

Oracle® Banking Payments

Development Security Guide

Release 14.8.0.0.0
G32431-01
April 2025

ORACLE®

Copyright © 2017, 2025, Oracle and/or its affiliates.

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software, software documentation, data (as defined in the Federal Acquisition Regulation), or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs) and Oracle computer documentation or other Oracle data delivered to or accessed by U.S. Government end users are "commercial computer software," "commercial computer software documentation," or "limited rights data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, reproduction, duplication, release, display, disclosure, modification, preparation of derivative works, and/or adaptation of i) Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs), ii) Oracle computer documentation and/or iii) other Oracle data, is subject to the rights and limitations specified in the license contained in the applicable contract. The terms governing the U.S. Government's use of Oracle cloud services are defined by the applicable contract for such services. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle®, Java, MySQL, and NetSuite are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Inside are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Epyc, and the AMD logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

Contents

1 Preface

1.1	Purpose	1-1
1.2	Audience	1-1
1.3	Documentation Accessibility	1-1
1.4	Critical Patches	1-2
1.5	Diversity and Inclusion	1-2
1.6	Conventions	1-2
1.7	Related Resources	1-2
1.8	Screenshot Disclaimer	1-2
1.9	Acronyms and Abbreviations	1-3
1.10	Basic Actions	1-3
1.11	Symbols, Definitions and Abbreviations	1-4

2 About this Manual

2.1	Introduction	2-1
2.2	Scope	2-1
2.2.1	Read Sections Completely	2-1
2.2.2	Understand the Purpose of this Guidance	2-1
2.2.3	Limitations	2-1

3 How to Address the OWASP Top10 in Oracle Banking Payments

3.1	Injection	3-1
3.2	Broken Authentication and Session Management	3-2
3.3	Cross-Site Scripting (XSS)	3-3
3.4	Insecure Direct Object References	3-4
3.5	Security Misconfiguration	3-5
3.6	Sensitive Data Exposure	3-6
3.7	Missing Function Level Access Control	3-7
3.8	Cross-Site Request Forgery (CSRF)	3-8
3.9	Using Components with Known Vulnerabilities	3-8
3.10	Unvalidated Redirects and Forwards Network Security	3-8

4 Securing Gateway Services

4.1	Inbound Application Integration	4-1
4.2	EJB Based Synchronous Deployment Pattern	4-2
4.3	Web Services Based Synchronous Deployment Pattern	4-2
4.4	HTTP Servlet Based Synchronous Deployment Pattern	4-2
4.5	MDB Based Asynchronous Deployment Pattern	4-3
4.6	Outbound Application Integration	4-3
4.7	Accessing Service and Operation	4-3
4.8	Gateway Password Generation Logic for External System Authentication	4-3
4.9	XSD Validation and Input Validation	4-4
4.10	List of Services	4-4
4.11	List of Interfaces	4-4

1

Preface

- [Purpose](#)
- [Audience](#)
This manual is intended for the following User/User Roles:
- [Documentation Accessibility](#)
- [Critical Patches](#)
- [Diversity and Inclusion](#)
- [Conventions](#)
- [Related Resources](#)
- [Screenshot Disclaimer](#)
- [Acronyms and Abbreviations](#)
- [Basic Actions](#)
- [Symbols, Definitions and Abbreviations](#)
The following are some of the Symbols you are likely to find in the manual:

1.1 Purpose

This guide is designed to help acquaint you with the Oracle Banking Payments application. This guide provides answers to specific features and procedures that the user need to be aware of the module to function successfully.

1.2 Audience

This manual is intended for the following User/User Roles:

Table 1-1 User Roles

Role	Function
Implementation & IT Staff	Implementation & Maintenance of the Software

1.3 Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc>.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info> or visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs> if you are hearing impaired.

1.4 Critical Patches

Oracle advises customers to get all their security vulnerability information from the Oracle Critical Patch Update Advisory, which is available at [Critical Patches](#), [Security Alerts and Bulletins](#). All critical patches should be applied in a timely manner to make sure effective security, as strongly recommended by [Oracle Software Security Assurance](#).

1.5 Diversity and Inclusion

Oracle is fully committed to diversity and inclusion. Oracle respects and values having a diverse workforce that increases thought leadership and innovation. As part of our initiative to build a more inclusive culture that positively impacts our employees, customers, and partners, we are working to remove insensitive terms from our products and documentation. We are also mindful of the necessity to maintain compatibility with our customers' existing technologies and the need to ensure continuity of service as Oracle's offerings and industry standards evolve. Because of these technical constraints, our effort to remove insensitive terms is ongoing and will take time and external cooperation.

1.6 Conventions

The following text conventions are used in this document:

Convention	Meaning
boldface	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text.
<i>italic</i>	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
<code>monospace</code>	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

1.7 Related Resources

For more information on any related features, refer to the following documents:

- *Getting Started User Guide*
- *Oracle Banking Security Management System User Guide*
- *Oracle Banking Microservices Platform Foundation User Guide*
- *Routing Hub Configuration User Guide*
- *Oracle Banking Common Core User Guide*
- *Interest and Charges User Guide*
- *Oracle Banking Liquidity Management Configuration Guide*
- *Oracle Banking Liquidity Management File Upload User Guide*

1.8 Screenshot Disclaimer

Personal information used in the interface or documents is dummy and does not exist in the real world. It is only for reference purposes.

1.9 Acronyms and Abbreviations

The list of the acronyms and abbreviations that are used in this guide are as follows:

Table 1-2 Acronyms and Abbreviations

Abbreviation	Description
DDA	Demand Deposit Accounts
ECA	External Credit Approval
EOD	End of Day
IBAN	International Bank Account Number

1.10 Basic Actions

The basic actions performed in the screens are as follows:

Table 1-3 Basic Actions

Actions	Description
New	Click New to add a new record. The system displays a new record to specify the required data. The fields marked with asterisk are mandatory. - This button is displayed only for the records that are already created.
Save	Click Save to save the details entered or selected in the screen.
Unlock	Click Unlock to update the details of an existing record. The system displays an existing record in editable mode. - This button is displayed only for the records that are already created.
Authorize	Click Authorize to authorize the record created. A maker of the screen is not allowed to authorize the same. Only a checker can authorize a record. - This button is displayed only for the already created records. For more information on the process, refer Authorization Process.
Approve	Click Approve to approve the initiated record. - This button is displayed once the user click Authorize .
Audit	Click Audit to view the maker details, checker details of the particular record. - This button is displayed only for the records that are already created.
Close	Click Close to close a record. This action is available only when a record is created.
Confirm	Click Confirm to confirm the action performed.
Cancel	Click Cancel to cancel the action performed.
Compare	Click Compare to view the comparison through the field values of old record and the current record. - This button is displayed in the widget once the user click Authorize .
View	Click View to view the details in a particular modification stage. - This button is displayed in the widget once the user click Authorize .

Table 1-3 (Cont.) Basic Actions

Actions	Description
View Difference only	Click View Difference only to view a comparison through the field element values of old record and the current record, which has undergone changes. - This button is displayed once the user click Compare .
Expand All	Click Expand All to expand and view all the details in the sections. - This button is displayed once the user click Compare .
Collapse All	Click Collapse All to hide the details in the sections. - This button is displayed once the user click Compare .
OK	Click OK to confirm the details in the screen.

1.11 Symbols, Definitions and Abbreviations

The following are some of the Symbols you are likely to find in the manual:

Table 1-4 Symbols

Icons	Function
	Exit
	Add row
	Delete row
	Option List

Table 1-5 Common Icons and its Definitions

Icon Names	Applicable Stages	Operation
Minimize	Initiation, Approval and Hand-off Retry	Users can minimize the transaction input screen. When the screen is minimized, it appears as to a separate tab within the same web page.
Maximize	Initiation, Approval and Hand-off Retry	User can maximize the transaction input screen.
Close	Initiation, Approval and Hand-off Retry	Users can close the transaction input screen. The system displays a warning message to the user that any unsaved data would be lost. User can either choose to ignore the message and close the screen or choose to 'save and close' the transaction.

2

About this Manual

- [Introduction](#)
- [Scope](#)

2.1 Introduction

Purpose: This document provides security-related usage and configuration recommendations for Oracle Banking Payments 14.6.0.0.0. This guide may outline procedures required to implement or secure certain features, but it is also not a general-purpose configuration manual.

Audience: This guide is primarily intended for Developers for Banking and third party or vendor software's. Some information may be relevant to IT decision makers and users of the application are also included. Readers are assumed to possess basic operating system, network, and system administration skills with awareness of vendor/third-party software's and knowledge of FCUBS application.

2.2 Scope

- [Read Sections Completely](#)
- [Understand the Purpose of this Guidance](#)
- [Limitations](#)

2.2.1 Read Sections Completely

Each section should be read and understood completely. Instructions should never be blindly applied. Relevant discussion may occur immediately after instructions for an action, so be sure to read whole sections before beginning implementation.

2.2.2 Understand the Purpose of this Guidance

The purpose of the guidance is to provide security-relevant code and configuration recommendations.

2.2.3 Limitations

This guide is limited in its scope to security-related guideline for developers.

3

How to Address the OWASP Top10 in Oracle Banking Payments

- [Injection](#)
- [Broken Authentication and Session Management](#)
- [Cross-Site Scripting \(XSS\)](#)
- [Insecure Direct Object References](#)
- [Security Misconfiguration](#)
- [Sensitive Data Exposure](#)
- [Missing Function Level Access Control](#)
- [Cross-Site Request Forgery \(CSRF\)](#)
- [Using Components with Known Vulnerabilities](#)
- [Unvalidated Redirects and Forwards Network Security](#)

3.1 Injection

Injection flaws occur when an application sends untrusted data to an interpreter. Injection flaws are very prevalent, particularly in legacy code. They are often found in SQL, LDAP, Xpath, or SQL queries; OS commands; XML parsers, SMTP Headers, program arguments, etc. Injection flaws are easy to discover when examining code.

Banking uses Oracle database and it has adequate inbuilt techniques to prevent SQL injections as underlined below:

1. **Use of prepared statements (parameterized queries)** - Banking uses PreparedStatement with bind variables to construct and execute SQL statements in JAVA.
2. **Use of Stored procedures** - Stored procedures have the same effect as the use of prepared statements when implemented safely. 'Implemented safely' means the stored procedure does not include any unsafe dynamic SQL generation. Banking uses safe Java stored procedures calls.

In addition to the above, wherever dynamic queries exist, Banking uses adequate defence to sanitize the untrusted input. The use of DBMS_ASSERT.SIMPLE_SQL_NAME and the use of bind variables justify the fact.

3. **Escaping all user supplied input** - This third technique is to escape user input before putting it in a query. If it's a concern that rewriting the dynamic queries as prepared statements or stored procedures might break the application or adversely affect performance, then this might be the best approach for the purpose. However, this methodology is frail compared to using parameterized queries and there's no guarantee that it will prevent all SQL Injection in all situations.

Banking uses context specific escaping. It has a StringEscapeUtils.java file, where context specific escaping is handled.

3.2 Broken Authentication and Session Management

In Oracle Banking Payments application session interval will be validated against the session interval stored in the configurable file FCUBS.properties file. Validations are added to check the maximum time limit for the inactive session from being expired. Java API method javax.servlet.http. HTTP Session will set the max time out period for the session.

A maximum limit is imposed on the value passed to set the maximum limit of session interval. The maximum limit is a positive practical value. This validation is required to prevent long running sessions that can be actively targeted.

The default value for session time out is 30 minutes and it is configurable in FCUBS properties file.

The session used for login authentication will be invalidated (destroyed) and a new session will be created once the user logged-in successfully to the application .And the new session will be used to store the required variables.

A session attribute IsAuthenticated set to “Y” on successful login to the application. A new random token (Cross-site request forgery) also generates and same is available in the session attribute.

The entire subsequent request within the session will be having the Authenticated and Cross-site request forgery tokens .Every request send to the application from the browser is validated against the IsAuthenticated attribute and Cross-site request forgery token.

A hidden form is used to submit the logout request to the server, with the response resulting in a 302 redirect instead of client initiated redirect to the login page.

Session get expire once user log off from application or if idle for its maximum limit.

Cryptography used

PCI council defines **Strong Cryptography** as:

Cryptography based on industry-tested and accepted algorithms, along with strong key lengths and proper key-management practices. Cryptography is a method to protect data and includes both encryption (which is reversible) and hashing (which is not reversible, or “one way”). SHA-1 is an example of an industry-tested and accepted hashing algorithm. Examples of industry-tested and accepted standards and algorithms for encryption include AES (128 bits and higher), TDES (minimum double-length keys), RSA (1024 bits and higher), ECC (160 bits and higher), and ElGamal (1024 bits and higher).

Encryption algorithm: The application leverages AES encryption algorithm to store sensitive information into properties file. This algorithm uses 256 bit secret key for encryption and decryption which would be stored at property file.

Hashing algorithm: Oracle Banking Payments leverages SHA-512 hashing algorithm for user password authentication. This algorithm generates a password digest for the user password by using the SALT (Random number generated using SHA1PRNG algorithm) and the iteration number available in the property file.

Session storage

Oracle Banking Payments application does not store Http Session objects.

A unique sequence number generates and stored in current user table for the purpose of mapping server-side sessions with the entries in the current user table.

During session expiry (triggered by the container), the session listener provides the application with the sequence number of the session. The application makes checks as to whether the entry in current user table contains the same sequence number. Only in such a case should the entry be deleted.

When authentication of credentials (involving an incorrect user ID) is unsuccessful, the user id should not be logged in the audit logs (database table). The following possible scenarios will be accounted for:

Session logging

Unsuccessful attempt to login is stored in the database with terminal's ip address and timestamp. Invalid and expired session IDs submitted to the application are categorized as authentication failures and the same are logged in the database table.

3.3 Cross-Site Scripting (XSS)

XSS is the most prevalent web application security flaw. XSS flaws occur when an application includes user supplied data in a page sent to the browser without properly validating or escaping that content. Banking is coded keeping in view the XSS prevention rules as below:

1. Technique#1—HTML Escape before inserting untrusted data into HTML element content

Across the Banking application, context specific escaping has been used to sanitize the untrusted data. For HTML content, the below function takes care of escaping the probable tainted data:

public static String escapeHTML(String input);

Escaping the following characters, with HTML entity encoding, to prevent switching into any execution context, such as script, style, or event handlers has been done. Use of recommended hex entities is in place. In addition to the 5 characters significant in XML (&, <, >, ", '), the forward slash is included as it helps to end an HTML entity.

- & --> &
- < --> <
- > --> >
- " --> "
- ' --> '
- / --> /

2. Technique #2-- JavaScript Escape Before Inserting Untrusted Data into JavaScript Data Values

Including untrusted data inside any other JavaScript context is quite dangerous, as it is extremely easy to switch into an execution context with characters including (but not limited to) semi-colon, equals, space, plus, and many more. For JavaScript context, the below function takes care of escaping the probable tainted data:

public static String escapeJavaScript(String input);

3. Technique #3—Escape JavaScript Characters

This works in conjunction with rule#2. Except for alphanumeric characters in Banking, all characters less than 256 are escaped with the \xHH format to prevent switching out of the data value into the script context or into another attribute. No use of any escaping shortcuts like \" , because the quote character may be matched by the HTML attribute parser which runs first. These escaping shortcuts are also susceptible to "escape-the-

escape" attacks where the attacker sends \" and the vulnerable code turns that into \\\" which enables the quote.

4. Technique #4--URL Escape And Strictly Validate Before Inserting Untrusted Data into HTMLURL Parameters.

Banking encodes URL with the URLEncoder java class. It doesn't check for a valid URL, but directly does URL encoding, and that encoding is based on the context of display.

5. Technique #5---Use of HttpOnly and secure cookie flag

Banking uses the HTTPOnly flag on the session cookie and any custom cookies that are not accessed by any JavaScript.

3.4 Insecure Direct Object References

1. Use of prepared statements (parameterized queries)

Banking uses PreparedStatement with bind variables to construct and execute SQL statements in JAVA.

2. Input Validation

Banking is a web based application, the request data from browser to server will be passed using request headers and request parameters. All the request fields coming from the client are validated using white list validation to prevent cross site scripting.

User defined method validateParameter() is used for input validation which checks each character of the request field with a range of allowed characters.

User defined methods escapeJavaScript(), escapeHTML() and escapeURL() will sanitize the output data before flushing it into client browser.

escapeJavaScript() will escape all characters except immune JavaScript characters and alphanumeric characters in the ASCII character set. All other characters are encoded using the \xHH or \uHHHH notation for representing ASCII or Unicode sequences.

escapeHTML() will escape the characters with equivalent HTML entities obtained from the lookup map. Lookup map will have entities such as amp, quot, lt, gt etc.

escapeURL() will encode the URL using URLEncoder class.

White list validation is also used to restrict Image/signature/excel upload and to check rights for every operation performed by user.

3. Image Content validation

Signature upload will check for image type and image content using the inbuilt classes (ImageIO and JarFile) available in java.

4. Field validation

Field level validations exist for all mandatory fields. Database too had limits on the type and the length of data. Blacklisted characters are not allowed in the mandatory fields. Nevertheless, Banking has free-text fields, which takes all data, entered by the user, as a String.

5. Restriction on Blacklist characters

Similar to white list validation black list validation is also used for validating the request fields. Banking uses blacklist validation to check whether the request xml contains unwanted tags like scripting tag, html tag, anchor tag etc inside the xml content. It is also used for the advance summary field's validation to check whether proper request fields are coming from the browser.

Below table shows the list of bad characters which should not be allowed in URL path but the Banking operations requires many of the below characters to be passed in the request. So Banking will encode the below bad characters before sending them through the URL and same will be decoded at the server to prevent the hacker from modifying the request.

Bad URL Characters(Unsafe Characters)	--
&	//
<	./
>	/.
;	/*
\"	*.
\'	~
%	\
)	25%
(%25u
+	%25U
,	%00-%1f, %7f-%ff
" " (space)	%00-%1f and %7f-%ff
-	%25u and %25U

6. Restriction on Script/Html tags

Banking has blacklist validation for unwanted tag in xml like scripting tag or html tag inside xml content particularly in the header.

3.5 Security Misconfiguration

1. Configuration files

Configuration files are securely placed inside the Classes folder of the WEB-INF folder which is not publicly accessible.

2. Exception handling in java

Different types of exceptions can rise in application. Java exceptions handled using try catch blocks available in java. Sometimes we use the Throw statement to throw an exception which is caught by the catch block. Caught exceptions will be written into the log files for the debug purpose when ever required. Whenever any exception occurs in application, proper information used to send to the front end user by showing alert.

3. Exception handling in oracle database

Database exceptions handled using EXCEPTION statement available in PL/SQL. Caught exceptions will be written into the log files for the debug purpose. And proper error message created to send the same in response to the user.

4. Package lockout situation handled in backend

Application will be hanged in an oracle system package lockout situation. Locked objects will be released manually using SQL scripts or through database restart.

We have handled cursor lock out problem in the required packages.

5. Auto generated password

The password is generated by the system accordance to the password policy. The salt is also be generated every time the password is changed by using predefined algorithm.

The salt concatenated with auto generated password and SHA-512 hash applies on the resultant which results the password digest.

Once the successful generation of password digests both salt and password digest is stored in the DB.

6. Custom password

The password is keyed in by the administrator or user accordance to the password policy. The salt is generated every time the password is changed by using predefined algorithm.

The salt concatenated with the password input and SHA-512 hash applies on the resultant which results the password digest.

Once the successful generation of password digests both salt and password digest is stored in the DB.

Oracle Banking Payments does not provide any default user/password. User and password needs to be created at the time of installation.

7. Sand Box for File Upload

The application uses a sandbox for placing files that are uploaded via the signature/image upload screen. The sandbox is placed in a specified location (the location will be specified in the properties file) on the server.

8. BI Publisher Reports - generation and access

The application uses a sandbox for placing the generated reports file into a sandbox area. The sandbox is placed in a specified location (the location will be specified in the properties file) on the server. The application validates if the user has explicit Rights to generate Reports.

3.6 Sensitive Data Exposure

1. Secure Transformation of Data (SSL)

The Oracle Banking Payments Installer allows a deployer to configure Oracle Banking Payments such that all HTTP connections to the Oracle Banking Payments application are over SSL/TLS. In other words, all HTTP traffic in the clear will be prohibited; only HTTPS traffic will be allowed. It is mandatory to enable this option in a production environment, especially when WebLogic Server acts as the SSL terminator.

A two-way SSL is used when the server needs to authenticate the client. In a two-way SSL connection the client verifies the identity of the server and then passes its identity certificate to the server. The server then validates the identity certificate of the client before completing the SSL handshake.

In order to establish a two-way SSL connection, need to have two certificates, one for the server and the other for client. This is required for de-centralized setup of application.

For Oracle Banking Payments, need to configure a single connector. This connector is related to SSL/TLS communication between host or browser and the branch which uses two-way authentication.

If the secure flag is set on a cookie, then browsers will not submit the cookie in any requests that use an unencrypted HTTP connection, thereby preventing the cookie from being trivially intercepted by an attacker monitoring network traffic.

Below configuration has to be ensured in weblogic.xml within the deployed application ear.

- Cookies are set with Http only as true
- Cookie secure flag set to true
- Cookie path to refer to deployed application

```
<wls: session-descriptor>
```

```
<wls: cookie-http-only>true</wls: cookie-http-only>
```

```
</wls: session-descriptor>
```

```
<wls: session-descriptor>
```

```
<wls: cookie-secure>true</wls: cookie-secure>
```

```
<wls: url-rewriting-enabled>>false</wls: url-rewriting-enabled>
```

```

</wls: session-descriptor>

<session-descriptor>
<cookie-name>JSESSIONID</cookie-name>
<cookie-path>/<DeployedApplicationPath></cookie-path>
<cookie-http-only>true</cookie-http-only>
<cookie-secure>true</cookie-secure>
<url-rewriting-enabled>false</url-rewriting-enabled>
</session-descriptor>

```

Always make sure Cookies are set with always Auth Flag enabled by default for WebLogic server.

2. Sign-On messages

Below table shows the general Sign-On messages which would be displayed to the user during invalid authentication:

Message	Explanation
User Already Logged In	The user has already logged into the system and is attempting a login through a different terminal.
Invalid User ID/Login	An incorrect user ID or password was entered.
User Status is Disabled. Please contact your System Administrator	The user profile has been disabled due to number of dormancy days allowed for the user has exceeded the dormancy days configured in the system.
User Status is Locked. Please contact your System Administrator	The user profile has been locked due to an excessive number of attempts to login, using an incorrect user ID or password. The number of attempts could have matched either the successive or cumulative number of login failures (configured for the system).

3. CACHE Control in Servlet and jsp

There are three basic HTTP response headers that prevent a page from being cached to disk. Different browsers handle them in slightly different ways, so they need to be used in combination to ensure all browsers do not cache the specific page. These headers are "Expires", "Pragma" and "Cache-control". In addition, these headers can either be sent directly by the server or placed in the HTML code as HTTP-EQUIV META tags within the HEAD section. The "Expire" header gives a date at which point the page should expire and no longer be cached. Internet Explorer supports a date of "0" for immediately and any negative number for already expired. The "Pragma: no-cache" header indicates that the page should not be cached.

4. Clickjacking/Frame-bursting

Banking uses the X-Frame-Options HTTP response header to indicate whether or not a browser should be allowed to render a page in a <frame> or <iframe>. This is used to avoid Clickjacking attacks, by ensuring that the content is not embedded into other sites.

3.7 Missing Function Level Access Control

It is likely that users working in the same department at the same level of hierarchy need to have similar user profiles. In such cases, you can define a Role Profile that includes access rights to the functions that are common to a group of users. A user can be linked to a Role Profile by which you give the user access rights to all the functions in the Role Profile.

Application level access has implemented via the Security Management System (SMS) module. SMS supports “ROLE BASED” access of Screens and different types of operations. Banking Payments supports dual control methodology, wherein every operation performed has to be authorized by another user with the requisite rights.

Please refer 2.6 section of the SMS user manual for more details.

Apart from the role based access control particular functions , products can be restricted for user as described below.

Disallowed functions: Function IDs or UI level restrictions can be provided for the user by including the function Ids in the disallowed list. This will restrict the user from accessing the UI. When accessed, an error message dialogue box will pop up saying-“User not authorized to access the screen”.

Disallowed account class: The user could be restricted to perform any operation using a particular a/c class. When disallowed, no accounts could be created by the user using the account class.

Disallowed products: The user could be restricted to use product(s) of any module(s), if disallowed. This is really required when restricting users department wise. For example, staffs of accounts department need not be given access to view the loans of customers.

Disallowed branches: The user could be restricted to access branches other than his own branch (reporting branch). He can be given access to login from other branches of the bank at an approval from authenticated person, an action which again requires manual authorization.

3.8 Cross-Site Request Forgery (CSRF)

In case of XMLHttpRequest objects, the XMLHttpRequest object sets a custom HTTP header in the request, with the header value being the Cross-site request forgery token; the server then verifies for the presence of such a header and the Cross-site request forgery token. This serves as a protection at endpoints used for XMLHttpRequest requests, since only XMLHttpRequest objects can set HTTP headers (apart from Flash; and both cannot make cross-domain requests).

3.9 Using Components with Known Vulnerabilities

Source code scanning done using the latest fortify to identify the sources code issue and will provide the proper fix for the reported issues.

3rd party libraries scanning for every release has been done to validate if any security issues rise for any of the components or not. Update the 3PL with latest security patch or upgraded to latest version.

3.10 Unvalidated Redirects and Forwards Network Security

Application uses 302 redirect wherever required. Banking UBS uses `response.sendRedirect(newURL);`

4

Securing Gateway Services

Different applications deployed on disparate platforms and using different infrastructure need to be able to communicate and integrate seamlessly with Oracle Banking Payments in order to exchange data. The Oracle Banking Payments Integration Gateway will cater to these integration needs.

The integration needs supported by the Gateway can be broadly categorized from the perspective of the Gateway as follows:

- Inbound application integration – used when any external system needs to add, modify or query information within Oracle Banking Payments.
- Outbound application integration – used when any external system needs to be notified of the various events that occur within Oracle Banking.

4.1 Inbound Application Integration

Oracle Banking Payments Inbound Application Gateway provides XML based interfaces thus enhancing the need to communicate and integrate with the external systems. The data exchanged between Oracle Banking Payments and the external systems will be in the form of XML messages. These XML messages are defined in FCUBS in the form of XML Schema Documents (XSD) and are referred to as 'FCUBS formats'.

FCUBS Inbound Application Integration Gateway uses the Synchronous and Asynchronous Deployment Pattern for addressing the integration needs.

The Synchronous Deployment Pattern is classified into the following:

- Oracle Banking Payments EJB Based Synchronous Inbound Application Integration Deployment Pattern
- Oracle Banking Payments Web Services Based Synchronous Inbound Application Integration Deployment Pattern
- Oracle Banking Payments MDB Based Asynchronous Inbound Application Integration Deployment Pattern

4.2 EJB Based Synchronous Deployment Pattern

The Enterprise Java Beans (EJB) deployment pattern will be used in integration scenarios where the external system connecting to Oracle Banking Payments is 'EJB literate', i.e., the external system is capable of interacting with Oracle Banking Payments based upon the EJB interface. In this deployment pattern, the external system will use the RMI/IIOP protocol to communicate with the Oracle Banking Payments EJB.

In this deployment pattern the EJB displayed by Oracle Banking Payments will be a stateless session bean. The actual request will be in the form of an XML message. After the necessary processing is done in Oracle Banking Payments based on the request, the response is returned to the external system as an XML message. The transaction control for the processing will stay with the Oracle Banking Payments EJB.

4.3 Web Services Based Synchronous Deployment Pattern

The web services deployment pattern will be used in integration scenarios where the external system connecting to Oracle Banking Payments wants to connect using standards-based, inter-operable web services.

This deployment pattern is especially applicable to systems which meet the following broad guidelines:

- Systems that are not 'EJB literate', i.e., such systems are not capable of establishing connections with Oracle Banking Payments based upon the EJB interface; and/or
- Systems that prefer to use a standards-based approach

In this deployment pattern, the external system will use the SOAP (Simple Object Access Protocol) messages to communicate to the Oracle Banking Payments web services.

The services displayed by Oracle Banking Payments are of a 'message based' style, i.e., the actual request will be in the form of an XML message, but the request will be a 'payload' within the SOAP message. After the necessary processing is done in Oracle Banking Payments based on the request, the response is returned to the external system as an XML message which will be a 'payload' within the response SOAP message. The transaction control for the processing will stay with the Oracle Banking Payments.

4.4 HTTP Servlet Based Synchronous Deployment Pattern

The HTTP servlet deployment pattern will be used in integration scenarios where the external system connecting to Oracle Banking Payments wants to connect to Oracle Banking Payments using simple HTTP messages.

This is especially applicable to systems such as the following:

- Systems that are not 'EJB literate', i.e., are not capable establishing a connections with Oracle Banking Payments based upon the EJB interface; and/or
- Systems that prefer to use a simple http message based approach without wanting to use SOAP as the standard

In this deployment pattern, the external system will make an HTTP request to the Oracle Banking Payments servlet.

For this deployment pattern, Oracle Banking Payments will display a single servlet. The actual request will be in the form of an XML message. This XML message is embedded into the body

of the HTTP request sent to the Oracle Banking Payments servlet. After the necessary processing is done in Oracle Banking based on the request, the response is returned to the external system as an XML message which is once again embedded within the body of the response HTTP message. The transaction control for the processing will stay with the Oracle Banking.

4.5 MDB Based Asynchronous Deployment Pattern

The MDB deployment pattern is used in integration scenarios where the external system connecting to Oracle Banking Payments wants to connect to Oracle Banking Payments using JMS queues.

This is especially applicable to systems such as the following:

- Systems that prefer to use JMS queues based approach without wanting to wait for the reply

Here external system sends messages in XML format to request queue on which an MDB is listening. When a message arrives on the queue, it is picked up for processing. After the necessary processing is done in Oracle Banking Payments, based on the request, the response is sent to the response queue as an XML message.

4.6 Outbound Application Integration

The Outbound Application Integration is also called the Oracle Banking Payments Notify Application Integration layer. This application layer sends out notification messages to the external system whenever events occur in Oracle Banking Payments.

The notification messages generated by FCUBS on the occurrence of these events will be XML messages. These XML messages are defined in FCUBS in the form of XML Schema Documents (XSD) and are referred to as 'FCUBS formats'.

4.7 Accessing Service and Operation

In a message it is mandatory to maintain a list of Service Names and Operation Codes. This information is called Gateway Operations.

A combination of every such Service Name and Operation Code is mapped to a combination of Function ID and Action. Every screen in Oracle Banking Payments is linked with a function ID. This information is called Gateway Functions.

User can gain access to an external system using the Gateway Functions. The Function IDs mapped in Gateway Functions should be valid Function IDs maintained in Oracle Banking Payments. Hence, for every new Service or Operation being introduced, it is important that you provide data in Gateway Operations and Gateway Functions.

4.8 Gateway Password Generation Logic for External System Authentication

As a secure configuration password authentication should be enabled for the external system maintained. The same can be verifying in External system detail screen level. Once these features enable, system will validate for Encrypted password as part of every request sent by the External System.

The Message ID which is present as part of the header in Request XML, is considered as hash. External System generates an unique Message ID, which is functional mandatory field in the header. Create a Message Digest with SHA-512 algorithm.

The hash created from the previous step and the password in clear text together is encrypted in AES encryption method. Apply Base64 encoding to encrypted value and send to the Oracle Banking Payments gateway.

4.9 XSD Validation and Input Validation

Oracle Banking Payments supports the XSD validation for all types Gateway. Each node in request xml is getting validated with the corresponding webservice XSD's.

Restriction on Script/Html tags

Banking Gateway has blacklist validation for unwanted tag in xml like scripting tag or html tag inside xml content particularly in the header.

4.10 List of Services

- COCategoryTypeService
- COCurrencyPairService
- COCurrencyRateTypeService
- COCurrencyService
- FCUBSPXService

4.11 List of Interfaces

- Generic Interface
- Document Management System Interface
- SWIFTNet Services Integrator Messaging Hub Interface
- Oracle Identity Manager Interface
