you cannot specify attributes of type ANYTYPE, ANYDATA, or ANYDATASET.
- JSON cannot be an attribute of a user defined type (ADT).

#### object\_type\_def

Creates an ADT. The variables that form the data structure are called **attributes**. The member subprograms that define the behavior of the ADT are called **methods**.

#### OBJECT

The keyword OBJECT is required.

## [NOT] FINAL, [NOT] INSTANTIABLE , [NOT] PERSISTABLE

At the schema level of the syntax, these clauses specify the inheritance attributes of the type.

## [NOT] FINAL

Use the [NOT] FINAL clause to indicate whether any further subtypes can be created for this type:

- (Default) Specify FINAL if no further subtypes can be created for this type.
- Specify NOT FINAL if further subtypes can be created under this type.

## [NOT] INSTANTIABLE

Use the [NOT] INSTANTIABLE clause to indicate whether any object instances of this type can be constructed:

- (Default) Specify INSTANTIABLE if object instances of this type can be constructed.
- Specify NOT INSTANTIABLE if no default or user-defined constructor exists for this ADT. You must specify these keywords for any type with noninstantiable methods and for any type that has no attributes, either inherited or specified in this statement.

## [NOT] PERSISTABLE

Use [NOT] PERSISTABLE clause to indicate whether or not instances of the object type are persistable.

Only **PERSISTABLE** types can be stored in a table.

- **(Default)** You can specify PERSISTABLE if all the object type attributes are persistable. Creating a persistable object type with non-persistable attributes is not allowed.
- You can specify NOT PERSISTABLE if the object type attributes are persistable or nonpersistable.
- Specify NOT PERSISTABLE if the ADT has a unique PL/SQL predefined type, such as SIMPLE\_INTEGER and PLS\_INTEGER.

## **Restrictions on [NOT] PERSISTABLE ADT**

You cannot specify the [NOT] PERSISTABLE clause in a subtype definition. The persistance property of a subtype is inherited from its supertype.

Non-persistable ADTs with PL/SQL unique attributes are only allowed in the PL/SQL context.

See : Example 15-30, "Creating a Non-Persistable Object Type"

#### varray\_type\_spec

Creates the type as an ordered set of elements, each of which has the same data type.

### Restrictions on varray\_type\_spec

You can create a VARRAY type of XMLType or of a LOB type for procedural purposes, for example, in PL/SQL or in view queries. However, database storage of such a varray is not supported, so you cannot create an object table or an column of such a VARRAY type.

See Also: "Example 15-28, Creating a Varray Type"

## [NOT] PERSISTABLE

## ( datatype [NOT NULL] )

The parentheses before and after the datatype [NOT NULL] clause are required when PERSISTABLE is specified. The parentheses are optional if PERSISTABLE is not specified.

Use [NOT] PERSISTABLE clause to indicate whether or not instances of the collection type (VARRAY or nested table) are persistable.

- **(Default)** A collection can be **PERSISTABLE** only if the collection element type is persistable. Creating a persistable collection type with non-persistable element type is not allowed.
- Specify NOT PERSISTABLE if any element type of the collection is not persistable. You can specify NOT PERSISTABLE for any collection, whether the element type is persistable or not.
- Specify NOT PERSISTABLE if the collection has a unique PL/SQL predefined type, such as SIMPLE\_INTEGER and PLS\_INTEGER.

## **Restrictions on [NOT] PERSISTABLE Varray and Nested Array**

Non-persistable types with PL/SQL unique attributes are only allowed in the PL/SQL context.

See Example 15-29, "Creating a Non-Persistable Nested Array" and Example 15-31, "Creating a Non-Persistable Varray"

#### nested\_table\_type\_spec

Creates a named nested table of type *datatype*.

#### [NOT] PERSISTABLE

Same as for VARRAY, see "[NOT] PERSISTABLE"

## 🖍 See Also:

- "Example 15-32, Creating a Nested Table Type"
- "Example 15-33, Creating a Nested Table Type Containing a VARRAY"

#### **Examples**

## Example 15-25 ADT Examples

This example shows how the sample type <code>customer\_typ</code> was created for the sample Order Entry (oe) schema. A hypothetical name is given to the table so that you can duplicate this example in your test database:

```
CREATE TYPE customer_typ_demo AS OBJECT
( customer_id NUMBER(6)
, cust_first_name VARCHAR2(20)
, cust_last_name VARCHAR2(20)
```

```
, cust_address CUST_ADDRESS_TYP
, phone_numbers PHONE_LIST_TYP
, nls_language VARCHAR2(3)
, nls_territory VARCHAR2(30)
, credit_limit NUMBER(9,2)
, cust_email VARCHAR2(30)
, cust_orders ORDER_LIST_TYP
);
/
```

In this example, the data\_typ1 ADT is created with one member function prod, which is implemented in the CREATE TYPE BODY statement:

```
CREATE TYPE data_typ1 AS OBJECT
  ( year NUMBER,
    MEMBER FUNCTION prod(invent NUMBER) RETURN NUMBER
  );
/
CREATE TYPE BODY data_typ1 IS
    MEMBER FUNCTION prod (invent NUMBER) RETURN NUMBER IS
    BEGIN
        RETURN (year + invent);
        END;
        END;
/
```

## Example 15-26 Creating a Subtype

This statement shows how the subtype corporate\_customer\_typ in the sample oe schema was created.

It is based on the customer\_typ supertype created in the preceding example and adds the account\_mgr\_id attribute. A hypothetical name is given to the table so that you can duplicate this example in your test database:

```
CREATE TYPE corporate_customer_typ_demo UNDER customer_typ
  ( account_mgr_id NUMBER(6)
  );
/
```

## Example 15-27 Creating a Type Hierarchy

These statements create a type hierarchy.

Type <code>employee\_t</code> inherits the <code>name</code> and <code>ssn</code> attributes from type <code>person\_t</code> and in addition has <code>department\_id</code> and <code>salary</code> attributes. Type <code>part\_time\_emp\_t</code> inherits all of the attributes from <code>employee\_t</code> and, through <code>employee\_t</code>, those of <code>person\_t</code> and in addition has a <code>num\_hrs</code> attribute. Type <code>part\_time\_emp\_t</code> is final by default, so no further subtypes can be created under it.

```
CREATE TYPE person_t AS OBJECT (name VARCHAR2(100), ssn NUMBER)
NOT FINAL;
/
```

```
CREATE TYPE employee_t UNDER person_t
   (department_id NUMBER, salary NUMBER) NOT FINAL;
/
CREATE TYPE part_time_emp_t UNDER employee_t (num_hrs NUMBER);
/
```

You can use type hierarchies to create substitutable tables and tables with substitutable columns.

#### Example 15-28 Creating a Varray Type

This statement shows how the phone\_list\_typ VARRAY type with five elements in the sample oe schema was created.

A hypothetical name is given to the table so that you can duplicate this example in your test database:

```
CREATE TYPE phone_list_typ_demo AS VARRAY(5) OF VARCHAR2(25); /
```

#### Example 15-29 Creating a Non-Persistable Nested Array

This example shows how to create a PL/SQL nested array with unique PL/SQL predefined type PLS INTEGER that is not persistable and can only be used in your PL/SQL programs.

```
CREATE TYPE IF NOT EXISTS varr_int AS VARRAY(10) OF (PLS_INTEGER) NOT PERSISTABLE; /
```

The optional IF NOT EXISTS clause is used to ensure that the statement is idempotent. The resulting output message (in this case Type created) is the same whether the type is created or the statement is ignored.

## Example 15-30 Creating a Non-Persistable Object Type

This example shows how to create a PL/SQL object type with unique PL/SQL predefined type PLS INTEGER that is not persistable and can only be used in your PL/SQL programs.

```
CREATE TYPE plsint AS OBJECT (I PLS_INTEGER) NOT PERSISTABLE; /
```

#### Example 15-31 Creating a Non-Persistable Varray

This example shows how to create a PL/SQL varray with unique PL/SQL predefined type PLS INTEGER that is not persistable and can only be used in your PL/SQL programs.

```
CREATE TYPE tab_plsint AS TABLE OF (PLS_INTEGER) NOT PERSISTABLE; /
```

## Example 15-32 Creating a Nested Table Type

This example from the sample schema pm creates the table type textdoc\_tab of type textdoc typ:

```
CREATE TYPE textdoc_typ AS OBJECT
  ( document_typ VARCHAR2(32)
  , formatted_doc BLOB
  );
/
CREATE TYPE textdoc_tab AS TABLE OF textdoc_typ;
/
```

## Example 15-33 Creating a Nested Table Type Containing a Varray

This example of multilevel collections is a variation of the sample table oe.customers.

In this example, the cust\_address object column becomes a nested table column with the phone\_list\_typ varray column embedded in it. The phone\_list\_typ\_demo type was created in "Example 15-28".

```
CREATE TYPE cust_address_typ2 AS OBJECT

( street_address VARCHAR2(40)

, postal_code VARCHAR2(10)

, city VARCHAR2(30)

, state_province VARCHAR2(10)

, country_id CHAR(2)

, phone phone_list_typ_demo

);

/

CREATE TYPE cust_nt_address_typ

AS TABLE OF cust_address_typ2;

/
```

## Example 15-34 Constructor Example

This example invokes the system-defined constructor to construct the demo\_typ object and insert it into the demo\_tab table.

```
CREATE TYPE demo_typ1 AS OBJECT (a1 NUMBER, a2 NUMBER);
/
CREATE TABLE demo_tab1 (b1 NUMBER, b2 demo_typ1);
/
INSERT INTO demo_tab1 VALUES (1, demo_typ1(2,3));
/
```

## Example 15-35 Creating a Member Method

This example invokes method constructor col.get square.

First the type is created:

```
CREATE TYPE demo_typ2 AS OBJECT (a1 NUMBER,
    MEMBER FUNCTION get_square RETURN NUMBER);
/
```

Next a table is created with an ADT column and some data is inserted into the table:

```
CREATE TABLE demo_tab2(col demo_typ2);
/
INSERT INTO demo_tab2 VALUES (demo_typ2(2));
/
```

The type body is created to define the member function, and the member method is invoked:

```
CREATE TYPE BODY demo_typ2 IS
   MEMBER FUNCTION get_square
   RETURN NUMBER
   IS x NUMBER;
   BEGIN
      SELECT c.col.a1*c.col.a1 INTO x
      FROM demo_tab2 c;
      RETURN (x);
   END;
/
SELECT t.col.get_square() FROM demo_tab2 t;
/
```

## Result:

Unlike function invocations, method invocations require parentheses, even when the methods do not have additional arguments.

#### Example 15-36 Creating a Static Method

This example changes the definition of the <code>employee\_t</code> type to associate it with the <code>construct emp</code> function.

The example first creates an ADT department\_t and then an ADT employee\_t containing an attribute of type department t:

```
CREATE OR REPLACE TYPE department_t AS OBJECT (
    deptno number(10),
    dname CHAR(30));
/
CREATE OR REPLACE TYPE employee t AS OBJECT(
```

```
empid RAW(16),
ename CHAR(31),
dept REF department_t,
STATIC function construct_emp
(name VARCHAR2, dept REF department_t)
RETURN employee_t
);
/
```

## This statement requires this type body statement.

```
CREATE OR REPLACE TYPE BODY employee_t IS
   STATIC FUNCTION construct_emp
   (name varchar2, dept REF department_t)
   RETURN employee_t IS
    BEGIN
       return employee_t(SYS_GUID(),name,dept);
   END;
/
```

#### Next create an object table and insert into the table:

```
CREATE TABLE emptab OF employee_t;
/
INSERT INTO emptab
VALUES (employee_t.construct_emp('John Smith', NULL));
/
```

# **CREATE TYPE BODY Statement**

The CREATE TYPE BODY defines or implements the member methods defined in the type specification that was created with the CREATE TYPE statement.

For each method specified in a type specification for which you did not specify the *call\_spec*, you must specify a corresponding method body in the type body.

## Topics

- Prerequisites
- Syntax
- Semantics
- Examples
- Related Topics

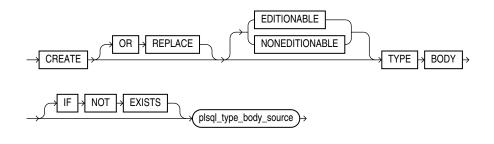

#### **Prerequisites**

Every member declaration in the CREATE TYPE specification for an ADT must have a corresponding construct in the CREATE TYPE or CREATE TYPE BODY statement.

To create or replace a type body in your schema, you must have the CREATE TYPE or the CREATE ANY TYPE system privilege. To create a type in another user's schema, you must have the CREATE ANY TYPE system privilege. To replace a type in another user's schema, you must have the DROP ANY TYPE system privilege.

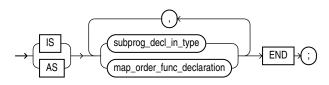

## **Syntax**

create\_type\_body ::=

plsql\_type\_body\_source ::=

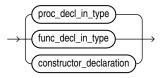

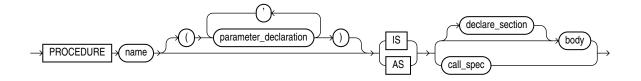

(sharing\_clause ::=, map\_order\_func\_declaration ::=, subprog\_decl\_in\_type ::=)

subprog\_decl\_in\_type ::=

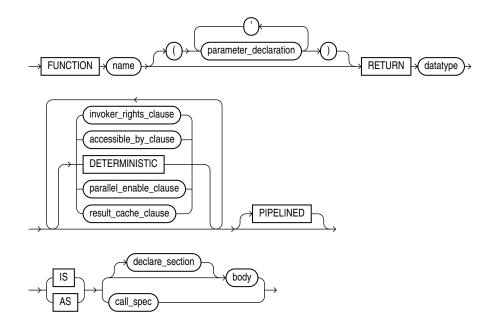

proc\_decl\_in\_type ::=

(body ::=, call\_spec ::=, declare\_section ::=, parameter\_declaration ::=)

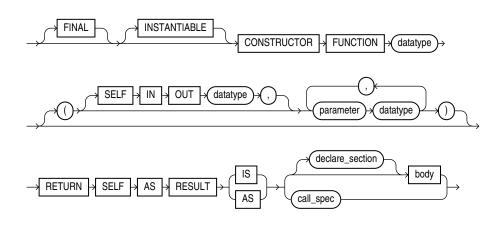

func\_decl\_in\_type ::=

(body ::=, invoker\_rights\_clause ::=, accessible\_by\_clause ::=, deterministic\_clause ::=, call\_spec ::=, declare\_section ::=, parameter\_declaration ::=, parallel\_enable\_clause ::=, result\_cache\_clause ::=, pipelined\_clause ::=)

## constructor\_declaration ::=

(call\_spec ::=)

map\_order\_func\_declaration ::=

## Semantics

create\_type\_body

## OR REPLACE

Re-creates the type body if it exists, and recompiles it.

Users who were granted privileges on the type body before it was redefined can still access the type body without being regranted the privileges.

You can use this clause to add member subprogram definitions to specifications added with the ALTER TYPE ... REPLACE statement.

## [EDITIONABLE | NONEDITIONABLE ]

If you do not specify this property, then the type body inherits EDITIONABLE or NONEDITIONABLE from the type specification. If you do specify this property, then it must match that of the type specification.

## **IF NOT EXISTS**

Creates the type body if it does not already exist. If a type body by the same name does exist, the statement is ignored without error and the original type body remains unchanged.

IF NOT EXISTS cannot be used in combination with OR REPLACE.

## plsql\_type\_body\_source

## schema

Name of the schema containing the type body. **Default:** your schema.

ORACLE

#### type\_name

Name of an ADT.

subprog\_decl\_in\_type

The type of function or procedure subprogram associated with the type specification.

You must define a corresponding method name and optional parameter list in the type specification for each procedure or function declaration. For functions, you also must specify a return type.

## map\_order\_func\_declaration

You can declare either one MAP method or one ORDER method, regardless of how many MEMBER or STATIC methods you declare. If you declare either a MAP or ORDER method, then you can compare object instances in SQL.

If you do not declare either method, then you can compare object instances only for equality or inequality. Instances of the same type definition are equal only if each pair of their corresponding attributes is equal.

## MAP MEMBER

Declares or implements a MAP member function that returns the relative position of a given instance in the ordering of all instances of the object. A MAP method is called implicitly and specifies an ordering of object instances by mapping them to values of a predefined scalar type. PL/SQL uses the ordering to evaluate Boolean expressions and to perform comparisons.

If the argument to the MAP method is null, then the MAP method returns null and the method is not invoked.

An type body can contain only one MAP method, which must be a function. The MAP function can have no arguments other than the implicit SELF argument.

## ORDER MEMBER

Specifies an ORDER member function that takes an instance of an object as an explicit argument and the implicit SELF argument and returns either a negative integer, zero, or a positive integer, indicating that the implicit SELF argument is less than, equal to, or greater than the explicit argument, respectively.

If either argument to the ORDER method is null, then the ORDER method returns null and the method is not invoked.

When instances of the same ADT definition are compared in an ORDER BY clause, the database invokes the ORDER MEMBER func decl in type.

An object specification can contain only one ORDER method, which must be a function having the return type NUMBER.

## proc\_decl\_in\_type

A procedure subprogram declaration.

## constructor\_declaration

A user-defined constructor subprogram declaration. The RETURN clause of a constructor function must be RETURN SELF AS RESULT. This setting indicates that the most specific type of

the value returned by the constructor function is the most specific type of the SELF argument that was passed in to the constructor function.

## See Also:

- "CREATE TYPE Statement" for a list of restrictions on user-defined functions
- "Overloaded Subprograms" for information about overloading subprogram names
- Oracle Database Object-Relational Developer's Guide for information about and examples of user-defined constructors

## declare\_section

Declares items that are local to the procedure or function.

## body

Procedure or function statements.

func\_decl\_in\_type

A function subprogram declaration.

## Examples

Several examples of creating type bodies appear in the Examples section of "CREATE TYPE Statement". For an example of re-creating a type body, see "Example 15-7".

#### **Related Topics**

- "CREATE TYPE Statement"
- "DROP TYPE BODY Statement"
- "CREATE FUNCTION Statement"
- "CREATE PROCEDURE Statement"

# **DROP FUNCTION Statement**

The DROP FUNCTION statement drops a standalone function from the database.

## Note:

Do not use this statement to drop a function that is part of a package. Instead, either drop the entire package using the "DROP PACKAGE Statement" or redefine the package without the function using the "CREATE PACKAGE Statement" with the OR REPLACE clause.

#### **Topics**

- Prerequisites
- Syntax

- Semantics
- Example
- Related Topics

## Prerequisites

The function must be in your schema or you must have the DROP ANY PROCEDURE system privilege.

**Syntax** 

drop\_function ::=

## Semantics

drop\_function

## **IF EXISTS**

Drops the function if it exists. If no such function exists, the statement is ignored without error.

#### schema

Name of the schema containing the function. Default: your schema.

## function\_name

Name of the function to be dropped.

The database invalidates any local objects that depend on, or invoke, the dropped function. If you subsequently reference one of these objects, then the database tries to recompile the object and returns an error if you have not re-created the dropped function.

If any statistics types are associated with the function, then the database disassociates the statistics types with the FORCE option and drops any user-defined statistics collected with the statistics type.

## 🖍 See Also:

- Oracle Database SQL Language Reference for information about the ASSOCIATE STATISTICS statement
- Oracle Database SQL Language Reference for information about the DISASSOCIATE STATISTICS statement

## Example

## Example 15-37 Dropping a Function

This statement drops the function SecondMax in the sample schema oe and invalidates all objects that depend upon SecondMax:

DROP FUNCTION IF EXISTS oe.SecondMax;

If SecondMax does not already exist in the schema, this statement is ignored without error. Note that the output message is the same whether or not the function exists (in this case, Function dropped.).

See Also: "Example 15-15" for information about creating the SecondMax function

## **Related Topics**

- "ALTER FUNCTION Statement"
- "CREATE FUNCTION Statement"

# **DROP LIBRARY Statement**

The DROP LIBRARY statement drops an external procedure library from the database.

## Topics

- Prerequisites
- Syntax
- Semantics
- Example
- Related Topics

### **Prerequisites**

You must have the DROP ANY LIBRARY system privilege.

Syntax

drop\_library ::=

## Semantics

## library\_name

Name of the external procedure library being dropped.

## **IF EXISTS**

Drops the library if it exists. If no such library exists, the statement is ignored without error.

## Example

## Example 15-38 Dropping a Library

The following statement drops the ext\_lib library, which was created in "CREATE LIBRARY Statement":

DROP LIBRARY IF EXISTS ext\_lib;

If ext\_lib does not already exist, this statement is ignored without error. Note that the output message is the same whether or not the library exists (in this case, Library dropped.).

## **Related Topics**

- "ALTER LIBRARY Statement"
- "CREATE LIBRARY Statement"

# **DROP PACKAGE Statement**

The DROP PACKAGE statement drops a stored package from the database.

This statement drops the body and specification of a package.

## Note:

Do not use this statement to drop a single object from a package. Instead, re-create the package without the object using the "CREATE PACKAGE Statement" and "CREATE PACKAGE BODY Statement" with the OR REPLACE clause.

## Topics

- Prerequisites
- Syntax
- Semantics
- Example
- Related Topics

#### **Prerequisites**

The package must be in your schema or you must have the DROP ANY PROCEDURE system privilege.

**Syntax** 

drop\_package ::=

## Semantics

### drop\_package

## BODY

Drops only the body of the package. If you omit this clause, then the database drops both the body and specification of the package.

When you drop only the body of a package but not its specification, the database does not invalidate dependent objects. However, you cannot invoke a procedure or stored function declared in the package specification until you re-create the package body.

## IF EXISTS

Drops the package if it exists. If no such package exists, the statement is ignored without error.

#### schema

Name of the schema containing the package. Default: your schema.

## package

Name of the package to be dropped.

The database invalidates any local objects that depend on the package specification. If you subsequently reference one of these objects, then the database tries to recompile the object and returns an error if you have not re-created the dropped package.

If any statistics types are associated with the package, then the database disassociates the statistics types with the FORCE clause and drops any user-defined statistics collected with the statistics types.

## See Also:

- Oracle Database SQL Language Reference for information about the ASSOCIATE STATISTICS statement
- Oracle Database SQL Language Reference for information about the DISASSOCIATE STATISTICS statement

## Example

## Example 15-39 Dropping a Package

This statement drops the specification and body of the emp\_mgmt package, which was created in "CREATE PACKAGE BODY Statement", invalidating all objects that depend on the specification:

DROP PACKAGE emp\_mgmt;

## **Related Topics**

- "ALTER PACKAGE Statement"
- "CREATE PACKAGE Statement"
- "CREATE PACKAGE BODY Statement"

# **DROP PROCEDURE Statement**

The DROP PROCEDURE statement drops a standalone procedure from the database.

## Note:

Do not use this statement to remove a procedure that is part of a package. Instead, either drop the entire package using the "DROP PACKAGE Statement", or redefine the package without the procedure using the "CREATE PACKAGE Statement" with the OR REPLACE clause.

## Topics

- Prerequisites
- Syntax
- Semantics
- Example
- Related Topics

#### **Prerequisites**

The procedure must be in your schema or you must have the DROP ANY PROCEDURE system privilege.

## Syntax

## drop\_procedure ::=

#### **Semantics**

## **IF EXISTS**

Drops the procedure if it exists. If no such procedure exists, the statement is ignored without error.

## schema

Name of the schema containing the procedure. **Default:** your schema.

## procedure

Name of the procedure to be dropped.

When you drop a procedure, the database invalidates any local objects that depend upon the dropped procedure. If you subsequently reference one of these objects, then the database tries to recompile the object and returns an error message if you have not re-created the dropped procedure.

### Example

## Example 15-40 Dropping a Procedure

This statement drops the procedure remove\_emp owned by the user hr and invalidates all objects that depend upon remove emp:

DROP PROCEDURE IF EXISTS hr.remove emp;

If remove\_emp does not already exist in the schema, this statement is ignored without error. Note that the output message is the same whether or not the procedure exists (in this case, Procedure dropped.).

## **Related Topics**

- "ALTER PROCEDURE Statement"
- "CREATE PROCEDURE Statement"

# **DROP TRIGGER Statement**

The DROP TRIGGER statement drops a database trigger from the database.

## Topics

- Prerequisites
- Syntax
- Semantics
- Example
- Related Topics

#### Prerequisites

The trigger must be in your schema or you must have the DROP ANY TRIGGER system privilege. To drop a trigger on DATABASE in another user's schema, you must also have the ADMINISTER DATABASE TRIGGER system privilege.

## Syntax

#### drop\_trigger ::=

#### Semantics

#### IF EXISTS

Drops the trigger if it exists. If no such trigger exists, the statement is ignored without error.

#### schema

Name of the schema containing the trigger. **Default:** your schema.

## trigger

Name of the trigger to be dropped.

## Example

## Example 15-41 Dropping a Trigger

This statement drops the salary check trigger in the schema hr:

DROP TRIGGER hr.salary\_check;

## **Related Topics**

- "ALTER TRIGGER Statement"
- "CREATE TRIGGER Statement"

# **DROP TYPE Statement**

The DROP TYPE statement drops the specification and body of an ADT, VARRAY type, or nested table type.

## **Topics**

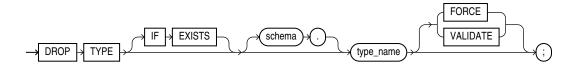

- Prerequisites
- Syntax
- Semantics
- Example
- Related Topics

### **Prerequisites**

The ADT, VARRAY type, or nested table type must be in your schema or you must have the DROP ANY TYPE system privilege.

#### **Syntax**

drop\_type ::=

#### **Semantics**

#### **IF EXISTS**

Drops the type if it exists. If no such type exists, the statement is ignored without error.

## schema

Name of the schema containing the type. **Default:** your schema.

#### type\_name

Name of the object, varray, or nested table type to be dropped. You can drop only types with no type or table dependencies.

If *type\_name* is a supertype, then this statement fails unless you also specify FORCE. If you specify FORCE, then the database invalidates all subtypes depending on this supertype.

If *type\_name* is a statistics type, then this statement fails unless you also specify FORCE. If you specify FORCE, then the database first disassociates all objects that are associated with *type\_name* and then drops *type\_name*.

#### 💉 See Also:

- Oracle Database SQL Language Reference for information about the ASSOCIATE STATISTICS statement
- Oracle Database SQL Language Reference for information about the DISASSOCIATE STATISTICS statement

If  $type\_name$  is an ADT that is associated with a statistics type, then the database first tries to disassociate  $type\_name$  from the statistics type and then drops  $type\_name$ . However, if statistics have been collected using the statistics type, then the database cannot disassociate  $type\_name$  from the statistics type, and this statement fails.

If *type\_name* is an implementation type for an index type, then the index type is marked INVALID.

If type name has a public synonym defined on it, then the database also drops the synonym.

Unless you specify FORCE, you can drop only types that are standalone schema objects with no dependencies. This is the default behavior.

#### See Also:

Oracle Database SQL Language Reference for information about the CREATE INDEXTYPE statement

#### FORCE

Drops the type even if it has dependent database objects. The database marks UNUSED all columns dependent on the type to be dropped, and those columns become inaccessible.

#### Note:

Oracle recommends against specifying FORCE to drop object types with dependencies. This operation is not recoverable and might make the data in the dependent tables or columns inaccessible.

#### VALIDATE

Causes the database to check for stored instances of this type in substitutable columns of any of its supertypes. If no such instances are found, then the database completes the drop operation.

This clause is meaningful only for subtypes. Oracle recommends the use of this option to safely drop subtypes that do not have any explicit type or table dependencies.

#### Example

#### Example 15-42 Dropping an ADT

This statement removes the ADT person\_t. See "CREATE TYPE Statement" for the example that creates this ADT. Any columns that are dependent on person\_t are marked UNUSED and become inaccessible.

DROP TYPE IF EXISTS person t FORCE;

If person\_t does not already exist, this statement is ignored without error. Note that the output message is the same whether or not the ADT exists (Type dropped.).

#### **Related Topics**

- "ALTER TYPE Statement"
- "CREATE TYPE Statement"
- "CREATE TYPE BODY Statement"

## **DROP TYPE BODY Statement**

The DROP TYPE BODY statement drops the body of an ADT, VARRAY type, or nested table type.

When you drop a type body, the type specification still exists, and you can re-create the type body. Prior to re-creating the body, you can still use the type, although you cannot invoke its member functions.

#### **Topics**

- Prerequisites
- Syntax
- Semantics
- Example
- Related Topics

#### Prerequisites

The type body must be in your schema or you must have the DROP ANY TYPE system privilege.

Syntax

drop\_type\_body ::=

#### Semantics

#### **IF EXISTS**

Drops the type body if it exists. If no such type body exists, the statement is ignored without error.

#### schema

Name of the schema containing the type. Default: your schema.

#### type\_name

Name of the type body to be dropped.

#### Restriction on type\_name

You can drop a type body only if it has no type or table dependencies.

#### Example

#### Example 15-43 Dropping an ADT Body

This statement removes the ADT body data\_typ1. See "CREATE TYPE Statement" for the example that creates this ADT.

DROP TYPE BODY data\_typ1;

#### **Related Topics**

- "ALTER TYPE Statement"
- "CREATE TYPE Statement"
- "CREATE TYPE BODY Statement"

# A PL/SQL Source Text Wrapping

You can wrap the PL/SQL source text for any of these stored PL/SQL units, thereby preventing anyone from displaying that text with the static data dictionary views \* SOURCE:

- Package specification
- Package body
- Type specification
- Type body
- Function
- Procedure

#### Note:

Wrapping text is low-assurance security. For high-assurance security, use Oracle Database Vault, described in *Oracle Database Vault Administrator's Guide*.

A file containing wrapped PL/SQL source text is called a **wrapped file**. A wrapped file can be moved, backed up, or processed by SQL\*Plus or the Import and Export utilities.

To produce a wrapped file, use either the PL/SQL Wrapper utility or a DBMS\_DDL subprogram. The PL/SQL Wrapper utility wraps the source text of every wrappable PL/SQL unit created by a specified SQL file. The DBMS\_DDL subprograms wrap the source text of single dynamically generated wrappable PL/SQL units.

Both the PL/SQL Wrapper utility and DBMS\_DDL subprograms detect tokenization errors (for example, runaway strings), but not syntax or semantic errors (for example, nonexistent tables or views).

By default, the 12.2 PL/SQL compiler can use wrapped packages that were compiled with the 9.2 PL/SQL compiler. To prevent the 12.2 PL/SQL compiler from using wrapped packages that were compiled with the 9.2 PL/SQL compiler, set the PL/SQL compilation parameter PERMIT\_92\_WRAP\_FORMAT to FALSE. For more information about PERMIT\_92\_WRAP\_FORMAT, see *Oracle Database Reference*. For more information about PL/SQL compilation parameters, see "PL/SQL Units and Compilation Parameters".

#### Topics

- PL/SQL Source Text Wrapping Limitations
- PL/SQL Source Text Wrapping Guidelines
- Wrapping PL/SQL Source Text with PL/SQL Wrapper Utility
- Wrapping PL/SQL Source Text with DBMS\_DDL Subprograms

# **PL/SQL Source Text Wrapping Limitations**

• Wrapped files are not downward-compatible between Oracle Database releases.

For example, you cannot load files produced by the version n.1 PL/SQL Wrapper utility into a version (n-1).2 Oracle Database. Nor can you load files produced by the version n.2 PL/SQL Wrapper utility into a version n.1 Oracle Database. Wrapped files are both upward- and downward-compatible across patch sets.

• Wrapping PL/SQL source text is not a secure way to hide passwords or table names.

For high-assurance security, use Oracle Database Vault, described in Oracle Database Vault Administrator's Guide.

• You cannot wrap the PL/SQL source text of triggers.

To hide the implementation details of a trigger, put them in a stored subprogram, wrap the subprogram, and write a one-line trigger that invokes the subprogram.

# PL/SQL Source Text Wrapping Guidelines

• Wrap only the body of a package or type, not the specification.

Leaving the specification unwrapped allows other developers to see the information needed to use the package or type (see Example A-5). Wrapping the body prevents them from seeing the package or type implementation.

• Wrap files only after you have finished editing them.

You cannot edit wrapped files. If a wrapped file needs changes, you must edit the original unwrapped file and then wrap it.

• Before distributing a wrapped file, view it in a text editor and ensure that all important parts are wrapped.

# Wrapping PL/SQL Source Text with PL/SQL Wrapper Utility

The PL/SQL Wrapper utility takes a single SQL file (such as a SQL\*Plus script) and produces an equivalent text file in which the PL/SQL source text of each wrappable PL/SQL unit is wrapped.

### Note:

Oracle recommends using PL/SQL Wrapper Utility version 10 or later.

For the list of wrappable PL/SQL units, see the introduction to "PL/SQL Source Text Wrapping".

The PL/SQL Wrapper utility cannot connect to Oracle Database. To run the PL/SQL Wrapper utility, enter this command at the operating system prompt (with no spaces around the equal signs):

wrap iname=input\_file [ oname=output\_file ] [ keep\_comments=yes ]

*input\_file* is the name of an existing file that contains any combination of SQL statements. *output\_file* is the name of the file that the PL/SQL Wrapper utility creates—the wrapped file.

#### Note:

*input\_file* cannot include substitution variables specified with the SQL\*Plus DEFINE notation, because *output\_file* is parsed by the PL/SQL compiler, not by SQL\*Plus.

The PL/SQL Wrapper utility deletes all comments from the wrapped file unless keep\_comments=yes is specified. When keep\_comments=yes is specified, only the comments outside the source are kept.

#### Note:

If *input\_file* is a wrapped file, then *input\_file* and *output\_file* have identical contents.

The default file extension for *input\_file* is sql. The default name of *output\_file* is *input\_file*.plb. Therefore, these commands are equivalent:

```
wrap iname=/mydir/myfile
wrap iname=/mydir/myfile.sql oname=/mydir/myfile.plb
```

This example specifies a different file extension for *input\_file* and a different name for *output\_file*:

```
wrap iname=/mydir/myfile.src oname=/yourdir/yourfile.out keep_comments=yes
```

You can run *output* file as a script in SQL\*Plus. For example:

SQL> @myfile.plb;

#### Example A-1 SQL File with Two Wrappable PL/SQL Units

This example shows the text of a SQL file, wraptest2.sql, that contains two wrappable PL/SQL units—the procedure wraptest and the function fibonacci. The file also contains comments and a SQL SELECT statement.

```
-- The following statement will not change.
```

```
SELECT COUNT(*) FROM EMPLOYEES /
```

/\* The PL/SQL source text of the following two CREATE statements will be wrapped. \*/

```
CREATE PROCEDURE wraptest AUTHID CURRENT_USER /* C style comment in procedure
declaration */ IS
  TYPE emp_tab IS TABLE OF employees%ROWTYPE INDEX BY PLS_INTEGER;
  all_emps emp_tab;
BEGIN
  SELECT * BULK COLLECT INTO all_emps FROM employees;
FOR i IN 1..10 LOOP /* C style in pl/sql source */
   DBMS OUTPUT.PUT_LINE('Emp Id: ' || all_emps(i).employee_id);
```

```
END LOOP;
END;
/
CREATE OR REPLACE FUNCTION fibonacci (
 n PLS INTEGER
) RETURN PLS INTEGER
AUTHID CURRENT USER -- PL/SQL style comment inside fibonacci function spec
IS
 fib 1 PLS INTEGER := 0;
 fib_2 PLS_INTEGER := 1;
BEGIN
 IF n = 1 THEN
                                             -- terminating condition
   RETURN fib 1;
 ELSIF n = 2 THEN
   RETURN fib 2;
                                            -- terminating condition
 ELSE
   RETURN fibonacci(n-2) + fibonacci(n-1); -- recursive invocations
 END IF;
END;
/
```

#### Example A-2 Wrapping File with PL/SQL Wrapper Utility

This example uses the PL/SQL Wrapper utility to wrap wraptest2.sql and shows the wrapped file, wraptest2.plb. The wrapped file shows that the utility deleted the comments inside the code and wrapped (made unreadable) the PL/SQL source text of the procedure wraptest and the function fibonacci, but kept the comments outside the wrapped source.

Assume that the operating system prompt is >. Wrap the file wraptest.sql:

```
> wrap keep comments=yes iname=wraptest2.sql
```

Result:

Processing wraptest2.sql to wraptest2.plb

#### Contents of wraptest.plb:

```
-- The following statement will not change.
SELECT COUNT (*) FROM EMPLOYEES
/
/* The PL/SQL source text of the following two CREATE statements will be wrapped. */
CREATE OR REPLACE PROCEDURE wraptest wrapped
a000000
1
abcd
```

```
abcd

#### Example A-3 Running Wrapped File and Viewing Wrapped PL/SQL Units

In SQL\*Plus, this example runs the wrapped file wraptest.plb, creating the procedure wraptest and the function fibonacci; selects the text of the subprograms (which is wrapped and therefore unreadable), and then invokes the subprograms.

# Wrapping PL/SQL Source Text with DBMS\_DDL Subprograms

The DBMS\_DDL package provides WRAP functions and CREATE\_WRAPPED procedures, each of which wraps the PL/SQL source text of a single dynamically generated wrappable PL/SQL unit. The DBMS\_DDL package also provides the exception MALFORMED\_WRAP\_INPUT (ORA-24230), which is raised if the input to WRAP or CREATE\_WRAPPED is not a valid wrappable PL/SQL unit. (For the list of wrappable PL/SQL units, see the introduction to "PL/SQL Source Text Wrapping".)

Each WRAP function takes as input a single CREATE statement that creates a wrappable PL/SQL unit and returns an equivalent CREATE statement in which the PL/SQL source text is wrapped. For more information about the WRAP functions, see Oracle Database PL/SQL Packages and Types Reference.

#### Caution:

If you pass the statement that DBMS\_DDL.WRAP returns to the DBMS\_SQL.PARSE procedure whose formal parameter statement has data type VARCHAR2A, then you must set the lfflg parameter of DBMS\_SQL.PARSE to FALSE. Otherwise, DBMS\_SQL.PARSE adds lines to the wrapped PL/SQL unit, corrupting it. (For the syntax of DBMS SQL.PARSE, see Oracle Database PL/SQL Packages and Types Reference.)

Each CREATE\_WRAPPED procedure does what its corresponding WRAP function does and then runs the returned CREATE statement, creating the specified PL/SQL unit. For more information about the CREATE\_WRAPPED procedures, see Oracle Database PL/SQL Packages and Types Reference.

#### 🖓 Tip:

When invoking a DBMS\_DDL subprogram, use the fully qualified package name, SYS.DBMS\_DDL, to avoid name conflict if someone creates a local package named DBMS\_DDL or defines the public synonym DBMS\_DDL.

#### Note:

The CREATE statement that is input to a WRAP function or CREATE\_WRAPPED procedure runs with the privileges of the user who invoked the subprogram.

Example A-4 dynamically creates a package specification (using the EXECUTE IMMEDIATE statement) and a wrapped package body, using a CREATE WRAPPED procedure.

Example A-5 selects the text of the package that Example A-4 created, emp\_actions, and then invokes the procedure emp\_actions.raise\_salary. If the package specification were wrapped, then the information needed to invoke the procedure would be unreadable, like the PL/SQL source text of the package body.

#### Example A-4 Creating Wrapped Package Body with CREATE\_WRAPPED Procedure

```
DECLARE
```

package text VARCHAR2(32767); -- text for creating package spec and body FUNCTION generate\_spec (pkgname VARCHAR2) RETURN VARCHAR2 AS BEGIN RETURN 'CREATE PACKAGE ' || pkgname || ' AUTHID CURRENT\_USER AS PROCEDURE raise salary (emp id NUMBER, amount NUMBER); PROCEDURE fire employee (emp id NUMBER); END ' || pkgname || ';'; END generate spec; FUNCTION generate body (pkgname VARCHAR2) RETURN VARCHAR2 AS BEGIN RETURN 'CREATE PACKAGE BODY ' || pkgname || ' AS PROCEDURE raise salary (emp id NUMBER, amount NUMBER) IS BEGIN UPDATE employees SET salary = salary + amount WHERE employee id = emp id; END raise salary; PROCEDURE fire employee (emp id NUMBER) IS BEGIN DELETE FROM employees WHERE employee id = emp id; END fire employee; END ' || pkgname || ';'; END generate body; BEGIN package\_text := generate\_spec('emp\_actions'); -- Generate package spec EXECUTE IMMEDIATE package text; -- Create package spec package text := generate body('emp actions'); -- Generate package body

```
SYS.DBMS_DDL.CREATE_WRAPPED(package_text); -- Create wrapped package
body
END;
/
```

#### Example A-5 Viewing Package with Wrapped Body and Invoking Package Procedure

Select text of package:

SELECT text FROM USER SOURCE WHERE name = 'EMP ACTIONS';

#### Result:

```
TEXT
```

\_\_\_\_\_ PACKAGE emp actions AUTHID CURRENT USER AS PROCEDURE raise salary (emp id NUMBER, amount NUMBER); PROCEDURE fire employee (emp id NUMBER); END emp actions; PACKAGE BODY emp actions wrapped a000000 1f abcd b 180 113 1fOVodewm7j9dBOmBsiEQz0BKCqwq/BKoZ4VZy/pTBIYo8Uj1sjpbEz08Ck3HMjYq/Mf0XZn u9D0Kd+i89g9ZO61I6vZYjw2AuBidnLESyR63LHZpFD/71yDTfF1eDY5vmNwLTXrFaxGy243 01HKAzmOlwwfBWylkZZNi2UnpmSIe6z/BU2nhbwfpqd224p69FwYVXmFX2H5IMsdZ2/vWsK9 cDMCD1KEqOnPpbU2yXdpW3GIbGD8JFIbKAfpJLkoLfVxoRPXQfj0h1k=

Invoke raised salary and show its effect:

```
DECLARE
s employees.salary%TYPE;
BEGIN
SELECT salary INTO s FROM employees WHERE employee_id=130;
DBMS_OUTPUT_PUT_LINE('Old salary: ' || s);
emp_actions.raise_salary(130, 100);
SELECT salary INTO s FROM employees WHERE employee id=130;
```

```
DBMS_OUTPUT.PUT_LINE('New salary: ' || s);
END;
/
```

#### Result:

Old salary: 2800 New salary: 2900

PL/SQL procedure successfully completed.

# B PL/SQL Name Resolution

This appendix explains PL/SQL **name resolution**; that is, how the PL/SQL compiler resolves ambiguous references to identifiers.

An unambiguous identifier reference can become ambiguous if you change identifiers in its compilation unit (that is, if you add, rename, or delete identifiers).

#### Note:

The AUTHID property of a stored PL/SQL unit affects the name resolution of SQL statements that the unit issues at run time. For more information, see "Invoker's Rights and Definer's Rights (AUTHID Property)".

#### Topics

- Qualified Names and Dot Notation
- Column Name Precedence
- Differences Between PL/SQL and SQL Name Resolution Rules
- Resolution of Names in Static SQL Statements
- What is Capture?
- Avoiding Inner Capture in SELECT and DML Statements

## **Qualified Names and Dot Notation**

When one named item belongs to another named item, you can (and sometimes must) qualify the name of the "child" item with the name of the "parent" item, using dot notation. For example:

When referencing	You must qualify its name Using this syntax with	
Field of a record	Name of the record record_name.field_name	
Method of a collection	Name of the collection	collection_name.method
Pseudocolumn CURRVAL	Name of a sequence	sequence_name.CURRVAL
Pseudocolumn NEXTVAL	Name of a sequence	sequence_name.NEXTVAL

If an identifier is declared in a named PL/SQL unit, you can qualify its simple name (the name in its declaration) with the name of the unit (block, subprogram, or package), using this syntax:

unit\_name.simple\_identifier\_name

If the identifier is not visible, then you *must* qualify its name (see "Scope and Visibility of Identifiers").

If an identifier belongs to another schema, then you must qualify its name with the name of the schema, using this syntax:

schema\_name.package\_name

A simple name can be qualified with multiple names, as Example B-1 shows.

Some examples of possibly ambiguous qualified names are:

• Field or attribute of a function return value, for example:

```
func_name().field_name
func name().attribute name
```

Schema object owned by another schema, for example:

```
schema_name.table_name
schema_name.procedure_name()
schema_name.type_name.member_name()
```

Package object owned by another user, for example:

```
schema_name.package_name.procedure_name()
schema name.package name.record name.field name
```

Record containing an ADT, for example:

```
record_name.field_name.attribute_name
record_name.field_name.member_name()
```

#### Example B-1 Qualified Names

```
CREATE OR REPLACE PACKAGE pkg1 AUTHID DEFINER AS
  m NUMBER:
  TYPE t1 IS RECORD (a NUMBER);
  v1 t1;
  TYPE t2 IS TABLE OF t1 INDEX BY PLS INTEGER;
  v2 t2;
  FUNCTION f1 (p1 NUMBER) RETURN t1;
  FUNCTION f2 (q1 NUMBER) RETURN t2;
END pkq1;
/
CREATE OR REPLACE PACKAGE BODY pkg1 AS
  FUNCTION f1 (p1 NUMBER) RETURN t1 IS
    n NUMBER;
  BEGIN
     n := m; -- Unqualified variable name
n := pkg1.m; -- Variable name qualified by package name
     n := m;
     n := pkg1.f1.p1; -- Parameter name qualified by function name,
                          -- which is qualified by package name
     n := v1.a;
                         -- Variable name followed by component name
     n := pkg1.v1.a;
                         -- Variable name qualified by package name
                         -- and followed by component name
     n := v2(10).a; -- Indexed name followed by component name
n := f1(10).a; -- Function invocation followed by component name
     n := f2(10)(10).a; -- Function invocation followed by indexed name
                           -- and followed by component name
     n := hr.pkg1.f2(10)(10).a; -- Schema name, package name,
                                   -- function invocation, index, component name
     v1.a := p1;
     RETURN v1;
   END f1;
   FUNCTION f2 (q1 NUMBER) RETURN t2 IS
```

**ORACLE** 

```
v_t1 t1;
v_t2 t2;
BEGIN
v_t1.a := q1;
v_t2(1) := v_t1;
RETURN v_t2;
END f2;
END pkg1;
/
```

### **Column Name Precedence**

If a SQL statement references a name that belongs to both a column and either a local variable or formal parameter, then the column name takes precedence.

#### **Caution**:

When a variable or parameter name is interpreted as a column name, data can be deleted, changed, or inserted unintentionally.

In Example B-2, the name last\_name belongs to both a local variable and a column (names are not case-sensitive). Therefore, in the WHERE clause, both references to last\_name resolve to the column, and all rows are deleted.

Example B-3 solves the problem in Example B-2 by giving the variable a different name.

Example B-4 solves the problem in Example B-2 by labeling the block and qualifying the variable name with the block name.

In Example B-5, the function dept\_name has a formal parameter and a local variable whose names are those of columns of the table DEPARTMENTS. The parameter and variable name are qualified with the function name to distinguish them from the column names.

#### Example B-2 Variable Name Interpreted as Column Name Causes Unintended Result

```
DROP TABLE employees2;
CREATE TABLE employees2 AS
SELECT LAST_NAME FROM employees;
DECLARE
last_name VARCHAR2(10) := 'King';
BEGIN
DELETE FROM employees2 WHERE LAST_NAME = last_name;
DBMS_OUTPUT.PUT_LINE('Deleted ' || SQL%ROWCOUNT || ' rows.');
END;
/
```

Result:

Deleted 107 rows.

#### Example B-3 Fixing Example B-2 with Different Variable Name

```
DROP TABLE employees2;
CREATE TABLE employees2 AS
SELECT LAST_NAME FROM employees;
DECLARE
v_last_name VARCHAR2(10) := 'King';
BEGIN
DELETE FROM employees2 WHERE LAST_NAME = v_last_name;
DBMS_OUTPUT.PUT_LINE('Deleted ' || SQL%ROWCOUNT || ' rows.');
END;
/
```

Result:

Deleted 2 rows.

#### Example B-4 Fixing Example B-2 with Block Label

```
DROP TABLE employees2;
CREATE TABLE employees2 AS
SELECT LAST_NAME FROM employees;
```

#### <<main>>

```
DECLARE
last_name VARCHAR2(10) := 'King';
BEGIN
DELETE FROM employees2 WHERE last_name = main.last_name;
DBMS_OUTPUT.PUT_LINE('Deleted ' || SQL%ROWCOUNT || ' rows.');
END;
/
```

#### Result:

Deleted 2 rows.

#### Example B-5 Subprogram Name for Name Resolution

```
DECLARE
 FUNCTION dept_name (department_id IN NUMBER)
   RETURN departments.department name%TYPE
 IS
   department name departments.department name%TYPE;
 BEGIN
   SELECT department name INTO dept name.department name
     ___
           ^column
                                 ^local variable
   FROM departments
   WHERE department id = dept name.department id;
          ^column
                    ^formal parameter
   __
   RETURN department name;
 END dept name;
BEGIN
```

```
FOR item IN (
   SELECT department_id
   FROM departments
   ORDER BY department_name) LOOP
   DBMS_OUTPUT.PUT_LINE ('Department: ' || dept_name(item.department_id));
   END LOOP;
END;
/
```

#### Result:

```
Department: Accounting
Department: Administration
Department: Benefits
Department: Construction
Department: Contracting
Department: Control And Credit
Department: Corporate Tax
Department: Executive
Department: Finance
Department: Government Sales
Department: Human Resources
Department: IT
Department: IT Helpdesk
Department: IT Support
Department: Manufacturing
Department: Marketing
Department: NOC
Department: Operations
Department: Payroll
Department: Public Relations
Department: Purchasing
Department: Recruiting
Department: Retail Sales
Department: Sales
Department: Shareholder Services
Department: Shipping
Department: Treasury
```

## Differences Between PL/SQL and SQL Name Resolution Rules

PL/SQL and SQL name resolution rules are very similar. However:

- PL/SQL rules are less permissive than SQL rules.
  - Because most SQL rules are context-sensitive, they recognize as legal more situations than PL/SQL rules do.
- PL/SQL and SQL resolve qualified names differently.

For example, when resolving the table name HR.JOBS:

 PL/SQL searches first for packages, types, tables, and views named HR in the current schema, then for public synonyms, and finally for objects named JOBS in the HR schema.

 SQL searches first for objects named JOBS in the HR schema, and then for packages, types, tables, and views named HR in the current schema.

To avoid problems caused by the few differences between PL/SQL and SQL name resolution rules, follow the recommendations in "Avoiding Inner Capture in SELECT and DML Statements".

#### Note:

When the PL/SQL compiler processes a static SQL statement, it sends that statement to the SQL subsystem, which uses SQL rules to resolve names in the statement. For details, see "Resolution of Names in Static SQL Statements".

## **Resolution of Names in Static SQL Statements**

Static SQL is described in PL/SQL Static SQL.

When the PL/SQL compiler finds a static SQL statement:

- **1.** If the statement is a SELECT statement, the PL/SQL compiler removes the INTO clause.
- 2. The PL/SQL compiler sends the statement to the SQL subsystem.
- 3. The SQL subsystem checks the syntax of the statement.

If the syntax is incorrect, the compilation of the PL/SQL unit fails. If the syntax is correct, the SQL subsystem determines the names of the tables and tries to resolve the other names in the scope of the SQL statement.

- If the SQL subsystem cannot resolve a name in the scope of the SQL statement, then it sends the name back to the PL/SQL compiler. The name is called an escaped identifier.
- 5. The PL/SQL compiler tries to resolve the escaped identifier.

First, the compiler tries to resolve the identifier in the scope of the PL/SQL unit. If that fails, the compiler tries to resolve the identifier in the scope of the schema. If that fails, the compilation of the PL/SQL unit fails.

- If the compilation of the PL/SQL unit succeeds, the PL/SQL compiler generates the text of the regular SQL statement that is equivalent to the static SQL statement and stores that text with the generated computer code.
- 7. At run time, the PL/SQL runtime system invokes routines that parse, bind, and run the regular SQL statement.

The bind variables are the escaped identifiers (see step 4).

8. If the statement is a SELECT statement, the PL/SQL runtime system stores the results in the PL/SQL targets specified in the INTO clause that the PL/SQL compiler removed in step 1.

#### Note:

Bind variables can be evaluated in any order. If a program determines order of evaluation, then at the point where the program does so, its behavior is undefined.

## What is Capture?

When a declaration or definition prevents the compiler from correctly resolving a reference in another scope, the declaration or definition is said to **capture** the reference. Capture is usually the result of migration or schema evolution.

**Topics** 

- Outer Capture
- Same-Scope Capture
- Inner Capture

Note:

Same-scope and inner capture occur only in SQL scope.

### **Outer Capture**

**Outer capture** occurs when a name in an inner scope, which had resolved to an item in an inner scope, now resolves to an item in an outer scope. Both PL/SQL and SQL are designed to prevent outer capture; you need not be careful to avoid it.

### Same-Scope Capture

**Same-scope capture** occurs when a column is added to one of two tables used in a join, and the new column has the same name as a column in the other table. When only one table had a column with that name, the name could appear in the join unqualified. Now, to avoid same-scope capture, you must qualify the column name with the appropriate table name, everywhere that the column name appears in the join.

### Inner Capture

**Inner capture** occurs when a name in an inner scope, which had resolved to an item in an outer scope, now either resolves to an item in an inner scope or cannot be resolved. In the first case, the result might change. In the second case, an error occurs.

In Example B-6, a new column captures a reference to an old column with the same name. Before new column col2 is added to table tab2, col2 resolves to tab1.col2; afterward, it resolves to tab2.col2.

To avoid inner capture, follow the rules in "Avoiding Inner Capture in SELECT and DML Statements".

#### Example B-6 Inner Capture of Column Reference

Table tab1 has a column named col2, but table tab2 does not:

```
DROP TABLE tab1;
CREATE TABLE tab1 (col1 NUMBER, col2 NUMBER);
INSERT INTO tab1 (col1, col2) VALUES (100, 10);
```

DROP TABLE tab2;

CREATE TABLE **tab2** (coll NUMBER); INSERT INTO tab2 (coll) VALUES (100);

Therefore, in the inner SELECT statement, the reference to col2 resolves to column tabl.col2:

```
CREATE OR REPLACE PROCEDURE proc AUTHID DEFINER AS
  CURSOR c1 IS
    select * FROM tab1
    wHERE EXISTS (SELECT * FROM tab2 WHERE col2 = 10);
BEGIN
    OPEN c1;
    CLOSE c1;
END;
/
```

Add a column named col2 to table tab2:

ALTER TABLE tab2 ADD (col2 NUMBER);

Now procedure proc is invalid. At its next invocation, the database automatically recompiles it, and the reference to col2 in the inner SELECT statement resolves to column tab2.col2.

## Avoiding Inner Capture in SELECT and DML Statements

Avoid inner capture of references in SELECT, SELECT INTO, and DML statements by following these recommendations:

- Specify a unique alias for each table in the statement.
- Do not specify a table alias that is the name of a schema that owns an item referenced in the statement.
- Qualify each column reference in the statement with the appropriate table alias.

In Example B-7, schema hr owns tables tab1 and tab2. Table tab1 has a column named tab2, whose Abstract Data Type (ADT) has attribute a. Table tab2 does not have a column named a. Against recommendation, the query specifies alias hr for table tab1 and references table tab2. Therefore, in the query, the reference hr.tab2.a resolves to table tab1, column tab2, attribute a. Then the example adds column a to table tab2. Now the reference hr.tab2.a in the query resolves to schema hr, table tab2, column a. Column a of table tab2 captures the reference to attribute a in column tab2 of table tab1.

#### Topics

- Qualifying References to Attributes and Methods
- Qualifying References to Row Expressions

#### Example B-7 Inner Capture of Attribute Reference

CREATE OR REPLACE **TYPE type1** AS OBJECT (**a** NUMBER); / DROP TABLE tab1; CREATE **TABLE tab1 (tab2 type1)**; INSERT INTO tab1 (tab2) VALUES (type1(10)); DROP TABLE tab2; CREATE **TABLE tab2 (x NUMBER)**; INSERT INTO tab2 (x) VALUES (10);

/\* Alias tab1 with same name as schema name,

a bad practice used here for illustration purpose. Note lack of alias in second SELECT statement. \*/ SELECT \* FROM tab1 hr WHERE EXISTS (SELECT \* FROM hr.tab2 WHERE x = hr.tab2.a);

Result:

TAB2 (A)

TYPE1 (10)

1 row selected.

Add a column named a to table tab2 (which belongs to schema hr):

ALTER TABLE tab2 ADD (a NUMBER);

Now, when the query runs, hr.tab2.a resolves to schema hr, table tab2, column a. To avoid this inner capture, apply the recommendations to the query:

```
SELECT * FROM hr.tab1 p1
WHERE EXISTS (SELECT * FROM hr.tab2 p2 WHERE p2.x = p1.tab2.a);
```

### Qualifying References to Attributes and Methods

To reference an attribute or method of a table element, you must give the table an alias and use the alias to qualify the reference to the attribute or method.

In Example B-8, table tbl1 has column col1 of data type t1, an ADT with attribute x. The example shows several correct and incorrect references to tbl1.col1.x.

#### Example B-8 Qualifying ADT Attribute References

```
CREATE OR REPLACE TYPE t1 AS OBJECT (x NUMBER);
/
DROP TABLE tb1;
CREATE TABLE tb1 (col1 t1);
```

The references in the following INSERT statements do not need aliases, because they have no column lists:

```
BEGIN
INSERT INTO tb1 VALUES ( t1(10) );
INSERT INTO tb1 VALUES ( t1(20) );
INSERT INTO tb1 VALUES ( t1(30) );
END;
/
```

The following references to the attribute x cause error ORA-00904:

```
UPDATE tb1 SET coll.x = 10 WHERE coll.x = 20;
UPDATE tb1 SET tb1.coll.x = 10 WHERE tb1.coll.x = 20;
UPDATE hr.tb1 SET hr.tb1.coll.x = 10 WHERE hr.tb1.coll.x = 20;
DELETE FROM tb1 WHERE tb1.coll.x = 10;
```

The following references to the attribute x, with table aliases, are correct:

```
UPDATE hr.tb1 t SET t.col1.x = 10 WHERE t.col1.x = 20;
DECLARE
  y NUMBER;
BEGIN
  SELECT t.col1.x INTO y FROM tb1 t WHERE t.col1.x = 30;
END;
/
DELETE FROM tb1 t WHERE t.col1.x = 10;
```

### Qualifying References to Row Expressions

Row expressions must resolve as references to table aliases. A row expression can appear in the SET clause of an UPDATE statement or be the parameter of the SQL function REF or VALUE.

In Example B-9, table otl is a standalone nested table of elements of data type tl, an ADT with attribute x. The example shows several correct and incorrect references to row expressions.

#### Example B-9 Qualifying References to Row Expressions

```
CREATE OR REPLACE TYPE t1 AS OBJECT (x number);
/
DROP TABLE ot1;
CREATE TABLE ot1 OF t1;
BEGIN
INSERT INTO ot1 VALUES (t1(10));
INSERT INTO ot1 VALUES (20);
INSERT INTO ot1 VALUES (30);
END;
/
```

The following references cause error ORA-00904:

UPDATE ot1 SET VALUE(ot1.x) = t1(20) WHERE VALUE(ot1.x) = t1(10);

DELETE FROM ot1 WHERE VALUE (ot1) = (t1(10));

The following references, with table aliases, are correct:

```
UPDATE ot1 o SET o = (t1(20)) WHERE o.x = 10;
DECLARE
  n ref REF t1;
BEGIN
  SELECT REF(o) INTO n ref FROM ot1 o WHERE VALUE(o) = t1(30);
END:
/
DECLARE
  n t1;
BEGIN
  SELECT VALUE(o) INTO n FROM ot1 o WHERE VALUE(o) = t1(30);
END;
/
DECLARE
  n NUMBER;
BEGIN
```

```
SELECT o.x INTO n FROM ot1 o WHERE o.x = 30;
END;
/
```

```
DELETE FROM ot1 \mathbf{o} WHERE VALUE(\mathbf{o}) = (t1(20));
```

# C PL/SQL Program Limits

This appendix describes the program limits that are imposed by the PL/SQL language. PL/SQL is based on the programming language Ada. As a result, PL/SQL uses a variant of Descriptive Intermediate Attributed Notation for Ada (DIANA), a tree-structured intermediate language. It is defined using a metanotation called Interface Definition Language (IDL). DIANA is used internally by compilers and other tools.

At compile time, PL/SQL source text is translated into system code. Both the DIANA and system code for a subprogram or package are stored in the database. At run time, they are loaded into the shared memory pool. The DIANA is used to compile dependent subprograms; the system code simply runs.

In the shared memory pool, a package specification, ADT specification, standalone subprogram, or anonymous block is limited to 67108864 (2\*\*26) DIANA nodes which correspond to tokens such as identifiers, keywords, operators, and so on. This allows for ~6,000,000 lines of code unless you exceed limits imposed by the PL/SQL compiler, some of which are given in Table C-1.

Item	Limit
bind variables passed to a program unit	32768
exception handlers in a program unit	65536
fields in a record	65536
levels of block nesting	255
levels of record nesting	32
levels of subquery nesting	254
levels of label nesting	98
levels of nested collections	no predefined limit
magnitude of a PLS_INTEGER or BINARY_INTEGER value	-21474836482147483647
number of formal parameters in an explicit cursor, function, or procedure	65536
objects referenced by a program unit	65536
precision of a FLOAT value (binary digits)	126
precision of a NUMBER value (decimal digits)	38
precision of a REAL value (binary digits)	63
size of an identifier (bytes)	128
size of a string literal (bytes)	32767
size of a CHAR value (bytes)	32767
size of a LONG value (bytes)	32760
size of a LONG RAW value (bytes)	32760

#### Table C-1 PL/SQL Compiler Limits

Item	Limit
size of a RAW value (bytes)	32767
size of a VARCHAR2 value (bytes)	32767
size of an NCHAR value (bytes)	32767
size of an NVARCHAR2 value (bytes)	32767
size of a BFILE value (bytes)	4G * value of DB_BLOCK_SIZE parameter
size of a BLOB value (bytes)	4G * value of DB_BLOCK_SIZE parameter
size of a CLOB value (bytes)	4G * value of DB_BLOCK_SIZE parameter
size of an NCLOB value (bytes)	4G * value of DB_BLOCK_SIZE parameter
size of a trigger	32 K

#### Table C-1 (Cont.) PL/SQL Compiler Limits

To estimate how much memory a program unit requires, you can query the static data dictionary view <code>USER\_OBJECT\_SIZE</code>. The column <code>PARSED\_SIZE</code> returns the size (in bytes) of the "flattened" DIANA. For example:

```
CREATE OR REPLACE PACKAGE pkg1 AS
  TYPE numset t IS TABLE OF NUMBER;
  FUNCTION f1(x NUMBER) RETURN numset t PIPELINED;
END pkg1;
/
CREATE OR REPLACE PACKAGE BODY pkg1 AS
  -- FUNCTION f1 returns a collection of elements (1,2,3,... x)
  FUNCTION f1(x NUMBER) RETURN numset t PIPELINED IS
  BEGIN
   FOR i IN 1... LOOP
     PIPE ROW(i);
   END LOOP;
   RETURN;
 END f1;
END pkg1;
/
```

SQL\*Plus commands for formatting results of next query:

```
COLUMN name FORMAT A4
COLUMN type FORMAT A12
COLUMN source_size FORMAT 999
COLUMN parsed_size FORMAT 999
COLUMN code_size FORMAT 999
COLUMN error size FORMAT 999
```

#### Query:

SELECT \* FROM user object size WHERE name = 'PKG1' ORDER BY type;

#### Result:

NAME TYPE	SOUR	CE_SIZE <b>Par</b>	RSED_SIZE	CODE_SIZE	ERROR_SIZE
PKG1 PACKAG	Ε	112	498	310	79
PKG1 PACKAG	E BODY	233	106	334	0

Unfortunately, you cannot estimate the number of DIANA nodes from the parsed size. Two program units with the same parsed size might require 1500 and 2000 DIANA nodes, respectively because, for example, the second unit contains more complex SQL statements.

When a PL/SQL block, subprogram, package, or schema-level user-defined type exceeds a size limit, you get an error such as PLS-00123: program too large. Typically, this problem occurs with packages or anonymous blocks. With a package, the best solution is to divide it into smaller packages. With an anonymous block, the best solution is to redefine it as a group of subprograms, which can be stored in the database.

For more information about the limits on data types, see PL/SQL Data Types.

# D PL/SQL Reserved Words and Keywords

**Reserved words** (listed in Table D-1) and **keywords** (listed in Table D-2) are identifiers that have special meaning in PL/SQL. They are case-insensitive. For more information about them, see "Reserved Words and Keywords".

#### Note:

Some of the words in this appendix are also reserved by SQL. You can display them with the dynamic performance view V\$RESERVED\_WORDS. For information about this view, see *Oracle Database Reference*.

Table D-1 PL/SQL Reserved Words

Begins with:	Reserved Words
A	ALL, ALTER, AND, ANY, AS, ASC, AT
В	BEGIN, BETWEEN, BY
С	CASE, CHECK, CLUSTERS, CLUSTER, COLAUTH, COLUMNS, COMPRESS, CONNECT, CRASH, CREATE, CURSOR
D	DECLARE, DEFAULT, DESC, DISTINCT, DROP
E	ELSE, END, EXCEPTION, EXCLUSIVE
F	FETCH, FOR, FROM, FUNCTION
G	GOTO, GRANT, GROUP
Н	HAVING
I	IDENTIFIED, IF, IN, INDEX, INDEXES, INSERT, INTERSECT, INTO, IS
L	LIKE, LOCK
М	MINUS, MODE
Ν	NOCOMPRESS, NOT, NOWAIT, NULL
0	OF, ON, OPTION, OR, ORDER, OVERLAPS
Р	PROCEDURE, PUBLIC
R	RESOURCE, REVOKE
S	SELECT, SHARE, SIZE, SQL, START, SUBTYPE
т	TABAUTH, TABLE, THEN, TO, TYPE
U	UNION, UNIQUE, UPDATE
V	VALUES, VIEW, VIEWS
W	WHEN, WHERE, WITH

#### Table D-2 PL/SQL Keywords

Begins with:	Keywords
A	A, ADD, ACCESSIBLE, AGENT, AGGREGATE, ARRAY, ATTRIBUTE, AUTHID, AVG
В	BFILE_BASE, BINARY, BLOB_BASE, BLOCK, BODY, BOTH, BOUND, BULK, BYTE
С	C, CALL, CALLING, CASCADE, CHAR, CHAR_BASE, CHARACTER, CHARSET, CHARSETFORM, CHARSETID, CLOB_BASE, CLONE, CLOSE, COLLECT, COMMENT, COMMIT, COMMITTED, COMPILED, CONSTANT, CONSTRUCTOR, CONTEXT, CONTINUE, CONVERT, COUNT, CREDENTIAL, CURRENT, CUSTOMDATUM
D	DANGLING, DATA, DATE, DATE_BASE, DAY, DEFINE, DELETE, DETERMINISTIC, DIRECTORY, DOUBLE, DURATION
E	ELEMENT, ELSIF, EMPTY, ESCAPE, EXCEPT, EXCEPTIONS, EXECUTE, EXISTS, EXIT, EXTERNAL
F	FINAL, FIRST, FIXED, FLOAT, FORALL, FORCE
G	GENERAL
Н	HASH, HEAP, HIDDEN, HOUR
I	IMMEDIATE, IMMUTABLE, INCLUDING, INDICATOR, INDICES, INFINITE, INSTANTIABLE, INT, INTERFACE, INTERVAL, INVALIDATE, ISOLATION
J	JAVA
L	LANGUAGE, LARGE, LEADING, LENGTH, LEVEL, LIBRARY, LIKE2, LIKE4, LIKEC, LIMIT, LIMITED, LOCAL, LONG, LOOP
Μ	MAP, MAX, MAXLEN, MEMBER, MERGE, MIN, MINUTE, MOD, MODIFY, MONTH, MULTISET, MUTABLE
Ν	NAME, NAN, NATIONAL, NATIVE, NCHAR, NEW, NOCOPY, NUMBER_BASE
0	OBJECT, OCICOLL, OCIDATE, OCIDATETIME, OCIDURATION, OCIINTERVAL, OCILOBLOCATOR, OCINUMBER, OCIRAW, OCIREF, OCIREFCURSOR, OCIROWID, OCISTRING, OCITYPE, OLD, ONLY, OPAQUE, OPEN, OPERATOR, ORACLE, ORADATA, ORGANIZATION, ORLANY, ORLVARY, OTHERS, OUT, OVERRIDING
Ρ	PACKAGE, PARALLEL_ENABLE, PARAMETER, PARAMETERS, PARENT, PARTITION, PASCAL, PERSISTABLE, PIPE, PIPELINED, PLUGGABLE, POLYMORPHIC, PRAGMA, PRECISION, PRIOR, PRIVATE
R	RAISE, RANGE, RAW, READ, RECORD, REF, REFERENCE, RELIES_ON, REM, REMAINDER, RENAME, RESULT, RESULT_CACHE, RETURN, RETURNING, REVERSE, ROLLBACK, ROW
S	SAMPLE, SAVE, SAVEPOINT, SB1, SB2, SB4, SECOND, SEGMENT, SELF, SEPARATE, SEQUENCE, SERIALIZABLE, SET, SHORT, SIZE_T, SOME, SPARSE, SQLCODE, SQLDATA, SQLNAME, SQLSTATE, STANDARD, STATIC, STDDEV, STORED, STRING, STRUCT, STYLE, SUBMULTISET, SUBPARTITION, SUBSTITUTABLE, SUM, SYNONYM
т	TDO, THE, TIME, TIMESTAMP, TIMEZONE_ABBR, TIMEZONE_HOUR, TIMEZONE_MINUTE, TIMEZONE_REGION, TRAILING, TRANSACTION, TRANSACTIONAL, TRUSTED
U	UB1, UB2, UB4, UNDER, UNPLUG, UNSIGNED, UNTRUSTED, USE, USING
V	VALIST, VALUE, VARIABLE, VARIANCE, VARRAY, VARYING, VOID
W	WHILE, WORK, WRAPPED, WRITE
Y	YEAR
Z	ZONE

# E PL/SQL Predefined Data Types

This appendix groups by data type family the data types and subtypes that the package STANDARD predefines.

#### Constants

This constant defines the maximum name length possible.

ORA MAX NAME LEN CONSTANT PLS INTEGER := 128;

#### **BFILE Data Type Family**

type BFILE is BFILE BASE;

#### **BLOB Data Type Family**

type BLOB is BLOB\_BASE;

subtype "BINARY LARGE OBJECT" is BLOB;

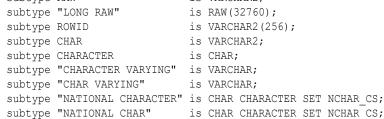

#### **BOOLEAN Data Type Family**

type BOOLEAN is (FALSE, TRUE);

#### **CHAR Data Type Family**

type VARCHAR2 is new CHAR\_BASE; type MLSLABEL is new CHAR\_BASE; type UROWID is new CHAR\_BASE;

```
DBMS_ID and DBMS_QUOTED_ID define the length of identifiers in objects for SQL, PL/SQL
and users.
subtype DBMS_ID is VARCHAR2(ORA_MAX_NAME_LEN);
subtype DBMS_QUOTED_ID is VARCHAR2(ORA_MAX_NAME_LEN+2);
DBMS_ID_30 and DBMS_QUOTED_ID_30 define the length of SQL objects whose limits is 30
bytes.
subtype DBMS_ID_30 is VARCHAR2(30);
subtype DBMS_QUOTED_ID_30 is VARCHAR2(32);
subtype VARCHAR is VARCHAR2;
subtype STRING is VARCHAR2;
subtype LONG is VARCHAR2;
subtype RAW is VARCHAR2;
subtype RAW is VARCHAR2;
subtype "LONG RAW" is RAW(32760);
subtype ROWID is VARCHAR2(256);
subtype CHAR is VARCHAR2:
```

subtype	"NCHAR"	is	CHAR (	CHAF	RACTER	SET	NCHA	AR_CS;	
subtype	"NVARCHAR2"	is	VARCHA	AR2	CHARAC	TER	SET	NCHAR	CS;

#### CLOB Data Type Family

type CLOB is CLOB\_BASE;

subtype "CHARACTER LARGE OBJECT"	is CLOB;
subtype "CHAR LARGE OBJECT"	is CLOB;
subtype "NATIONAL CHARACTER LARGE OBJECT"	is CLOB CHARACTER SET NCHAR_CS;
subtype "NCHAR LARGE OBJECT"	is CLOB CHARACTER SET NCHAR_CS;
subtype "NCLOB"	is CLOB CHARACTER SET NCHAR_CS;

#### DATE Data Type Family

type DATE	is DATE_BASE;
type TIMESTAMP	is new DATE_BASE;
type "TIMESTAMP WITH TIME ZONE" type "INTERVAL YEAR TO MONTH" type "INTERVAL DAY TO SECOND" type "TIMESTAMP WITH LOCAL TIME ZON	is new DATE_BASE;
subtype TIME_TZ_UNCONSTRAINED subtype TIMESTAMP_UNCONSTRAINED subtype TIMESTAMP_TZ_UNCONSTRAINED subtype YMINTERVAL_UNCONSTRAINED subtype DSINTERVAL_UNCONSTRAINED	is TIMESTAMP(9) WITH TIME ZONE; is INTERVAL YEAR(9) TO MONTH;

#### **JSON Data Type Family**

type JSON is BLOB\_BASE;

#### NUMBER Data Type Family

type NUMBER is NUMBER_BASE;
subtype FLOAT is NUMBER; NUMBER(126) subtype REAL is FLOAT; FLOAT(63) subtype "DOUBLE PRECISION" is FLOAT;
<pre>subtype INTEGER is NUMBER(38,0); subtype INT is INTEGER; subtype SMALLINT is NUMBER(38,0);</pre>
<pre>subtype DECIMAL is NUMBER(38,0); subtype NUMERIC is DECIMAL; subtype DEC is DECIMAL;</pre>
subtype BINARY_INTEGER is INTEGER range '-2147483647'2147483647;subtype NATURALis BINARY_INTEGER range 02147483647;subtype NATURALNis NATURAL not null;subtype POSITIVEis BINARY_INTEGER range 12147483647;subtype POSITIVENis POSITIVE not null;subtype SIGNTYPEis BINARY_INTEGER range '-1'1; for SIGN functionssubtype PLS_INTEGERis BINARY_INTEGER;
type BINARY_FLOAT is NUMBER; type BINARY_DOUBLE is NUMBER;

subtype SIMPLE\_INTEGER is BINARY\_INTEGER NOT NULL; subtype SIMPLE\_FLOAT is BINARY\_FLOAT NOT NULL; subtype SIMPLE\_DOUBLE is BINARY\_DOUBLE NOT NULL;
