Oracle® Banking APIs Security Guide

Patchset Release 22.2.5.0.0 G22955-01 October 2024

ORACLE

Oracle Banking APIs Security Guide, Patchset Release 22.2.5.0.0

G22955-01

Copyright © 2006, 2024, Oracle and/or its affiliates.

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software, software documentation, data (as defined in the Federal Acquisition Regulation), or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs) and Oracle computer documentation or other Oracle data delivered to or accessed by U.S. Government end users are "commercial computer software," "commercial computer software documentation," or "limited rights data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, reproduction, duplication, release, display, disclosure, modification, preparation of derivative works, and/or adaptation of i) Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs), ii) Oracle computer documentation and/or iii) other Oracle data, is subject to the rights and limitations specified in the license contained in the applicable contract. The terms governing the U.S. Government's use of Oracle cloud services are defined by the applicable contract for such services. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle®, Java, MySQL, and NetSuite are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Inside are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Epyc, and the AMD logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

Purpose

This guide is designed to help acquaint you with the Oracle Banking APIs application. This guide provides answers to specific features and procedures that the user need to be aware of the module to function successfully.

Audience

This document is intended for the following audience:

- Customers
- Partners

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customer access to and use of Oracle support services will be pursuant to the terms and conditions specified in their Oracle order for the applicable services.

Critical Patches

Oracle advises customers to get all their security vulnerability information from the Oracle Critical Patch Update Advisory, which is available at Critical Patches, Security Alerts and

Bulletins. All critical patches should be applied in a timely manner to ensure effective security, as strongly recommended by Oracle Software Security Assurance.

Diversity and Inclusion

Oracle is fully committed to diversity and inclusion. Oracle respects and values having a diverse workforce that increases thought leadership and innovation. As part of our initiative to build a more inclusive culture that positively impacts our employees, customers, and partners, we are working to remove insensitive terms from our products and documentation. We are also mindful of the necessity to maintain compatibility with our customers' existing technologies and the need to ensure continuity of service as Oracle's offerings and industry standards evolve. Because of these technical constraints, our effort to remove insensitive terms is ongoing and will take time and external cooperation.

Conventions

The following text conventions are used in this document:

| Convention | Meaning | |
|------------|---|--|
| boldface | Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary. | |
| italic | Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values. | |
| monospace | Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter. | |

Related Resources

For more information on any related features, refer to the following documents:

Oracle Banking APIs Installation Manuals

Screenshot Disclaimer

Personal information used in the interface or documents is dummy and does not exist in the real world. It is only for reference purposes.

Acronyms and Abbreviations

The list of the acronyms and abbreviations used in this guide are as follows:

Table 1Acronyms and Abbreviations

| Abbreviation | Description |
|--------------|---------------------|
| OBAPI | Oracle Banking APIs |

1 General Security Principles

The following principles are fundamental for using any application securely.

- Restrict Network Access to Critical Services
- Follow the Principle of Least Privilege
- Monitor System Activity
- Keep Up To Date on Latest Security Information

1.1 Restrict Network Access to Critical Services

Keep both the Oracle Banking Digital Experience middle-tier and the database behind a firewall. In addition, place a firewall between the middle-tier and the database. The firewalls provide assurance that access to these systems is restricted to a known network route, which can be monitored and restricted, if necessary. As an alternative, a firewall router substitutes for multiple, independent firewalls.

If firewalls cannot be used, be certain to configure the TNS Listener Valid Node Checking feature which restricts access based upon IP address. Restricting database access by IP address often causes application client or server programs to fail for DHCP clients. To resolve this, consider using static IP addresses, a software or a hardware VPN or Windows Terminal Services or its equivalent.

1.2 Follow the Principle of Least Privilege

The principle of least privilege states that users should be given the least amount of privilege to perform their jobs. User privileges should be reviewed periodically to determine relevance to current job responsibilities.

1.3 Monitor System Activity

System security largely depends on the following practices:

- Good security protocols
- Proper system configuration
- System monitoring

The system needs to be constantly monitored from a monitoring tool.

1.4 Keep Up To Date on Latest Security Information

Oracle continually improves its software and documentation. It is recommended to keep your software updated.

2 Secure Installation and Configuration

This chapter provides an overview of the architecture of the deployment and describes the installation and configuration procedure for Oracle Banking APIs.

Please note that this is only a guide to securing the Oracle Banking APIs application and does not replace periodic reviews of the security architecture of the entire ecosystem of multiple applications maintained by the customer. The guidance provided in this document must always be augmented by specific understanding of the security considerations of the specific deployment architecture.

2.2 Installing WebLogic

Installation of WebLogic Server can be done by referring to the documentation published at https://docs.oracle.com/cd/E24329 01/doc.1211/e24492/toc.htm

2.3 Configuring SSL

One way SSL between the presentation tier and the application on WebLogic server is supported. The detailed configuration is explained below:

Note: Procure an external CA signed certificate before proceeding further. Follow the instructions below to install the certificate once the certificate is available. 1. Import the Certificate into a Java Trust Keystore. Execute the following command: keytool -import -trustcacerts -alias sampletrustself -keystore SampleTrust.jks -file SampleSelfCA.cer.der -keyalg RSAkeytool -import -alias `hostname -f` -file `hostname -f`.cer -keystore <JAVA_HOME>/jre/lib/security/cacerts storepass changeit -noprompt

- 2. Configure Application Domain's WebLogic with Custom Identity and Trust Keystores.
 - a. Open the WebLogic admin console and navigate to Home → Summary of Servers → AdminServer.
 - b. Click the Keystores tab.

5. Click the Save button.

2.4 Disable SSLv3

By default, SSLv3 should be disabled.

Specifying the weblogic.security.SSL.protocolVersion system property in a command-line argument that starts the WebLogic Server lets you specify the protocol that is used for SSL connections.

The following command-line arguments can be specified so that WebLogic Server supports only TLS connections:

- Dweblogic.security.SSL.protocolVersion=TLS1

Note:

If you don't specify the above property, WebLogic assumes SSLv3 by default.

2.5 HTTP Response Header Configurations

The following are some HTTP Response Headers that mitigate certain vulnerabilities.

| Vulnerability | HTTP Response Header |
|--|---------------------------|
| Clickjacking | X-Frame-Options |
| XSS | Content-Security-Policy |
| | X-XSS-Protection |
| Cookie hijacking | Strict-Transport-Security |
| Protocol Downgrade attacks | |
| Retrieving Sensitive data from browser cache | Cache-Control |

The sections below specify how to configure these response headers in the httpd.conf file of the web server.

i. X-Frame-Options

Header always append X-Frame-Options SAMEORIGIN

ii. Content-Security-Policy

```
Header set Content-Security-Policy "default-src 'none'; img-src 'self';
script-src 'self'
'unsafe-inline' 'unsafe-eval'; style-src 'self' https://fonts.googleapis.com
'unsafe-inline';
object-src 'none'; frame-src 'none'; font-src 'self' https://
fonts.gstatic.com; connect-src 'self'
http://<OAM Server>:<OAM Port>/; child-src 'self'"
```

Please note that the policy mentioned here is for the base product. If the product gets customized and content from different URLs needs to be allowed to be executed by the browser, then this policy will have to be modified accordingly.

iii. X-XSS-Protection

Header set X-XSS-Protection "1; mode=block"

iv. Strict-Transport-Security

Set this for your top level domain. The header directive needs to be included inside the VirtualHost directive

```
<VirtualHost *:443>
Header always set Strict-Transport-Security
"max-age=31540000; includeSubDomains" </VirtualHost>
```

Consider submitting your website to be included in the HSTS preload list of websites maintained by Google Chrome at https://hstspreload.appspot.com/. Other browsers like MS IE 11, MS Edge, Firefox and Opera also refer to this list maintained by Google and therefore the security offered by this mechanism will extend to other browsers too.

v. Cache-Control

```
Header set Cache-Control "max-age=0, no-cache, no-store, must-revalidate
"Header set Pragma "no-cache"
Header set Expires 0
```

2.6 Cookie Attributes

Cookie contains sensitive information like session ID which is stored on the client. The cookie is sent with every request from client to server to maintain a valid authenticated session. Cookies can be secured by properly setting cookie attributes. The following two attributes must be set to secure a cookie.

- Secure: This attribute tells the browser to only send the cookie if the request is being sent over a secure channel such as HTTPS.
- HttpOnly: This attribute is used to help prevent attacks such as cross-site scripting, since it does not allow the cookie to be accessed via a client side script such as JavaScript.

Set these attributes in the WebLogic deployment descriptor file (weblogic.xml). The following attributes need to be included in

```
<wls:session-descriptor>
<wls:cookie-secure>true</wls:cookie-secure>
<wls:cookie-http-only>true</wls:cookie-http-only>
```

2.7 Password Policy Guidelines

Our recommendations for setting a password policy are in line with the latest recommendations from NIST as of June 2018.

- 1. The minimum length of a password must be at least 8 characters. You can choose to increase this number to 10 or 12.
- 2. The maximum length of a password must be at least 64 characters. You can choose to increase this number to 80 or 100.
- 3. Do not cause passwords to expire without reason. A password must be expired only when the user has forgotten it and has requested a reset.
- Allow all printable ASCII characters, including spaces, and accept all UNICODE characters too.
- 5. Do not force the user to use a combination of upper case characters, lower case characters, numbers and special characters. Instead recommend to him that he uses "passphrases" instead of passwords, and that's the reason why the recommended minimum length must be at least 8 and the maximum length must be at least 64.

Passphrases are sentences like "Wow, I like the freedom to choose this password!!" (yes, with spaces, a comma and exclamation marks in it)

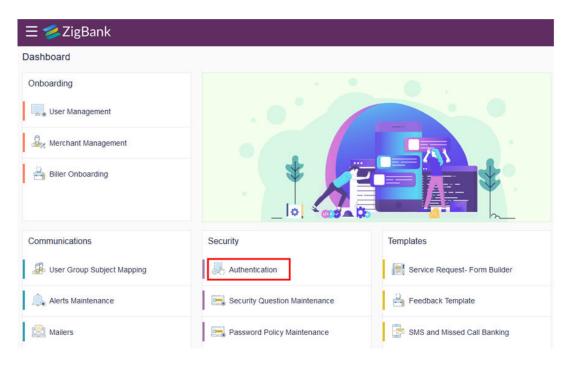

2.8 Configuring 2FA for login

Oracle Banking Digital Experience supports a 2nd factor of authentication during login.

1. Login as the Admin user.

2. Click on "Authentication".

3. Choose the Enterprise role and user segment for which you want to configure 2FA for login and click on **View**.

| Ξ | E 🥩 ZigBank | |
|---|-----------------|----------------|
| | Authentication | |
| | Enterprise Role | Retail User 🗸 |
| | User Segment | Corporate User |
| | | Administrator |
| | | Retail User |
| | View Cancel | Back |
| | | |

4. You will see the following screen where you can configure 2FA for virtually every transaction, including Login.

| Ξ | ≡ 💋 ZigBank | | | | | | | | |
|---|----------------------------------|------------|-------------------|---------|--|--|--|--|--|
| | Authentication | | | | | | | | |
| | Enterprise Role | Retail | | | | | | | |
| | User Segment | RETAILGOLD | | | | | | | |
| | Transaction Type | | Level 1 | Level 2 | | | | | |
| | Forgot Password | | One Time Password | | | | | | |
| | Login | | One Time Password | | | | | | |
| | External Transfer Confirm | | One Time Password | | | | | | |
| | Multiple Bill Payments | | One Time Password | | | | | | |
| | Multiple Transfers | | One Time Password | | | | | | |
| | Multiple Mutual Fund Purchase | | One Time Password | | | | | | |
| | Update Nominee | | | | | | | | |
| | International Demand Draft | | | | | | | | |
| | Create RD | | | | | | | | |
| | Service Request - Debit Card Cha | nge | | | | | | | |

5. Click on the **Edit** button at the bottom of the screen.

| Delete Nominee | | | | | | | |
|----------------------------|--|--|--|--|--|--|--|
| Create International Payee | | | | | | | |
| Update Facility | | | | | | | |
| Create Demand Draft Payee | | | | | | | |
| | | | | | | | |
| Edit Cancel Back | | | | | | | |

6. You can now configure up to 2 factors (levels) of authentication / re-authorization. However please note that the system will not let you set "Security Questions" as a factor of authentication / re-authorization for the Login transaction. You will have to choose either OTP or Soft Token.

| Ξ | n 🌮 ZigBank | | | | |
|---|-------------------------------|-------------------|--------------|------------|----------------|
| | Authentication | | | | |
| | Enterprise Role | Retail | | | |
| | User Segment | RETAILGOLD | | | |
| | Transaction Type | Level 1 | | Level 2 | |
| | Forgot Password | One Time Password | \sim | None | ✓ Apply to all |
| | Login | One Time Password | ~ | Soft Token | \sim |
| | External Transfer Confirm | None | | None | \checkmark |
| | External Transfer Confirm | One Time Password | | | |
| | Multiple Bill Payments | Soft Token | | None | \checkmark |
| | Multiple Transfers | Security Question | ~ | None | \checkmark |
| | Multiple Mutual Fund Purchase | One Time Password | \checkmark | None | \checkmark |
| | Update Nominee | None | \checkmark | None | \sim |

 Click on the Save button at the bottom of the screen, followed by the Confirm button seen in the subsequent verification screen.

2.9 Configuring 2FA Attributes

This section covers some key attributes of the 2nd factor of authentication (re-authorization). Attributes like the maximum number of times a user is allowed to hit the "Resend" button after an OTP is generated, the pool of security questions etc are a couple of examples of 2FA attributes.

These attributes are seen in the database in the PROP_ID column of the table DIGX_FW_CONFIG_ALL_B (CATEGORY_ID = `authenticationConfig'). The following table lists down all possible attributes and their significance. Their values must be set in the column PROP_VALUE.

Table DIGX_FW_CONFIG_ALL_B (CATEGORY_ID = `authenticationConfig')

| PROP_ID | SIGNIFICANCE |
|----------------------------------|--|
| OTP.EXPIRATION_TIME | Time in milliseconds after which an OTP will expire. |
| OTP.MAX_NO_ATTEMPTS | Max number of unsuccessful attempts of entering a valid OTP after which all 2FA enabled transactions for the user will be locked for a "cooling period" amount of time |
| T_SOFT_TOKEN.EXPIRATION _TIME | Time in milliseconds after which a time based soft token will expire. |
| R_SOFT_TOKEN.EXPIRATION _TIME | Time in milliseconds after which a random soft token will expire. |
| SEC_QUE.EXPIRATION_TIME | Time in milliseconds after which answers to the security questions presented to the user will no longer be considered for re-authorization. |
| EXPIRATION_TIME | Time in milliseconds after which the re-authorization factor will expire. This is the default property that will be looked up in case factor specific expiration times are not maintained. |

| PROP_ID | SIGNIFICANCE |
|------------------------------------|---|
| T_SOFT_TOKEN.MAX_NO_ATT EMPTS | Max number of unsuccessful attempts of entering a valid time based soft token after which all 2FA enabled transactions for the user will be locked for a "cooling period" amount of time. |
| R_SOFT_TOKEN.MAX_NO_ATT EMPTS | Max number of unsuccessful attempts of entering a valid random soft token after which all 2FA enabled transactions for the user will be locked for a "cooling period" amount of time. |
| SEC_QUE.MAX_NO_ATTEMPTS | Max number of unsuccessful attempts of entering valid answers to security questions after which all 2FA enabled transactions for the user will be locked for a "cooling period" amount of time. |
| MAX_NO_ATTEMPTS | Max number of unsuccessful attempts of entering valid 2FA after which all 2FA enabled transactions for the user will be locked for a "cooling period" amount of time. This is the default property that will be looked up in case factor specific Max Attempts are not maintained. |
| TFA_LOCK_COOLING_PERIOD | This is the cooling period in milliseconds after which 2FA transactions which were locked out because of exceeding MAX_NO_ATTEMPTS, are enabled once again. |
| OTP.MAX_ACTIVE_REF_NO | Max number of attempts to generate 2FA reference numbers for a transaction after which no more attempts can be made for EXPIRATION_TIME units of time for that factor of authentication. This one is specific to OTPs. |
| | This property is in place as a basic mechanism to protect the application against DOS attacks where the end user can keep generating OTPs by initiating transactions and making the system generate the 2nd factor of authentication, but not going through and completing the transaction. |
| OTP.MAX_ACTIVE_REF_NO | This property is in place as a basic mechanism to protect the application against DOS attacks where the end user can keep generating OTPs by initiating transactions and making the system generate the 2nd factor of authentication, but not going through and completing the transaction. |
| T_SOFT_TOKEN.MAX_ACTIVE _REF_NO | Max number of attempts to generate 2FA reference numbers for a transaction after which no more attempts can be made for EXPIRATION_TIME units of time for that factor of authentication. This one is specific to Time Based Soft Tokens. |
| R_SOFT_TOKEN.MAX_ACTIVE _REF_NO | Max number of attempts to generate 2FA reference numbers for a transaction after which no more attempts can be made for EXPIRATION_TIME units of time for that factor of authentication. This one is specific to Random Soft Tokens. |
| SEC_QUE.MAX_ACTIVE_REF_ NO | Max number of attempts to generate 2FA reference numbers for a transaction after which no more attempts can be made for EXPIRATION_TIME units of time for that factor of authentication. This one is specific to Security Questions. |
| MAX_ACTIVE_REF_NO | Max number of attempts to generate 2FA reference numbers for a transaction after which no more attempts can be made for EXPIRATION_TIME units of time for that factor of authentication. This is the default property that will be looked up in case factor specific Max Active Reference Number attempts are not maintained. |
| OTP.RESEND_COUNT | Max number of times a user can hit the "Resend" button in case of OTPs. After exceeding this count, the user will need to re-initiate the transaction all over again. |
| retailuser.NO_QUE_ANS | Number of security questions that a retail user needs to setup (answer). During an actual transaction he will be asked a sub set of these questions. |

| PROP_ID | SIGNIFICANCE |
|------------------------------|---|
| corporateuser.NO_QUE_AN S | Number of security questions that a corporate user needs to setup (answer). During an actual transaction he will be asked a sub set of these questions. |
| administrator.NO_QUE_AN S | Number of security questions that an admin user needs to setup (answer). During an actual transaction he will be asked a sub set of these questions. |
| NO_QUE_ANS | Number of security questions that a user segment needs to setup (answer). During an actual transaction he will be asked a sub set of these questions. This is the default property that will be looked up in case factor specific NO_QUES_ANS is not maintained |

2.10 Choosing a non blocking PRNG

OBAPI uses Java's random number generation capabilities internally. However the out of the box algorithm for PRNG configured in the JDK can block the thread after a certain time if there isn't enough randomness available. This is because the default configuration uses /dev/ random on Linux for PRNG.

Therefore we recommend that you navigate to <JDK_HOME>/jre/lib/security and edit the java.security file. Comment out the old property and change its value as shown below:

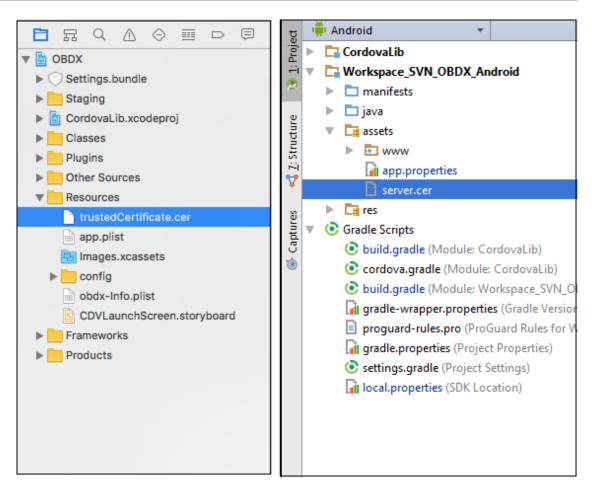

```
#securerandom.strongAlgorithms=NativePRNGBlocking:SUN
securerandom.strongAlgorithms=NativePRNGNonBlocking:SUN
```

This will ensure that the application uses /dev/urandom for PRNG.

Needless to say, make sure you make this change in the JDK that your WebLogic server is going to be using.

2.11 Mobile App SSL Pinning Configuration

SSL Pinning has been implemented in the mobile apps, both iOS and Android. The public key certificate of the server needs to be imported into these apps for the connection to the server to be successful. The certificate needs to have an extension .cer and needs to be placed in mobile app workspaces as shown in the images below:

The name of the certificate file needs to be configured in a property file. For iOS it is the <code>app.plist</code> file.

| V DBDX | Кеу | Туре | Value |
|----------------------------|-------------------------|------------|--------------------|
| Settings.bundle | ▼ Root | Dictionary | (3 items) |

2.12 Generating Security Keys

Oracle Banking Digital Experience supports generating Security Keys required for encryption of sensitive information.

i. Generating Public and Private Key Pair

Oracle Banking Digital Experience supports generating Public and Private Key pair that will be used for encryption of login password on the User Interface.

- 1. Login as the Admin user.
- 2. Click on menu item "Security" → "Security Keys"

| 🗙 🂋 ZigBank | | | م ⊠ ¹⁶ |
|--|----------------------------|-------------------------------|--------------------------|
| Your current view is System Administrator V | Dashboard | | |
| Security | Onboarding | | |
| Authentication | User Management | . • | |

| | User Group Subject Mapping | Authentication | Service Request- Fo |
| | Alerts Maintenance | Security Question Maintenance | Feedback Template |
| | 🔯 Mailers | Password Policy Maintenance | SMS and Missed Ca |

3. Click on "Generate" for new Public and Private Key Pair generation used for encryption.

E ZigBank
Security Keys
Public and Private Key Pair
Public and Private key pair helps to encrypt information that ensures data is protected during transmission. Whatever is encrypted with a Public Key may only be decrypted by its corresponding Private Key and vice versa. You can click to generate the key pair.
Generate

 Restart the WebLogic server for utilizing the above generated key pair. By default the Public and Private key pair is not generated and the password is not encrypted on the User Interface. Once the Key Pair is generated, encryption will be effective after server restart.

In case of Private key compromise, an Administrator can generate a new Key Pair to mitigate the impact of compromised key.

ii. Generating JWT Encryption Key

Oracle Banking Digital Experience supports generating key that will be used for encryption of JSON Web Token (JWT). The JWT is used as a session token for Alternate login (Fingerprint/Pin/Pattern) on mobile apps.

- 1. Login as the Admin user.
- 2. Click on menu item "Security" → "Security Keys".

3. Click on "Generate" for new encryption key generation used to encrypt JWT.

JWT Encryption Key

To encrypt and decrypt a JWT, you need a symmetric key which can be generated by clicking the generate button.

 Restart the WebLogic server for the utilizing the above generated encryption key. By default the JWT Encryption key is not generated and the JWT is stored in clear text. Once the Encyrption Key is generated, encryption will be effective after server restart.

In case of JWT encryption key compromise, an Administrator can generate new encyrption key to mitigate the impact of compromised key.

iii.Generating API Key

The API key is a unique identifier that helps authentication server handle non authenticated requests. This is required by asynchronous requests such as File upload, alerts, etc. to communicate with the authentication server. Hence, as a part of Day 1 activity, API Key should be mandatorily generated by clicking the **Generate** button.

Navigation Path:

From System/ Bank Administrator Dashboard, click Toggle Menu, then click Menu and then click Security. Under Security , click Security Keys, then click API Key.

Figure 2-1 API Key

Note:

If you change the AES key connector password from Weblogic console, then you need to again generate the API key and take managed server restart.

2.13 API Rate Limiting Recommendations

We recommend API Rate Limiting to be implemented for Business APIs. These APIs can be configured in Web Application Firewall (WAF) for protection from Denial of Service (DoS) attacks.

2.14 Host Header Injection Attack Recommendations

A web server may host several web applications on the same IP address, referring to each application via the virtual host. In an incoming HTTP request, web servers often dispatch the request to the target virtual host based on the value supplied in the Host header. Without proper validation of the header value, the attacker can supply invalid input to cause the web server to:

- dispatch requests to the first virtual host on the list
- cause a redirect to an attacker-controlled domain
- perform web cache poisoning

We recommend the following configuration to be included inside the VirtualHost directive of the **ssl.conf** file in the OHS. The file would be available at location:

domains<Your domain><config\fmwconfig\components\OHS<<OHS instance>

```
<VirtualHost *:<OHS_PORT>>
    ServerName <OHS_DOMAIN>
    RewriteEngine on
    RewriteOptions inherit
    RewriteCond %{HTTP_HOST}
    !(<OHS_DOMAIN>|<OHS_DOMAIN>:<OHS_PORT>)
    RewriteRule ^(.*)$ -[F,L]
</VirtualHost>
```

This will cause a request to be forbidden if the Host Header is modified to a value other than OHS DOMAIN specified in the configuration.

Guidance for Implementation Teams

- CSRF Mitigation Generating Nonces
- Indirect Object Reference Implementation
- Output Encoding
- Implementing a custom Cryptography Provider
- Implementing a custom 2FA mechanism
- Configuring Password Printing Securely

3.1 CSRF Mitigation – Generating Nonces

A nonce is a pseudo random number that may be used only once. If a nonce is sent across in every request from the client to the server and the server validates the sent nonce every single time, then it mitigates the risk of Cross Site Request Forgery (CSRF).

The product provides a REST Service to generate nonces – each nonce can be used only once to identify each request uniquely, for each session. The product also has an inbuilt framework that will validate the nonce sent in the request.

Therefore post a successful login you need to make a call to https://<Host>:<Port>/digx/v1/ session/nonce before you make a call to any other service. This service will return back an array of nonces in the response header. You can pick up any one nonce from the array and use it to send across the nonce required in a subsequent request. A nonce can be used only once. You need to discard it after usage.

Please note that unless you send across a nonce, the services that are accessed post login will not work.

3.2 Indirect Object Reference Implementation

i. What it means

It is a good security practice to hide sensitive data objects from the end user. Although the system needs to play around with sensitive data objects, it is recommended to refer to these sensitive data objects via pointers – tokens that temporarily point to the sensitive data objects but themselves do not contain any sensitive data.

For example consider a credit card application on the web which offers the following 2 transactions:

- Credit Cards Summary Displays a list of all credit cards the user owns.
- Credit Card Details Displays the details of one specific Credit Card that the user selects

The Credit Cards Summary page will typically list all credit card numbers in a masked format. Let's assume that the end user holds 2 Credit Cards C1 and C2. When the end user hits the Summary link, the server returns back the following in its response:

- 1. Masked Credit Card Number C1 (visible to the user)
- 2. Masked Credit Card Number C2 (visible to the user)

- 3. Token T1 (not visible to the user)
- 4. Token T2 (not visible to the user)

T1 and T2 are random tokens – difficult to guess – which the server has generated as proxies for C1 and C2 respectively. The server has internally stored this mapping of C1-T1 and C2-T2 somewhere. Please note that T1 and T2 are tied to the current session. The moment the session expires, T1 and T2 get discarded. Next time the user logs in, the server generates different tokens T1x and T2x for C1 and C2 respectively.

Whenever the user clicks on say Credit Card Details for C1, the client sends T1 to the server instead of C1, as a request parameter. The server internally figures out that the request is actually for C1 and processes the request accordingly.

Thus we refer to sensitive data indirectly via tokens that are generated with different values for every session.

ii. How OBAPI supports it

To implement the above mechanism the framework offers interception of both the request and the response. The recommendation is to apply indirect referencing to sensitive data fields like Personally Identifiable Information fields aka PII data.

For the interception to work automatically, the sensitive fields holding the PII data must be defined as a Java type, which extends the abstract class

com.ofss.digx.datatype.complex.MaskedIndirectedObject.

The abstract class exposes 2 data fields, namely value and displayValue. The value field holds the indirect reference value, which is used during data transmission from the client to the server. The displayValue field holds the masked value of the data.

The following data types are supported out-of-box:

- 1. com.ofss.digx.datatype.complex.Account Account number
- 2. com.ofss.digx.datatype.complex.Applicant The unique identifier to identify an applicant. Typically a party ID.
- com.ofss.digx.datatype.complex.ApplicationId The unique identifier of an application for account opening.
- com.ofss.digx.datatype.complex.ContentId The unique identifier for content such as documents for a party.
- 5. com.ofss.digx.datatype.complex.CreditCard Credit Card Number
- 6. com.ofss.digx.datatype.complex.DebitCard Debit Card Number
- 7. com.ofss.digx.datatype.complex.Email Email ID
- 8. com.ofss.digx.datatype.complex.Party The unique identifier for a party.
- 9. com.ofss.digx.datatype.complex.PhoneNumber Phone Number
- 10. com.ofss.digx.datatype.complex.SSN Social Security Number
- **11.** com.ofss.digx.datatype.complex.SubmissionId The unique identifier for a submission containing 1 or more applications for account opening.

To modify the existing/base product-masking pattern for any of the above data types, the following entries need to be copied/cloned from the table DIGX_FW_CONFIG_ALL_B to the table DIGX_FW_CONFIG_ALL_0 and then modified as required in DIGX_FW_CONFIG_ALL_0.

Note:

Please DO NOT MODIFY these entries in DIGX FW CONFIG ALL B.

| Data Type | Category ID / Preference Name | Property ID |
|---------------|----------------------------------|----------------------------|
| Account | MaskingPattern | AccountNumberMasking |
| Applicant | MaskingPattern | ApplicantIdMasking |
| ApplicationId | MaskingPattern | ApplicationIdIdMasking |
| ContentId | MaskingPattern | ContentIdMaskingPattern |
| CreditCard | MaskingPattern | CreditCardNumberMasking |
| DebitCard | MaskingPattern | DebitCardNumberMasking |
| Email | MaskingPattern | EmailIdMasking |
| Party | MaskingPattern | PartyIdMasking |
| PhoneNumber | MaskingPattern | PhoneNumberMasking |
| SSN | MaskingPattern | SSNMasking |
| SubmissionId | MaskingPattern | SubmissionIdMaskingPattern |
| | | |

The characters allowed in the making pattern are as below:

N – Keeps the character transparent. Does not mask.

Any other character – Replaces the character at the location with the character specified.

For example: XXXXXNNNN will keep the last 4 characters in clear text and mask the first 5 characters using the character 'X'.

3.3 Output Encoding

To mitigate inline Cross Site Scripting attacks, the product provides a framework to encode the data sent in the response. In the previous versions up until OBAPI 17.2.0.0.0 there was guidance in this section of the security guide on the steps needed to be followed to implement output encoding in your service response. However, in OBAPI 18.2.0.0.0 this is something that is handled implicitly in the framework for all services, base as well as any custom services that you might write.

There is nothing that you need to do explicitly to achieve this.

3.4 Implementing a custom Cryptography Provider

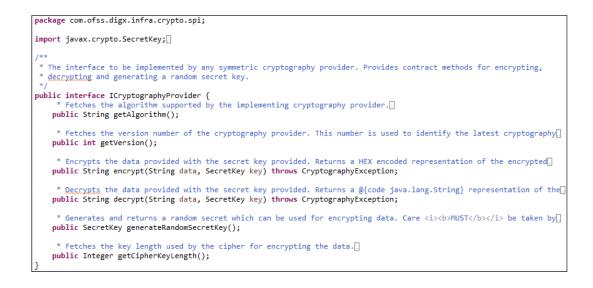

The base product provides a <u>symmetric key cryptography</u> framework that enables the implementation team to implement its own custom symmetric key encryption/decryption mechanism.

The product is shipped out with an out of the box Cryptography Provider that will be invoked if no custom implementation is found.

If you wish to write your own custom Cryptography Provider, the required steps are as follows:

 Write the custom cryptography provider class such that it implements the interface com.ofss.digx.infra.crypto.spi.ICryptographyProvider. The interface defines methods as shown below:

- 2. Implement the encrypt() and decrypt() methods to encrypt and decrypt the data passed to the methods, using the key passed along with the data.
- 3. Implement the getVersion() method to simply return a number greater than 1. For example:

```
public int getVersion() {
    return 2;
}
```

4. Implement the method to simply return the symmetric encryption algorithm name. For example:

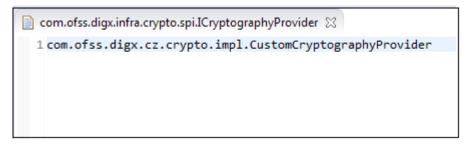

- 5. You can leave the implementations of the other two methods blank.
- 6. In the custom jar file that contains the custom Cryptography Provider, create a file with the name com.ofss.digx.infra.crypto.spi.ICryptographyProvider under the folder structure META-INF/services.

- 7. Open the file for editing.
- 8. Type out the fully qualified class name of your custom Cryptography Provider class. For example:

Deploy your custom jar on the WebLogic server and you should be all set.

The Cryptography Provider will be invoked when the system invokes the encryption framework for the following actions:

- a. Encrypting the SMTP Server password entered by the OBAPI Admin, before storing it in the Database.
- **b.** Encrypting the system generated password for first time users, before storing it in the Database. This is will be relevant to the function of Password Printing.
- c. Encrypting the Identification Number for the selected Identification Type (Driver's License, Passport etc.) during originating a loan application online.

3.5 Implementing a custom 2FA mechanism

- 1. You will need to write your own Java class to implement your own custom factor of authentication.
- 2. The class must be registered in the table DIGX AU AUTH TYPE MST. Choose a custom ID.

| 9 | select * from DIGX_FW_CONFIG_VAR_B where prop_id like '%SUPPORTED_AUTH_TYPE%' | | | | | | | |
|---|---|----|-----------------------------------|--------------------|--------|--|------------------------|--|
| _ | | ₽. | • ⊕ + - ✓ ₹ ₹ ₩ 🖉 🏠 | \bigtriangledown | △ ∉ | | 🖬 🍯 🛍 🗸 | |
| | | | PROP_ID | | ENV_ID | | PROP_VALUE | |
| | | 1 | SUPPORTED_AUTH_TYPE | | OBDX | | OTP~SOFT_TOKEN~SEC_QUE | |
| | | 2 | administrator.SUPPORTED_AUTH_TYPE | | OBDX | | OTP~SOFT_TOKEN~SEC_QUE | |
| | | 3 | corporateuser.SUPPORTED_AUTH_TYPE | | OBDX | | OTP~SOFT_TOKEN~SEC_QUE | |
| | | 4 | retailuser.SUPPORTED_AUTH_TYPE | | OBDX | | OTP~SOFT_TOKEN~SEC_QUE | |
| | | 5 | PC_CM_ME.SUPPORTED_AUTH_TYPE | | OBDX | | OTP~SOFT_TOKEN | |
| | | | | | | | | |

- 3. The custom class must implement the interface. com.ofss.digx.framework.security.authentication.provider.I2FactorAuthenticatio nProvider
- To configure your custom authenticator as an additional option available to the admin during the 2FA configuration of transactions, set the custom ID used in Step 2 in the table DIGX_FW_CONFIG_VAR_B.

| select * from DIGX_FW_CONFIG_VAR_B where prop_id like '%SUPPORTED_AUTH_TYPE%' | | | | | | |
|---|---|-----------------------------------|--------------------|----------|------------------------|--|
| ₽ | | - 🔒 + - 🗸 🗟 🛎 🔌 🎼 | \bigtriangledown | | 🖬 🍯 🛍 🗸 | |
| | | PROP_ID | | ENV_ID | PROP_VALUE | |
| | 1 | SUPPORTED_AUTH_TYPE | | OBDX ··· | OTP~SOFT_TOKEN~SEC_QUE | |
| | 2 | administrator.SUPPORTED_AUTH_TYPE | | OBDX ··· | OTP~SOFT_TOKEN~SEC_QUE | |
| | 3 | corporateuser.SUPPORTED_AUTH_TYPE | | OBDX ··· | OTP~SOFT_TOKEN~SEC_QUE | |
| | 4 | retailuser.SUPPORTED_AUTH_TYPE | | OBDX ··· | OTP~SOFT_TOKEN~SEC_QUE | |
| | 5 | PC_CM_ME.SUPPORTED_AUTH_TYPE | | OBDX ··· | OTP~SOFT_TOKEN | |

- 5. The configuration already seen in the above image suggests that an admin will have the option of setting one of OTP, Soft Token and Security Questions as an additional factor of authentication when configuring 2FA for user segments Retail, Corporate and Administrator.
- 6. The PROP_ID that the system must look up in this table (DIGX_FW_CONFIG_VAR_B) is maintained in the table DIGX_FW_CONFIG_ALL_B against the PROP_ID SUPPORTED AUTH TYPE.
- 7. If \${_PROPERTY_} is the value maintained against retailuser. SUPPORTED_AUTH_TYPE in the table DIGX_FW_CONFIG_ALL_B, then for retail users the application will look up the table DIGX_FW_CONFIG_VAR_B where PROP_ID = _PROPERTY_ to check what options are available to the admin.

| | <pre>select * from DIGX_FW_CONFIG_ALL_B where CATEGORY_ID='authenticationConfig' AND PROP_ID LIKE '&SUPPORTED_AUTH_TYPE&';</pre> | | | | | | |
|---|--|-----------------------------------|--------------------|----------------------|---------------------------------------|--|--|
| Ę | []: • | • ⊕ + - ✓ ₹ ₹ ₩ 🖉 좗 | \bigtriangledown | △ 🐗 日 🏅 (| <u>û</u> • | | |
| | | PROP_ID | | CATEGORY_ID | PROP_VALUE | | |
| | 1 | PC_CM_ME.SUPPORTED_AUTH_TYPE | | authenticationConfig | \${PC_CM_ME.SUPPORTED_AUTH_TYPE} | | |
| | 2 | SUPPORTED_AUTH_TYPE | | authenticationConfig | \${SUPPORTED_AUTH_TYPE} | | |
| | 3 | administrator.SUPPORTED_AUTH_TYPE | | authenticationConfig | \${administrator.SUPPORTED_AUTH_TYPE} | | |
| | 4 | corporateuser.SUPPORTED_AUTH_TYPE | | authenticationConfig | \${corporateuser.SUPPORTED_AUTH_TYPE} | | |
| | 5 | retailuser.SUPPORTED_AUTH_TYPE | | authenticationConfig | \${retailuser.SUPPORTED_AUTH_TYPE} | | |

3.6 Configuring Password Printing Securely

Banks need to provide new customers with system-generated credentials to enable them to login into the system for the first time. Some of the banks prefer to print the first time password on paper and then hand it over to the customer in person.

To enable banks to do this, OBAPI has the "Print Password" function built out of the box. However, the base OBAPI product will not provide an end-to-end solution since password printing is not something universal.

For the sake of this explanation, we are going to break up the process of Password Printing into 6 steps:

- Generate the password using a secure random number generation mechanism.
- Encrypt the password.
- Store the password in the Database.

- Retrieve the password for printing.
- Decrypt the password.
- Do the actual printing.

Steps 2 and 5 can be customized, but not mandatory. Please refer to section **Implementing a** custom Cryptography Provider.

However, it is mandatory to implement Step 6. Here is how you can plug-in your implementation of printing the password:

- Write a custom class that will implement the interface com.ofss.digx.app.sms.user.printinformation.provider.IUserInformationPrintAdapter
- The interface defines a single method as shown below:

```
package com.ofss.digx.app.sms.user.printinformation.provider;
import com.ofss.digx.app.sms.dto.user.printInformation.PasswordPrintInformationDTO;
public interface IUserInformationPrintAdapter {
    /**[]
    public void print(PasswordPrintInformationDTO userprintDTO) throws Exception;
}
```

- The DTO passed to the print () method will contain the password that is needed for printing.
- Also, add the following entry to the file Preferences.xml <Preference name="UserPrintConfig'" PreferencesProvider="com.ofss.digx.infra.config.impl.DBBasedPropertyProvider" parent="jdbcpreference" propertyFileName="select prop_id, prop_value from digx_fw_config_all_b where category_id = 'UserPrintConfig'" syncTimeInterval="36000000" />
- Run the following Database script

4 List of Topics

This user manual is organized as follows:

Table 4-1 List of Topics

| Topics | Description | | | |
|--|--|--|--|--|
| Preface | This topic provides information on the introduction, intended audience, list of topics, and acronyms covered in this guide. | | | |
| General Security Principles | This topic explains principles are fundamental for using any application securely. | | | |
| Secure Installation and Configuration | This topic explains the overview of the architecture of the deployment and describes the installation and configuration procedure for Oracle Banking Digital Experience. | | | |
| Guidance for Implementation Teams | This topic provides information about the guidance forimplementation teams such as CSRF Mitigation – Generating Nonces, Indirect Object Reference ImplementationOutput Encoding etc. | | | |
