71.2.7 JSON Payload

The property value in JSON format indicates the value type using `concreteType` field names. The following table maps the property definition type and Java data type to the values of `concreteType`.

Table 71–1 concreteType Values

Property Definition Type	Java Data Type	concreteType Value
INT	java.lang.Integer	urn:oracle:wcps:property:internal:jaxrs:model:integer-value
NUMBER	java.lang.Double	urn:oracle:wcps:property:internal:jaxrs:model:double-value
STRING	java.lang.String	urn:oracle:wcps:property:internal:jaxrs:model:string-value
BOOLEAN	java.lang.Boolean	urn:oracle:wcps:property:internal:jaxrs:model:boolean-value
BLOB	oracle.wcps.property.BlobData	urn:oracle:wcps:property:blob-data
CLOB	oracle.wcps.property.ClobData	urn:oracle:wcps:property:clob-data
DATETIME	oracle.wcps.property.DateTime	urn:oracle:wcps:property:date-time

71.2.8 Exceptions

- If optimistic concurrency is disabled on the property server, the "If-Match" request header is not required. If enabled, the value of the "If-Match" header should be the value sent for the response header "ETag".
- Not sending the request header X-Oracle-RF-Token results in a 403 response status. The value of the token should be the one sent in response of the `/resouceIndex` request.
- Attempting to delete an "in use" Namespace, Property Definition, or Property Set Definition results in a 412 response status.

71.2.9 Query Parameters

Table 71–2 shows the supported query parameters and their default values.

Table 71–2 Query Parameters

Query Parameter Name	Description	Default Value	Other Special Values
q	the value for it is a search expression	none	none
startIndex	Represents the index of the first element in a page	0	none
itemsPerPage	Represents the number of items to be included in a page	10	none
dataFields	Represents a list of attributes of a property service entities for which data is returned	empty list = (Return zero attributes)	* = (all attributes)

71.2.10 Search Expressions

71.2.10.1 Format

The value for the 'q' query parameter is a search expression. The search expression format is:

```
single_expression = attribute_name:operator_name:value
expression = single_expression[;single_expression]
```

71.2.10.2 Supported Operators

- Relational Operator
  - `:equals:` ==> Equals
  - `:contains:` ==> Contains
  - `:like:` ==> SQL Like, applies only to string type property values
  - `:gt:` ==> Greater than
  - `:gte:` ==> Greater than or equals to
  - `:lt:` ==> Less than
  - `:lte:` ==> Less than or equals to
- Logical Operation
  - `;` ==> and

71.2.10.3 Supported Attribute Names

Table 71–3, Table 71–4, Table 71–5, and Table 71–6 show the supported attribute names that can be used in a search expressions to search for property service entities.

Namespace Attributes

Table 71–3 Namespace Attributes

Attribute Name	Description
ns-name	A namespace's name

Table 71–3 (Cont.) Namespace Attributes

Attribute Name	Description
ns-property-locator-class-name	A namespace's property locator class name
ns-definition-locator-class-name	A namespace's definition locator class name
ns-created-on	A namespace's created on date time
ns-updated-on	A namespace's updated on date time

Examples:

```
/wcps/api/property/namespaces?q=ns-name:like:Oracle_%25
```

```
/wcps/api/property/namespaces?q=ns-definition-locator-class-name:like:%25Locator%2
5;ns-name:like:Oracle_%25
```

Property Definition Attributes

Table 71–4 Property Definition Attributes

Attribute Name	Description
pd-name	A property definition's name
pd-description	A property definition's description
pd-type	A property definition's type
pd-restricted	A property definition's restricted attribute
pd-validator-class-name	A property definition's validator class name
pd-created-on	A property definition's created on date time
pd-updated-on	A property definition's updated on date time

Example:

```
/wcps/api/property/namespaces/Oracle/propertydefinitions?q=pd-name:like:%25D%25;pd
-description:contains:4th;pd-restricted:contains:true
```

Property Set Definition Attributes

Table 71–5 Property Set Definition Attributes

Attribute Name	Description
psd-name	A property set definition's name
psd-description	A property set definition's description
psd-pd-name	A property definition name referred by a property set definition
psd-property-locator-class-name	A property locator class name associated with a property set definition
psd-created-on	A property set definition's created on date time
psd-updated-on	A property set definition's updated on date time

Example:

```
wcps/api/property/namespaces/Oracle/propertysetdefinitions?q=psd-created-on:gt:198
0-01-01T00:00:00.000-0700;psd-name:like:%255%25
```

Property Set Attributes

Table 71–6 Property Set Attributes

Attribute Name	Description
ps-name	A property set's name
ps-description	A property set's description
psd-created-on	A property set's created on date time
psd-updated-on	A property set's updated on date time
a property's name	A property's name attribute (for example, firstName, zipCode, etc.)

Example:

```
/wcps/api/property/namespaces/Oracle/propertysetdefinitions/partners_
info/propertysets?q=ps-created-on:gt:1980-01-01T00:00:00.000-0700
```

72 Conductor API Reference

This chapter describes the public APIs for the Conductor, the component that orchestrates data integration components and activities for WebCenter Portal.

This chapter includes the following topics:

- Section 72.1, "Using Java APIs"
- Section 72.2, "Using the Conductor REST APIs"
- Section 72.3, "Calling Data Integration Client Services Using ELs"

72.1 Using Java APIs

The service interfaces shown in Table 72–1 define the remote Conductor API.

Table 72–1 Remote Conductor APIs

Interface/Service	Description
`oracle.wcps.conductor.services.IScenariosService`	General management, retrieval, and execution of stored Scenarios.
`oracle.wcps.conductor.services.INamespaceService`	General management of stored namespaces known to the Conductor.
`oracle.wcps.conductor.services.IProviderService`	Retrieval of provider metadata known to the Conductor server.

72.2 Using the Conductor REST APIs

This section provides examples of how you can use the Conductor's REST APIs to programatically carry out basic data integration tasks, such as:

- Get information about data providers
- Get information about function providers
- Create, retrieve, or delete a namespace
- Create, retrieve, execute, or delete a scenario

You can use the Conductor REST APIs from within application code, or using data integration ELs to call them from within your WebCenter Portal Framework application or WebCenter Portal.

This section includes the following subsections:

- Section 72.2.1, "Using the Data Provider Management REST APIs"
- Section 72.2.2, "Using the Function Provider Management APIs"

- Section 72.2.3, "Using the Namespace Management APIs"
- Section 72.2.4, "Using the Scenario Management APIs"

72.2.1 Using the Data Provider Management REST APIs

This section provides examples of using the Conductor's data provider management APIs, and contains the following subsections:

- Section 72.2.1.1, "Getting a Collection of Data Providers (GET)"
- Section 72.2.1.2, "Getting a Single Data Provider's Metadata (GET)"
- Section 72.2.1.3, "Getting Information About a Data Provider Connection (GET)"
- Section 72.2.1.4, "Getting Information about an Executable Resource for a Data Provider and Connection (GET)"
- Section 72.2.1.5, "Getting Method Information for an Executable Resource for a Data Provider and Connection (GET)"
- Section 72.2.1.6, "Getting Entire Data Provider Information with Details Projection (GET)"

72.2.1.1 Getting a Collection of Data Providers (GET)

XML

```

72.2.2 Using the Function Provider Management APIs

This section provides examples of using the Conductor's function provider APIs, and contains the following subsections:

- Section 72.2.2.1, "Getting a Collection of Function Providers (GET)"
- Section 72.2.2.2, "Getting Metadata for a Single Function Provider (GET)"

72.2.2.1 Getting a Collection of Function Providers (GET)

XML

Request:

```
GET
http://localhost:7001/wcps/api/conductor/namespaces/Oracle/functionProviders?proje
ction=summary
accept-language: en
content-type: application/xml
accept: application/xml
```

Response:

```

72.2.3 Using the Namespace Management APIs

This section provides examples of using the Conductor's namespace management APIs, and contains the following subsections:

- Section 72.2.3.1, "Getting a Collection of Namespaces (GET)"
- Section 72.2.3.2, "Retrieving a Single Namespace (GET)"
- Section 72.2.3.3, "Creating a Namespace (POST)"
- Section 72.2.3.4, "Deleting a Namespace (DELETE)"

72.2.3.1 Getting a Collection of Namespaces (GET)

72.2.4 Using the Scenario Management APIs

This section provides examples of using the Conductor's scenario management APIs, and contains the following susbsections:

- Section 72.2.4.1, "Getting a Collection of Scenarios (GET)"
- Section 72.2.4.2, "Retrieving a Single Scenario (GET)"
- Section 72.2.4.3, "Creating a Scenario (POST)"
- Section 72.2.4.4, "Updating a Scenario (PUT)"
- Section 72.2.4.5, "Deleting a Scenario (DELETE)"
- Section 72.2.4.6, "Execute a Scenario (POST)"

72.2.4.1 Getting a Collection of Scenarios (GET)

XML

```
Request:
GET
http://localhost:7001/wcps/api/conductor/namespaces/Oracle/scenarios?projection=su
mmary&startIndex=0&itemsPerPage=10
accept-language: en
content-type: application/xml
accept: application/xml

Response:

72.3 Calling Data Integration Client Services Using ELs

Using Expression Language (EL) expressions, you can call data integration services from remote clients such as web pages and Java Server Faces environments. You can, for example, use ELs to apply data integration scenarios to pages in WebCenter Portal. For more information about data integration ELs, see also Section G.11, "ELs Related to Personalization."

This section contains the following subsections:

- Section 72.3.1, "Calling Data Integration Client Services from JSF Pages"
- Section 72.3.2, "Calling Data Integration Client Services from JSP Pages"
- Section 72.3.3, "Data Integration Context Object Method Reference"
- Section 72.3.4, "Enabling Single Sign-on"

72.3.1 Calling Data Integration Client Services from JSF Pages

The P13NContext is a session-scoped managed bean that is automatically declared and instantiated by the Java Server Faces context, and there for use with the following EL:

```
#{p13nContext}
```

Accessing the Conductor context

Access to remote Conductor services can be accessed in the following way:

```
#{p13nContext.conductor["<UrlOrConnectionName>"]}
```

where ***UrlOrConnectionName*** is a URL to the conductor resource index (for example, `http://localhost:7001/wcps/api/conductor/resourceIndex`), or a connection name specified in connections.xml (available only within JDeveloper or WebCenter environments).

If the connection name "default" is specified, the first connection name that starts with "Conductor" is retrieved. For example:

```
#{p13nContext.conductor['default'].namespaces['myNamespace'].scenario['myScenario'
].results}
```

Accessing the Properties service context

Access to remote Properties Service services can be accessed in the following way:

```
#{p13nContext.properties["<UrlOrConnectionName>"]}
```

where ***UrlOrConnectionName*** is a URL to the Properties Service resource index (for example http://localhost:7001/wcps/api/property/resourceIndex), or a connection name specified in connections.xml (available only within JDeveloper or WebCenter environments).

If the connection name "default" is specified, the first connection name that starts with "Properties" is retrieved. For example:

```
#{p13nContext.properties['default'].namespaces['myNamespace'].setDefinitions['MyPr
opertySetDefinition'].sets['MyPropertySet'].results['MyPropertyName']}
```

Configuring the client services for request scope

You may sometimes need to have the data integration services client use request scope rather than session scope. To do this, configure a custom managed bean in your application's faces-config as shown in the example below:

```
<managed-bean>
    <managed-bean-name>myP13nContext</managed-bean-name>
    <managed-bean-class>oracle.wcps.client.PersonalizationContext
 </managed-bean-class>
    <managed-bean-scope>request</managed-bean-scope>
</managed-bean>
```

72.3.2 Calling Data Integration Client Services from JSP Pages

The data integration client can be used with

JSP pages similarly to the way it is used in Java Server Faces pages (see Section 72.3.1, "Calling Data Integration Client Services from JSF Pages"). You must, however, register the bean using <jsp:useBean> as shown in the following example:

```
<jsp:useBean id="p13nContext" class="oracle.wcps.client.PersonalizationContext"
scope="session"/>
<c:out
value="${p13nContext.conductor['http://weblogic:webl0gic@localhost:7001/wcps/api/c
onductor'].namespaces['default'].scenario['my_scenario_
name'].withInput['question=Does JSP work?'].results}"/>
```

If you want to clear the bean's state, you can invoke it using scriptlet code by placing it after the <jsp:useBean> statement:

```
<jsp:scriptlet>((oracle.wcps.client.PersonalizationContext)session.getAttribute("p
13nContext")).reset();</jsp:scriptlet>
```

72.3.3 Data Integration Context Object Method Reference

Table 72–2 shows the data integration context object methods.

Table 72–2 Data Integration Context Object Method Reference

Method Name	Description	Example

reset	Clears the state of the context object in which it is invoked.	`#{p13nContext.reset}`
		`#{p13nContext.conductor['ConductorConnection'].reset}`
		`#{p13nContext.conductor['ConductorConnection'].namespaces['MyNamespace'].reset}`
		`#{p13nContext.properties['PropertiesConnection'].namespaces['MyNamespace'].setDefinitions['MyPropertySetDefinition'].set['MyPropertySet'].reset}`

update	Updates the property set with new values if bound to a form. This method only applies to the PropertySetContext. **Note:** This method can only called as part of a form-based action.	`#{p13nContext.properties['PropertiesConnection'].namespaces['MyNamespace'].setDefinitions['MyPropertySetDefinition'].set['MyPropertySet'].update}`

results	Retrieves the results of the context object.
	For PropertySetContext, it retrieves the property set by name and property set definitions, if they exist.
	For ScenarioExecutionContext and ParameterizedScenarioExecutionContext, the scenario results are retrieved.
		`#{p13nContext.properties['PropertiesConnection'].namespaces['MyNamespace'].setDefinitions['MyPropertySetDefinition'].set['MyPropertySet'].results}`
		`#{p13nContext.conductor['ConductorConnection'].namespaces['MyNamespace'].scenario['MyScenario'].results}`
		`#{p13nContext.conductor['ConductorConnection'].namespaces['MyNamespace'].scenario['MyScenario'].withInput['input1=val1;input2=value2;input3=value3'].results}`

withInput	Executes a scenario by name with input parameters. Input parameters must be in the format: `<paramOne>=<valueOne>;<paramTwo>=<valueTwo>;<paramThree>=<valueThree>` where each parameter name and value is separated by semicolon. This method only applies to ScenarioExecutionContext.	`#{p13nContext.conductor['ConductorConnection'].namespaces['MyNamespace'].scenario['MyScenario'].withInput['input1=val1;input2=value2;input3=value3'].results}`

isError	Determines if an error has occurred in the current context object. Only applies to PropertySetContext and ScenarioExecutionContext.	`#{p13nContext.conductor['ConductorConnection'].namespaces[myManagedBean.namespace].scenario[myManagedBean.scenario].isError}`
		`#{p13nContext.properties['PropertiesConnection'].namespaces['MyNamespace'].setDefinitions['MyPropertySetDefinition'].set['MyPropertySet'].isError}`

errorMessage	Returns the error message if an error has occurred in the current context object. Only applies to PropertySetContext and ScenarioExecutionContext.	`#{p13nContext.conductor['ConductorConnection'].namespaces[myManagedBean.namespace].scenario[myManagedBean.scenario].errorMessage}`
		`#{p13nContext.properties['PropertiesConnection'].namespaces['MyNamespace'].setDefinitions['MyPropertySetDefinition'].set['MyPropertySet'].errorMessage}`

72.3.4 Enabling Single Sign-on

To enable single sign-on, access to the `HttpServletRequest` must be available for both JSF and JSP environments. An implementation of `javax.servlet.Filter` (`PersonalizationFilter`) puts the `HttpServletRequest` on `ThreadLocal` for access within the client as shown in the example below:

```
<filter>
     <description>Personalization Filter for staging client-side
objects.</description>
     <filter-name>PersonalizationFilter</filter-name>
     <filter-class>oracle.wcps.client.PersonalizationFilter</filter-class>
</filter>

<filter-mapping>
     <filter-name>PersonalizationFilter</filter-name>
     <url-pattern>/*</url-pattern>
     <dispatcher>REQUEST</dispatcher>
</filter-mapping>
```

This filter is automatically configured in the `wcps-services-client-web-lib`.

73 Cache Management for Personalization

This chapter discusses cache management for Oracle WebCenter Personalization.

This chapter includes the following topics:

- Section 73.1, "Introduction to Cache Management for Personalization"
- Section 73.2, "Locating and Updating Cache Configuration Files"
- Section 73.3, "Using Caching with Personalization Components"
- Section 73.4, "Configuring Caches for Personalization Components"
- Section 73.5, "Configuring a Cache on a Data Provider Connection"
- Section 73.6, "Monitoring Oracle Coherence"

73.1 Introduction to Cache Management for Personalization

WebCenter Portal uses Oracle Coherence to manage server-side caching for personalization features. A local Coherence license is provided with all WebCenter installations. Personalization supports other more complex modes of Coherence use, although appropriate Coherence licenses must be purchased for those cases.

This chapter explains how to use caching with WebCenter Portal personalization features, like scenarios and data providers.

Note: It is assumed that you have a basic understanding of caching concepts and techniques. In general, no attempt will be made in this chapter to explain these concepts. It is also assumed that you are familiar with Oracle Coherence. To learn about Coherence, see *Getting Started with Oracle Coherence*.

It is also assumed that you are familiar with the WebCenter Portal personalization concepts and features described in Chapter 66, "Personalizing Oracle WebCenter Portal Applications."

73.2 Locating and Updating Cache Configuration Files

WebCenter Portal provides two Coherence cache configuration files for use with personalization. The use of these files is described in this section.

Note: All cache factories instantiated by WebCenter Personalization Server (WCPS) are specific to the WCPS classloader.

- Section 73.2.1, "Where are the Cache Configuration Files Located?"
- Section 73.2.2, "Using the Cache Configuration Files"

73.2.1 Where are the Cache Configuration Files Located?

Cache configuration files are located in:

```
$ORACLE_HOME/user_projects/applications/<domain>/conductor-extensions-library/WEB-INF/classes
```

If you create any custom cache configuration files, the best practice is to place them in this same directory. On the other hand, you can place them in any location that is in the WCPS web application classpath. You need to redeploy the WCPS web application or restart the server for the new class to be recognized. See also Section 73.2.2.3, "Creating Custom Cache Configuration Files."

73.2.2 Using the Cache Configuration Files

This section discusses each of the cache configuration files used by personalization features and the creation of custom cache configuration files.

73.2.2.1 Internal Cache Configuration File

The cache configuration file `wcps-coherence-cache-config.xml` supports internal integration components like the Property Service, Conductor, and the core data provider functionality.

> **Note:** Do not change the names of the caches in this configuration file. You can, however, change the cache configuration parameters in the file.

73.2.2.2 Data Provider Cache File

The cache configuration file `wcps-dataprovider-cache-config.xml` addresses caching associated with data providers. This file uses the wildcard pattern so that clients can have their specific caches, either by using a pattern like `wcps-dp-small-content` or `my-custom-cache`. For example, a wildcard pattern such as `wcps-dp-medium-*` will resolved when specifying cache names such as `wcps-dp-small-content` or `wcps-dp-small-ebs`.

The out-of-the-box data provider configurations may be modified to suit your needs, or you may add new entries to support your custom data providers. Please note that any changes to existing out-of-the-box configurations may affect other custom data providers deployed to your environment.

Default data provider cache configurations include the following:

- Local cache implemented in memory
- LRU eviction policy
- Small: 100 entries, default TTL of 1 hour
- Medium: 1000 entries, default TTL of 1 hour
- Large: 10000 entries, default TTL of 1 hour

> **Note:** These configurations may be changed to support upgraded Coherence license features.

This cache configuration file takes advantage of Coherence parameter macros and can easily be modified to fit specific needs. Links to Coherence documentation specific to the parameters are provided in the configuration file itself.

Clients can configure additional entries in this configuration file. Those entries will be available to the personalization cache APIs. See Section 73.3, "Using Caching with Personalization Components."

73.2.2.3 Creating Custom Cache Configuration Files

You can create custom Coherence cache configuration files to address specific use cases. Oracle recommends that all Coherence cache configuration files adhere to these general rules:

- Place cache configuration files in:

  ```
  $ORACLE_HOME/user_
  projects/applications/<domain>/conductor-extensions-library/WEB-INF/classes
  ```

- Only refer to caches that are used by server-side personalization components, like data and function providers. For details on these components, see Chapter 67, "Implementing Custom Data Providers: Introduction" and Chapter 68, "Implementing Custom Function Providers: Introduction."

> **Note:** In reality, cache configuration files can be placed wherever they are visible to the WCPS web application classloader; placing it in the above directory keeps it consistent with other WCPS cache configuration files. However, there may be times when you wish to define and package your cache configuration file differently.

You can package cache configuration files as part of the data provider's JAR file, or anywhere on the file system, because the CoherenceCacheFactory loads files using a URI. CoherenceCacheFactory is used programmatically by data providers or any other class deployed to the WCPS server. See Section 73.3.2, "Using CoherenceCacheFactory."

> **Note:** Data provider JAR files are located in:
>
> `$DOMAIN_HOME/conductor-extensions-library/WEB-INF/lib`.
>
> See Chapter 67, "Implementing Custom Data Providers: Introduction" for more information on packaging and deploying data providers.

You must redeploy the WCPS web application or restart the server for the new classes to be recognized.

73.3 Using Caching with Personalization Components

Personalization components like data and function providers, and custom data providers, interact with Coherence in one of two ways, depending on the context.

- **CacheFunctionProvider** – Includes methods that can be used within the context of a scenario or used programmatically by any data provider. Function providers perform operations on data within the context of a scenario. See also Section 68.1, "Introduction to Function Providers."

- **CoherenceCacheFactory** – Data providers and other classes deployed to the WCPS use this factory class to implement caching programmatically.

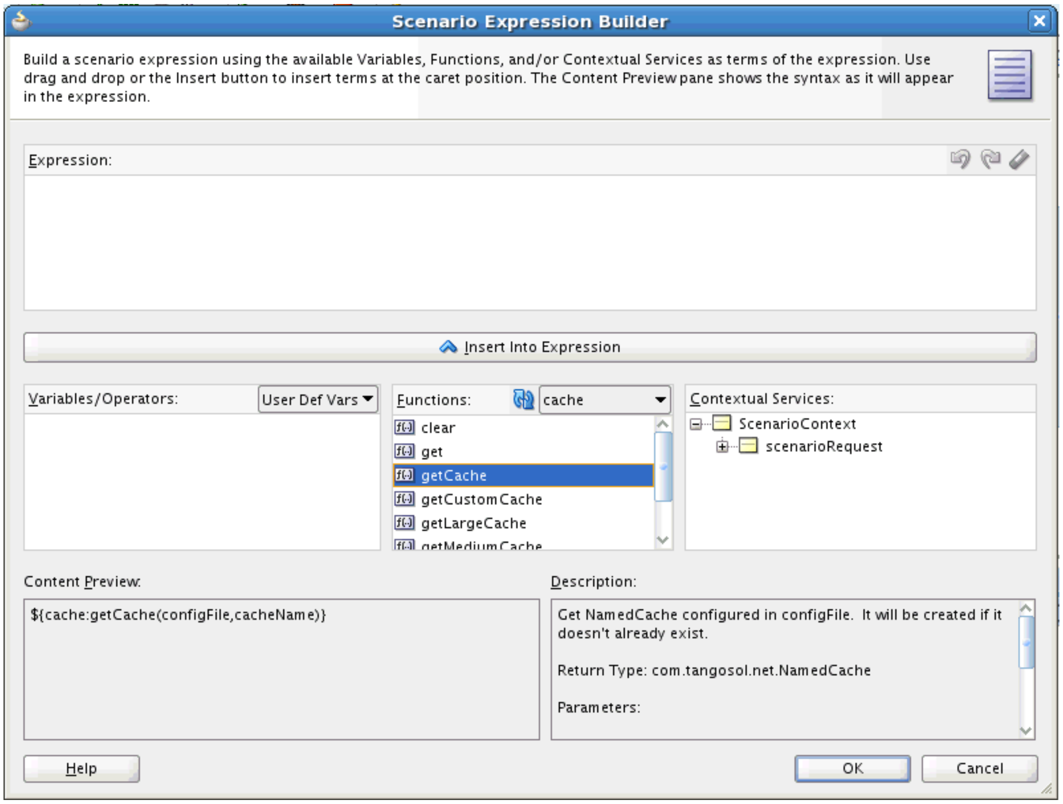
73.3.1 The Cache Function Provider

The CacheFunctionProvider provides methods for managing caches from within a scenario. This function provider delegates to the CoherenceCacheFactory class and includes several convenience methods.

The methods of the Cache Function Provider are described in "Cache Methods" in Chapter 69, "Function Provider Reference."

The prefix for the CacheFunctionProvider is `cache` (the name that appears in the Expression Builder dialogs in the scenario editor). Figure 73–1 shows the cache function provider in the Expression Builder dialog.

Figure 73–1 The Cache Function Provider



Build a scenario expression using the available Variables, Functions, and/or Contextual Services as terms of the expression. Use drag and drop or the Insert button to insert terms at the caret position. The Content Preview pane shows the syntax as it will appear in the expression.

Functions: cache

Content Preview:

${cache:getCache(configFile,cacheName)}

Description:

Get NamedCache configured in configFile. It will be created if it doesn't already exist.

Return Type: com.tangosol.net.NamedCache

Parameters:

Example 73–1 lists the XML structure of a scenario that uses the Cache Function Provider method getMediumCache(). First, a cache is returned and stored in a variable. Then, that variable is used to return a specific value from the cache.

Example 73–1 Using the Cache Function Provider in a Scenario

```
<!-- Check cache first, using CacheFunctionProvider -->
        <assign-variable>
            <variable>userIdCache</variable>
            <expression>${cache:getMediumCache('userIdCache')}</expression>
        </assign-variable>

        <assign-variable>
            <variable>userId</variable>
            <expression>${cache:get(userIdCache,username)}</expression>
        </assign-variable>
```

Example 73–2 shows how the CacheFunctionProvider methods can be called programmatically. Be sure to import: oracle.wcps.dataprovider.base.CacheFunctionProvider.

Example 73–2 Using the Cache Function Provider Methods in a Java Class

```
NamedCache myCache = CacheFunctionProvider.getMediumCache("userIdCache");
String userId = (String)myCache.get("jpalmer");
```

> **Note:** Both examples Example 73–1 and Example 73–2 return a cache named `wcps-cp-medium-userIdCache`. If this cache does not already exist, it will be created.

Example 73–3 shows an example where a custom cache is used. In this case, the returned cache will not be the full cache name without a prefix.

Example 73–3 Using the Cache Function Provider Methods in a Java Class

```
NamedCache myCache = CacheFunctionProvider.getCustomCache("my-custom-cache");
```

73.3.2 Using CoherenceCacheFactory

Data providers and other classes deployed to the WCPS use this factory class to implement caching programmatically. This class is scoped to the web application with which it is deployed.

The CoherenceCacheFactory has a single method to call:

```
public static NamedCache getCache(String cacheConfigFile, String cacheName)
```

Example 73–4 shows how to call getCache() when the cache configuration file is in the WCPS classpath, according to the best practice described previously in Section 73.2.2.3, "Creating Custom Cache Configuration Files."

Example 73–4 Calling getCache() with Configuration File in the Classpath

```
NamedCache myCache = CoherenceCacheFactory.getCache("content-cache-config.xml", "userIdCache");
String userId = (String)myCache.get("jpalmer");
```

Example 73–5 shows how to call getCache() when the cache configuration file is located elsewhere on the file system.

Example 73–5 Calling getCache() with Configuration File on the Filesystem

```
NamedCache myCache = CoherenceCacheFactory.getCache("file:///myconfig/content-cache-config.xml",
"userIdCache");
StringuserId = (String)myCache.get("jpalmer");
```

73.4 Configuring Caches for Personalization Components

This section explains how caches are configured in configuration files. Pre-configured and custom caches configured in `wcps-datatprovider-cache-config.xml` are discussed. Then, cases where a cache has it's own configuration file is explained.

- Section 73.4.1, "Pre-configured Caches"

- Section 73.4.2, "Custom Caches"
- Section 73.4.3, "When a Cache Has Its Own Configuration File"

73.4.1 Pre-configured Caches

The configuration file includes pre-configured caches (small, medium, and large). These caches are accessible through the Cache Function Provider (see Section 73.3.1, "The Cache Function Provider"). The access methods are described in "Cache Methods" in Chapter 69, "Function Provider Reference." They include:

- getSmallCache(String cacheName)
- getMediumCache(String cacheName)
- getLargeCache(String cacheName)

> **Note:** The "cacheName" parameter is appended to an internal prefix to match patterns in the `wcps-dataprovider-cache-config.xml`. For example: `wcps-dp-large-<cacheName>`. For more details, see Section 73.2.2.2, "Data Provider Cache File."

73.4.2 Custom Caches

This assumes you have added a new entry in `wcps-dataprovider-cache-config.xml`. It returns a cache with that cacheName (no prefix), configured as the configuration file has specified it.

The Cache Function Provider method used to return a custom cache that is configured in `wcps-dataprovider-cache-config.xml` is:

```
getCustomCache(String cacheName)
```

For more details, see "Cache Methods" in Chapter 69, "Function Provider Reference."

73.4.3 When a Cache Has Its Own Configuration File

The configuration file, "configFile" must be available to the WCPS web application classloader. See also Section 73.2.2.3, "Creating Custom Cache Configuration Files."

The function provider method used to return a cache configured in a custom cache configuration file is:

`getCache(String` *`myConfigFile.xml`*`,` String *`cacheName`*)

> **Note:** The cache configuration file must be in the application classpath. Otherwise, it can be anywhere in the classpath of the caller.

For more details, see "Cache Methods" in Chapter 69, "Function Provider Reference."

73.5 Configuring a Cache on a Data Provider Connection

You can hard code a cache name into a data provider. Or, you can set the cache name as a parameter in the `wcps-connections.xml` provider configuration file. This file is explained in detail in Section 67.5.6, "Updating the WCPS Connections Configuration File."

> **Tip:** The advantage of setting the cache name as a connection parameter is that the cache name can be changed at runtime.

Example 73–6 illustrates how to configure a cache into `wcps-connnections.xml`. You need to add two properties to the <connection> element.

- **<cacheName>** – Specifies a name for the cache. In the example, the name is `demo-cache`.
- **<configFileUri>** – Specifies the location of the cache configuration file on the filesystem. In the example, the value is file:///mydir/demo-cache.xml.

In this example, the `<connection>` element is given a `<cache-name>` property with a value of `demo-cache`.

Example 73–6 Data Provider Connection Configuration

```
<connection>
        <connection-name>TestConnection</connection-name>
        <connection-type>my.test.connection</connection-type>
        <namespace>default</namespace>
        <properties>
            <property>
                <name>cacheName</name>
                <value>demo-cache</value>
            </property>
            <property>
                <name>configFileUri</name>
                <value>file:///Users/jpalmer/demo-cache.xml</value>
            </property>
        </properties>
    </connection>
```

73.6 Monitoring Oracle Coherence

Coherence provides an MBean console to monitor its caches. For information on how to set server properties to enable this feature, see *Using JMX to Manage Oracle Coherence*.

Part XII

Completing Your WebCenter Portal Application

Part XII contains the following chapters:

74

Securing Your WebCenter Portal Framework Application

This chapter describes the security features and mechanisms provided in a WebCenter Portal Framework application, and how you can use Oracle ADF Security to handle authentication and authorization.

This chapter includes the following topics:

74.1 Introduction to Portal Framework Application Security

Portal Framework applications are dynamic and often involve input from users in the form of customizations and preferences, and consequently require a flexible security model. The WebCenter security model is based on the ADF security model rather than the more traditional J2EE security model. For more information on ADF security, see the "Enabling ADF Security in a Fusion Web Application" section in *Fusion Developer's Guide for Oracle Application Development Framework*.

By default, a Portal Framework application is configured with ADF security. A default username and password (weblogic/weblogic1) are created automatically for you, and you can use this username/password combination for testing purposes immediately. For more information about configuring ADF security, see Section 74.3, "Configuring ADF Security." Default login and logout pages are also provided with the Portal Framework application template.

Portal Framework applications can also use two out-of-the-box security tools: the *Role Manager* task flow, and *Page Hierarchy* security editor. The Role Manager task flow provides pre-defined runtime security administration functionality to define roles and permissions for users. Using the Page Hierarchy security editor provides a quick way to apply inherited and/or delegated security to application pages. These two security tools are described in Section 74.4, "Using the Role Manager Task Flow," and Section 74.6, "Using the Page Hierarchy Security Editor."

74.2 Creating an Application Role

There are three roles available out-of-the box:

- **Administrator** - the default member for the application Administrator role is the enterprise Administrator role, which has administrator privileges for the domain, and whose default member is `weblogic`
- **AppConnectionManager** - the default member for the AppConnectionManager role is the application Administrator role, which has administration privileges for the application
- **AppConnectionViewer** - the default member for the AppConnectionViewer role is the authenticated-role

The Administrator role is provided so that you can set up navigation and security for your application, and delegate permissions to other users.

The AppConnectionManager and AppConnectionViewer are roles that are defined for managing and viewing application connections respectively. Typically, application connections are configured and managed using Fusion Middleware Control or WLST commands. However, connections for portlet producers and external applications can be configured through the application's runtime Administration page (or the Role Manager taskflow if implemented separately). To manage or view these connections, you must be part of one of these roles. For more information about the default roles, see the "Understanding Application Roles" section in *Administering Oracle WebCenter Portal*.

You can add members at runtime for these roles using the Administrator page (or the Role Manager taskflow if implemented separately), and in JDeveloper using the JAZN Editor. Out-of-the-box, an administrator will be able to configure external application and portlet producer connections, and any other authenticated user will only be able to view these connections. Similarly, you can add users to the application by selecting the Users tab in the ADF Security Policy editor, clicking the Add (+) icon, and specifying a username and password.

To create an application role:

1. Access the ADF Security Policy editor using any of the following methods:
   - Navigate to the **jazn-data.xml** file in the Application Resources Panel, under the META-INF folder. Right-click **jazn-data.xml** and select **Open** from the context menu. Open the Application Roles tab.
   - Right-click the application name, select **Secure** and then **Application Roles**.
   - From the Application menu, select **Secure** and then **Application Roles**.
2. In the Application Roles editor, click the Add (+) icon and select **New Role**.
3. Enter a name, a display name, and description for the new role.
4. Save the file.

Similarly, you can add users to the application by opening the Users tab in the ADF Security Policy editor, clicking the Add (+) icon, and specifying a username and password.

74.3 Configuring ADF Security

ADF security is configured by default if you created your application using the Portal Framework application template. This section describes the Configure ADF security wizard, which you can use to override the default settings for a Portal Framework application, or if your application does not use the Portal Framework application template (i.e., you did not select the "Configure the application with standard portal features" checkbox when you created your application). This section also describes the grants that are generated when you create a Portal Framework application, and when components are consumed.

This section contains the following subsections:

- Section 74.3.1, "Configuring ADF Security Settings"
- Section 74.3.2, "Automated Security Grants for Portal Framework Applications"

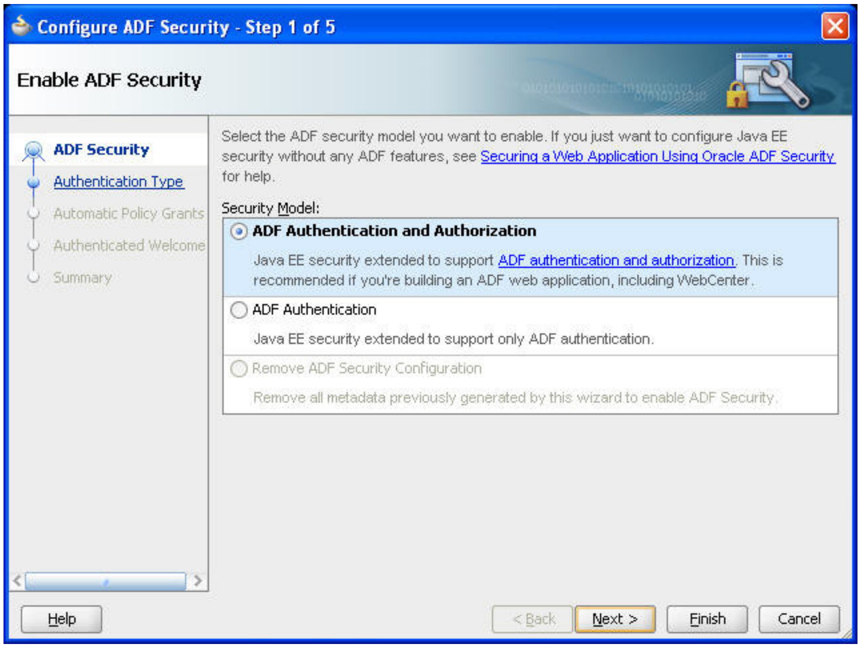
74.3.1 Configuring ADF Security Settings

This section describes the Configure ADF security wizard, which you can use to override the default settings for a Portal Framework application, or if your application does not use the Portal Framework application template (i.e., you did not select the "Configure the application with standard portal features" checkbox when you created your application).

To configure the ADF security settings:

1. Open your portal application.
2. Access the Configure ADF Security Wizard using one of the following methods:
   - From the **Application** menu, select **Secure** and then **Configure ADF Security**.
   - Right-click the application name, select **Secure** and then **Configure ADF Security**.
3. On the Enable ADF Security page, select **ADF Authentication and Authorization**, which is the typical choice for Portal Framework applications.

Figure 74–1 ADF Security Page of the ADF Security Wizard



Configure ADF Security - Step 1 of 5

Enable ADF Security

Select the ADF security model you want to enable. If you just want to configure Java EE security without any ADF features, see Securing a Web Application Using Oracle ADF Security for help.

Security Model:

● **ADF Authentication and Authorization**

Java EE security extended to support ADF authentication and authorization. This is recommended if you're building an ADF web application, including WebCenter.

○ ADF Authentication

Java EE security extended to support only ADF authentication.

○ Remove ADF Security Configuration

Remove all metadata previously generated by this wizard to enable ADF Security.

4. Click **Next**.

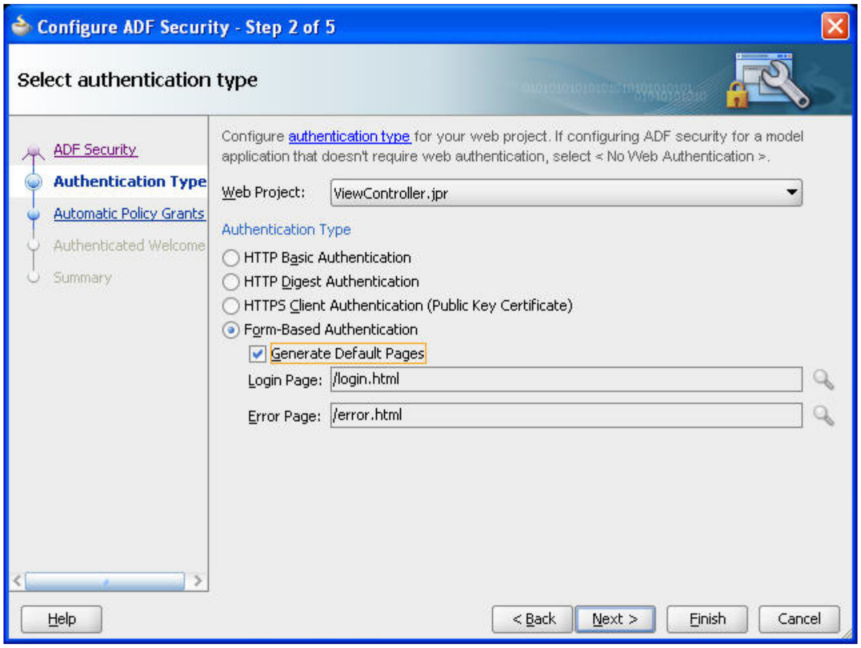
5. Notice that form-based authentication is selected by default.

   To make the process of securing your application easy, select **Form-Based Authentication** and then the **Generate Default Pages** option, as shown in Figure 74–2.

   > **Note:** Portal Framework applications provide default login and error pages. You should only select the **Generate Default Pages** option for applications not built using the Portal Framework application template.

   Alternatively, if you do not select Generate Default Pages, you can create custom login and error pages. For information about creating custom login pages, see Section 74.7, "Creating Login Pages and a Login Component."

Figure 74–2 Authentication Page of ADF Security Wizard



Configure ADF Security - Step 2 of 5

Select authentication type

Configure authentication type for your web project. If configuring ADF security for a model application that doesn't require web authentication, select < No Web Authentication >.

Web Project: ViewController.jpr

Authentication Type

○ HTTP Basic Authentication

○ HTTP Digest Authentication

○ HTTPS Client Authentication (Public Key Certificate)

● Form-Based Authentication

☑ Generate Default Pages

Login Page: /login.html

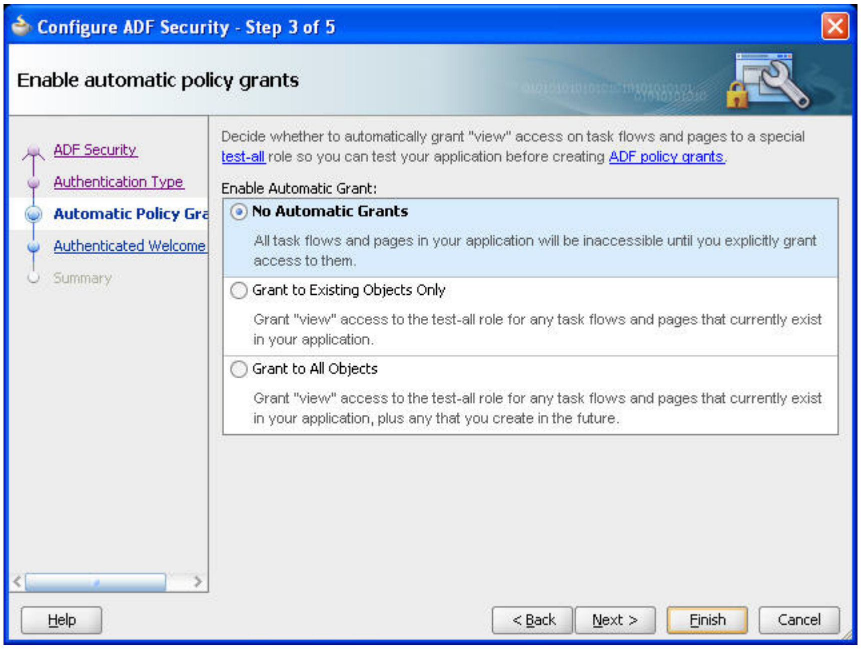
Error Page: /error.html

6. Click **Next**.

7. On the Enable automatic policy grants page, shown in Figure 74–3, select whether to make ADF resources public without requiring application developers to first define ADF policy grants. For a standard security implementation, you can select the **No Automatic Grant** option.

   However, in this case, you must individually grant permissions on each page in the application.

Figure 74–3 Automatic Policy Grants Page



Configure ADF Security - Step 3 of 5

Enable automatic policy grants

Decide whether to automatically grant "view" access on task flows and pages to a special test-all role so you can test your application before creating ADF policy grants.

Enable Automatic Grant:

● **No Automatic Grants**

All task flows and pages in your application will be inaccessible until you explicitly grant access to them.

○ Grant to Existing Objects Only

Grant "view" access to the test-all role for any task flows and pages that currently exist in your application.

○ Grant to All Objects

Grant "view" access to the test-all role for any task flows and pages that currently exist in your application, plus any that you create in the future.

When you enable automatic policy grants, a *View* grant for all ADF resources is made to the `test-all` application role, whose default member is the `public` role. This option provides a convenient way to run and test application resources without the restricted access that ADF authorization enforces. You can also disable automatic policy grants to secure all ADF resources by default.

Select **No Automatic Grant** when you want to explicitly configure a policy store to grant access to ADF resources. No automatic grants to the `test-all` application role are granted. However when WebCenter Portal task flows are consumed in an application, the WebCenter extension automatically adds appropriate grants for these task flows, giving View access to the role `authenticated-role`. For more information about the specific grants provided through task flows, see Section 74.3.2, "Automated Security Grants for Portal Framework Applications."

> **Note:** By default, `anonymous-user` is granted permission to access task flows. Anonymous access is also provided to the `resourceViewer` task flow that allows resources to be visible when looking at data through Activity Stream or Search. If you have no public or anonymous access to your functionality, all the grants that are currently given to `anonymous-role`, should be moved to `authenticated-role`. Also, grants made to `authenticated-role` are visible in the source view of the `jazn-data.xml` file.
>
> If the default grants to `anonymous-role` or `authenticated-role` are not appropriate to the application, you can change them by opening the source view of the application's the `jazn-data.xml` file and cutting and pasting the permissions to the appropriate role.

Select **Grant to Existing Objects Only** when you want JDeveloper to grant View privileges to the `test-all` (public) application role and you want this policy to apply to all your application's existing ADF task flows and web pages in the user interface project.

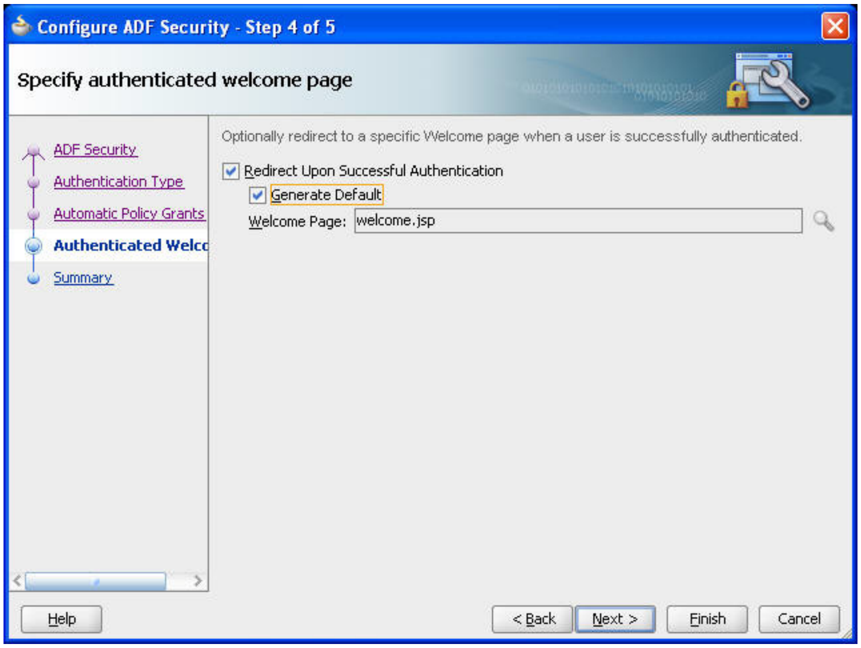
Select **Grant to All Objects** when you want JDeveloper to grant View privileges to the `test-all` application role and you want this policy to apply to all ADF task flows and web pages that developers create in the user interface project. Note that the **Grant to All Objects** option appears when you run the wizard for the first time. Subsequently, the **Grant to New Objects** option appears each time you run the wizard.

8. Click **Next**.

9. Optionally, if you want to display a specific welcome page upon authentication, then select the **Redirect Upon Successful Authentication** option as shown in Figure 74–4.

   You can either create a custom welcome page or let the wizard create a default one. To keep the process simple, select **Generate Default**.

Figure 74–4 Specify an Authenticated Welcome Page



Specify authenticated welcome page

Optionally redirect to a specific Welcome page when a user is successfully authenticated.

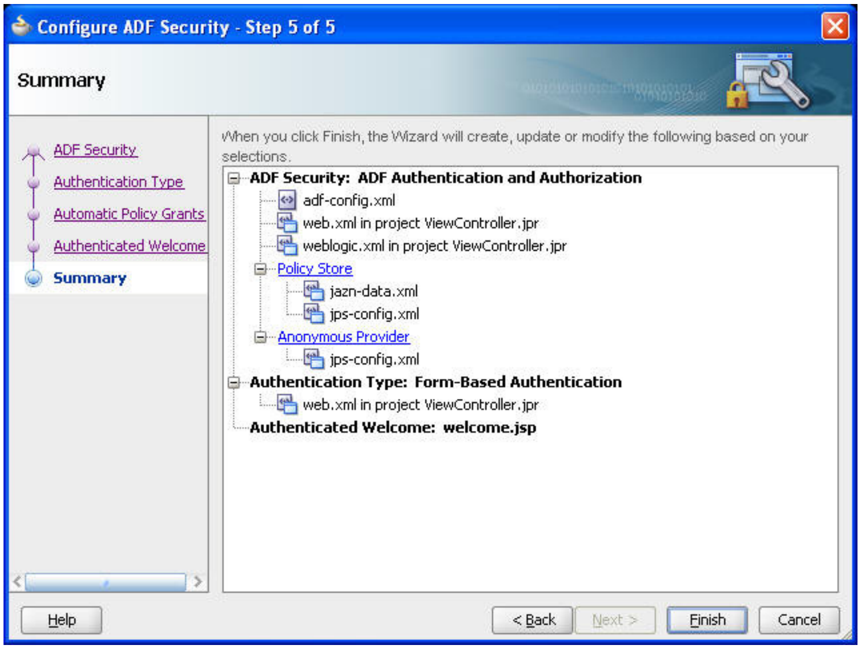
☑ Redirect Upon Successful Authentication

☑ Generate Default

Welcome Page: welcome.jsp

10. The Summary page opens, as shown in Figure 74–5.

Figure 74–5 Summary Page



Summary

When you click Finish, the Wizard will create, update or modify the following based on your selections.

```
⊟ ADF Security: ADF Authentication and Authorization
    adf-config.xml
    web.xml in project ViewController.jpr
    weblogic.xml in project ViewController.jpr
  ⊟ Policy Store
      jazn-data.xml
      jps-config.xml
  ⊟ Anonymous Provider
      jps-config.xml
⊟ Authentication Type: Form-Based Authentication
    web.xml in project ViewController.jpr
  Authenticated Welcome: welcome.jsp
```

11. Click **Finish**.

    It may take several moments for the wizard to complete.

12. On the Security Infrastructure Created dialog, click **OK**.

74.3.2 Automated Security Grants for Portal Framework Applications

Table 74–1 lists the security grants that are provided automatically in a Portal Portal Framework application configured with standard portal features.

Note: If you do not have public or anonymous access to your application, grants that are currently given to `anonymous-role` can be removed using the following WLST command:

```
revokePermission(appStripe="papp1#V2.0",principalClass=
"oracle.security.jps.internal.core.principals.JpsAnonymousRoleImpl"
,
principalName="anonymous-role",
permClass="oracle.adf.controller.security.TaskFlowPermission",
permActions="view", permTarget="/oracle/webcenter/.*")
```

Table 74–2 lists the grants that are given when a service is consumed. A service is consumed whenever a component (from the Component Palette) or a task flow (from the Resource Palette) belonging to that service is added to a page.

Grants are added automatically to the `jazn-data.xml` file. They can be viewed and edited through the ADF Security Policy Editor. For more information, see Section 74.3.1, "Configuring ADF Security Settings."

> **Note:** When a Portal Framework application is created, the following element:
>
> `<name>resource=`*`MyApplicationName`*`</name>`
>
> (where *`MyApplicationName`* is the name of the application you created) is added to the `jazn-data.xml` file. If you modify the `jazn-data.xml` file, be sure that the application name matches the application name under the `jazn-data.xml` file's <policy-store> element. If these two application names do not match, any functionality that relies on WS-security identity propagation will not work.

If ADF security has not been configured for the application, then these grants are not added; however, if security is later configured, grants are added for all components that have been consumed in the application. Common grants are granted whenever any WebCenter Portal service is consumed.

74.4 Using the Role Manager Task Flow

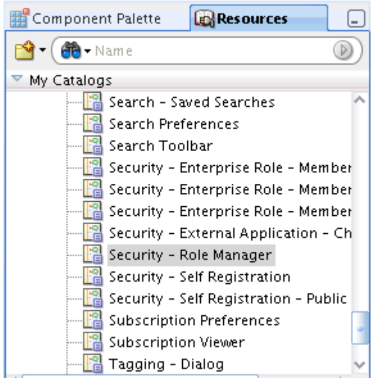
The Role Manager task flow lets administrators manage application roles, its memberships, and associate service permissions for the role. The Role Manager task flow is available out-of-the-box from the runtime Administration page's Security tab for applications built using the Portal Framework application template. For information on how to use the Role Manager runtime to manage and configure users and application roles, see the "Managing Users and Application Roles" section in *Administering Oracle WebCenter Portal*.

To prevent customizations from being overwritten during updates, the source for the Administration page should not be customized. You can, however, choose to write your own administration page if the default administration page is not sufficient, in which case you can use the Role Manager task flow as part of your application's runtime security administration. Follow the steps below to add it a JSF or JSP page and include it in your application.

To add the Role Manager task flow to your Portal Framework application:

1. Create a new application choosing **Portal Framework application** as the application type.
2. Create the application adding any project technology libraries that the application may require. Do not uncheck the **Configure the application with standard Portal features** check box.
3. Create a new JSF or JSP page.
4. From the Resource Palette, expand WebCenter Portal - Services Catalog, and from the list of Task Flows, select the `Security - Role Manager` task flow.

Figure 74–6 Resource Palette - WebCenter Portal - Services Catalog



Component Palette
Resources
Name

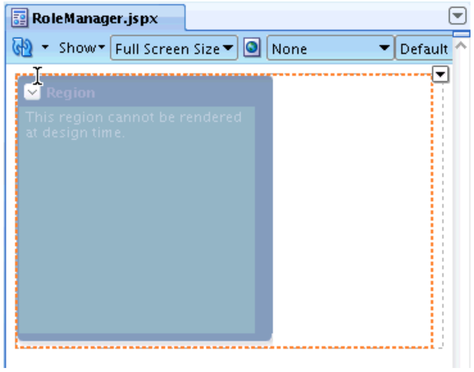
Security - Self Registration
Security - Self Registration - Public
Subscription Preferences
Subscription Viewer
Tagging - Dialog

5. Drag the Role Manager task flow onto the page you created as a region.

Figure 74–7 Role Manager Task Flow



6. Build the application, log in as an administrator, and navigate to the page containing the role Manager task flow.

74.5 Using the Enterprise Role Member Task Flows

The Enterprise Role Member task flows provide additional task flows to the Role Manager task flow that you can add to a page to monitor enterprise users and roles. The members shown are both roles and users, with the result shown in a tree structure. Roles can be further expanded to see their members.

To add the task flows, follow the same steps as for the Role Manager task flow (see Section 74.4, "Using the Role Manager Task Flow"), substituting one of the task flows described below. Note that all of the Enterprise Role Members task flows take a single mandatory parameter which is the enterprise role name.

- **Security - Enterprise Role Members**

  This task flow shows a list of the members for a specified role.

- **Security - Enterprise Role - Members Search**

  This task flow does a nested search of members using a pattern for the specified role and shows the list of members.

- **Security - Enterprise Role - Members Viewer**

  This task flow shows the Members and Search tabs that are shown for the Enterprise Role Members and Members Search task flows in a single page.

74.6 Using the Page Hierarchy Security Editor

This section describes how to use page hierarchy security to provide inherited and delegated security for Portal Framework application pages. It includes the following sections:

- Section 74.6.1, "Introduction to Page Hierarchy Security"
- Section 74.6.2, "Building a Page Hierarchy"

74.6.1 Introduction to Page Hierarchy Security

This section describes the page hierarchy model and how page hierarchy security works within a Portal Framework application.

This section includes the following subsections:

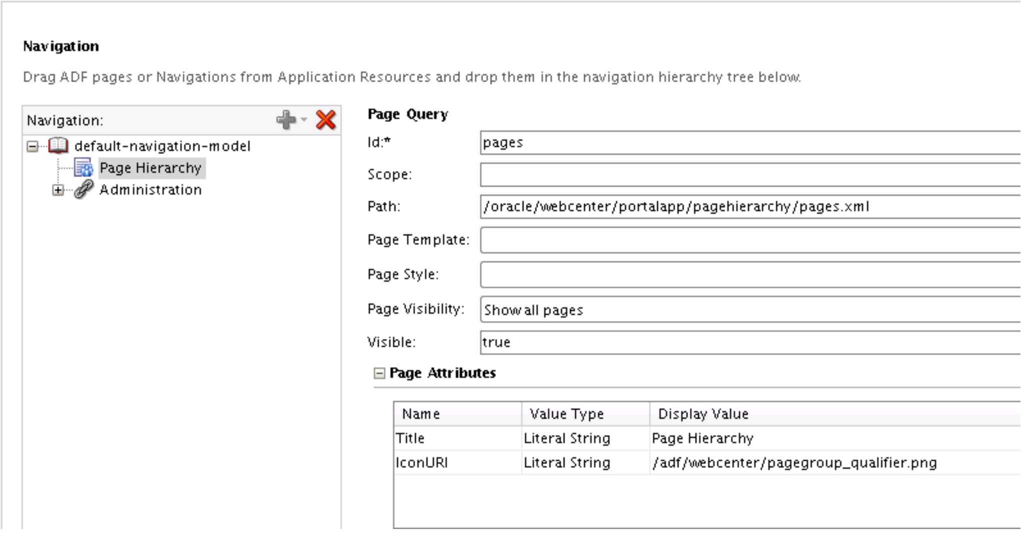
- Section 74.6.1.1, "Page Hierarchy Model"
- Section 74.6.1.2, "Page-level and Page Hierarchy Security"
- Section 74.6.1.3, "Inherited and Delegated Security"

74.6.1.1 Page Hierarchy Model

A page hierarchy has a default security policy that is set at the root of the hierarchy. Unless explicitly overridden, this policy applies to all pages underneath. At any page in the hierarchy, it is possible to override the inherited policy with a new overriding policy, allowing for delegated administration and modifying the policy at the subordinate pages. Once the policy is overridden for a particular page, the children of that page, by default, will inherit the new policy. The policy established at any node is a list of grants indicating what permissions each of the grantees has on that page and its children, if any.

When you create a Framework application, a default navigation model is created for you that also contains the root node of a page hierarchy. These two structures work independently and collectively to provide the navigation flow and secured access to pages for your application. Figure 74–8 shows the default navigation model (`default-navigation-model.xml`), which includes a node for the default page hierarchy (`pages.xml`).

Figure 74–8 Default Navigation Model



Navigation

Drag ADF pages or Navigations from Application Resources and drop them in the navigation hierarchy tree below.

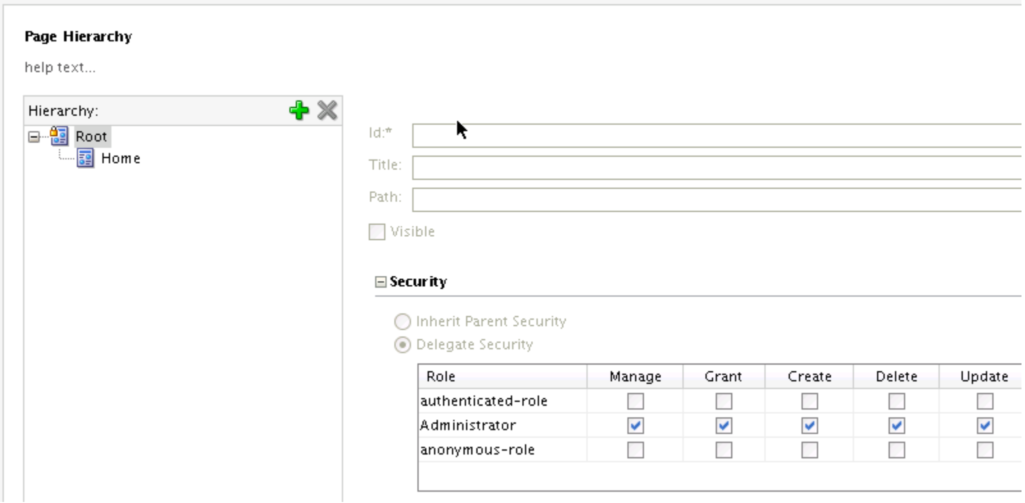
Page Attributes

Name	Value Type	Display Value
Title	Literal String	Page Hierarchy
IconURI	Literal String	/adf/webcenter/pagegroup_qualifier.png

You can add additional navigation models to, for example, provide different navigation views for specific user groups. For each navigation you can also add one or more page hierarchy nodes to provide a more granular navigation and security model. For more information about creating new navigation models, see Section 10.2, "Creating a Navigation Model." For more information about adding page hierarchies to a navigation, see Section 10.3.5, "How to Add Other Resources to a Navigation Model."

Although there is only a single page hierarchy within your application, any node within that hierarchy can be used as the root node in a navigation model. For example, you might have a page hierarchy that contains top level nodes for Human Resources, Support, Sales, Administration, and so forth. Each of these nodes can be added to the navigation model separately to create navigation only to that section of the page hierarchy.

Figure 74–9 Page Hierarchy Root Node Permissions



□ Visible

Security

○ Inherit Parent Security

● Delegate Security

Role	Manage	Grant	Create	Delete	Update
authenticated-role	□	□	□	□	□
Administrator	☑	☑	☑	☑	☑
anonymous-role	□	□	□	□	□

Figure 74–9 shows the page hierarchy root node and the associated permissions. From the root node you can start building your page hierarchy by adding or dragging pages into it. Note that the "Manage" permission appears only on the root node, and only for the administrator. This allows the administrator to delegate security and have full access to all pages within the hierarchy regardless of any security overrides downstream. In short, a user with "manage" permission on the root node is a "super admin" and has all access to all pages in the entire hierarchy.

74.6.1.2 Page-level and Page Hierarchy Security

A page hierarchy provides an alternative security mechanism to page-level security for your Portal Framework application. Although you can add pages to your application and provide security for them without making them a part of a page hierarchy, a page hierarchy provides a convenient and more manageable way to secure the content for large sites. By simply adding a hierarchy node to the hierarchy root or home node and dragging and dropping pages into it, you can very quickly provide basic security for them.

Note: Although page-level security can co-exist with page hierarchy security, you cannot apply both page-level and page hierarchy security to the same page. Note also that if you add a page to a hierarchy node, all previous page-level permissions are purged.

74.6.1.3 Inherited and Delegated Security

The page hierarchy model uses a node structure that provides cascaded, role-based security where each child node inherits its parent's security permissions. By adding pages to a node you can quickly configure security for your application pages.

To be able to perform any action at a particular node, you need to have the required permission at the node or its immediate parent that delegates (overrides) security. However in order to view a page, you need to have view access for all pages up the hierarchy right till the root page.

As well as providing basic security inherited from a node's parent, you can also apply delegated security to child nodes to limit or override the security that would otherwise have been inherited. These aspects of page hierarchy security are described in

Section 74.6.2, "Building a Page Hierarchy."

> **Note:** Inherited security is cascaded through a root node that can initially only be populated by an administrator. For other users to be able to create and delegate permissions the administrator must first delegate those permissions. In all cases, permissions are only cascaded down in the tree (that is, a user cannot change settings for a parent node). A user can also only delegate the rights they have themselves or a subset of those rights to another user.

74.6.2 Building a Page Hierarchy

This section explains how to use page hierarchy security to automatically cascade a parent page's role-based security settings to its child pages, and how to "delegate" security for individual page nodes.

This section contains the following subsections:

- Section 74.6.2.1, "Adding a Page Hierarchy to a Navigation"
- Section 74.6.2.2, "Adding Pages to a Page Hierarchy"
- Section 74.6.2.3, "Delegating Security"

74.6.2.1 Adding a Page Hierarchy to a Navigation

In addition to the default page hierarchy in the default navigation model, you can add page hierarchy nodes from the default page hierarchy to the navigations within your application as root nodes. For more information about adding a page hierarchy to a navigation, see Section 10.3.5, "How to Add Other Resources to a Navigation Model."

74.6.2.2 Adding Pages to a Page Hierarchy

This section describes how to add JSF or JSP pages to a page hierarchy.

> **Note:** To avoid issues with conflicting inherited security models, a page can only appear once in the page hierarchy.

To add a JSF or JSP page to a page hierarchy:

1. Open the page hierarchy editor in JDeveloper:
   - Right-click the `/oracle/webcenter/portalapp/pagehierarchy` folder

     or
   - Right-click any `.jspx` page under `/oracle/webcenter/portalapp` and select **Edit Page Hierarchy** from the context menu
2. Select the node to which you want to add pages, and either:
   - Click the **Add page** icon and use the browser to locate and add the page

     or
   - Drag and drop the page from the Navigator under the appropriate node
3. Continue by adding additional pages as required, or use the **Remove Page** icon to delete any unwanted pages.

74.6.2.3 Delegating Security

This section describes how to override inherited security by delegating permissions for a node and its child pages. You can also delegate security for pages using the runtime Administration page. For more information about delegating security using the runtime Administration page, see the "Managing Application Roles and Permissions" section in *Administering Oracle WebCenter Portal*.

To override inherited security with delegated security:

1. Open the page hierarchy (`pages.xml`) in JDeveloper.

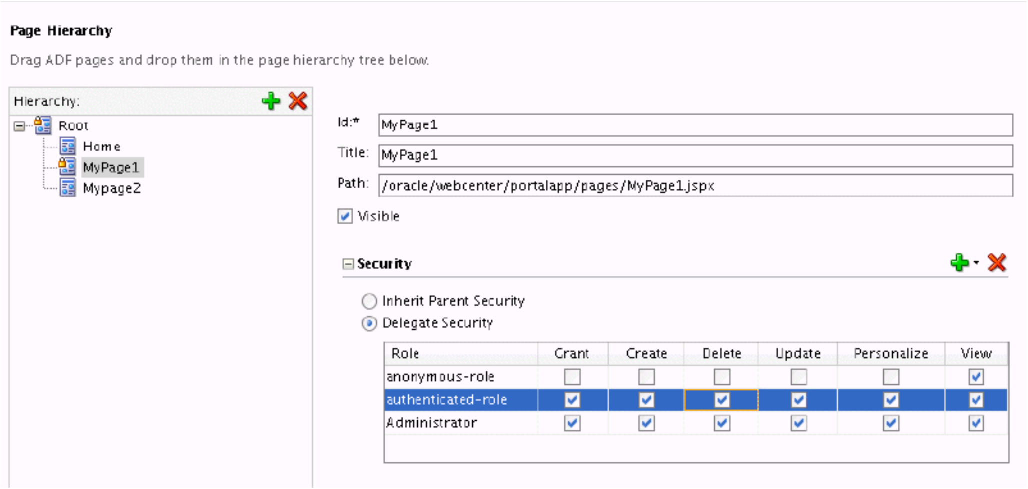
2. Select the node at which to begin overriding inherited security.

3. Check or uncheck the **Visible** checkbox to specify whether the page or resource is displayed. Check the checkbox if you want the resource to be displayed to all users at all times. Uncheck the checkbox to hide the resource from all users at all times.

4. Select **Delegate Security**.

   The Security options for delegating security displays (see Figure 74–10).

Figure 74–10 Page Hierarchy - Delegate Security



Page Hierarchy

Drag ADF pages and drop them in the page hierarchy tree below.

Id:* MyPage1

Title: MyPage1

Path: /oracle/webcenter/portalapp/pages/MyPage1.jspx

☑ Visible

Security

○ Inherit Parent Security

● Delegate Security

Role	Grant	Create	Delete	Update	Personalize	View
anonymous-role	☐	☐	☐	☐	☐	☑
authenticated-role	☑	☑	☑	☑	☑	☑
Administrator	☑	☑	☑	☑	☑	☑

5. Check or uncheck permissions for the roles for this page and its child pages.

6. To specify permissions for another available user role, click the **Add** icon (**+**) and select the desired role. A new row will be created in the table for this role. To remove the permissions for an existing role, select the corresponding row in the table and click the **Delete** (**X**) icon.

> **Note:** The role names in the Add list correspond to the application roles that have been defined in the policy store for the application. Delegating security is limited to only application roles at design time. You can, however, add user and enterprise roles at runtime using the runtime Administration page, as described in the "Managing Application Roles and Permissions" section in *Administering Oracle WebCenter Portal*.

74.7 Creating Login Pages and a Login Component

You can add login and logout links to your public welcome page or other page using a login backing bean (LoginBackingBean) so that users can explicitly log in and out while they are in the application. The bean provides methods that can be used by the user to log in and log out.

To use the bean, create a simple page and bind it to the bean to do the login and logout as described in the following steps:

1. Create a JSF page.
2. Add the LoginBackingBean to the faces-config.xml or taskflow.xml file.
3. Create a page with user name, password, login and logout links.
4. Bind the user name and password to the bean's user name and password.
5. Map the login and logout links to the doLogin and doLogout method respectively as shown in the example below:

```
           <af:subform id="pt_sf1" defaultCommand="pt_logincb"
                          rendered="#{attrs.showLogin and
!securityContext.authenticated}">
                <af:panelFormLayout id="pt_pfl1">
                  <af:panelLabelAndMessage id="pt_plam1" label="User Name"
                                           styleClass="NoLabelWrap"

labelStyle="font-size:small;color:white;">
                    <af:inputText id="pt_it1" simple="true"
                                  value="#{o_w_s_l_LoginBackingBean.userName}"
                                  columns="15"/>
                  </af:panelLabelAndMessage>
                  <af:panelLabelAndMessage id="pt_plam2" label="Password"
                                           styleClass="NoLabelWrap"

labelStyle="font-size:small;color:white;">
                    <af:inputText id="pt_it2" simple="true"
                                  value="#{o_w_s_l_LoginBackingBean.password}"
                                  columns="15" secret="true"/>
                  </af:panelLabelAndMessage>
                </af:panelFormLayout>
                <af:spacer width="3" height="3" id="pt_s2"/>
                <af:panelGroupLayout id="pt_pgl14" layout="horizontal"
                                     halign="end">
                  <af:commandLink id="pt_logincb" text="Login"
                                  action="#{o_w_s_l_LoginBackingBean.doLogin}"
                                  inlineStyle="font-size:small;color:white;"/>
                  <af:spacer id="pt_s3" width="5px"/>
                </af:panelGroupLayout>
              </af:subform>
```

The login and logout methods return values that can be mapped to actions and used in the navigation rules of faces-config.xml after a successful login and logout. The following entry in faces-config.xml is seeded by default in a Portal Framework application:

```
  <navigation-rule>
    <from-view-id>*</from-view-id>
    <navigation-case>
      <from-outcome>login_success</from-outcome>
      <to-view-id>/pages_home</to-view-id>
      <redirect/>
    </navigation-case>
    <navigation-case>
      <from-outcome>logout_success</from-outcome>
      <to-view-id>/pages_home</to-view-id>
      <redirect/>
    </navigation-case>
  </navigation-rule>
```

This defines where to go to after a successful login and logout (in this case, for both login and logout the user is returned to the home page). If you want to alter that behavior, you can edit these rules in faces-config.xml to, for example, redirect the user to a different page.

For reference information about other configuration elements you can use in the faces-config.xml file, see the "ADF Faces Configuration" section in *Fusion Developer's Guide for Oracle Application Development Framework.*

74.8 Creating a Login Portlet

Refer to *Fusion Developer's Guide for Oracle Application Development Framework* for information about creating a login portlet for your application.

74.9 Adding Portlets to a Login Page

Fusion Developer's Guide for Oracle Application Development Framework describes how you can create an ADF Faces-based login page for your application. In this section, you will add some portlets to such a login page so that the login page becomes indistinguishable from the other pages in your Framework application.

Make sure your portlet producers have been registered before proceeding. See Chapter 63, "Consuming Portlets" for details.

To add portlets to the login page, perform the following steps:

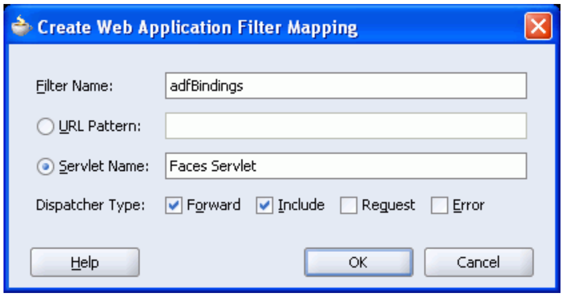
1. Drag a **PanelCustomizable** onto the h:form tag that is inside the first cust:panelCustomizable tag you added to the login page.
2. From the Component Palette, select **RichTextPortlet Producer**, then select the Rich Text portlet from the list and drag it onto the PanelCustomizable component.
3. From the Component Palette, select **ADF Faces Core** and drag an **ObjectSeparator** below the Rich Text portlet on the PanelCustomizable component.
4. From the Component Palette, select **OmniPortlet Producer**, then select the OmniPortlet from the list and drag it onto the PanelCustomizable component.
5. Save the page.

Because the login page is called from the container as part of the login process, the request must be forwarded to the ADF binding filter to establish the appropriate portlet and security context. To do this, you must configure a mapping for the ADF Binding filter in the web.xml file. To do this, perform the following steps:

1. In the Applications Navigator, expand the WEB-INF node, right-click **web.xml** and select **properties** to open the property palette.
2. Select **Filter Mappings** in the left panel and click **add** to define a new mapping for the adfBindings Filter. This displays the Create Web Application Filter Mapping dialog box.

3. Specify **adfBindings** for the filter name and click the Servlet Name option and specify **Faces Servlet** as the servlet name. Ensure that the Forward and Include dispatcher types are selected as shown in Figure 74–11.

Figure 74–11 Create Web Application Filter Mapping Dialog Box



Create Web Application Filter Mapping

Filter Name: adfBindings

○ URL Pattern:

● Servlet Name: Faces Servlet

Dispatcher Type: ☑ Forward ☑ Include □ Request □ Error

4. Click **OK**.

Follow the steps in *Fusion Developer's Guide for Oracle Application Development Framework* to complete the creation of the login page.

74.10 Creating a Self-Registration Page

You can create a self-registration page using the WebCenter Portal self-registration task flow, or build a custom self-registration page based on a provided sample that shows how to use the user and role APIs provided in `CreateUserHelper`. This type of self-registration provides a way for public users to create their own login and password for your application.

You can also invite users who may, for example, be outside your organization to self-register using the WebCenter Portal public invitation task flow. For more information about these two types of self-registration pages and their runtime behavior, see the "Enabling Self-Registration" section in *Administering Oracle WebCenter Portal*.

This section contains the following subsections:

- Section 74.10.1, "Integrating the WeBCenter Portal Self-Registration Task Flow"
- Section 74.10.2, "Building a Custom Self-Registration Page"

74.10.1 Integrating the WeBCenter Portal Self-Registration Task Flow

You can integrate the self-registration page provided in WebCenter Portal in a Framework application as described below. For information about the runtime behavior of the task flow, see the "Enabling Anyone to Self-Register" section in *Administering Oracle WebCenter Portal*.

To consume the WebCenter Portal self-registration task flow:

1. Open or create a Portal Framework application in JDeveloper.
2. Create a JSPX page.
3. From the Resource Palette, expand the task flows and drag and drop the self-registration task flow onto the page.
4. Create a mail connection and an external application with public credentials and connect the external application to the mail connection. Make this the mail default

connection. For information on how to set up a mail connection, see the "Managing Mail" chapter in *Administering Oracle WebCenter Portal*.

5. Run the page with the self-registration task flow to see the runtime self-registration page.

> **Caution:** If you are using a login attribute other than cn, such as uid or mail, then your jps-config.xml file must contain the properties user.login.attr and username.attr, and these must be set to the corresponding login attribute (mail, for example). Modify jps-config.xml file as shown in the example below:
>
> ```
> <serviceInstance provider="idstore.ldap.provider"
> name="idstore.ldap.0">
>      <!-- existing props ... ->
>      <property name="user.login.attr" value="mail"/>
>      <property name="username.attr"  value="mail"/>
>      <extendedProperty>
>       ......
>       </extendedProperty>
> </serviceInstance>
> ```
>
> After making the change, restart the WebCenter Portal server (WC_Spaces).

74.10.2 Building a Custom Self-Registration Page

The example self-registration page described below provides a simple page that accepts the user's firstname, lastname, mailid, login name and password. Use the sample files as a starting point for use within your local environment, or build your own self-registration page and logic using the user and role APIs provided in CreateUserHelper. You can use the property set of the user profile attributes provided in the sample and add more attributes to the user as required.

To create the sample self-registration page:

1. Unzip the security samples files in security-samples.zip found in the webcenter/customportal directory in the WebCenter extension bundle.
2. Copy the CreateUserBean.java and CreateUserHelper.java files into the application sources folder for your Framework application.
3. Copy the TestCreateUserPage.jspx file into the public-html folder.
4. Edit the TestCreateUserPage.jspx file to suit the local environment and local requirements.
5. Run the TestCreateUserPage.jspx page to view the self-registration page.

74.10.3 Creating a Self-Registration Invitation Page

You can create a public invitation to self-register page in your Portal Framework application using the WebCenter Portal public invitation task flow. For information about the runtime behavior of the task flow, see the "Enabling Self-Registration By Invitation-Only" section in the *Administering Oracle WebCenter Portal*.

To consume the self-registration invitation task flow:

1. Open or create a Portal Framework application in JDeveloper.
2. Create a JSPX page.

3. From the Resource Palette, expand the task flows and drag and drop the self-registration invitation task flow onto the page.
4. Grant the following `CredentialAccessPermission` in `jazn-data.xml` to `oracle.webcenter.framework.view/-`

   The `jazn-data.xml` file should like the following:

   ```
   <permission>
   <class>oracle.security.jps.service.credstore.CredentialAccessPermission</class>
   <name>context=SYSTEM,mapName=o.webcenter.security.selfreg,keyName=o.webcenter.s
   ecurity.selfreg.hmackey</name>
   <actions>read,write</actions>
   </permission>
   ```

5. Run the page with the self-registration task flow to see the runtime self-registration invitation page.

74.11 Creating a Reset Password Page

The following example provides a simple reset password page that accepts a username and new password. Use the sample files as a starting point for use within your local environment, or build your own reset password page and logic using the user and role APIs provided in `ResetPasswordHelper` to change the password.

To create the sample reset password page:

1. Unzip the security samples files in `security-samples.zip` found in the `webcenter/customportal` directory in the WebCenter extension bundle.
2. Copy the `ResetPasswordBean.java` and `ResetPasswordHelper.java` files into the application sources folder for your Portal Framework application.
3. Copy the `TestResetPasswordPage.jspx` file into the public-html folder.
4. Edit the `TestResetPasswordPage.jspx` file to suit the local environment and local requirements.
5. Run the `TestResetPasswordPage.jspx` page to view the reset password page.

74.12 Configuring Basic Authentication for Testing Portlet Personalization

Portlet personalizations are tied to particular, authenticated users. Hence, when running a portlet that has an Edit mode, the Personalize option in the portlet's dropdown menu only appears to authenticated users of the application. Anonymous or public users will not have the option to personalize the portlet. If you are a developer creating portlets and pages, then you may want to quickly test the Edit mode of your portlet without creating a complete security model for your application. To perform this sort of testing, you can easily configure some very basic authentication for your application and then remove it when you have finished testing:

> **Note:** This procedure is useful for any portlet that has an Edit mode (Omniportlet, JPS, and PDK-Java).

1. Create a user `sking` and the role `manager`. See *Fusion Developer's Guide for Oracle Application Development Framework* for information about creating users and roles.

2. Secure your application using the ADF Security Wizard. See *Fusion Developer's Guide for Oracle Application Development Framework* for the steps to be performed. On the Login page of the wizard, select **HTTP Basic Authentication (RFC 2617)**. This specifies that the application will use basic authentication.
3. Run the page in the integrated WLS and log in as a valid user and test your portlet's edit mode.

When you are done testing your portlet's Edit mode, you can quickly remove this test security by do the following:

1. In the Applications Navigator, click the project that contains a page with the portlet you want to test.
2. From the **Tools** menu, choose **ADF Security Wizard**.
3. If the Welcome page appears, then click **Next**.
4. Choose **Remove All ADF Security Settings**.
5. Click **Next** until you come to the Finish page of the wizard. Click **Finish**. The security is removed. If you want to ensure that the security has been removed, then exit your browser and rerun the application. When you access the page, you are not prompted to login and the personalize option no longer available from the portlet's dropdown menu.

74.13 Working with External Applications

The Oracle WebCenter Framework defines an external application as any application that implements its own authentication process. That is, an application that does not take part in the Portal Framework application's single sign-on process. In some cases, the identity management solution may be the same, but the authentication process can be different.

When WebCenter Framework Service interacts with an application that handles its own authentication, you can associate that service with an external application to allow for credential provisioning. Therefore, the use of an external application definition provides a means of accessing content from these independently authenticated applications.

To replicate a single sign-on experience from the end user's perspective, the external application service captures the username and password, and any other credentials for the external application, and supplies it to the WebCenter service requiring it. The WebCenter service then uses this and logs in on behalf of the end user. This username and password combination is securely stored in a credential store configured for the WebLogic domain where the application is deployed.

The user provides login credentials when prompted, and these credentials are mapped to the Portal Framework application user and stored in the credential store configured for the domain. The credential store subsequently supplies that information during authentication to the external application. Unless the external application's credentials change, the user supplies the credentials only once as the mapped information is read from the credential store for future requests.

> **Note:** When logging in to an external application, if you clear the **Remember My Login Information** checkbox, then the credentials provisioned for that user session are lost if there is a failover in a high availability (HA) environment. You are prompted to specify the credentials again if you try to access the external application content in the same user session.

The external applications that are to be used by the Portal Framework application can be specified before deployment through a wizard in Oracle JDeveloper, or post-deployment through the application server management interfaces (WebLogic Scripting Tool and Oracle Enterprise Manager). See *Administrator's Guide* for more information.

This section contains the following:

- Section 74.13.1, "Using External Applications"
- Section 74.13.2, "Supplying User Credentials"
- Section 74.13.3, "Managing External Applications"

74.13.1 Using External Applications

The WebCenter External Application Service provides a way for mapped user identities to be passed to a web application that requires its own authentication. The support for external applications and credential mapping provided by the WebCenter External Application Service can be used to set up a secured service connection and to provide a seamless automated single sign-on experience for the user.

This is described in the following sections:

- Section 74.13.1.1, "Secured Service Connections"
- Section 74.13.1.2, "Automated Single Sign-On"

74.13.1.1 Secured Service Connections

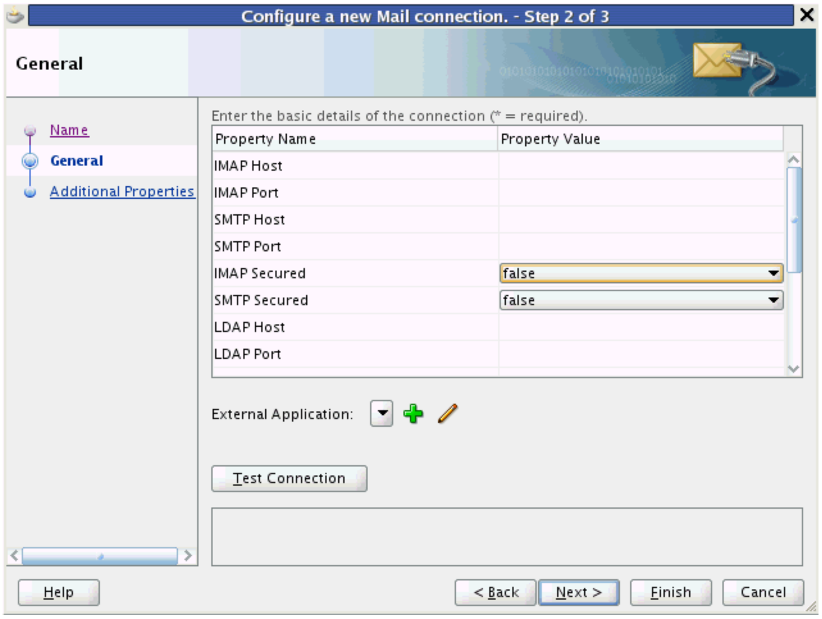
To use an external application definition with a secured service (such as a mail server or portlet producer) you associate the named external application with the connection configuration to the required service. For example, the connection to a mail server requires the user to supply a valid username and password to see their mail. Therefore, by associating an external application to the IMAP server connection definition, the user's credentials are automatically passed as part of the mail request as shown in Figure 74–12.

Note: The following WebCenter Portal components must be configured with external applications for credential mapping support to be available:

- Instant Messaging and Presence (IMP)
- Mail
- Documents
- RSS

For more information about the identity propagation mechanisms used by WebCenter Portal, see Section 74.16, "Identity Propagation Mechanisms".

Figure 74–12 Configure a New Mail Connection Page

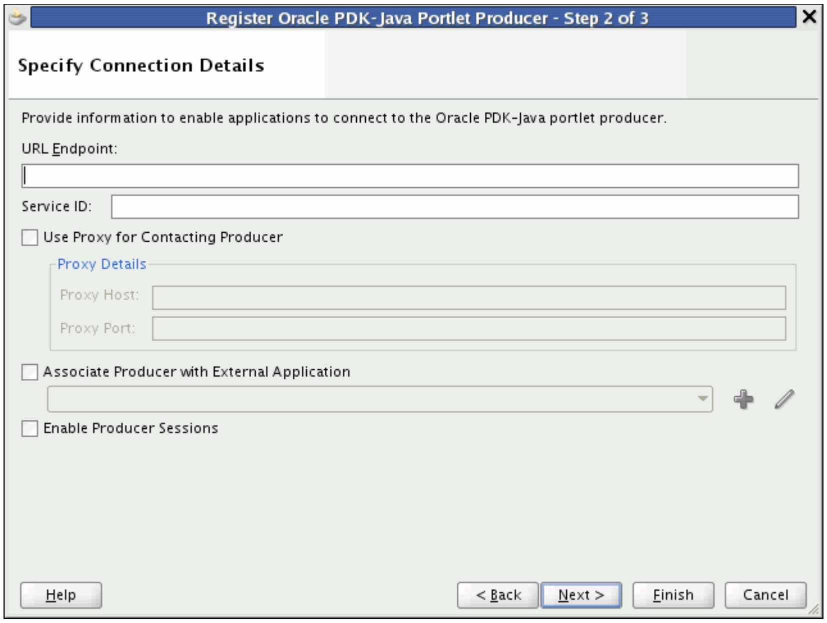


Enter the basic details of the connection (* = required).

Property Name	Property Value
IMAP Host	
IMAP Port	
SMTP Host	
SMTP Port	
IMAP Secured	false
SMTP Secured	false
LDAP Host	
LDAP Port	

When a portlet producer depends on an application that handles its own authentication, you can associate the producer with an external application so that when you register the producer it is a simple task to select the appropriate external definition that maps to the application that is exposed within the portlet, as shown in Figure 74–13.

Figure 74–13 External Application URL



Register Oracle PDK-Java Portlet Producer - Step 2 of 3

Specify Connection Details

Provide information to enable applications to connect to the Oracle PDK-Java portlet producer.

URL Endpoint:

Service ID:

□ Use Proxy for Contacting Producer

Proxy Details

Proxy Host:

Proxy Port:

□ Associate Producer with External Application

□ Enable Producer Sessions

At run time, the producer uses the information associated with the external application to authenticate the user to the application, and consequently consume its portlets. The producer code is responsible for actually performing the authentication interaction with the external application. The external application support provided with the WebCenter Portal Framework simply provides the information needed for authentication to the portlet producer. The use of external applications is supported for both Oracle PDK-Java as well as WSRP producers.

For example, a producer provides a stock portfolio portlet from a portlet-producing application that has its own authentication mechanism. In this case the developer:

- Defines the external application. This can be done through the Oracle JDeveloper wizard or through Oracle Enterprise Manager.
- Associates the external application with the portlet producer.

74.13.1.2 Automated Single Sign-On

With automated single sign-on, the user directly links to the application and is automatically authenticated to the secured web application, as their credentials are retrieved from the credential store. This provides the end user with a seamless single sign-on experience.

Note: Automated login is not supported for:

- External applications using BASIC authentication.
- External applications configured for SSO.
- External applications with a customized login form (built using ADF Faces) that does not implement the J2EE security container login method `j_security_check` for authentication.
- External sites that do not support UTF8 encoding

Rather than using a URL directly to the web application, links to the application are proxied through the external application's automated login servlet (adfextapplogin). If the user is not authenticated to the external application and they have not previously stored their credentials in the credential store, they will be challenged for their password through the credential provisioning page discussed below. If, however, the user has previously defined credentials, they will be returned from the credential store and the user will automatically be logged on to the application.

The proxy URL references the external application in question and redirects to the URL that is specified in the external application definition.

```
/adfextapplogin?extappid=<extappid>
```

For example, if you had a Framework application in which you defined an external application that represented the myoracle.com web site (external application identifier is "myoracle"), the proxy URL would look like this:

```
/adfextapplogin?extappid=myoracle
```

The link's target attribute should also be set appropriately. For example, if you use <a href=>, then set the target attribute appropriately in addition to specifying the target in the href. The target attribute specified for the servlet will determine how the Cancel button functions as described below.

```
/adfextapplogin?extappid=<extappid> [target= _self | _blank]
```

If you specify target=_blank the link opens in new window. If you specify target=_self the link opens in current window. If the target parameter is not specified the link opens in current window.

This parameter also affects how the **Cancel** button on the credential provisioning page works. If _blank is specified, the new window is closed when **Cancel** is clicked; if _self is specified (or the target parameter is not used), the user is returned to the calling page.

> **Note:** Automated login for external sites is not supported for sites that do not support UTF8 encoding.

74.13.2 Supplying User Credentials

How you allow an end user to define their credentials for an external application depends on the use of the external application. For most components, the credential provisioning screen is incorporated into the task flow that the component exposes and for these no further configuration steps are required. You can, however, add the External Application - Change Password task flow component to applications using these components thereby allowing the end user to preemptively set the appropriate user name and password for each of the external applications that is registered with your WebCenter Portal Framework application.

The External Application - Change Password task flow displays all external applications defined in the application that do not specify shared credentials (for more information about shared credentials, see Section 74.13.3, "Managing External Applications"). Note that the user must to be authenticated to view this task flow.

For the Instant Messaging and Presence service, however, you must explicitly add the External Application - Change Password task flow component to your application from the Resource Palette or Component Palette. For step-by-step instructions on how to configure security for the Instant Messaging and Presence service using the

`External Application - Change Password` task flow component, see Section 34.2.2, "Adding IMP Functionality at Design Time".

At run time, the credential provisioning screen displays login data fields composed of the data fields specified through external application registration. Users fill in the data fields with their login information for the specified external application and that login information is passed to the external application or service. Entering the credentials in the provisioning screen also results in the credentials being persisted in the credential store configured for the WebLogic domain.

By default, the login information the user entered is preserved in a credential store, which handles logins for future sessions. The user does not have to enter login information again (unless the user's credentials change). However, the end user can choose to use the information for the current session by deselecting the **Remember my Login Information** checkbox on the credential provisioning page.

74.13.3 Managing External Applications

This section provides information about registering external applications. Additionally, it describes the process of editing and deleting registration details. It contains the following subsections:

- Section 74.13.3.1, "Adding External Application Task Flows"
- Section 74.13.3.2, "Working with External Applications in Oracle JDeveloper"
- Section 74.13.3.3, "Working with External Applications in Enterprise Manager"
- Section 74.13.3.4, "Working with External Applications Using WLST"

74.13.3.1 Adding External Application Task Flows

The External Application task flow enables users to manage external application connections at runtime. This task flow provides an interface for users to update their credentials for all external applications as and when these credentials are changed at the back end. That is, users do not need to update credentials through the runtime Administration Console's Tools and Services tab if they use this task flow.

The external application task flows that you can add using Oracle JDeveloper are:

- **External Application**: This task flow enables users to register, modify, and delete connections at runtime.
- **External Application - Change Password**: This task flow enables users to change external application passwords at runtime.

For applications created using the Portal Framework application template, both these task flows are available out-of-the-box through Portal Framework application Administration page (Tools and Services tab). For details, see the "Configuring Services, Portlet Producers, and External Applications for Portal Framework Applications" section in *Administering Oracle WebCenter Portal*.

In addition, just like other task flows, you can add external application task flows to your application pages. This may be especially useful if you are not using the Portal Framework application template and the Administration pages are therefore not part of your project.

Special permissions are required to manage or view external application connections through these task flows:

- **AppConnectionManager** - Users with this role can register, modify, and delete external application connections at runtime.

- **AppConnectionViewer** - Users with this role can view external application connections at runtime. By default, any user who is logged in (that is, has the authenticated-role) is granted this role.

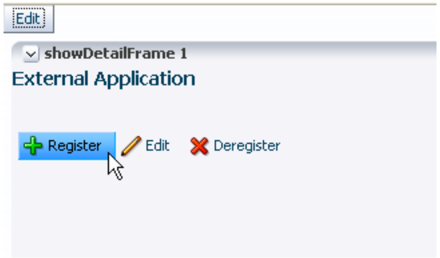
By default, users with the Administrator role can manage external applications. If you want other users to manage connection through these task flows you must grant them the AppConnectionManager role.

To add the external application task flows:

1. Create or open a JSF page in your application where you want the task flow to be added (see Section 15.2, "Creating Pages in a WebCenter Portal Framework Application").
2. In the Resource Palette, expand **My Catalogs**, **WebCenter Portal - Services Catalog**, and **Task Flows**.
3. Drag **External Application** from the Resource Palette and drop it onto the page inside of the `af:form` begin and end tags.
4. Drag **External Application - Change Password** from the Resource Palette and drop it onto the page inside of the `af:form` begin and end tags after the **External Application** task flow (`af:region - # {bindings.extapp1.regionModel}`).
5. Grant the AppConnectionManager role to one or more test users, if required:
   - Add the test user `TEST_EXTAPP`.
   - Grant the AppConnectionManager role.

   For information about how to add a user and grant this role, see the "Creating Test Users" section in *Fusion Developer's Guide for Oracle Application Development Framework*.
6. Save and run your page. Log in as an administrator or the `TEST_EXTAPP` user defined in the previous step. The screen shown in Figure 74–14 appears.

Figure 74–14 External Application Task Flow in a Browser



Note: At runtime, application administrators can grant users the AppConnectionManager and AppConnectionViewer roles through WebCenter Portal administration (see the "Adding Members to Application Roles" section in *Administering Oracle WebCenter Portal*). Alternatively, system administrators can grant AppConnectionManager and AppConnectionViewer roles through Fusion Middleware Control (see the "Granting Application Roles Using Fusion Middleware Control" section in *Administering Oracle WebCenter Portal*).

74.13.3.2 Working with External Applications in Oracle JDeveloper

This section provides information about registering external applications and editing and deleting registration details in Oracle JDeveloper. It contains the following subsections:

- Section 74.13.3.2.1, "Registering an External Application in Oracle JDeveloper"
- Section 74.13.3.2.2, "Editing External Application Registration Details in Oracle JDeveloper"
- Section 74.13.3.2.3, "Deleting External Application Registration Details in Oracle JDeveloper"

74.13.3.2.1 Registering an External Application in Oracle JDeveloper

Use the Register External Application Wizard to identify and store information about the type of data required to authenticate to an external application, such as the names of login fields.

To register an external application in Oracle JDeveloper:

1. In the Applications Navigator, right-click a WebCenter Portal Framework application or project and select **New** from the context menu.
2. In the New Gallery, select **External Applications** under the **General** node.
3. In the right pane, select **External Application**, and click **OK**.

   This displays the Register External Application Wizard.
4. On the Name page, use the **Create external application in** option to specify whether the external application can be reused in other Portal Framework applications. Select **Application Resources** to make the external application available only in the Portal Framework application in which it is registered, or select **Resource Palette** to make the external application available from the Resource Palette to any new Portal Framework applications you create in Oracle JDeveloper.

   If you choose **Resource Palette**, then the external application connection will be visible under IDE connections in the Resource Palette. If you want to use it in an application, you can right click the external application from resource palette and click **Add to Application**.
5. In the **Name** field enter a unique name to identify the application.

   This name must be unique within the WebCenter Portal Framework application, and among other connections as well. Note that you cannot edit this field afterward.
6. In the **Display Name** field enter a name for the application that end users will see in the credential provisioning screens.

   You can modify the Display Name at any time as described in Section 74.13.3.2.2, "Editing External Application Registration Details in Oracle JDeveloper". If you leave the field blank the display name is set to the value of the Name field by default.
7. Click **Next**.
8. On the General page, in the **Login URL** field enter the URL to which the HTML login page is submitted.

   View the HTML source of the application's login form to retrieve this URL.

Note: The fields on the General pane are only required if the external application being defined participates in click-through login as described in Section 74.13.2, "Supplying User Credentials".

9. In the **User Name/ID FieldName** field, enter the label that the application uses for the user name field, for example, `User Name`.
10. In the **Password FieldName** field, enter the label that the application uses for the password field, for example `Password`.
11. From the **Authentication Method** list, select the application's login method.

    Choose from the following:

    - **GET**

      Presents a page request to a server. Submits the login credentials as part of the login URL.

    - **POST**

      Submits login credentials within the body of a form.

12. Click **Next**.
13. On the Additional Fields page, enter the names and values of any additional fields that are submitted with the external application's login form:

    Click the **Add Field** button to create an input field:

    - **Field Name**

      Enter a unique name for any additional field that requires user input on the external application HTML login form.

    - **Field Value**

      Enter a default value for the corresponding field name.

    - **Display to User**

      Select to display the field on the external application login screen. If the field is not displayed (unchecked), then a default value must be specified, which will be used to login into the external application for all users. If the value is user-specific, then the field must be displayed to the user provisioning page.

    Note: The Delete Field option can be used to delete selected rows.

14. Click **Next**.
15. On the Shared Credentials page, select the **Specify Shared Credentials** check box and specify a **Username** and **Password** if you want all authenticated users to access the external application using this credential. Authenticated users will not be challenged to provide their credentials when they access the external application.
16. Click **Next**.
17. On the Public Credentials page, select the **Specify Public Credentials** check box and specify a **Username** and **Password** to be used for all unauthenticated (public) users accessing the external application. This is required when the external application content is accessed through one of the WebCenter Portal components

(such as Document Library, or Instant Messaging and Presence), and the taskflow is placed on a public page.

18. Click **Finish** to register the external application.

After registering your external application, you must configure the application to allow the end user to define the username and password. You can do this by dropping an `External Application - Change Password` task flow component into your application. This allows the end user to preemptively set the appropriate username and password for each of the external applications that is registered with your WebCenter Portal Framework application.

To configure the application to allow the end user to define the username and password, perform the following steps:

1. Open a JSF Page in your ViewController project.
2. From the Resource Palette, under My Catalogs, WebCenter Portal - Services Catalog, expand **Task Flows**.
3. Drag an `External Application - Change Password` task flow component onto your page.
4. When prompted, choose **Region** as the way to create the task flow.
5. Secure the page as this taskflow is accessible only to authenticated users

74.13.3.2.2 Editing External Application Registration Details in Oracle JDeveloper Use the Edit External Application Registration Information Wizard to revise the registration details provided for an external application.

To edit external application registration details:

1. In the Application Navigator, from the Application Resources pane under the Connections node, right-click an external application and select **Properties** from the context menu.
2. In the Edit External Application Wizard, click a link to show a page and revise its values.

   Choose from the following:

   - **Name**
   - **General**
   - **Additional Fields**
   - **Shared Credentials**
   - **Public Credentials**

   For more information, see Section 74.13.3.2.1, "Registering an External Application in Oracle JDeveloper".
3. Click **OK** to save your changes and exit the wizard, or click **Cancel** to exit the wizard without saving.

74.13.3.2.3 Deleting External Application Registration Details in Oracle JDeveloper To delete external application registration information, perform the following steps:

1. In the Application Navigator, from the Application Resources pane under the Connections node, right-click an external application and select **Delete** from the context menu.

Alternatively, you can select an external application in the Applications Navigator and from the Edit menu, select **Delete**.

2. In the External Application Delete dialog box, select **Yes**.

Oracle recommends that you remove any references to components, such as a portlet producer, with which the external application is associated. Failing to do so will likely result in runtime errors, because the components will attempt to communicate with the external application.

74.13.3.3 Working with External Applications in Enterprise Manager

Just as you can create, edit, and delete external application registration details in Oracle JDeveloper, you can also do this in Enterprise Manager. See the "Working with External Applications" chapter in the *Using Oracle WebCenter Portal*.

74.13.3.4 Working with External Applications Using WLST

As well as Oracle JDeveloper and Enterprise Manager, you can also use WebLogic Scripting Tool (WLST) commands to create, edit, and delete external application registration details. See the "Working with External Applications" chapter in the *Using Oracle WebCenter Portal*.

74.14 Registering Custom Certificates with the Keystore

Secure Sockets Layer (SSL) Communication requires the use of trusted certificates issued by a certificate authority, which vouches for the authenticity of the certificates that it issues or signs. Widely accepted certificate authorities are listed in the keystore, the `cacerts` file, available in the `<`*`JDEV_HOME`*`>\jdk\jre\lib\security` directory. If a portlet producer uses a security certificate issued by a non-widely accepted certificate authority and you try to access portlets from this producer, a security alert is displayed informing you that the security certificate was issued from a certificate authority you do not trust. This means the certificate is not available in the keystore. To avoid being prompted each time you access such portlets, you must register this certificate with the keystore.

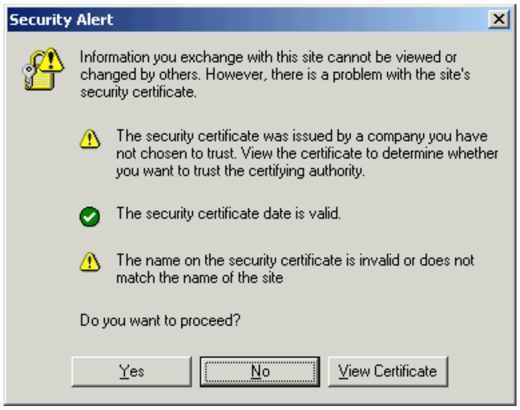
To register a certificate with the keystore, perform the following steps:

1. Navigate to *`JDEV_HOME`*`\jdk\jre\lib\security`.
2. Back up the `cacerts` file.
3. Access the producer URL in Internet Explorer to get the certificate.

> **Note:** Recent versions of FireFox do not provide a means to export certificates.

4. In the Security Alert dialog box, shown in Figure 74–15, click **View Certificate**.

Figure 74–15 Security Alert Dialog Box



Security Alert

Information you exchange with this site cannot be viewed or changed by others. However, there is a problem with the site's security certificate.

⚠ The security certificate was issued by a company you have not chosen to trust. View the certificate to determine whether you want to trust the certifying authority.

✓ The security certificate date is valid.

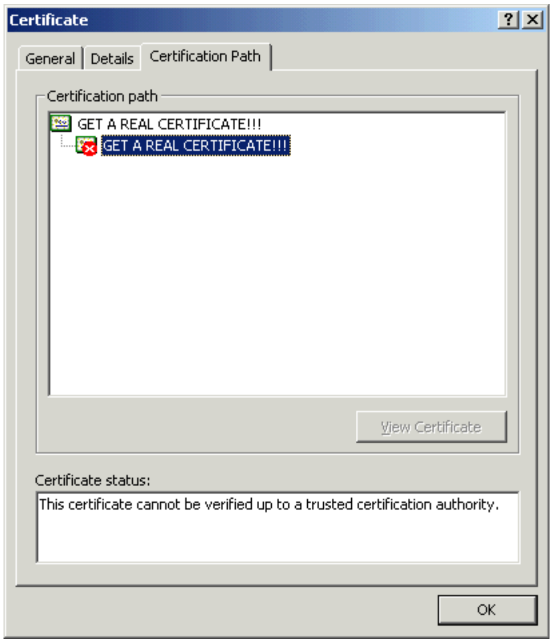
⚠ The name on the security certificate is invalid or does not match the name of the site

Do you want to proceed?

5. In the Certificate dialog box, click the **Certification Path** tab.

6. The dummy child certificate is selected by default as shown in Figure 74–16. Select the root certificate and click **View Certificate**.

Figure 74–16 Certificate Dialog Box



GET A REAL CERTIFICATE!!!

GET A REAL CERTIFICATE!!!

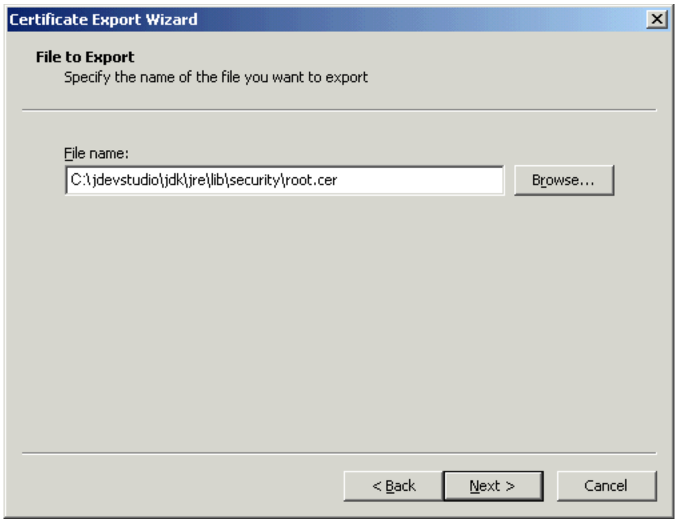
Certificate status:

This certificate cannot be verified up to a trusted certification authority.

7. Click the **Details** tab, and click **Copy to File**.

8. In the Certificate Export Wizard, accept the default settings and click **Next** until you reach the File to Export screen, shown in Figure 74–17.

Figure 74–17 File to Export Screen of the Certificate Export Wizard



Certificate Export Wizard
File to Export
Specify the name of the file you want to export
File name:
C:\jdevstudio\jdk\jre\lib\security\root.cer
Browse...
< Back
Next >
Cancel

9. In the File Name field, enter <*JDEV_HOME*>`\jdk\jre\lib\security\root.cer` and click **Next**.
10. Click **Finish**.
11. In the command prompt, set your default directory to <*JDEV_HOME*>`\jdk\jre\lib\security` and run the following command:

    ```
    keytool -import -file root.cer -keystore cacerts -storepass changeit
    ```

    By running this command, the `root.cer` certificate is imported into the keystore.
12. Enter `y` at the prompt to confirm that you trust this certificate.
13. Verify that the `cacerts` file is updated with the certificate.

74.15 Overriding Inherited Security on Portlets and Customizable Components

Individual actions on portlets and customizable components are not secured by default. Rather, the ability to customize a portlet or customizable component as a whole is inherited from the page permissions. If you want to grant more granular activities within a portlet or customizable component, then you can override the page-level security inheritance and define security directly on the required actions.

The ability of a user to perform actions on portlets and customizable components is inherited from the page security based on the value of the application-wide switch, `enableSecurity`, in the `adf-config.xml` file. If you selected the WebCenter Portal Framework application template while creating your application, then the `adf-config.xml` file is located in the <*APPLICATION_NAME*>`/.adf/META-INF` directory. The `enableSecurity` element is not available by default in `adf-config.xml`. To override or extend the page-level security inheritance for portlets and customizable components, you must add the portlets security and customizable components security sections in the `adf-config.xml` file, as shown in Example 74–1 and Example 74–2 and set the `enableSecurity` element in those sections to `true`.

Example 74–1 enableSecurity Element in the Portlet Security Section in adf-config.xml

```
<!--
```

```
==============================================================================
PORTLETS ACTIONS SECURITY
==============================================================================
-->
<adfp:adf-config-child xmlns:adfp="http://xmlns.oracle.com/adfp/portlet">
  <adfp:enableSecurity value="true"/>
    <adfp:actionsCategory>
       ..........................................
</adfp:adf-config-child>
```

Example 74–2 enableSecurity Element in the Customizable Components Security Section in adf-config.xml

```
<!--
==============================================================================
CUSTOMIZABLE COMPONENTS ACTIONS SECURITY
==============================================================================
-->
<cust:customizableComponentsSecurity
xmlns:cust="http://xmlns.oracle.com/adf/faces/customizable/config">
  <cust:enableSecurity value="true"/>
    <cust:actionsCategory>
       ..........................................
</cust:customizableComponentsSecurity>
```

Security for actions on portlets and customizable components can be implemented at the following levels:

- Page level: You can define security for portlets and customizable components such that page-level privileges are inherited by these components. This is the default behavior.

  By default, portlets and customizable components inherit allowable actions from the defined page-level permissions such as personalize or customize. That is, a user who has *customize* privileges on the page has permission on the customize action for the components on that page. The `enableSecurity` element enables you to override the security inheritance behavior and can take either of the following values:

  - `true`: If set to `true` (the default), then the ability for a user to modify a component will first be determined from the page permissions and then adjusted according to the current set of actions defined for that type of permission. If a user has customize permission, then the actions that constitute the customize category (move, customize, and so on) are available to the user, but they will be overridden by the actions that are defined in the `adf-config.xml` file. For example, a page designer wants to allow the end user to be able to customize portlets, but not customize the page layout. By setting `enableSecurity` to `true`, the page designer enforces that users must first have customize permission on the page. Setting `customizeActionsCategory` to `false` for customizable components will prevent the customization of the page layout, yet still allowing portlet customization. (As the default for `customizeActionsCategory` is `true`, it does not need to be set explicitly for portlets.).
  - `false`: If set to `false`, then all the actions are available to users. The user's page permissions and actions configured in `adf-config.xml` are ignored.

- Actions category level: You can define security on all actions for portlets or customizable components that belong to a named category.

You can add an actionsCategory element in the adf-config.xml file to define security on multiple actions simultaneously. Depending on the actionCategory attributes that you enable, appropriate privileges are provided on the portlets or customizable components.

- Actions level: You can define security on individual actions for portlets or customizable components.

  You can use the actions element in the adf-config.xml file to enable or disable individual actions. Depending on the actions attributes that you enable, appropriate privileges are provided on the portlets or customizable components.

Notes:

- Privileges can be inherited from the parent only. Inheritance from a component in any other position in the hierarchy is not supported
- Although the security override implementation for portlets and customizable components is similar, they are independent from each other. Therefore, if you place a portlet inside a customizable component (for example, in a PanelCustomizable component), the portlet will not inherit override settings from the customizable component. Instead it will use the security override settings that are defined for portlets.
- Settings made at the actions category level or actions level are applicable for all component instances in the application. These settings cannot be made for a single instance of a portlet or customizable component.

Section 74.15.1, "Portlets Security" describes how you can implement security on portlets at the actions category level and actions level. For information on how to define security for actions on customizable components at the application level, see Section 22.5, "Applying Action-Level Restrictions on Panel Customizable and Show Detail Component Actions."

74.15.1 Portlets Security

You can define portlet security if actions on portlets are inherited from the page at the application level by setting enableSecurity to true in the portlets security section of the adf-config.xml file. A value of true implies that the user's permissions are determined from the page permission and then augmented according to the actionsCategory and actions elements specified. By defining actions categories and individual actions, you can control the exposure of the individual actions available within the given page permissions.

To implement security for actions on portlets at various levels as described earlier, you must define security settings at the following sections:

- Defining Security at the Actions Category Level
- Defining Security at the Actions Level

74.15.1.1 Defining Security at the Actions Category Level

You can add an actionsCategory element in the portlets security section in the adf-config.xml file to define the group of actions that are exposed on the portlets within the application. Depending on the actionsCategory attributes that you enable, appropriate privileges are provided on the portlets. Table 74–3 describes the different actionsCategory attributes and the portlet actions they support by default.

Table 74–3 actionsCategory Attributes and Portlets Actions Mapping

Attribute Value	Actions Supported
viewActionsCategory	Render isHelpModeAvailable isNormalModeAvailable isAboutModeAvailable isPreviewModeAvailable isDetailModeAvailable isLinkModeAvailable isPrintModeAvailable
customizeActionsCategory	showMoveAction showRemoveAction isCustomizeModeAvailable showMinimizeAction showMaximizeAction isConfigModeAvailable
personalizeActionsCategory	isPersonalizeModeAvailable

Example 74–3 shows the actionsCategory entry that you can add to the portlets security section in the adf-config.xml file. In this example, customizeActionsCategory is set to false to prevent customization. You can use Expression Language (EL) for the values of these elements.

Example 74–3 actionsCategory Element in the Portlets Security Section

```
<!--
==============================================================================
PORTLETS ACTIONS SECURITY
==============================================================================
-->
<adfp:adf-config-child xmlns:adfp="http://xmlns.oracle.com/adfp/portlet">
  <adfp:enableSecurity value="true"/>
    <adfp:actionsCategory>
      <adfp:actionCategory name="viewActionsCategory" value="true"/>
      <adfp:actionCategory name="customizeActionsCategory" value="false"/>
      <adfp:actionCategory name="personalizeActionsCategory" value="true"/>
    </adfp:actionsCategory>

    <adfp:actions>
    ..........................................
    </adfp:actions>

</adfp:adf-config-child>
```

74.15.1.2 Defining Security at the Actions Level

You can use the actions element in the portlets security section of the adf-config.xml file to enable or disable individual portlet actions. Depending on the action attributes that you enable, appropriate privileges are provided on the portlets.

Example 74–4 shows an example of an actions entry that you can add to the portlets security section in the adf-config.xml file. You can use EL for the values of these elements. In this case you prevent customization by setting isCustomizeModeAvailable to false.

Example 74–4 actions Element in the Portlets Security Section

```
<!--
==============================================================================
PORTLETS ACTIONS SECURITY
==============================================================================
-->
<adfp:adf-config-child xmlns:adfp="http://xmlns.oracle.com/adfp/portlet">
  <adfp:enableSecurity value="true"/>
    <adfp:actionsCategory>
    ........................................
    </adfp:actionsCategory>

    <adfp:actions>
      <adfp:action name="Render" value="true"/>
      <adfp:action name="showMoveAction" value="true"/>
      <adfp:action name="isCustomizeModeAvailable" value="false"/>
      <adfp:action name="isPersonalizeModeAvailable" value="true"/>
    </adfp:actions>

</adfp:adf-config-child>
```

Using EL to Prevent Customization of Portlets Outside of Business Hours

An example to show when you may need to override inherited portlet security is an application that is configured to disable portlet customization outside of standard business hours. For this, you must first create a managed bean (for example, a managed bean called appBusinessRules), containing the method shown in Example 74–5.

Example 74–5 InsideBizHours Method Defined in appBusinessRules Managed Bean

```
public boolean isInsideBizHours()
  {
    Calendar rightNow = Calendar.getInstance();
    int      currentHr = rightNow.get(rightNow.HOUR_OF_DAY);

    // Do not allow customize operation outside of standard business hours

    if ((currentHr > 9) && (currentHr < 17))
       return true;
    else
       return false;
  }
```

You can then reference this managed bean from the actionsCategory element in the portlet security section of the adf-config.xml file, as shown in Example 74–6.

Example 74–6 InsideBizHours Method Referenced in the adf-config.xml File

```
<adfp:adf-config-child xmlns:adfp="http://xmlns.oracle.com/adfp/portlet">
  <adfp:enableSecurity value="true"/>

    <adfp:actionsCategory>
      <adfp:actionCategory name="customizeActionsCategory"
      value="#{appBusinessRules.InsideBizHours?"true":"false"}"/>
    </adfp:actionsCategory>

</adfp:adf-config-child>
```

In this example, the `customizeActionsCategory` will be set to `true` only if the application is run within business hours. Outside of these hours, the portlet cannot be customized even if the user had that permission granted on the page. All other categories that are not explicitly defined, will be inherited from the page.

Using EL to Prevent Personalization and Customization of Portlets Outside the Corporate Network

In this example the managed bean checks the IP address of the request to determine whether the user has accessed the application through the corporate proxy server or from within the corporate network. In this simple example, assume that if the request has the proxy server's IP address, then it is coming from outside the corporate network. In general it is not advised to base security strictly on IP addresses, because these can be compromised. For this, you must add the method shown in Example 74–7 to the managed bean:

Example 74–7 InsideCorpNetwork Method Defined in appBusinessRules Managed Bean

```
public boolean isInsideCorpNetwork()
  {
    // Do not allow personalize and customize operations
    // for requests that go through the corporate proxy

    FacesContext       ctx = FacesContext.getCurrentInstance();
    ExternalContext    ectx = ctx.getExternalContext();
    HttpServletRequest myrequest = (HttpServletRequest) ectx.getRequest();
    String             currentIP = myrequest.getRemoteAddr();

    if (currentIP.equals(getProxyServerIP()))
        return false;
    else
        return true;
  }
```

You can then reference this managed bean from the `actionsCategory` element in the portlet security section of the `adf-config.xml` file, as shown in Example 74–8.

Example 74–8 InsideCorpNetwork Method Referenced in the adf-config.xml File

```
<adfp:adf-config-child xmlns="http://xmlns.oracle.com/adfp/portlet">
  <adfp:enableSecurity value="true"/>

    <adfp:actionsCategory>
      <adfp:actionCategory name="customizeActionsCategory"
                    value="#{appBusinessRules.InsideCorpNetwork?"true":"false"}"/>
      <adfp:actionCategory name="personalizeActionsCategory"
                    value="#{appBusinessRules.InsideCorpNetwork?"true":"false"}"/>
    </adfp:actionsCategory>
```

```
</adfp:adf-config-child>
```

In this example, the `customizeActionsCategory` and the `personalizeActionsCategory` will be set to `true` only if the IP address of the request for the application does not match that of the corporate proxy. The assumption is that the internal requests would have a valid client IP address. All other categories that are not explicitly defined, will be inherited from the page.

74.16 Identity Propagation Mechanisms

The following table lists the identity propagation mechanisms employed by WebCenter Services for propagating the end-user's identity to the various information sources from which content is being integrated into the Portal Framework application.

Whenever possible, WS-Security is the preferred means of identity propagation. Where WS-Security cannot be used due to legacy restrictions or pre-defined store-specific standards or specifications, the primary mechanism used is the credential mapping capability provided by the External Applications service to obtain the user's credentials for a remote application using a distinct security provider. For more information about WS-Security, see the *Security and Administrator's Guide for Web Services*. For more information about External Applications, see Section 74.13, "Working with External Applications".

Table 74–4 Identity Propagation Mechanisms

Service	Connection Type	Identity Propagation Mechanism
Discussions	Jive	Oracle WS-Security
Announcements	see Discussion Forum	
Documents	Content Server	Proprietary ID propagation mechanism through socket connection. Can use SSL with mutual authentication, or clear socket with IP authorization (or use External Application option)
	File System	N/A
	Portal 10g/11g	JSR-170 (External Application)
	Day Adapters	JSR-170 (External Application)
EMail	EMail Connection	External Application
	LDAP Connection	External Application
Events - Personal	Exchange Server Connection	External Application
External Application	HTTP Request from Browser	External Application
IMP	Microsoft Live Communication Server (LCS)	SOAP, Web Services calls. External Application
Portlet Producers	WSRP Producer (Secure)	Oracle WS-Security (Recommended by WSRP Specification)
	WSRP Producer (Non-Secure)	WSRP userContext in SOAP message (WSRP Specification)

Table 74–4 (Cont.) Identity Propagation Mechanisms

Service	Connection Type	Identity Propagation Mechanism
	JPDK Producer (External App)	External Application JPDK payload includes the user information and is conveyed to the producer in the ProviderUser. The information also includes a mapped username and password. (Proprietary, Legacy)
	JPDK Producer (Non-Secure)	Username in render request (Proprietary, Legacy)
Search	Secure Enterprise Search (SES)	Web Service Call
Wiki	Browser Connection	SSO mechanisms - OSSO/OAM or other WLS supported SSO mechanism
Worklist Service	BPEL Connection	Web Service call Oracle WS-Security

74.17 Securing Identity Propagation Through WSRP Producers with WS-Security

The Web Services for Remote Portlets (WSRP) specification indicates that Web Services Security (WS-Security) can be leveraged for providing secure identity propagation between the consumer and the portlet producer. However, WSRP in and of itself does not provide secure identity propagation of the end user's identity to the portlet producer. The WSRP specification explicitly defers to other security standards for secure identity propagation and does not go into the specific WS-Security profiles or options that may be employed. In the absence of a secure mechanism, WSRP defines the concept of *user categories*, which can be mapped to security roles like the ones used by the JSR168 portlets. By using a combination of WSRP and WS-Security, you can ensure end-to-end security.

This section covers the following:

- Section 74.17.1, "Identity Propagation Without WS-Security"
- Section 74.17.2, "Identity Propagation with WS-Security"
- Section 74.17.3, "Configuring Security for WSRP Portlets"

74.17.1 Identity Propagation Without WS-Security

When using WSRP without WS-Security, the `userContext` structure within the SOAP message contains user profile information and user category information. This information is not considered secure and should only be used for personalization and customization functionality. It should not be used for authorization of sensitive resources. This information is also exposed in the JSR168 APIs, `isUserInRole(`*`role`*`)` and `getUserPrincipal`. The code in Example 74–9 shows how a sample portlet's markup rendering code uses the `isUserInRole` API to decide what content to display.

Example 74–9 isUserInRole (role) API

```
private void doViewHtml(RenderRequest
request, RenderResponse response)
```

```
throws PortletException, IOException
{
// To do: markup the required content.
PrintWriter out = response.getWriter();
out.print("<p>Welcome");
out.println("</p>");
if (request.isUserInRole("moderator"))
   {out.println("<p>MODERATOR</p>" );}
else
   {out.println("<p>not moderator</p>" );}
if (request.isUserInRole("participant"))
   {out.println("<p>PARTICIPANT</p>" );}
else
   {out.println("<p>not participant</p>" );}
if (request.isUserInRole("viewer"))
   {out.println("<p>VIEWER</p>" );}
else
   {out.println("<p>not viewer</p>" );}
    }
```

74.17.2 Identity Propagation with WS-Security

When WS-Security is leveraged with WSRP, the user's identity is propagated outside of the SOAP message body in the WS-Security header. This is a user assertion, using the Username Token format, and is digitally signed to authenticate the consumer and to ensure the integrity of the assertion.

When this mechanism is used, the JSR 168 APIs `isUserInRole` and `getUserPrincipal` are established based on the security context resulting from the WS-Security authentication, rather than the information in the SOAP message's `userContext`.

Also, when an Anonymous (i.e., PUBLIC) client is mapped to a default user using the producer's Default User connection parameter, the WSRP producer must be configured with `strict-authentication` and a grant must be added to the Policy store. For more information, see the "Registering Oracle PDK-Java Producers" section in the *Administering Oracle WebCenter Portal*.

The use of WS-Security adds some complexity to the configuration and management of the Framework application and the set of producers it consumes. However, when the situation warrants its use, it becomes an important ingredient of the SOA architecture that ensures the security of the information being published by the Framework application.

The Oracle WebCenter Framework supports the following token profiles (to digitally sign the security token and message body to ensure authenticity and integrity):

- Username token without password
- Username token with password
- SAML token (uses the *sender vouches* method that the producer uses to confirm the subject assertion)

Digitally signing the security token and the SOAP message body accomplishes the following objectives:

- Consumer Authentication
- Assertion and Message Integrity
- Supported Producers
- Security Domain Implication

Consumer Authentication

When a portlet producer is generating sensitive information, for example paystub information, it is imperative that it only responds to requests to show the information from a legitimate consumer.

By using WS-Security, and having the consumer digitally sign the security token and the message body, the producer can verify the signature using the public key of the legitimate consumer. If the signature cannot be verified, then it means that the request may have come from a fraudulent consumer. By requiring the verification of the digital signature, the sensitive information will only be sent to the legitimate consumer.

Assertion and Message Integrity

In addition to verifying the identity of the consumer making the Web Service requests, digitally signing the security token and the message body also ensures that the token and the message have not been tampered with. This prevents such problems as man-in-the-middle attacks where a legitimate request might be intercepted and the user name in the security token replaced with another user name to see the paystub information coming back for the other user. By digitally signing the token, it cannot be tampered with. Any modification to the token would result in the inability to verify the signature on the producer end, and would result in a SOAP fault to be returned instead of the requested paystub information.

Supported Producers

WS-Security implementation is supported by the Oracle WebCenter Suite WSRP container. Other WSRP vendors may also be able to support the WS-Security configuration of Username Token without password, with XML digital signature on the Username Token and the SOAP Message body.

Security Domain Implication

When using secure identity propagation as described in this section, the user name of the user authenticated to the consumer (the Framework application) is propagated to the producer without any remapping or providing any credentials. There is an inherent assumption that the producer understands this user name and can locate this user in its associated security domain. Consequently, it is highly desirable to ensure that the consumer and producer share the same security provider (identity store) to simplify the management of this configuration.

Figure 74–18 summarizes the overall WSRP portlet security architecture.

Figure 74–18 WSRP Portlet Security Architecture

Role-refs are used by the WSRP Container to determine what roles to publish to the consumer as user categories.
The portlet can leverage the JSR-168 API PortletRequest.isUserInRole("category") to check for category membership.
MDS
User category mappings
J2EE roles may be used on the consumer side to control security access to the consumer application.
They are also used for mapping to the producer's user categories.

74.17.3 Configuring Security for WSRP Portlets

Before you configure the producer for WS-Security, you must first deploy your standards-compliant portlet producer to the Oracle WebCenter Suite WSRP Container by performing the steps described in Chapter 61, "Deploying Portlet Producers."

After you have deployed the producer, configure the producer for WS-Security by performing the following steps:

- Attaching a policy to the producer endpoint
- Creating the keystores
- Configuring the producer
- Configuring the consumer

These steps are described in the "Configuring WS-Security" chapter in *Administering Oracle WebCenter Portal*.

74.18 Implementing PDK-Java Portlet Security

This section describes the available security services for your PDK-Java portlet.

More On OTN

For more detailed information about the PDK classes referred to in this section, see the JavaDoc on OTN by clicking **Java Doc API** on the Portlet Development page available at

`http://www.oracle.com/technology/products/ias/portal/portlet_development_10g1014.html`

74.18.1 Assumptions

The following assumptions are made to perform the tasks in this section:

1. You have followed through and understood Section 60.2, "Creating a PDK-Java Portlet."
2. You built a portlet using the wizard and successfully added it to a page.

74.18.2 Introduction to PDK-Java Portlet Security Features

This section introduces the major features that are available to secure your PDK-Java portlet producers.

74.18.2.1 Identity Propagation

When a user first logs in, they must enter their password to verify their identity and obtain access.

Once the user is authenticated, the producer code has access to the authenticated user's identity from the `PortletRenderRequest` that is available from the `HttpServletRequest` object as follows:

```
PortletRenderRequest pr = (PortletRenderRequest)request.getAttribute
   (HttpCommonConstants.PORTLET_RENDER_REQUEST);
   String userName = pr.getUser().getName();
```

When using this user identity for sensitive operations, it is important to ensure that you have configured this producer to use basic message authentication to secure the integrity of the identity assertion.

74.18.2.2 Authorization

Authorization determines if a particular user may view or interact with a portlet. For information about how to restrict access to portlets, see Section 74.18.4, "Portlet Security Managers."

74.18.2.3 Message-level Security

To this point, user authentication and authorization are covered, which do not check the authenticity of messages received by a producer. To completely secure your producers, you should also secure the communication with a producer. If the communication is not secured, then it is possible for someone to imitate an application instance and fool the producer into returning sensitive information. There are three types of communication security:

- **Server Authentication** restricts access to a producer to a small number of recognized computers. This method compares the IP address or the host name of an incoming HTTP message with a list of trusted hosts. If the IP address or host name is in the list, then the message is passed to the producer. If not, it is rejected before reaching the producer.
- **Message Authentication** provides consumer authentication and message integrity. It uses a shared key known to the client (Portal Framework application) and the producer to digitally sign messages. See Section 74.18.5, "Message Authentication" for more information.
- **Message Encryption** relies on the use of the HTTPS protocol for communication between applications and producers. Messages are strongly encrypted to protect the data therein. Encryption provides a high level of security, but it incurs a performance penalty due to the additional processing required for each message.

- **User Input Escape** causes the application to escape any user input strings and treat them as text only to protect against XSS attacks, where an attacker attempts to pass in malicious scripts through user input forms. For example, if a portlet title is customizable, then an attacker might attempt to pass scripts or commands to the portlet through the title parameter entry. For this reason, the default behavior is to escape user input and thus disable any incoming scripts. See Section 74.18.6, "User Input Escape" for more information.

74.18.3 Single Sign-On

Portlets may act as windows into an application. They display summary information and provide a way to access the full functionality of the application. Portlets display some portions of the application in the Framework application and typically enable the user to perform some application tasks.

An application may need to authenticate the user accessing the application through the portlet. The following are the possible application authentication methods:

- External Application. In this case, the Oracle Portal (Oracle Portal) user is different from the application user, but the application user name and password are managed by the Oracle Portal user.
- No Application Authentication. In this case, the communication between producer and consumer is not protected at all.

74.18.3.1 External Application

An external application uses a different authentication server than the Framework application. This means that when a user is logged into the Framework application, you want to also log them into the external application without having to type in their user name or password.

Applications that manage the authentication of users can be loosely integrated with the WebCenter Framework if the administrator registers them as external applications. When a user who was previously authenticated by the WebCenter Framework accesses an external application for the first time, WebCenter Framework attempts to authenticate the user with the external application. The authentication process submits an HTTP request that combines the registration information and the user's user name and password for the application. If the user has not yet registered their user name and password for the external application, then the user is prompted for the required information before making the authentication request. When a user supplies a user name and password for an external application, WebCenter Framework maps the new user name and password to the Framework application user name and stores them. They will be used the next time the user needs authentication with the external application.

The advantages of an external application implementation are as follows:

- Provides a single sign-on experience for users. However, users still must maintain different user names and passwords. In addition, the external application user name mapping must be maintained.
- Allows integration with multiple portals independent of their user repositories and Oracle Single Sign-On.
- Avoids the requirement of having access to the application source code.

The disadvantages of an external application implementation are as follows:

- Does not share the same user repository as the portal, which requires additional maintenance of user information by the end user.

- Transmits the user name and password to the producer in plain text, unless you implement Secure Sockets Layer (SSL).

74.18.3.2 No Application Authentication

The producer trusts the Framework application instance sending the request completely. The producer can determine if the user is logged in and the portal user name, but the application has not authenticated the user.

The advantages of no application authentication are as follows:

- Provides the easiest form of integration and the fastest to implement.

The disadvantages of no application authentication are as follows:

- Provides the least security.
- Provides the weakest integration with the WebCenter Portal Framework application.

74.18.4 Portlet Security Managers

Portlet security managers may be implemented within a producer to restrict access to portlets depending on the user details. When a user views a page with a portlet instance on it, security managers determine whether the user has the appropriate privileges to see the portlet. Implementing access control methods in the producer restricts the retrieval of content from a portlet (that is, hides the portlet) from users without the appropriate privileges. Only if the specified characteristics, such as user details and preferences, pass the authorization logic will the content be retrieved for the user. If no portlet security methods are implemented in the producer, then any user name may be passed in, even fictitious, unauthenticated ones.

`AuthLevelSecurityManager` has access to the following information about authorization level:

- Strongly authenticated.

  The user has signed into the Portal Framework application, and requested the portlet in the context of that session.

- Public or not authenticated.

  The user has not logged in within the context of the current session, and does not have a persistent cookie to indicate that such a state previously existed.

To incorporate these security services into your Java portlet, you must update `provider.xml` and set the security level to strong, weak, or public. Place the following XML right before the `</portlet>` tag in `provider.xml`:

```
<securityManager class="oracle.portal.provider.v2.security.AuthLevelSecurityManager">
   <securityLevel>strong</securityLevel>
</securityManager>
```

After you make this change to `provider.xml`, refresh the producer.

More On OTN

For more information about the syntax of `provider.xml`, see the producer JavaDoc on OTN:

http://www.oracle.com/technology/products/ias/portal/html/javadoc/xml_tag_reference_v2.html

74.18.4.1 Implementing Your Own Security Manager

If your portlet requires special security arrangements which are not provided by the implementations shipped with the PDK, then you must supply your own custom `PortletSecurityManager` controller class. To do this, extend the `oracle.portal.provider.v2.security.PortletSecurityManager` class and supply implementations for the two methods specified by the interface. Then replace the class attribute of the `securityManager` controller element in the XML producer definition with you new class name and configure child elements appropriately.

74.18.5 Message Authentication

Message authentication uses a digital signature. The signature is generated using a Hashed Message Authentication Code (HMAC) algorithm and is based on user information, the shared key, and a UTC (Universal Time, Coordinated) timestamp. The producer authenticates the message using its own copy of the shared key. This technique can be used in Secure Sockets Layer (SSL) communication with a producer instead of client certificates.

For caching purposes, show request signatures are calculated each time a session is set up so producers using message authentication must always have Producer Sessions enabled. This also means that there is a trade-off between performance and security. Shorter session timeouts mean less chance of a message being re-sent illegally, but there is a performance overhead associated with reestablishing a provider session.

A single producer instance cannot support multiple shared keys because it could cause security and administration problems. For instance, if one copy of the shared key is compromised in some way, then the producer administrator has to create a key and distribute it to all of the application clients, who then must update their producer definitions. The way around this problem is to deploy different producer services, specifying a unique shared key for each service. Each producer service has its own deployment properties file so that each service is configured independently of the others. The overhead of deploying multiple producer services within the same producer adapter is relatively small.

While the signature element provides protection against interception and resending of messages, it does nothing to prevent interception and reading of message contents. Messages are still transmitted in plain text. If you are concerned about the content of messages being read by unauthorized people, then this must used in conjunction with SSL to encrypt the message.

The advantage of message authentication is as follows:

- Ensures that the message received by a producer comes from a legitimate Framework application instance.

The disadvantages of message authentication are as follows:

- Causes administration problems if a producer serves multiple portals.
- Entails performance implications if made very secure by having a short session timeout.

74.18.6 User Input Escape

By accepting user input without escaping it to text, you run the risk of an XSS attack, where an attacker attempts to pass in malicious scripts through user input forms. For example, if a portlet title is customizable, then an attacker might attempt to pass scripts or commands to the portlet through the title string. PDK-Java provides the following features to ensure that you can protect your portlets from such attacks:

- Default Container Encoding
- Escape Methods

74.18.6.1 Default Container Encoding

To prevent any script inside a portlet title from being executed, the framework default container renderer class encodes any script characters. This default behavior is controlled through a JNDI variable, `escapeStrings`. When set to `true`, the markup tags in portlet titles are rendered as visible tag characters. For example, a title customization of `<i>title</i>` will be rendered as `<i>title</i>` not *title*. This mode is secure, but, if it is not the desired behavior, then you can set `escapeStrings` to `false` for that producer.

`escapeStrings` applies to all logical producers within a producer. You can set the value of `escapeStrings` from the Fusion Middleware Control Console as you would any other JNDI variable. See Section 60.3.5.2, "Setting JNDI Variable Values" for more information.

74.18.6.2 Escape Methods

If you have code that renders customized values, then you must ensure that you escape those input values appropriately to avoid XSS attacks. This requirement applies to code for rendering pages in any mode. PDK-Java supplies two new static methods for this purpose. They are in the Java class `oracle.portal.provider.v2.url.UrlUtils`, and can be described as follows:

- `public static escapeString(`*`string_text`*`)` escapes any script characters in a given string. For example, less than < becomes `&lt`. This method is unaffected by the `escapeStrings` JNDI variable and is the secure, recommended method to use.
- `public static escapeStringByFlag(`*`string_text`*`)` escapes any script characters in a given string. This method is controlled by the `escapeStrings` JNDI variable and is therefore less secure and not the recommended method to use.

For example:

```
title = UrlUtils.escapeString(data.getPortletTitle());
```

74.19 Using WebCenter Portal Impersonation ELs and APIs

WebCenter Portal Impersonation offers a set of Expression Language expressions (ELs) and matching Java APIs that can be used to customize impersonation sessions. For more information about managing WebCenter Portal Impersonation, see the "Managing Impersonation" chapter in *Administering Oracle WebCenter Portal*. For instructions on how to initiate an impersonation session (by the impersonator) and how to allow an Impersonation session (by the impersonatee), see the "Using WebCenter Portal Impersonation" chapter in *Using Oracle WebCenter Portal*.

The following ELs are exposed:

- `#{WCSecurityContext.impersonationConfigured}` - returns whether or not impersonation has been enabled for the current domain

  This EL can be useful when determining if an error was caused by an impersonation session ending prematurely, or to provide an additional indicator that a session has ended.

- `#{WCSecurityContext.userInImpersonationSession}` - returns whether the current user is in an impersonation session or not.

You can use this EL to protect content and render it inaccessible during an impersonation session. For example, you could map the rendered attribute of an administration taskflow on a page to this EL only rendering the taskflow if the user is not viewing the taskflow in an impersonation session.

- `#{WCSecurityContext.currentImpersonator}` - returns the current impersonator, if any.

  This EL could be used to modify the page template to display the impersonator or render content accessible only to a particular impersonator.

For more information about impersonation and other ELs, refer to Appendix G, "Expression Language Expressions."

The following public APIs are exposed in `oracle.webcenter.security.common.WCSecurityUtility`:

- `isImpersonationConfigured()` - returns whether or not impersonation has been enabled for the current domain.

  This API can be useful to determine if an error was caused by an impersonation session ending prematurely, or to provide an additional indicator that a session has ended.

- `isUserInImpersonationSession()` - returns whether the current user is in an impersonation session or not.

  This API is recommended for use to protect content and render it inaccessible during an impersonation session. For example, you could map the rendered attribute of an administration taskflow on a page to this API throwing an authorization exception or returning an empty list if the user is viewing the taskflow in an impersonation session.

- `getCurrentImpersonatorId()` - returns the current impersonator, if any.

  This API could be used to modify the page template to display the impersonator (as shown in Example 74–10), or render some content accessible only to a particular impersonator.

For more information about these and other APIs, refer to *Java API Reference for Oracle WebCenter Portal*.

Example 74–10 getCurrentImpersonatorId API

```
import oracle.webcenter.security.common.WCSecurityUtility;
if (WCSecurityUtility.isUserInImpersonationSession())
{
  String impersonator = WCSecurityUtility.getCurrentImpersonatorId();
  String currentUser = ADFContext.getCurrent().getSecurityContext().getUserName();
  //Code to be executed when the user is in an impersonation session.
  ..log("User " + impersonator + " is impersonating as user " + currentUser);
}
```

74.20 Troubleshooting Security Issues

This section provides troubleshooting information to help diagnose security related issues for Portal Framework applications.

This section includes the following troubleshooting notes:

- Section 74.20.1, "Error Message Appears When Running a Page with a Content Repository Data Control Method Being Consumed"

74.20.1 Error Message Appears When Running a Page with a Content Repository Data Control Method Being Consumed

Problem

When you run a page containing a content repository data control method, the following error message appears:

```
"Unable to locate the credential for key extapp in JPS credential store."
```

Cause

Credentials need to be provisioned explicitly using the change password task flow before you access the page that uses the data control method.

Solution

Since the data control is only a model and cannot do anything at the user interface level to allow credential provisioning, you must write an error handler that takes care of the redirection in the user interface. For information about writing an error handler, see the "Customizing Error Handling" section in the *Oracle Application Development Framework Developer's Guide*.

The following is a sample error handler:

```
public class ErrorHandler
  extends DCErrorHandlerImpl
{
  public ErrorHandler(boolean b)
  {
    super(b);
  }

  public ErrorHandler()
  {
    super(true);
  }

@Override
  public void reportException(DCBindingContainer formBnd, Exception ex)
  {
   if (ex instanceof AdapterException)
    {
      AdapterException ae = (AdapterException) ex;
      if (ae.getCause() != null &&
          ae.getCause() instanceof ExtAppLoginException)
      {
        ExtAppLoginException eale = (ExtAppLoginException) ae.getCause();
        Throwable t = eale.getCause();
         if (t != null &&
            (t instanceof ExtAppCredentialNotFoundException) ||
            (t instanceof ExtAppInvalidUserCredential))
        {
          String extAppId = eale.getExternalAppId();
          showCredentialsProvisioningDialog(extAppId);
          return;
        }
      }
    }
    super.reportException(formBnd, ex);
  }
  private void showCredentialsProvisioningDialog(String extAppId)
  {
    FacesContext context = FacesContext.getCurrentInstance();
    // Create the dialog UIViewRoot
    ViewHandler viewHandler = context.getApplication().getViewHandler();
    UIViewRoot dialog =
      viewHandler.createView(context,
      "/oracle/adfinternal/extapp/view/pages/CredentialProvisionerDialog.jspx");

     HashMap<String, Object> properties = new HashMap<String, Object>();
     properties.put("width", new Integer(500));
     properties.put("height", new Integer(350));

     HashMap<String, Object> parameters = new HashMap<String, Object>();
     parameters.put("oracle.extapp.id", extAppId);

     RequestContext reqContext = RequestContext.getCurrentInstance();
     //launched from the button, need to specify this for the return listener
     //to be called.
     reqContext.launchDialog(dialog, parameters, null, true, properties);
  }
}
```

75

Building Multilanguage Portals

This chapter describes how to configure your application to display text in the correct language of a user's browser.

This chapter includes the following topics:

- Section 75.1, "Guidelines for Building Multilanguage Portals"
- Section 75.2, "Adding Support for a New Language"
- Section 75.3, "Language Support in ADF Faces Components"
- Section 75.4, "Using Resource Bundles to Support Multiple Languages"

75.1 Guidelines for Building Multilanguage Portals

When your application will be viewed by users in multiple countries, you can configure your JSF page or application to use different locales so that it displays the correct language for the language setting of a user's browser. For example, if you know your page will be viewed in Italy, you can localize your page so that when a user's browser is set to use the Italian language, text strings in the browser page appear in Italian.

Additionally, locale selection applies special formatting considerations applicable to the selected locale. For example, whether information is typically viewed from left to right or right to left, how numbers are depicted (such as monetary information), and the like.

When you develop a multi-language portal:

- Make use of the inherent multi-language support in Oracle WebCenter Portal tools and services. For more information, see Section 75.3, "Language Support in ADF Faces Components."
- Put all resources in resource bundles, provide alternate-language resource bundles, and code your application to respond to users' language selection. For more information, see Section 75.4, "Using Resource Bundles to Support Multiple Languages."
- Make sure your database character set supports all required languages.

  For more information, see the "Choosing a Character Set" chapter in *Oracle Database Globalization Support Guide*.
- Use number, date, and time formatting that supports all required locales.

  For more information, see the "Setting Up a Globalization Support Environment" chapter in *Oracle Database Globalization Support Guide*.

- Use linguistic sort parameters to get the correct sort ordering for locale.

  For example, the same characters have different sort ordering in French and Canadian-French.

  For more information, see the "Linguistic Sorting and Matching" chapter in *Oracle Database Globalization Support Guide*.

- Write web pages that correctly render left to right or right to left (for example, if Arabic languages must be supported).

For more guidelines on globalization, see the "Internationalizing and Localizing Pages" chapter in *Web User Interface Developer's Guide for Oracle Application Development Framework* or refer to *Oracle Database Globalization Support Guide*.

75.2 Adding Support for a New Language

Oracle WebCenter Portal provides run-time translations for 28 languages and 100 different locales. If you want to support a language that is not supported out-of-the-box, you need to provide string files for the new language, and add a `<language>` tag for the new language in the `supported-languages.xml` configuration file.

For information about adding support for a new language, see the "Using WebCenter Spaces Extension Samples" white paper on the *Oracle WebCenter Portal White Papers and Technical Notes* page on Oracle Technology Network.

For a WebCenter Portal Framework application, there may be a need to verify or add the entry for the new language, if not present, in the `web.xml` file of the application.

For example, to add portuguese as a language (Portugal & Brazil), ensure the following entry is present in `web.xml`:

```
...
    <locale-config>
...
      <supported-locale>pt</supported-locale>
      <supported-locale>pt-BR</supported-locale>
      <supported-locale>pt-PT</supported-locale>
...
    </locale-config>
...
```

75.3 Language Support in ADF Faces Components

Some ADF Faces components include text that is part of the component, for example the `af:table` component uses the resource string `af_table.LABEL_FETCHING` for the message text that is displayed in the browser while the table is fetching data during the initial load of data or while the table is being scrolled. Oracle JDeveloper provides translations of these text resources into 28 languages. Therefore, when using the supplied components, you do not need to perform additional steps to translate the text in the components.

75.4 Using Resource Bundles to Support Multiple Languages

For any text you add to a component, for example if you define the label of an `af:commandButton` component by setting the text attribute, you must provide a resource bundle that holds the actual text, create a version of the resource bundle for each locale, and add a `<locale-config>` element to define default and support locales in the application's faces-config.xml file. You must also add a `<resource-bundle>` element to your application's faces-config.xml file to make the resource bundles available to all the pages in your application. Once you have configured and registered a resource bundle, the Expression Language (EL) editor displays the key from the bundle, making it easier to reference the bundle in application pages.

To simplify the process of creating text resources for text you add to ADF components, JDeveloper supports automatic resource bundle synchronization for any translatable string in the visual editor. When you edit components directly in the visual editor or in the Property Inspector, text resources are automatically created in the base resource bundle.

For more information about automatic resource bundles, see the "Using Automatic Resource Bundle Integration in JDeveloper" section in *Web User Interface Developer's Guide for Oracle Application Development Framework*.

For more information about manually defining resource bundles, see the "Manually Defining Resource Bundles and Locales" section in *Web User Interface Developer's Guide for Oracle Application Development Framework*.

Part XIII

Appendixes

Part XIII contains the following appendixes:

A

WebCenter Portal Files

This appendix describes the files that are created and modified as you build up your WebCenter Portal Framework application.

This appendix includes the following topics:

- Section A.1, "About Files"
- Section A.2, "Files Overview"
- Section A.3, "Files Related to WebCenter Portal Framework Applications"
- Section A.4, "Files Related to JSR 286 Portlets"
- Section A.5, "Files Related to PDK-Java Portlets"
- Section A.6, "System Files"
- Section A.7, "Files Related to Security"
- Section A.8, "Oracle JDeveloper Files"
- Section A.9, "Files Related to WebCenter Portal Tools and Services"

For a complete reference for the Oracle Application Development Framework (Oracle ADF) metadata files that you create in your data model and user interface projects, see the *Fusion Developer's Guide for Oracle Application Development Framework*.

A.1 About Files

When you use Oracle WebCenter Portal to build applications and components, several files are created as you perform such actions as building and consuming portlets. As you work with your application, you may find it useful to know a little bit about each of these files and how they relate to your application. You can group the files affected by Oracle WebCenter Portal into two broad categories as follows:

- Files that are common to any Oracle ADF application, such as `web.xml`. For these files, it is useful to know what specific additions and changes are made for Portal Framework applications. Those modifications are described in this appendix, but for more complete descriptions of these common files, see the *Fusion Developer's Guide for Oracle Application Development Framework*.
- Files that are unique to Portal Framework applications, such as `portlet.xml`. For these files, it is useful to know what the file is for and what it contains. These files are described completely in this appendix.

A.2 Files Overview

The files that are created and modified are closely associated with the objects that you create as part of your Portal Framework application. Hence, the easiest way to discuss these files is by object:

- Files Related to WebCenter Portal Framework Applications
- Files Related to JSR 286 Portlets
- Files Related to PDK-Java Portlets
- System Files
- Files Related to Security
- Oracle JDeveloper Files
- Files Related to WebCenter Portal Tools and Services

A.3 Files Related to WebCenter Portal Framework Applications

This section describes the files that are created for you when you create an application using WebCenter Portal's Portal Framework application template. It includes the following topics:

- Section A.3.1, "catalog-registry.xml"
- Section A.3.2, "default-catalog.xml"
- Section A.3.3, "default-navigation-model.xml"
- Section A.3.4, "index.html"
- Section A.3.5, "navigation-registry.xml"
- Section A.3.6, "pages.xml"
- Section A.3.7, "error.jspx"
- Section A.3.8, "home.jspx"
- Section A.3.9, "login.jspx"
- Section A.3.10, "navigation-renderer.jspx"
- Section A.3.11, "pageTemplate_globe.jspx"
- Section A.3.12, "pageTemplate_swooshy.jspx"

There are also image files created that are used in the application.

A.3.1 catalog-registry.xml

`catalog-registry.xml` is a catalog registry file. It is used by the runtime administration console when a user creates or edits a resource catalog. The registry defines the superset of all items that are available to be included in a catalog that you create or edit. You can create multiple catalogs for an application, but an application can only have one catalog registry file.

A.3.2 default-catalog.xml

`default-catalog.xml` is a default resource catalog. When a user edits pages at runtime using Composer, the default catalog file specifies all of the items that are available to be added to a page.

A.3.3 default-navigation-model.xml

`default-navigation-model.xml` is the navigation model file, which incorporates navigation structures in portal site. For more information, see Chapter 10, "Developing a Navigation Model."

A.3.4 index.html

`index.html` contains a redirect statement that refers to the portal navigation model, including an URL element, `pages_home`, which refers to the "home" page specified in the page hierarchy. For more information, see Section 5.11, "Changing the Default Home Page and Login/Logout Target Pages."

A.3.5 navigation-registry.xml

`navigation-registry.xml` is used by the runtime administration console when a user creates or edits a navigation model. The registry defines the superset of all items that are available to be included in a model that you create or edit. You can create multiple navigation models for an application, but an application can only have one navigation registry file. For more information, see Chapter 10, "Developing a Navigation Model."

A.3.6 pages.xml

`pages.xml`, or the *page hierarchy file*, organizes pages into a tree structure, with a parent-child relationship between pages. This hierarchical structure allows the convenient propagation or inheritance of security settings from pages to sub pages. For more information, see Section 5.3.2, "Understanding Pages, Page Templates, and the Portal Page Hierarchy."

A.3.7 error.jspx

`error.jspx` is the default error page displayed to users when Oracle WebCenter Portal encounters an error.

A.3.8 home.jspx

`home.jspx` is the default Home page, providing users access to features such as the documents, links, tags, and discussions.

A.3.9 login.jspx

`login.jspx` is the default login page that provides login/logout functionality to users. For information on customizing the login page, see Section 74.9, "Adding Portlets to a Login Page."

A.3.10 navigation-renderer.jspx

`navigation-renderer.jspx` is responsible for rendering non-page resources that appear in a navigation, such as portlets, content, and task flows. For more information, see Section 10.8, "Editing the Navigation Renderer."

A.3.11 pageTemplate_globe.jspx

`pageTemplate_globe.jspx` is one of two seeded page templates created when you select the **Configure the application with standard Portal features** option when creating an application. This template offers essentially the same functionality as pageTemplate_swooshy.jxpx but with different graphics. For more information, see Chapter 11, "Developing Page Templates."

A.3.12 pageTemplate_swooshy.jspx

pageTemplate_swooshy.jspx is one of two seeded page templates created when you select the **Configure the application with standard Portal features** option when creating an application. This template offers essentially the same functionality as pageTemplate_globe.jxpx but with different graphics. For more information, see Chapter 11, "Developing Page Templates."

A.4 Files Related to JSR 286 Portlets

This section describes the files that are created for you when you build a JSR 286 portlet. It includes the following topics:

- Section A.4.1, "portlet.xml"
- Section A.4.2, "oracle-portlet-tags.jar"
- Section A.4.3, "portlet_mode.jsp"
- Section A.4.4, "portlet_name.java"
- Section A.4.5, "portlet_nameBundle.jar"
- Section A.4.6, "web.xml"

A.4.1 portlet.xml

portlet.xml defines the characteristics of your JSR 286 portlet. For complete details on portlet.xml, you should see the Java Portlet Specification available at:

http://jcp.org/en/jsr/detail?id=168

Example A–1 provides a sample fragment from a portlet.xml file. Note that this example does not include all of the available elements of portlet.xml.

Example A–1 portlet.xml Sample

```
<portlet>
   <description xml:lang="en">JSR 286 map portlet </description>
   <portlet-name>portlet1</portlet-name>
   <display-name xml:lang="en">Map Portlet</display-name>
   <portlet-class>jsrportlet.MapPortlet</portlet-class>
   <expiration-cache>0</expiration-cache>
   <supports>
      <mime-type>text/html</mime-type>
      <portlet-mode>edit</portlet-mode>
      <portlet-mode>help</portlet-mode>
      <portlet-mode>about</portlet-mode>
   </supports>
   <supported-locale>en</supported-locale>
   <resource-bundle>jsrportlet.resource.MapPortletBundle</resource-bundle>
   <portlet-info>
      <title>Map Portlet</title>
      <short-title>Map</short-title>
      <keywords/>
   <portlet-preferences>
      <preference>
         <name>portletTitle</name>
      </preference>
   </portlet-preferences>
   <security-role-ref>
      <role-name>viewer</role-name>
   </security-role-ref>
</portlet>
```

For JSR 286 portlets, the `portlet.xml` file contains all information related to portlets and their settings. Note that not all of these settings are used in the previous sample.

- `<description>` describes the portlet, providing details to the end user.
- `<portlet-name>` uniquely identifies the portlet within the Portlet Producer application.
- `<display-name>` is used when presenting a list of available portlets to the user.
- `<portlet-class>` contains the fully qualified class name of the class implementing the `javax.portlet.Portlet` interface or extending the `GenericPortlet` abstract class that becomes the entry point for the portlet logic. The portlet container uses this class when it invokes the portlet life cycle methods. For JSF portlets created using the Oracle JSF Portlet Bridge, this is `oracle.portlet.bridge.adf.application.ADFBridgePortlet`.
- `<expiration-cache>` the default duration (in seconds) of the expiration cache.
- `<init-param>` defines initialization parameters for configuring the behavior of the portlet. The Oracle JSF Portlet Bridge uses initialization parameters to identify the entry points for the different portlet modes supported by the portlet, for example, for View mode:

  ```
  <init-param>
    <name>javax.portlet.faces.defaultViewId.view</name>
    <value>/myPage.jspx</value>
  </init-param>
  ```

  Initialization parameters for other WebCenter Portal-supported modes are:

  – Edit mode: `javax.portlet.faces.defaultViewId.edit`

  – Help mode: `javax.portlet.faces.defaultViewId.help`

  – About mode: `javax.portlet.faces.defaultViewId.about`

  – Config mode: `javax.portlet.faces.defaultViewId.config`

  – Edit Defaults mode: `javax.portlet.faces.defaultViewId.edit_defaults`

  – Preview mode: `javax.portlet.faces.defaultViewId.preview`

  – Print mode: `javax.portlet.faces.defaultViewId.print`

  Note: The value for the `defaultViewId` is relative to the application context root and must always start with a `/`. In the example provided, the value for `defaultViewId.view` is `/myPage.jspx`.

  If you add a `defaultViewId` for other portlet modes, then you must also add the mode to the `<supports>` tag. For example, `<portlet-mode>HELP</portlet-mode>`.

- `<supports>` provides information about the portlet modes supported for each content type. Portlet modes supported by WebCenter Portal include: `edit`, `help`, `about`, `config`, `edit_defaults`, `preview`, and `print`.
- `<supported-locale>` lists the locales supported by the portlet at runtime.
- `<resource-bundle>` is the fully qualified class name of the resource bundle used to provide language specific portlet information, such as title and keywords.
- `<title>` is the static title of the portlet, usually displayed in the portlet decoration on the portlet window.
- `<short-title>` is the title that is used on devices (such as mobile phones) that have limited display capabilities.
- `<keywords>` are used by applications that offer search capabilities for their users.
- `<portlet-preferences>` are preference attribute definitions.
- `<supported-processing-event>` are events that the portlet can receive.
- `<supported-publishing-event>` are events that the portlet raises.
- `<supported-public-render-parameter>` is a public render parameter supported by the portlet.
- `<container-runtime-option>` an option for defining additional runtime behavior.
- `<security-role-ref>` maps a role name to a security role in `web.xml`. The list of roles in `web.xml` that the `<security-role-ref>` maps to is published to the consumer as the producer's user categories. In `web.xml`, `<security-role>` appears similar to the following:

```
<security-role>
   <description>Viewer role</description>
   <role-name>viewer</role-name>
</security-role>
```

A.4.2 oracle-portlet-tags.jar

`oracle-portlet-tags.jar` is the Oracle implementation of the JSP tag library defined by the Java Portlet Specification.

A.4.3 portlet_mode.jsp

Depending on the implementation style of the portlet mode that you choose to create for your portlet, a corresponding JSP file is created in your *`portlet_name`*`\html` directory to define that mode. For example, if you choose to have View and Edit modes for your portlet, then you need `view.jsp` and `edit.jsp` in your *`portlet_name`*`\html` directory. For JSR 286 portlets, you can have the following JSP files for your portlet modes:

- `about.jsp`
- `config.jsp`
- `edit_defaults.jsp`
- `edit.jsp`
- `help.jsp`
- `preview.jsp`
- `print.jsp`

- `view.jsp`

For further explanation of portlet modes, see Section 57.4.2, "Portlet Modes."

A.4.4 portlet_name.java

`portlet_name.java` is the class that acts as the entry point for the portlet logic. This class must implement the `javax.portlet.Portlet` interface or extend the `GenericPortlet` abstract class. The portlet container uses this class when it invokes the portlet lifecycle methods.

A.4.5 portlet_nameBundle.jar

`portlet_nameBundle.jar` is a resource bundle class, containing translation of the strings used by the portlet.

A.4.6 web.xml

`web.xml` is a Java EE standard descriptor that contains details about Web applications. For more information about `web.xml`, see the *Fusion Developer's Guide for Oracle Application Development Framework*.

A.5 Files Related to PDK-Java Portlets

This section describes the files that are created for you when you build a PDK-Java portlet. It includes the following topics:

- Section A.5.1, "producer_name.properties"
- Section A.5.2, "_default.properties"
- Section A.5.3, "index.jsp"
- Section A.5.4, "portlet_name_modePage.jsp"
- Section A.5.5, "provider.xml"
- Section A.5.6, "web.xml"

A.5.1 producer_name.properties

`producer_name.properties` specifies deployment details about the producer, such as the location of the `provider.xml` file. For example, this file is used if the registration URL to the PDK-Java samples is of the form:

```
http://host:port/jpdk/provider/samples
```

or:

```
http://host:port/jpdk/provider
```

where the service ID field contains `samples`. See also Section A.5.2, "_default.properties".

A.5.2 _default.properties

`_default.properties` specifies deployment details about the producer, such as the location of the `provider.xml` file. For example, this file is used if the registration URL to the PDK-Java samples is of the form:

```
http://host:port/jpdk/provider
```

Note that the producer name is not supplied here so it has to default. See also Section A.5.1, "producer_name.properties".

A.5.3 index.jsp

`index.jsp` serves as a convenient starting point when testing PDK-Java producers from Oracle JDeveloper. This file lists all of the producers available in the application.

A.5.4 portlet_name_modePage.jsp

Depending on the implementation style of the portlet mode that you choose to create for your portlet, a corresponding JSP file is created in your `\htdocs\`*`portlet_name`* directory to define that mode. For example, if you choose to have View and Edit modes for a portlet named `portletOne`, then you need `portletOneShowPage.jsp` and `PortletOneEditPage.jsp` in your `\htdocs\portletOne` directory. For PDK-Java portlets, you can have the following JSP files for your portlet modes:

- `portlet_nameAboutPage.jsp`
- `portlet_nameEditDefaultsPage.jsp`
- `portlet_nameEditPage.jsp`
- `portlet_nameHelpPage.jsp`
- `portlet_nameShowDetailsPage.jsp`
- `portlet_nameShowPage.jsp`

For further explanation of portlet modes, see Section 57.4.2, "Portlet Modes".

A.5.5 provider.xml

`provider.xml` is the definition file for your PDK-Java producer.

Example A–2 provides a sample `provider.xml` file.

Example A–2 provider.xml Sample

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<?providerDefinition version="3.1"?>
<provider class="oracle.portal.provider.v2.DefaultProviderDefinition">
 <localePersonalizationLevel>none</localePersonalizationLevel>
 <session>true</session>
 <defaultLocale>en</defaultLocale>
 <preferenceStore
  class="oracle.portal.provider.v2.preference.FilePreferenceStore">
  <name>prefStore1</name>
  <useHashing>true</useHashing>
 </preferenceStore>
 <portlet class="oracle.portal.provider.v2.DefaultPortletDefinition">
  <id>1</id>
  <name>SampleRenderer</name>
  <title>SampleRenderer example</title>
  <shortTitle>SampleRenderer</shortTitle>
  <description>Example portlet rendered using the SampleRenderer</description>
  <timeout>40</timeout>
  <timeoutMessage>SampleRenderer example timed out</timeoutMessage>
  <acceptContentType>text/html</acceptContentType>
  <showEdit>true</showEdit>
  <showEditToPublic>false</showEditToPublic>
  <showEditDefault>true</showEditDefault>
  <showPreview>true</showPreview>
  <showDetails>true</showDetails>
  <hasHelp>true</hasHelp>
  <hasAbout>true</hasAbout>
  <renderer
   class="oracle.portal.sample.v2.devguide.samplerenderer.SampleRenderer"/>
   <personalizationManager
   class="oracle.portal.provider.v2.personalize.PrefStorePersonalizationManager">
   <dataClass>oracle.portal.provider.v2.personalize.
     NameValuePersonalizationObject
   </dataClass>
   </personalizationManager>
 </portlet>
</provider>
```

A.5.6 web.xml

`web.xml` is a Java EE standard descriptor that contains details about Web applications. For more information about `web.xml`, see the *Fusion Developer's Guide for Oracle Application Development Framework*.

A.6 System Files

This section describes the files that are created or modified when you create or modify pages, deploy your application, or consume JSR 268 portlets. It includes the following topics:

- Section A.6.1, "adf-config.xml"
- Section A.6.2, "DataBindings.cpx"
- Section A.6.3, "faces-config.xml"
- Section A.6.4, "page_name.jspx"
- Section A.6.5, "PageDef.xml"
- Section A.6.6, "trinidad-config.xml"
- Section A.6.7, "trinidad-skins.xml"
- Section A.6.8, "web.xml"
- Section A.6.9, "weblogic-application.xml"
- Section A.6.10, "mds Subdirectory"
- Section A.6.11, "wsdl Subdirectory"

A.6.1 adf-config.xml

The `adf-config.xml` file is an extensible configuration file used by any ADF component. This file is used by the various WebCenter Portal tools and services, including pages, portlets, and all the tools and services such as search, worklist, discussions, and so on, to set configuration information. This file, with `connections.xml`, contains the configuration information required for most of the tools and services to function.

For more information, see:

- Section 19.2.1.3, "Registering Add-Ons in adf-config.xml"

- Section 21.2.1.1, "Updating Your Application's adf-config.xml File" (for information on configuring sandbox creation)
- Section 22.5.1, "How to Add an enableSecurity Section to adf-config.xml"
- Section 63.3.5, "How to Edit Portlet Client Configuration"
- Section B.2.2, "adf-config.xml" (for information on Composer-specific settings)

A.6.2 DataBindings.cpx

`DataBindings.cpx` is a file common to web applications. For more information about `DataBindings.cpx`, see the *Fusion Developer's Guide for Oracle Application Development Framework*.

A.6.3 faces-config.xml

`faces-config.xml` is a file common to JSF applications. It describes the page flow of your application. For more information about `faces-config.xml`, see the *Fusion Developer's Guide for Oracle Application Development Framework*.

A.6.4 page_name.jspx

`page_name``.jspx` is the JSP file for your page. Whenever you add or remove components, such as portlets or data controls from the page, this file is updated.

A.6.5 PageDef.xml

`PageDef.xml` is a file common to Oracle ADF applications. This file holds information about portlet bindings. Also, portlet parameters can be tied to page variables in this file.

For more information about `PageDef.xml`, see the *Fusion Developer's Guide for Oracle Application Development Framework*.

PageDef.xml Sample

Example A–3 provides a sample `PageDef.xml` file.

Example A–3 PageDef.xml Sample

```
<?xml version="1.0" encoding="UTF-8" ?>
<pageDefinition xmlns="http://xmlns.oracle.com/adfm/uimodel"
   version="10.1.3.37.97" id="app_SRFeedbackPageDef"
   Package="oracle.srdemo.view.pageDefs">
  <parameters/>
  <executables>
    <methodIterator id="findAllServiceRequestIter"
                    Binds="findAllServiceRequest.result"
                    DataControl="SRPublicFacade" RangeSize="4"
                    BeanClass="oracle.srdemo.model.entities.ServiceRequest"/>
    <variableIterator id="variables">
      <variable Name="portlet1_Param1" Type="java.lang.Object"
      DefaultValue="
      ${bindings.findAllServiceRequestIter.currentRow.dataProvider['svrId']}"/>
      <variable Name="portlet1_Param2" Type="java.lang.Object"/>
      <variable Name="portlet1_Param3" Type="java.lang.Object"/>
      <variable Name="portlet1_Param4" Type="java.lang.Object"/>
      <variable Name="portlet1_Param5" Type="java.lang.Object"/>
    </variableIterator>
    <methodIterator id="findServiceRequestByIdIter"
                    Binds="findServiceRequestById.result"
                    DataControl="SRPublicFacade" RangeSize="10"
                    BeanClass="oracle.srdemo.model.entities.ServiceRequest"/>
    <portlet id="portlet1"
      portletInstance="/oracle/adf/portlet/OmniProducer_1150310748178/
      applicationPortlets/Portlet100_eebc7f18_010b_1000_8001_82235f640cea"
      class="oracle.adf.model.portlet.binding.PortletBinding"
        xmlns="http://xmlns.oracle.com/portlet/bindings">
      <parameters>
        <parameter name="Param1" pageVariable="portlet1_Param1"/>
        <parameter name="Param2" pageVariable="portlet1_Param2"/>
        <parameter name="Param3" pageVariable="portlet1_Param3"/>
        <parameter name="Param4" pageVariable="portlet1_Param4"/>
        <parameter name="Param5" pageVariable="portlet1_Param5"/>
      </parameters>
    </portlet>
  </executables>
  <bindings>
    <methodAction id="findAllServiceRequest"
                  InstanceName="SRPublicFacade.dataProvider"
                  DataControl="SRPublicFacade"
                  MethodName="findAllServiceRequest" RequiresUpdateModel="true"
                  Action="999" IsViewObjectMethod="false"
                  ReturnName="SRPublicFacade.methodResults.
                     SRPublicFacade_dataProvider_findAllServiceRequest_result"/>
    <table id="findAllServiceRequest1" IterBinding="findAllServiceRequestIter">
      <AttrNames>
        <Item Value="assignedDate"/>
        <Item Value="problemDescription"/>
        <Item Value="requestDate"/>
        <Item Value="status"/>
        <Item Value="svrId"/>
        <Item Value="custComment"/>
        <Item Value="custCommentDate"/>
        <Item Value="custCommentContactBy"/>
        <Item Value="mgrNotes"/>
        <Item Value="mgrNotesDate"/>
      </AttrNames>
    </table>
    <methodAction id="findServiceRequestById"
                  InstanceName="SRPublicFacade.dataProvider"
                  DataControl="SRPublicFacade"
                  MethodName="findServiceRequestById" RequiresUpdateModel="true"
                  Action="999" IsViewObjectMethod="false"
                  ReturnName="SRPublicFacade.methodResults.
                     SRPublicFacade_dataProvider_findServiceRequestById_result">
      <NamedData NDName="svrIdParam"
         NDValue=
          "${bindings.findAllServiceRequestIter.currentRow.dataProvider['svrId']}"
         NDType="java.lang.Integer"/>
    </methodAction>
    <attributeValues id="svrId" IterBinding="findServiceRequestByIdIter">
      <AttrNames>
        <Item Value="svrId"/>
      </AttrNames>
    </attributeValues>
    <attributeValues id="custComment" IterBinding="findServiceRequestByIdIter">
      <AttrNames>
        <Item Value="custComment"/>
      </AttrNames>
    </attributeValues>
    <attributeValues id="mgrNotes" IterBinding="findServiceRequestByIdIter">
      <AttrNames>
        <Item Value="mgrNotes"/>
      </AttrNames>
    </attributeValues>
    <list id="ServiceRequestcustCommentContactBy"
          IterBinding="findServiceRequestByIdIter" ListOperMode="0"
          StaticList="true" NullValueFlag="1">
      <AttrNames>
        <Item Value="custCommentContactBy"/>
      </AttrNames>
      <ValueList>
        <Item Value=" "/>
        <Item Value="Phone"/>
        <Item Value="Email"/>
        <Item Value="SMS"/>
      </ValueList>
    </list>
    <methodAction id="mergeEntity" InstanceName="SRPublicFacade.dataProvider"
                  DataControl="SRPublicFacade" MethodName="mergeEntity"
                  RequiresUpdateModel="true" Action="999"
                  IsViewObjectMethod="false"
                  ReturnName="SRPublicFacade.methodResults.
                              SRPublicFacade_dataProvider_mergeEntity_result">
      <NamedData NDName="entity"
         NDValue=
         "${bindings.findServiceRequestByIdIter.currentRow.dataProvider}"
         NDType="java.lang.Object"/>
    </methodAction>
  </bindings>
</pageDefinition>
```

A.6.6 trinidad-config.xml

In JDeveloper, when you create a Portal Framework application, a `trinidad-config.xml` file is automatically created in the `/WEB-INF` directory. Example A–4 shows this seeded `trinidad-config.xml` file.

Example A–4 Seeded trinidad-config.xml File Created by JDeveloper

```
<?xml version="1.0" encoding="US-ASCII"?>
<trinidad-config xmlns="http://myfaces.apache.org/trinidad/config">
  <skin-family>#{preferenceBean.defaultTrinidadSkin}</skin-family>
</trinidad-config>
```

In the `trinidad-config.xml`, you can set `<skin-family>`, which determines which skin to use, and if necessary, under what conditions. The `trinidad-config.xml` file has a simple XML structure that enables you to define element properties using the JSF Expression Language (EL) or static values.

> **Note:** The default value of `<skin-family>` is `#{preferenceBean.defaultTrinidadSkin}`. If you change the default value, your application users cannot set skins at runtime.

Additionally, `trinidad-config.xml` can contain information about the level of page accessibility support, page animation, time zone, enhanced debugging output, and the URL for Oracle Help for the Web (OHW).

For more information, see the "Configuration in trinidad-config.xml" section in the *Web User Interface Developer's Guide for Oracle Application Development Framework*.

A.6.7 trinidad-skins.xml

`trinidad-skins.xml` is required for any skin that is provided as a JAR. The file is usually bundled with each skin JAR to provide a lookup between skin ID and the actual path of the skin. However, for a skin created as a portal resource in a Portal Framework application, a separate runtime API is used to lookup the location of a skin. Therefore, this file is not needed for such skins.

For more information, see the "Customizing the Appearance Using Styles and Skins" chapter in the *Web User Interface Developer's Guide for Oracle Application Development Framework*.

A.6.8 web.xml

`web.xml` is a Java EE standard descriptor that contains details about web applications. For more information about `web.xml`, see the *Fusion Developer's Guide for Oracle Application Development Framework*.

A.6.9 weblogic-application.xml

`weblogic-application.xml` is a deployment descriptor (a server configuration file that defines the application configuration) for Oracle WebLogic Server deployment.

A.6.10 mds Subdirectory

When you deploy a WebCenter Portal Framework application, an `mds` subdirectory is created in your project directory. This subdirectory contains other subdirectories and metadata files, such as portlet customizations and personalizations.

A.6.11 wsdl Subdirectory

When you consume JSR 286 portlets in an application, a `wsdl` subdirectory is created in the `WEB-INF` directory. The files in this subdirectory are internal files created for portlets from a WSRP producer.

A.7 Files Related to Security

This section describes the files that are created or modified when you implement or modify security. It includes the following topics:

- Section A.7.1, "connections.xml"
- Section A.7.2, "jazn-data.xml"
- Section A.7.3, "cwallet.sso"
- Section A.7.4, "jps-config.xml"
- Section A.7.5, "adf-config.xml"

A.7.1 connections.xml

`connections.xml` contains portlet producer connection information. Example A–5 shows a sample `connections.xml` file.

Example A–5 connections.xml

```
<?xml version = '1.0' encoding = 'UTF-8'?>
<References xmlns="http://xmlns.oracle.com/adf/jndi">

A.7.2 jazn-data.xml

When you implement or modify security for your application, the jazn-data.xml file is created or modified.

The jazn-data.xml file is used to facilitate the deployment of realm and policy information for your application. In your development environment (JDeveloper), jazn-data.xml is located in your application's *workspacedir*/src/META-INF directory. After deployment, the contents of this file are merged in domain-level identity or policy stores. This file contains the policies that are created at design time, and is merged at deployment by JpsApplicationLifecycleListener into the system-jazn-data.xml file (or appropriately configured policy store) for the deployment target.

When you migrate security information with JpsApplicationLifecycleListener, the jazn-data.xml file can be used as the source file for the migration. For more information about migrating roles, see the *Fusion Developer's Guide for Oracle Application Development Framework*.

jazn-data.xml Sample

Example A–6 provides a sample jazn-data.xml file.

Example A–6 jazn-data.xml Sample

```
<?xml version = '1.0' encoding = 'UTF-8'?>
<jazn-data>
   <jazn-realm>
      <realm>
         <name>jazn.com</name>
      </realm>
   </jazn-realm>
   <policy-store>
      <applications>
         <application>
            <name>mdsapp-secure</name>
            <app-roles>
               <app-role>
                  <name>unauthenticated-role</name>
                  <display-name>anonymous-role</display-name>

<class>oracle.security.jps.service.policystore.ApplicationRole</class>
               </app-role>
               <app-role>
                  <name>authenticated-role</name>
                  <display-name>authenticated-users</display-name>

<class>oracle.security.jps.service.policystore.ApplicationRole</class>
               </app-role>
               <app-role>
```

```
                  <name>approle</name>
                  <display-name>approle</display-name>

```

A.7.3 cwallet.sso

`cwallet.sso` contains external application credentials, if any, and the connection's secure data such as database password. The `cwallet.sso` file is located in the *`workspaceroot`*`/src/META-INF` directory.

A.7.4 jps-config.xml

`jps-config.xml` is located at *`workspaceroot`*`/src/META-INF`. The `jps-config.xml` file packaged with the application is used only at design time. At runtime, the configurations stored in the domain-level `jps-config.xml` file become functional.

`jps-config.xml` configures OPSS services. For more information on the element hierarchy and attributes of `jps-config.xml`, see the "OPSS Configuration File Reference" appendix in the *Securing Applications with Oracle Platform Security Services*.

The recommendation for migration is to create a new `jps-config.xml` file with the source and destination contexts defined as required by the migration commands. For details on migrating identities, see the "Migrating Identities Manually" section in the *Securing Applications with Oracle Platform Security Services*.

The policy store is migrated in the following ways: entire policy store, application-specific policies, and global polices. For details, see the "Migrating Policies Manually" section in the *Securing Applications with Oracle Platform Security Services*.

The credential store is migrated in the following ways: entire credential store or application-specific credentials. When migrating application-specific credentials, ensure that `srcFolder` and `targetFolder` are the same. `srcFolder` and `targetFolder` can be determined from `appUID` in the `adf-config.xml` file, see Example A–7. For details, see the "Migrating Credentials Manually" section in the *Securing Applications with Oracle Platform Security Services*.

Example A–7 appUID in the adf-config.xml file

```
<adf:adf-properties-child xmlns="http://xmlns.oracle.com/adf/config/properties">
  <adf-property name="adfAppUID" value="Application1-1167"/>
</adf:adf-properties-child>
```

A.7.5 adf-config.xml

Security configurations are stored in `adf-config.xml`. This file is located at *`workspaceroot`*`/.adf/META-INF/adf-config.xml`. See Example A–8.

Example A–8 adf-config.xml

```
<adf-security-child xmlns="http://xmlns.oracle.com/adf/security/config">
        <JaasSecurityContext
initialContextFactoryClass="oracle.adf.share.security.JAASInitialContextFactory"
jaasProviderClass="oracle.adf.share.security.providers.jps.JpsSecurityContext"
             authorizationEnforce="true"
             authenticationRequire="true"/>
    <CredentialStoreContext
credentialStoreClass="oracle.adf.share.security.providers.jps.CSFCredentialStore"
             credentialStoreLocation="../../src/META-INF/jps-config.xml"/>
</adf-security-child>
```

Note: The `credentialStoreLocation` entry in the sample is valid at design time only.

A.8 Oracle JDeveloper Files

This section describes the `pagetemplate-metadata.xml` file that is created or modified when you create a page template.

`pagetemplate-metadata.xml` keeps track of all the page templates you create in a project.

A.9 Files Related to WebCenter Portal Tools and Services

This section includes sample `connections.xml` and `adf-config.xml` files for some WebCenter Portal tools and services.

Example A–9 shows the minimum required configuration for the SES web service connection.

Example A–9 SES Web Service Sample Connection

```
<Reference name="GenericSesConnection"
className="oracle.adf.mbean.share.connection.webcenter.search.SesConnectionReferen
ceable"
credentialStoreKey="GenericSesConnection" xmlns="">
      <Factory
className="oracle.adf.mbean.share.connection.webcenter.search.SesConnectionFactory
"/>
      <RefAddresses>
         <XmlRefAddr addrType="SesConfig">
            <Contents>
               <SesConfig>
                  <AttributeMap>
                     <Attribute name="date">
                        <SesAttribute>LastModifiedDate</SesAttribute>
                     </Attribute>
                     <Attribute name="person">
                        <SesAttribute>Author</SesAttribute>
                     </Attribute>
                  </AttributeMap>
                  <SoapUrl>http://host:port/search/query/OracleSearch</SoapUrl>
               </SesConfig>
            </Contents>
         </XmlRefAddr>
         <StringRefAddr addrType="appUsername">
            <Contents>wpadmin</Contents>
         </StringRefAddr>
         <SecureRefAddr addrType="appPassword"/>
      </RefAddresses>
   </Reference>
```

Example A–10 shows a sample `adf-config.xml` for documents.

Example A–10 ADF Configuration for the Documents

```
<doclibC:adf-doclib-config xmlns="http://xmlns.oracle.com/webcenter/doclib/config"
   primaryConnectionName="Oracle_Content_Server">
    <doclibC:spaces-repository
    spacesRoot="/repositoryPath"
    adminUserName="sysadmin"
    applicationName="application_name" />
</doclibC:adf-doclib-config>
```

Example A–11 shows a sample `adf-config.xml` for worklists.

Example A–11 ADF Configuration for Worklists

```
<worklistC:adf-worklist-config>
  <worklistC:ConnectionName>WebCenter-Worklist</worklistC:ConnectionName>
</worklistC:adf-worklist-config>
```

B

Composer Component Properties and Files

This appendix provides reference information about Composer-specific tags, configuration files, and style properties.

This appendix includes the following topics:

- Section B.1, "Composer Component Properties"
- Section B.2, "Composer-Specific Files and Configurations"
- Section B.3, "Composer Default Add-Ons and Property Panels"
- Section B.4, "Composer Components Style-Specific Properties"
- Section B.5, "Customizable Components (HTML) Properties"

The information provided in this chapter is useful while performing the tasks described in Chapter 18, "Enabling Runtime Editing of Pages Using Composer" and Chapter 19, "Extending Runtime Editing Capabilities Using Composer."

B.1 Composer Component Properties

This section is a quick reference for all Composer tags. When you add Composer components to a page, default values are assigned to certain attributes. You can change these default values and define values for the remaining attributes in JDeveloper.

For information about adding these components to the page, see Section 18.1, "Designing Editable Pages Using Composer Components."

> **Note:** The Property Inspector in JDeveloper displays certain extended metadata attributes under the Customization Attributes category. You can use these properties to provide additional metadata information. For more information, see the "Extended Metadata Properties" section in *Fusion Developer's Guide for Oracle Application Development Framework*.

This section contains the following subsections:

- Section B.1.1, "Page Customizable Component"
- Section B.1.2, "Change Mode Link and Change Mode Button"
- Section B.1.3, "Layout Customizable Component"
- Section B.1.4, "Panel Customizable Component"
- Section B.1.5, "Show Detail Frame Component"

- Section B.1.6, "Custom Action"
- Section B.1.7, "Show Property"

B.1.1 Page Customizable Component

Use the `Page Customizable` component to enable page editing at runtime. The `Page Customizable` component denotes the customizable part of a page and shows the Composer toolbar in Edit mode at runtime. When you enclose components within a `Page Customizable` component, Composer is enabled in the application page at runtime, allowing the user to customize and edit the components.

In large applications, where you want to enable runtime page editing on multiple pages, you can include the `Page Customizable` component in the page template, somewhere in the top of the hierarchy. This way, all pages created using the template are editable at runtime.

Geometry Management

View mode: The `Page Customizable` component can be stretched by a parent layout component that stretches its children, for example, a `Panel Stretch Layout` or `Panel Splitter` component. If the `Page Customizable` component is stretched, it in turn stretches its child component to fill the space available to it. However, if the `Page Customizable` component is not stretched, its size is determined by the child component.

Edit mode: The `Page Customizable` component stretches its child component to fill the space available to it.

Attributes

Table B–1 describes the attributes of a `Page Customizable` component.

Table B–1 Attributes of a Page Customizable Component

Attribute	Type	Supports EL	Description
Common Attributes			
id	String	No	The identifier for the component. The identifier must follow a subset of the syntax allowed in HTML: ▪ Must not be a zero-length String. ▪ First character must be an ASCII letter (A-Za-z) or an underscore ('_'). ▪ Subsequent characters must be an ASCII letter or digit (A-Za-z0-9), an underscore ('_'), or a dash ('-').
rendered	Boolean	Yes	Specifies whether the component is rendered. When set to `false`, no output is delivered for this component (the component is not in any way rendered, and cannot be made visible on the client). The default value is `true`.

Table B–1 (Cont.) Attributes of a Page Customizable Component

Attribute	Type	Supports EL	Description
Appearance Attributes			
sourceViewPosition	String	Yes	The position of the Structure view pane displaying components in a tree structure. Valid values are `bottom`, `end`, `start`, and `top`. Default value is `top`. For more information, see the section, Section 16.6, "Editing Capabilities in Structure View in Page Edit Mode.".
sourceViewSize	String	Yes	The height or width of the Structure view pane in pixels. Use this to specify height if the `sourceViewPosition` is set to `top` or `bottom`, or to specify width if `sourceViewPosition` is set to `start` or `end`. Since the default for `sourceViewPosition` is `top`, the pane has a default height of `200` pixels. Alternatively, the resize handler on the edge of the Structure view pane enables users to alter the height or width of the pane at runtime.
editModeView			Specifies the default view in which to open a page in Composer. Valid options are `design` and `source`. Default value is `design`. If you select `source`, the page is opened in Structure view in Composer. If you select `design`, the page is opened in Design view in Composer if the value `design` or `all` is specified for the `designViews` attribute. Else the page is displayed in Add Content view.
rendered	Boolean	Yes	Specifies whether the component is rendered. When set to `false`, no output is delivered for this component (the component is not in any way rendered, and cannot be made visible on the client). The default value is `true`.
toolbarLayout	String	Yes	The elements to be displayed on the Composer toolbar. This attribute can take a space-separated list of elements. The built in strings the component recognizes are `message`, `stretch`, `statusindicator`, `newline`, `menu`, `addonpanels`, `stretch`, `help`, and `button`. For more information about using this attribute, see Section 19.10, "Customizing the Composer Toolbar."
Style Attributes			
styleClass	String	Yes	The CSS style class to use for this component. The style class can be defined in your JSPX page or in a skinning CSS file, for example.

Table B–1 (Cont.) Attributes of a Page Customizable Component

Attribute	Type	Supports EL	Description
inlineStyle	String	Yes	The CSS styles to use for this component. This is intended for basic style changes. The `inlineStyle` is a set of CSS styles that are applied to the root DOM element of the component. If the `inlineStyle`'s CSS properties do not affect the DOM element you want affected, then you must create a skin and use the skinning keys which are meant to target particular DOM elements, like `::label` or `::icon-style`.
Advanced Attributes			
binding	`oracle.adf.view.page.editor.component.PageCustomizable`	Supports only EL	An EL reference that stores the component instance on a bean. This can be used to give programmatic access to a component from a backing bean, or to move creation of the component to a backing bean.
sourceViewNodeActions	String	Yes	The name of the JPSX file to be called if you want to display custom actions against task flows in the component navigator in Composer Structure view. The `sourceViewNodeAction` attribute can take the name of a JSPX file or an EL value that evaluates to a JSPX file name. For information about using this attribute, see Section 20.4, "Enabling Custom Actions that Display on Task Flows in the Component Navigator."
allowLabel	Boolean	Yes	Specifies whether label creation must be enabled in the Customization Manager. When `allowLabel` is set to `true`, a Save and Label button is displayed on the Composer toolbar. For more information, see Section 16.5.15, "Manage Application Customizations." This attribute is relevant only if you have configured sandbox support in your application.
catalog	String	Yes	The resource catalog to be used as the default one for the application page. Provide the catalog definition file name. For more information about using multiple resource catalogs, see Chapter 14, "Developing Resource Catalogs."
allowEL	Boolean	No	Specifies whether or not EL can be run in application pages. Default is true. This setting overrides the `<pe:allow-el>` setting in adf-config.xml. For more information, see Section 19.4.2, "How to Protect Expression Language."
protectEL	Boolean	No	Specifies whether or not EL in form elements is read-only. Default is false. This setting overrides the `<pe:protect-el>` setting in adf-config.xml. For more information, see Section 19.4.2, "How to Protect Expression Language."

Table B–1 (Cont.) Attributes of a Page Customizable Component

Attribute	Type	Supports EL	Description
designViews	String	Yes	Specifies the views available to a user in Composer. By default, Add Content and Structure views are available for backward compatibility. This attribute can take a space-separated list of elements. Available options are `design`, `add-content`, `source`, `select`, `preview`, and `all`. If you set the value as `all`, all the views are rendered except Add Content, and Design view becomes the default view in Composer. If the `designViews` attribute is set, it overrides the `designViews` setting in `adf-config.xml`. However, if this attribute is set to an EL that returns null, then the `adf-config.xml` setting for `designViews` is used. For more information see Section 19.11, "Enabling Direct Select in Design or Add Content View."
Customization Attributes			
customizationAllowed	Boolean		Specifies whether customizations are allowed on this component. Available values are `true` and `false`. The default value is `true`.
customizationAllowedBy	String		Specifies the roles for which customization is enabled.

Supported Facets

The `Page Customizable` component provides an `editor` facet, which is prepopulated with a `Page Editor Panel` component. To ensure that Composer works properly, the `editor` facet must contain the `Page Editor Panel` component.

B.1.2 Change Mode Link and Change Mode Button

Use the `Change Mode Button` or `Change Mode Link` to enable switching to Edit mode of the page at runtime.

The `Change Mode Link` and `Change Mode Button` components share a common set of attributes. Table B–2 describes the attributes of a `Change Mode Link` or `Change Mode Button` component.

Table B–2 Attributes of a Change Mode Link or Change Mode Button Component

Attribute	Type	Supports EL?	Description
Common Attributes			
id	String	Yes	The identifier for the component. The identifier must follow a subset of the syntax allowed in HTML: - Must not be a zero-length String. - First character must be an ASCII letter (A-Za-z) or an underscore ('_ '). - Subsequent characters must be an ASCII letter or digit (A-Za-z0-9), an underscore ('_'), or a dash ('-').
rendered	Boolean	Yes	Specifies whether the component is rendered. When set to `false`, no output is delivered for this component (the component is not in any way rendered, and cannot be made visible on the client). The default value is `true`. In a secured application, to enable the Edit link or button only for selected users based on specific criteria, you can specify an EL value for the `rendered` attribute. **Note**: In a secured application, it is recommended that you check all users' privileges and enable the Edit link or button only for privileged users. Unauthenticated users who stumble into page Edit mode can change component properties.
Behavior Attribute			
immediate	Boolean	Yes	Specifies whether data validation - client-side or server-side - must be skipped when events are generated by this component. When `immediate` is `true`, the command's action and ActionListeners, including the default ActionListener provided by the JavaServer Faces implementation, is executed during the Apply Request Values phase of the request processing lifecycle, rather than waiting until the Invoke Application phase. Because validation runs during Process Validators (after Apply Request Values, but before Invoke Application), setting `immediate` to `true` skips validation.
Advanced Attributes			

Table B–2 (Cont.) Attributes of a Change Mode Link or Change Mode Button Component

Attribute	Type	Supports EL?	Description

binding	`oracle.adf.view.page.editor.component.ChangeModeLink`
	or
	`oracle.adf.view.page.editor.component.ChangeModeButton`
		Supports only EL	An EL reference that stores the component instance in a bean. This can be used to give programmatic access to a component from a backing bean, or to move creation of the component to a backing bean.

Customization Attributes			
customizationAllowed	Boolean		Specifies whether customizations are allowed on this component. Available values are `true` and `false`. The default value is `true`.
customizationAllowedBy	String		Specifies the roles for which customization is enabled.
Other Attribute			
customizationId			This attribute has been deprecated. Use the `id` attribute.

If you do not want to use the `Change Mode Link` or `Change Mode Button` component, you can add your own button or link component and use the `ChangeModeLink` or `ChangeModeButton` API to enable the switching of the page mode.

Disabling Runtime Editing in Your Application Pages

To disable runtime editing of pages, you can revoke Edit privileges for users, or delete the `Change Mode Link` or `Change Mode Button` component from the page so that the user cannot navigate to the Edit mode of the page.

B.1.3 Layout Customizable Component

The `Layout Customizable` component applies a predefined layout to its child components. It is a container component that enables end users to lay out its child components in several predefined ways. Use the `Layout Customizable` component only to enable changing of the page layout at runtime. If you just want container components in which to layout components, but do not want to enable runtime layout changes, then it is recommended that you use ADF Faces layout components like `Panel Stretch Layout` and `Panel Group Layout`. It is recommended that you have just one `Layout Customizable` on the page.

A `Layout Customizable` component contains a direct child `Panel Customizable` component and two facets with `Panel Customizable` components by default to enable users to add content inside them at runtime. However, you can add any components inside the `Layout Customizable` component and its facets. The content in the three `Panel Customizable` components can be placed in different ways using predefined layouts. For more information, see the section, "Predefined Layout Types".

Table B–3 describes the attributes of a `Layout Customizable` component.

Table B–3 Attributes of the Layout Customizable Component

Attribute	Type	Supports EL?	Description
Common Attributes			
id	String	No	The identifier for the component. The identifier must follow a subset of the syntax allowed in HTML: ■ Must not be a zero-length String. ■ First character must be an ASCII letter (A-Za-z) or an underscore ('_'). ■ Subsequent characters must be an ASCII letter or digit (A-Za-z0-9), an underscore ('_'), or a dash ('-').
rendered	Boolean	Yes	Specifies whether the component is rendered. When set to `false`, no output is delivered for this component (the component is not in any way rendered, and cannot be made visible on the client). The default value is `true`. The rendering of a component can also be defined at runtime using the Show Component and Hide Component options.
type	String	Yes	Specifies the layout to be used for the page. You can choose from a list of eight predefined layouts. For more information, see Table B–5. Default value is `threeColumn`. You can define customization restrictions on a `Layout Customizable` component. Specifically, if you place a restriction on the `type` attribute, then layout changer options are shown as disabled and users cannot use them to change the page layout. For more information, see Chapter 22, "Modifying Default Security Behavior of Composer Components."
Appearance Attributes			
text	String	Yes	Specifies the text to be displayed for the Change Layout menu. Use the `text` attribute to provide a descriptive label for the `Layout Customizable` component so that the component is clearly visible on the page at runtime. For example: `text="Change Layout"`

Table B–3 (Cont.) Attributes of the Layout Customizable Component

Attribute	Type	Supports EL?	Description
accessKey	Char	Yes	A character used to gain quick access to this button. For accessibility reasons, this functionality is not supported in screen reader mode. If the same access key appears in multiple input fields in the same page of output, the rendering user agent cycles among the elements accessed by the similar keys. Note that user agents are inconsistent about dealing with two links having same access key, and so the cycling behavior is dependent on what the user agent provides. This attribute is sometimes referred to as the "mnemonic". The character specified by this attribute must exist in the `Text` attribute of this button instance. If it does not, the user receives no visual indication of the existence of the `accessKey`. The easiest, and most convenient way to specify both the text and the mnemonic together is to use `textAndAccessKey`. Note that the `accessKey` is triggered by browser-specific and platform-specific modifier keys. It even has browser-specific meaning. For example, Internet Explorer 7.0 sets focus when you press Alt+<accessKey>. Firefox 2.0 on some operating systems sets focus when you press Alt+Shift+<accessKey>. Firefox 2.0 on other operating systems set focus when you press Control+<accessKey>. Refer to your browser's documentation for how it treats accessKey.
showIcon	Boolean	Yes	Specifies whether the default **Change Layout** icon is visible or not. The default value is `true`.
showLayoutChanger	Boolean	Yes	Specifies whether the **Change Layout** icon or text must be displayed. The default value is `true`. When set to `true`, the runtime behavior of the layout changer is as follows: ■ Displayed in View mode. ■ Displayed in Edit mode. It is always displayed in Edit mode, even if the value of the `showLayoutChanger` attribute is `false`. ■ If there is a security or MDS restriction on the Layout Customizable component, then the layout changer is not displayed in View or Edit modes.

Table B–3 (Cont.) Attributes of the Layout Customizable Component

Attribute	Type	Supports EL?	Description
showTypes	String	Yes	Specifies the names of predefined layouts that must be displayed in the layout changer. Use this attribute to control the layout options displayed to users. You can provide a space-separated list of layout types. By default, all eight layouts are displayed when a user clicks the Change Layout icon or link.
shortDesc	String	Yes	The short description of the component. This text is commonly used by user agents to display tooltip help text, in which case the behavior for the tooltip is controlled by the user agent, for example, Firefox 2 truncates long tooltips. For form components, the `shortDesc` is displayed in a note window.
Style Attributes			
styleClass	String	Yes	A CSS style class to use for this component. The style class can be defined in your JSPX page or in a skinning CSS file, for example.
inlineStyle	String	Yes	The CSS styles to use for this component. This is intended for basic style changes. The `inlineStyle` is a set of CSS styles that are applied to the root DOM element of the component. If the `inlineStyle`'s CSS properties do not affect the DOM element you want affected, then you must create a skin and use the skinning keys which are meant to target particular DOM elements, like `::label` or `::icon-style`.
Advanced Attribute			
binding	`oracle.adf.view.page.editor.component.LayoutCustomizable`	Supports only EL	An EL reference that stores the component instance in a bean. This can be used to give programmatic access to a component from a backing bean, or to move creation of the component to a backing bean. For example: `binding="#{yourManagedBean.Binding}"`
Customization Attributes			
customizationAllowed	Boolean		Specifies whether customizations are allowed on this component. Available values are `true` and `false`. The default value is `true`.
customizationAllowedBy	String		Specifies the roles for which customization is enabled.
Other Attribute			
customizationId			This attribute has been deprecated. Use the `id` attribute.

Supported Facets

Table B–4 describes the facets provided for a `Layout Customizable` component.

Table B–4 Facets of the Layout Customizable Component

Name	Description
contentA	Prepopulated with a `Panel Customizable` component. This `Panel Customizable` contains content to be rendered in area A in the layouts shown in Table B–5.
contentB	Prepopulated with a `Panel Customizable` component. This `Panel Customizable` contains content to be rendered in area B in the layouts shown in Table B–5.
facetSeparator	Content to be rendered once between each facet.
separator	Content to be rendered once between each of the other children.

Predefined Layout Types

When you add a `Layout Customizable` component to the page, three child `Panel Cutsomizable` components are added by default; one direct child and two `Panel Customizables` in the two facets. However, you can replace the child `Panel Customizable` components with any container components of your choice. When you select the layout type, the components in these `Panel Customizables` are arranged according to the layout type chosen.

Table B–5 describes the eight layouts that you can apply to your page or an area of the page at design time. To easily describe how components are laid out, let us assume the following:

- The child `Panel Customizable` of `contentA` facet is called **A**.
- The child `Panel Customizable` of `contentB` facet is called **B**.
- The primary `Panel Customizable`, which is a direct child of the `Layout Customizable`, is called **C**.

Table B–5 Values for Type Attribute of Layout Customizable

Layout Type	Image Showing Content Arrangement
oneColumn	 **Note**: In a `oneColumn` layout, `A` and `B` are rendered only if they contain child components.
threeColumn	threeColumnNarrow	twoColumn	twoColumnBottom	twoColumnNarrowLeft	
Table B–5 (Cont.) Values for Type Attribute of Layout Customizable

Layout Type	Image Showing Content Arrangement
twoColumnNarrowRight	twoColumnTop	
B.1.4 Panel Customizable Component

Use the `Panel Customizable` component as a container for page content that can be customized at runtime. You can add content inside a `Panel Customizable` component at runtime using the resource catalog. When you add child `Show Detail Frame` components inside a `Panel Customizable`, the `Show Detail Frame` components provide runtime customization options for arranging or deleting components on the page.

Use this component only to perform runtime customizations on child components. If you just want a container to arrange components, then it is recommended that you use an ADF Faces container like `Panel Group Layout`.

Geometry Management

The `Panel Customizable` component can be stretched by a parent layout component that stretches its children, for example, a `Panel Stretch Layout` or `Panel Splitter` component. By setting the `layout` attribute on the `Panel Customizable` component to `stretch`, the child component can be stretched to the size of the `Panel Customizable`.

Table B–6 describes the attributes of a `Panel Customizable` component.

Table B–6 Attributes of a Panel Customizable Component

Attribute	Type	Supports EL?	Description
Common Attributes			
id	String	No	The identifier for the component. The identifier must follow a subset of the syntax allowed in HTML: ■ Must not be a zero-length String. ■ First character must be an ASCII letter (A-Za-z) or an underscore ('_'). ■ Subsequent characters must be an ASCII letter or digit (A-Za-z0-9), an underscore ('_'), or a dash ('-').
rendered	Boolean	Yes	Specifies whether the component is rendered. When set to `false`, no output is delivered for this component (the component is not in any way rendered, and cannot be made visible on the client). The default value is `true`. The rendering of a component can also be defined at runtime using the Show Component and Hide Component options.
halign	String	Yes	Specifies the horizontal alignment of child components. You can set horizontal alignment on child components only if the `Panel Customizable` component has a horizontal or vertical layout. Available values are `center`, `end`, `left`, `right`, and `start`. Default value is `start`.
valign	String	Yes	Specifies the vertical alignment of child components. You can set vertical alignment on child components only if the `Panel Customizable` component has a horizontal layout. Available values are `baseline`, `bottom`, `middle`, and `top`. Default value is `top`.
shortDesc	String	Yes	Specifies a short description of the component. This text is commonly used by user agents to display tooltip help text, in which case the behavior for the tooltip is controlled by the user agent.

Table B–6 (Cont.) Attributes of a Panel Customizable Component

Attribute	Type	Supports EL?	Description
layout	String	Yes	Specifies how the children of the `Panel Customizable` must be laid out. Available options are `horizontal`, `vertical`, `scroll`, `stretch`, and `auto`. The default value is `vertical`. Depending on the value of the `layout` attribute, child components are laid out as follows: ■ If you select `vertical`, then the child components are displayed one below the other and can be moved either up or down within the layout. ■ If you select `horizontal`, then the child components are displayed adjacent to each other and can be moved either to the left or right within the layout. ■ If you select `scroll`, then the child components are displayed one below the other, with scroll bars displayed if content overflows. ■ If you select `stretch`, then the first child component is stretched to fill up available space in the `Panel Customizable` component. Subsequent child components are ignored. However, they are not removed from the page. The Add icons for adding new `Panel Customizable` components adjacent to the selected one are not enabled if you set `layout` to `stretch`. ■ If you select `auto`, the child component is stretched only if the `Panel Customizable` is stretched by its parent. If not, the content scrolls.
Style Attributes			
styleClass	String	Yes	A CSS style class to use for this component. The style class can be defined in your JSPX page or in a skinning CSS file, for example.

Table B–6 (Cont.) Attributes of a Panel Customizable Component

Attribute	Type	Supports EL?	Description
inlineStyle	String	Yes	The CSS styles to use for this component. This is intended for basic style changes. The `inlineStyle` is a set of CSS styles that are applied to the root DOM element of the component. If the `inlineStyle` attribute's CSS properties do not affect the DOM element you want affected, then you must create a skin and use the skinning keys which are meant to target particular DOM elements, like `::label` or `::icon-style`.
Behavior Attributes			
allowAction	Boolean	Yes	Determines whether this component allows addition of child components, dragging and dropping `Show Detail Frame` components inside and from it, and rearranging child components at runtime. It also determines whether the Add Box icons (that enable users to add Box components adjacent to the component) must be rendered on the component. Available values are `none` and `all`. The default value is `all`. **Note:** You can also set this attribute while defining component security in the application's `adf-config.xml` file. For more information, see Section 22.5, "Applying Action-Level Restrictions on Panel Customizable and Show Detail Component Actions."
showEditAction	Boolean	Yes	While in Edit mode, in Add Content or Design view, renders an **Edit** icon on the `Panel Customizable` header that enables users to edit component properties at runtime. Available values are `true` and `false`. Default value is `true`. This is relevant only in a Composer-enabled page, that is, if the `Panel Customizable` component is nested within a `Page Customizable` component.

Table B–6 (Cont.) Attributes of a Panel Customizable Component

Attribute	Type	Supports EL?	Description
showSplitAction	Boolean	Yes	In Add Content or Design view of a page in Edit mode, renders the Add Box icons on the `Panel Customizable` header that enable users to add Box components above, below, to the left, or right of the selected component. Available values are `true` and `false`. Default value is `true`. This is relevant only in a Composer-enabled page, that is, if the `Panel Customizable` component is nested within a `Page Customizable` component. However, the Add Box icons are not displayed on the root `Panel Customizable` component. Although the default value for this attribute is `true`, the Add Box icons are not displayed on a component that is stretched.
showTabAction	Boolean	Yes	In Add Content or Design view of a page in Edit mode, renders the Add a Tab Set or a Tab icon on the `Panel Customizable` header that enables users to add a tabs to the page. Available values are `true` and `false`. Default value is `false`. This is relevant only in a Composer-enabled page, that is, if the `Panel Customizable` component is nested within a `Page Customizable` component.
Advanced Attributes			
binding	`oracle.adf.view.page.editor.component.PanelCustomizable`	Supports only EL	An EL reference that stores the component instance in a bean. This can be used to give programmatic access to a component from a backing bean, or to move creation of the component to a backing bean.
Customization Attributes			
customizationAllowed	Boolean		Specifies whether customizations are allowed on this component. Available values are `true` and `false`. The default value is `true`.
customizationAllowedBy	String		Specifies the roles for which customization is enabled.
Other Attribute			
customizationId			This attribute has been deprecated. Use the `id` attribute.

Supported Facets

The `Panel Customizable` component supports a `separator` facet, which can be used to render content once between each of its child components.

Disabling the Edit Option on a Panel Customizable Component

When you switch to the Edit mode of a page at runtime, in Add Content or Design view you will notice an **Edit** icon on all `Panel Customizable` or `Box` components that can be edited. To disable property editing on a specific `Panel Customizable` or `Box` component in Add Content or Design view, you must set the `showEditAction` attribute on the component to `false` at design time. The **Edit** icon is no longer displayed on the component in Add Content or Design view. However, users can still select such a component in Structure view and edit its properties.

B.1.5 Show Detail Frame Component

Add `Show Detail Frame` components inside `Panel Customizable` components to enable runtime customizations like move, minimize, restore, and delete of child components. You can move `Show Detail Frame` components only if they are added inside a `Panel Customizable` component.

Geometry Management

A `Show Detail Frame` component can be stretched by a parent layout component that stretches its children, for example, `Panel Customizable`.

A `Show Detail Frame` component stretches its child component to fill the height and width available to it. It is recommended that you add only one child component inside a `Show Detail Frame` component. However, if you have more than one child component, the first child component is stretched to the height and width of the `Show Detail Frame`'s content area and subsequent child components are ignored.

The resize handler at the lower right corner of a `Show Detail Frame` enables you to resize the component vertically. From then on, the `Show Detail Frame` cannot be stretched by its parent.

Table B–7 describes the attributes of a `Show Detail Frame` component.

Table B–7 Attributes of a Show Detail Frame Component

Attribute	Type	Supports EL?	Description
Common Attributes			
id	String	No	The identifier for the component. The identifier must follow a subset of the syntax allowed in HTML: - Must not be a zero-length String. - First character must be an ASCII letter (A-Za-z) or an underscore ('_'). - Subsequent characters must be an ASCII letter or digit (A-Za-z0-9), an underscore ('_'), or a dash ('-').
rendered	Boolean	Yes	Specifies whether the component is rendered. When set to `false`, no output is delivered for this component (the component is not in any way rendered, and cannot be made visible on the client). The default value is `true`. The rendering of a component can also be defined at runtime using the Show Component and Hide Component options.
text	String	Yes	A title for the `Show Detail Frame` component. You can change the style of this text using the `headerStyle` attribute.

icon	String	Yes	If you decide to add an icon on the header of the `Show Detail Frame` component, then this specifies the URI for the image to be used.
			For example:
			`icon="http://source-pc/images/accessability.gif"`
			Note: An image that is stored at the document root does not require a full path. For example:
			`icon="detail.gif"`

Appearance Attributes			
text	String	Yes	A title for the `Show Detail Frame` component. You can change the style of this text using the `headerStyle` attribute.

Table B–7 (Cont.) Attributes of a Show Detail Frame Component

Attribute	Type	Supports EL?	Description
shortDesc	String	Yes	The short description of the component. This text is commonly used by user agents to display tooltip help text, in which case the behavior for the tooltip is controlled by the user agent, for example, Firefox 2 truncates long tooltips. For form components, the `shortDesc` is displayed in a note window.

icon	String	Yes	If you decide to add an icon on the header of the `Show Detail Frame` component, then this specifies the URI for the image to be used.
			For example:
			`icon="http://source-pc/images/accessability.gif"`
			Note: An image that is stored at the document root does not require a full path. For example:
			`icon="detail.gif"`

background	String	Yes	Working with the skin CSS, provides a means of applying a different look and feel for this `Show Detail Frame` instance. Available values are `light`, `medium`, `dark`, and `coreDefault`. The default value is `medium`. The `coreDefault` value is similar to `medium`, but additionally it provides a rounded border for the container and renders a shadow. The background in this case would be similar to that of an ADF Faces `panelBox` component.
displayHeader	Boolean	Yes	Indicates whether the header of the `Show Detail Frame` is displayed. The default value is `true`. If you choose to set `displayHeader` to `false` and if you have exposed some actions on the component, then a toolbar is displayed when you move the mouse over the component area. The toolbar contains a drop down icon, which displays a menu of available options. This toolbar displays only in Edit mode, if there are actions available on the component.
displayShadow	Boolean	Yes	Specifies whether a shadow is cast by the `Show Detail Frame` component. The default value is `false`.

Table B–7 (Cont.) Attributes of a Show Detail Frame Component

Attribute	Type	Supports EL?	Description
expansionMode	String	Yes	The default state of the `Show Detail Frame`. Available values are `minimized` and `normal`. The default display mode is `normal`.
rendered	Boolean	Yes	Specifies whether the component is rendered. When set to `false`, no output is delivered for this component (the component is not in any way rendered, and cannot be made visible on the client). The default value is `true`. The rendering of a component can also be defined at runtime using the Show Component and Hide Component options.
Actions Attributes			
displayActions	String	Yes	Specifies when seeded interactions are displayed. Available options are `onHover` and `always`. The default is `always`.
inheritGlobalActions	Boolean	Yes	This attribute is of significance if you add child custom action components, and the attribute specifies whether the global `action` value of a `custom action` must override the local value. The default value is `false`. For information about global custom actions, see Section 20.3.2.2, "Defining Custom Actions at the Global Level."
showMoveAction	String	Yes	Specifies whether the Move action is available for the component. Available values are: ■ `menu`—Move action is displayed in the Actions menu, and the action to drag and drop the header is enabled ■ `none`—User can move the component by clicking the header and using drag and drop ■ `disabled`—Component cannot be moved The default value is `menu`. **Note:** The disabled option is applicable only in View mode.

Table B–7 (Cont.) Attributes of a Show Detail Frame Component

Attribute	Type	Supports EL?	Description
showRemoveAction	String	Yes	Renders a **Remove** icon on the `Show Detail Frame` header. Clicking this icon removes the component from the page. Available values are `chrome` and `none`. The default value is `none`. Note: In page Edit mode, the Remove icon appears regardless of this setting, provided other restrictions have not been applied.
showResizer	String	Yes	Specifies whether a resize handle is displayed on the lower right corner of the `Show Detail Frame`. You can alter only the height of a `Show Detail Frame` while resizing it. Available values are `never` and `always`. The default value is `always`.
showMinimizeAction	String	Yes	Specifies whether the minimize action is displayed on the header. Available values are `chrome` and `none`. The default is `chrome`.
showEditAction	Boolean	Yes	While in Edit mode, in Add Content or Design view, renders an **Edit** icon on the `Show Detail Frame` header that enables you to edit component properties at runtime. Default value is `true`. This is relevant only in a Composer-enabled page, that is, if the `Show Detail Frame` component is nested within a `Page Customizable` component.
Style Attributes			
contentStyle	String	Yes	The CSS style to apply to the `Show Detail Frame` content area. Manually enter any style in compliance with CSS version 2.0 or later. The CSS styles in this attribute are commonly used to define the height and background color of the `Show Detail Frame`. For example, `height:200px; background-color:green;` **Note**: If the `Show Detail Frame` component is nested inside a `Panel Customizable` component with a horizontal layout, you must specify a width for the `Show Detail Frame` component to ensure that it is rendered in page View mode.

Table B–7 (Cont.) Attributes of a Show Detail Frame Component

Attribute	Type	Supports EL?	Description
styleClass	String	Yes	The CSS style class to use for this component. The style class can be defined in your JSPX page or in a skinning CSS file, for example.
inlineStyle	String	Yes	The CSS styles to use for this component. This is intended for basic style changes. The `inlineStyle` is a set of CSS styles that are applied to the root DOM element of the component. If the `inlineStyle`'s CSS properties do not affect the DOM element you want affected, then you must create a skin and use the skinning keys which are meant to target particular DOM elements, like `::label` or `::icon-style`.
headerStyle	String	Yes	The CSS style to apply to the `Show Detail Frame` title that is displayed on the header. Manually enter any style in compliance with CSS version 2.0 or later. The CSS styles in this attribute are commonly used to define the font, size, and color of the title text.
Behavior Attributes			
partialTriggers	String	Yes	The IDs of the components that should trigger a partial update. This component listens on the trigger components. If a trigger component receives an event that causes it to update in some way, this component requests to be updated too. Identifiers are relative to the source component (this component), and must account for NamingContainers. If your component is inside of a naming container, you can use a single colon to start the search from the root of the page, or multiple colons to move up through the NamingContainers - "`::`" pop out of the component's naming container (or itself if the component is a naming container) and begin the search from there, "`:::`" pop out of two naming containers (including itself if the component is a naming container) and begin the search from there.
disclosureListener	`javax.el.MethodExpression`	Yes	A method reference to a disclosure listener. A disclosure event is fired when the user expands or collapses the `Show Detail Frame` component.

Table B–7 (Cont.) Attributes of a Show Detail Frame Component

Attribute	Type	Supports EL?	Description
stretchContent	String	Yes	Specifies whether the `Show Detail Frame` stretches its child component. Available options are `true`, `false`, and `auto`. The default value is `true`. You can use the `stretchContent` attribute to stretch a child component that supports being stretched. For example, container components like `Panel Form Layout`, `Panel Customizable`, and `Show Detail Item` provide the capability to be stretched. If you select `true`, then the child component is stretched to the height and width of the `Show Detail Frame`'s content area. The default height of the `Show Detail Frame` is 200px. The height of the `Show Detail Frame` is defined using the `ContentStyle` attribute. If you select `auto`, the child component is stretched only if the `Show Detail Frame` is wrapped inside a component that stretches it. If not, `stretchContent` is set to `false`.
Advanced Attributes			
binding	`oracle.adf.view.page.editor.component.ShowDetailFrame`	Supports only EL	An EL reference that stores the component instance in a bean. This can be used to give programmatic access to a component from a backing bean, or to move creation of the component to a backing bean.
attributeChangeListener	`javax.el.MethodExpression`	Yes	A method reference to an attribute change listener. Attribute change events are not delivered for any programmatic change to a property. They are only delivered when a renderer changes a property without the application's specific request. An example of an attribute change event might include the width of a column that supported client-side resizing.

Table B–7 (Cont.) Attributes of a Show Detail Frame Component

Attribute	Type	Supports EL?	Description
selectChild	String	Yes	Specifies whether runtime selection and customization are enabled on child components. This is relevant only in a Composer-enabled page, that is, if the `Show Detail Frame` component is nested within a `Page Customizable` component. Default value is `yes`. However, when you add a task flow as a child of the `Show Detail Frame` component, this attribute defaults to `no`. If you select `yes`, then child components can be selected and customized at runtime.
Customization Attributes			
customizationAllowed	Boolean		Specifies whether customizations are allowed on this component. Available values are `true` and `false`. The default value is `true`.
customizationAllowedBy	String		Specifies the roles for which customization is enabled.

Table B–7 (Cont.) Attributes of a Show Detail Frame Component

Attribute	Type	Supports EL?	Description
Other Attributes			
childCreation	String	Yes	Specifies when the children (contents) of the `Show Detail Frame` component are created. Valid values are: - `immediate` (default): All children are immediately created when the `Show Detail Frame` component is rendered, even when it is collapsed. - `lazy`: Children are created when the `Show Detail Frame` component is likely to be expanded. This behavior optimizes performance by postponing the creation of children until the `Show Detail Frame` parent component is expanded. The children remain in cached memory for subsequent display. - `lazyUncached`: Children are created when the `Show Detail Frame` parent component is likely to be expanded, and children are deleted when no longer visible. This means children do not reside in cached memory when not visible so must be re-created each time the parent component is expanded.
customizationId			This attribute has been deprecated. Use the `id` attribute.
helpTopicID	String	Yes	Specifies a Help topic ID that is used to link to a custom Help topic from the component. To link to a Help topic from your `Show Detail Frame` component instance, you can either link to an HTML file that is stored directly in your application directory, or to a Help topic that is part of a JAR file.

Supported Facets

Table B–8 describes the facets available on a `Show Detail Frame` component.

Table B–8 Show Detail Frame Facets

Name	Description
titleBarAction	Used if an action is to be associated with title of the `Show Detail Frame` component. The component specified by the facet is rendered in place of the `Show Detail Frame`'s `text` attribute.

Table B–8 (Cont.) Show Detail Frame Facets

Name	Description
additionalActions	Used if some additional actions are to be added to the Actions menu available on the `Show Detail Frame` header. To ensure that the additional actions appear similar to other actions on the menu, use `Command Menu Item` components or a `Group` component with nested `Command Menu Item` components inside this facet.

Displaying Child Component Properties Along with Show Detail Frame Properties

When you switch to the Edit mode of a page at runtime, in Add Content or Design view you will notice an **Edit** icon on all `Show Detail Frame` components that can be edited. Clicking this icon invokes the Component Properties dialog in which users can edit the `Show Detail Frame`'s properties. If you want the Component Properties dialog to display the `Show Detail Frame`'s properties and its child component's properties, then you can use the custom attribute, `sdf_selection_rule`.

In JDeveloper, right-click the `Show Detail Frame` component and select **Insert inside cust:showDetailFrame**, **JSF core**, and then **Attribute**. In the Insert Attribute dialog, specify `sdf_selection_rule` as the name and `sdf_for_edit_mode_only` as the value. In Source mode, this attribute appears as shown in the following example:

```
<cust:showDetailFrame text="showDetailFrame 1" id="sdf1">
  <f:attribute name="sdf_selection_rule" value="sdf_for_edit_mode_only"/>
</cust:showDetailFrame>
```

Disabling the Edit Option on a Show Detail Frame Component

When you switch to the Edit mode of a page at runtime, in Add Content or Design view you will notice an **Edit** icon on all `Show Detail Frame` components that can be edited. To disable property editing on a specific `Show Detail Frame` or `Movable Box` component in Add Content or Design view, then you can do this by setting the `showEditAction` attribute on the component to `false` at design time. The **Edit** icon is no longer displayed on the component when you enter the Edit mode of the page at runtime. However, users can still select such a component in Structure view and edit its properties.

B.1.6 Custom Action

Use `Custom Action` components to trigger navigational flow in a task flow when a region is included inside a `Show Detail Frame` component. You can define custom actions corresponding to the ADFc outcomes of the task flows. At runtime, these custom actions are displayed on the `Show Detail Frame` header as icons, menu options, or both. A `Custom Action` must always be defined as a child component of a `Show Detail Frame` and is useful only when the `Show Detail Frame` also contains a task flow as its child component.

You can add as many `Custom Action` components as there are ADFc outcomes in the task flow. If you add a `Custom Action` attribute without a corresponding ADFc outcome, or if the `action` attribute value does not match an ADFc outcome defined on the view that is currently being displayed by the task flow, then that action is not displayed at runtime.

Note: You can also define custom actions for `Show Detail Frame` components at the global level. For more information, see Section 20.3.2, "How to Enable Custom Actions on a Show Detail Frame Enclosing a Task Flow."

Table B–9 describes the attributes of a `Custom Action` component.

Table B–9 Attributes of a Custom Action Component

Attribute	Type	Supports EL?	Description
Common Attributes			
id	String	No	The identifier for the component. The identifier must follow a subset of the syntax allowed in HTML: ■ Must not be a zero-length String. ■ First character must be an ASCII letter (A-Za-z) or an underscore ('_'). ■ Subsequent characters must be an ASCII letter or digit (A-Za-z0-9), an underscore ('_'), or a dash ('-').
action	String	Yes	Specifies the action outcome defined for the task flow. The value of this attribute must match the relevant ADFc outcome in the task flow definition file.
rendered	Boolean	Yes	Specifies whether the component is rendered. When set to `false`, no output is delivered for this component (the component is not in any way rendered, and cannot be made visible on the client). The default value is `true`. The rendering of a component can also be defined at runtime using the Show Component and Hide Component options.
text	String	Yes	Represents the text of the menu item link. This is applicable for a custom action rendered as a menu item link.
Appearance Attributes			

Table B–9 (Cont.) Attributes of a Custom Action Component

Attribute	Type	Supports EL?	Description
icon	String	Yes	For a custom action rendered as a toolbar link, specifies the icon to be rendered on the chrome. For a custom action rendered as a menu item link, this represents the icon to be displayed against the menu item text. This attribute supports these various types of URIs: ■ absolute - an absolute path to the image, like `"http://oracleimg.com/admin/images/ocom/hp/oralogo_small.gif"` ■ relative - a path located relatively to the source page, like `"bullet.jpg"` ■ context relative - a path relatively based on the web application's context root, like `"/images/error.png"` ■ server relative - a path relatively based on the web server by application name, like `"//adf-richclient-demo-context-root/images/error.png"` As icon does not allow alternative text to be provided for the image, in order to create an accessible product an icon must only be used when its use is purely decorative.
shortDesc	String	Yes	Provides a short description of the component. This text is commonly used by user agents to display tooltip help text, in which case the behavior for the tooltip is controlled by the user agent, for example, Firefox 2 truncates long tooltips. For form components, the `shortDesc` is displayed in a note window. This is applicable only for a custom action rendered as a toolbar icon.
location	String	Yes	Determines whether the custom action is rendered as a toolbar icon or a menu item link. Available values are `chrome`, `menu`, or `both`. Default value is `chrome`.
Customization Attributes			
customizationAllowed	Boolean		Specifies whether customizations are allowed on this component. Available values are `true` and `false`. The default value is `true`.
customizationAllowedBy	String		Specifies the roles for which customization is enabled.

Table B–9 (Cont.) Attributes of a Custom Action Component

Attribute	Type	Supports EL?	Description
Other Attributes			
actionComponent	String	Yes	Specifies the ID of the command component that must be queued for the action event. When the `actionComponent` attribute is specified, the `Show Detail Frame` component queues the action event on this component. For more information, see Section 20.3.2.3, "Configuring Custom Actions that Display Task Flow Views in a Separate Browser Window."
customizationId			This attribute has been deprecated. Use the `id` attribute.

B.1.7 Show Property

Use the `Show Property` component to display an attribute or parameter in a custom property panel at runtime. Use one `Show Property` component for each attribute or parameter that you want to display to users at runtime.

For more information about the `Show Property` component, see Section 19.3.6, "How to Display Properties and Parameters in a Custom Property Panel."

Table B–10 describes the new attributes of a `Show Property` component.

Table B–10 Attributes of a Show Property Component

Attribute	Type	Supports EL?	Description
Common Attributes:			
id	String	No	The identifier for the component. The identifier must follow a subset of the syntax allowed in HTML: ■ Must not be a zero-length String. ■ First character must be an ASCII letter (A-Za-z) or an underscore ('_'). ■ Subsequent characters must be an ASCII letter or digit (A-Za-z0-9), an underscore ('_'), or a dash ('-').
rendered	Boolean	Yes	Specifies whether the component is rendered. When set to `false`, no output is delivered for this component (the component is not in any way rendered, and cannot be made visible on the client). The default value is `true`. The rendering of a component can also be defined at runtime using the Show Component and Hide Component options.
attributeType	String	Yes	Specifies the property type. Supported values are `text`, `cbox`, `date`, `lov`.

Table B–10 (Cont.) Attributes of a Show Property Component

Attribute	Type	Supports EL?	Description
value	String	Yes	Specifies the current value of the property. If the EL binding for the "value" points to a bean property with a getter but no setter, and this is an editable component, the component will be rendered in read-only mode.
label	String	Yes	Specifies the label of the component. If you want the label to appear above the control, use a `panelFormLayout`.
Data Attributes:			
value	String	Yes	Specifies the current value of the property. If the EL binding for the "value" points to a bean property with a getter but no setter, and this is an editable component, the component will be rendered in read-only mode.
selectItem			Specifies the list of values to be displayed if `attributeType` was set to `lov`. This attribute takes an EL value that returns the list of values dynamically.
Appearance Attributes:			
columns	Int	Yes	Specifies the size of the text control specified by the number of characters shown. The number of columns is estimated based on the default font size of the browser.
rows	Int	Yes	Specifies the height of the text control specified by the number of characters shown. The default value is 1, which generates a one-row input field. The number of rows is estimated based on the default font size of the browser.
label	String	Yes	Specifies the label of the component. If you want the label to appear above the control, use a `panelFormLayout`.
shortDesc	String	Yes	Provides a short description of the component. This text is commonly used by user agents to display tooltip help text, in which case the behavior for the tooltip is controlled by the user agent, for example, Firefox 2 truncates long tooltips. For form components, the `shortDesc` is displayed in a note window. This is applicable only for a custom action rendered as a toolbar icon.

Table B–10 (Cont.) Attributes of a Show Property Component

Attribute	Type	Supports EL?	Description
simple	Boolean	Yes	A boolean value that controls whether the component provides label support; when set to "true", the component will not display the label (these may be ignored: label, labelAndAccessKey, accessKey, showRequired, help facet) and may use simpler layout primitives. One of the usecases can be when the component is used in repeatable elements like in table, for-each etc., where label is not required.
unselectedLabel	String	Yes	Specifies the label for the option that represents a value of null, meaning nothing is selected. If `unselectedLabel` is not set and if the component does not have a selected value, then an option with an empty string as the label and value is rendered as the first option in the choice box (if there isn't an empty option already defined). Once an option has been successfully selected, and if `unselectedLabel` is not set, then the empty option will not be rendered.
Behavior Attributes:			
required	Boolean	Yes	Specifies whether a non-null, non-empty value must be entered. If `false`, validators will not be executed when the value is null or empty.
autoSubmit	Boolean	Yes	Specifies an attribute which if set to TRUE on a form element, the component will automatically submit when an appropriate action takes place (a click, text change, etc.). Since `autoSubmit` is a partial submit, also submitted and re-rendered are any other components with `partialTriggers` pointing to this component.
disabled	Boolean	Yes	Specifies whether the property should be shown as disabled. This is useful if the `Show Property` component is inside an iterator whose model specifies that the property must be shown as disabled, for example, if an MDS restriction has been applied on the property.
validator	String	Yes	Specifies a method reference to a validator method.
valueChangeListener	javax.faces.el.MethodBinding	EL only	Specifies a method reference to a value change listener.
Advanced Attributes:			
binding	`oracle.adf.view.rich.component.fragment.UIXDeclarativeComponent`	Supports only EL	Specifies an EL reference that stores the component instance in a bean. This can be used to give programmatic access to a component from a backing bean, or to move creation of the component to a backing bean.

Table B–10 (Cont.) Attributes of a Show Property Component

Attribute	Type	Supports EL?	Description
clientComponent	Boolean	Yes	Specifies whether a client-side component will be generated. A component may be generated whether or not this flag is set, but if client Javascript requires the component object, this must be set to true to guarantee the component's presence. Client component objects that are generated today by default may not be present in the future; setting this flag is the only way to guarantee a component's presence, and clients cannot rely on implicit behavior. However, there is a performance cost to setting this flag, so clients should avoid turning on client components unless absolutely necessary.
componentId			If you use the `Show Property` tag in Composer's property panel, `componentId` specifies the ID of the component for which the property must be rendered.
showELBuilder	Boolean	Yes	Specifies whether to display the EL builder for the property.
showResourceEditor	Boolean	Yes	Specifies whether to display the resource string editor for the property. However, this option is enabled only if you have configured resource string editing in the application and the property is of type String. For more information, see Section 20.12, "Configuring Runtime Resource String Editing."
taskFlowId	String	Yes	If `Show Property` is used to display task flow parameters, `taskFlowId` specifies the ID of the task flow.
taskFlowParam	String	Yes	If `Show Property` is used to display task flow parameters, `taskflowParam` specifies the task flow parameter that the input field must display.
customizationId			This attribute has been deprecated. Use the `id` attribute.
Customization Attributes			
customizationAllowed	Boolean		Specifies whether customizations are allowed on this component. Available values are `true` and `false`. The default value is `true`.
customizationAllowedBy	String		Specifies the roles for which customization is enabled.
Other Attribute			
text	String	Yes	Specifies the text used for the check box. This is used only when `type` is set to `boolean`.

Supported Facets

The `Show Property` component supports a `customLink` facet, which can be used to include a `Commamd Menu Item`. The `Command Menu Item` specified in this facet appears as a custom link in the dropdown next to the property field, along with Resource String editor and EL Builder.

B.2 Composer-Specific Files and Configurations

This section describes the various files that you can modify to extend Composer capabilities. While some files, for example the Composer extension file, `pe_ext.xml`, are entirely relevant to Composer only, others are ADF configuration files that can take entries for Composer-specific configurations.

This section includes the following topics:

- Section B.2.1, "pe_ext.xml"
- Section B.2.2, "adf-config.xml"
- Section B.2.3, "adf-settings.xml"
- Section B.2.4, "web.xml"

B.2.1 pe_ext.xml

You can create a `pe_ext.xml` file and add elements in it to register new Composer add-ons and custom property panels, selectively render panels, register event handlers, and define property filters. This file is not available by default when you add Oracle Components to a page. You can create this file in the `META-INF` directory in your `Portal` project; for example, in the *`APPLICATION_HOME`*`\Portal\src\META-INF` directory. This section describes the different elements of the Composer extension file schema and explain when you may want to use the schema elements.

> **Note:** In applications that use shared libraries with their own pe_ext.xml file, use the **`sequence`** element within the `pe-extension` tag to define the order of execution. Use `sequence="first"` to lay down default settings, and `sequence="last"` to load the file last and override settings defined by files loaded previously.

This section contains the following subsections:

- Section B.2.1.1, "addon-config"
- Section B.2.1.2, "property-panels"
- Section B.2.1.3, "lov-config"
- Section B.2.1.4, "event-handlers"
- Section B.2.1.5, "drop-handlers"
- Section B.2.1.6, "filter-config"
- Section B.2.1.7, "elbuilder-config"
- Section B.2.1.8, "selection-config"
- Section B.2.1.9, "Sample pe_ext.xml File"

B.2.1.1 addon-config

Use the addon-config element to include entries for new Composer add-ons and custom property panels. For example, to add a new **About** button to your page that invokes a panel displaying information about your application, you must first create a task flow containing the information and then register this task flow in the pe_ext.xml file. Composer add-ons declared inside the addon-config element are configured in the adf-config.xml file, whereas custom property panels declared within the addon-config element are configured within the property-panels element in the extension file itself.

For information about configuring add-ons in adf-config.xml, see Section B.2.2.2, "addon-panels." For information about configuring custom property panels using the property-panels element, see Section B.2.1.2, "property-panels."

Insert the addon-config element within the pe-extension tag. You can add only one addon-config element in the XML file. Within the addon-config element you can have a panels element to define add-ons.

panels

Use the panels element to register new add-ons or property panels in Composer. Add the panels element within the addon-config element. You can have only one panels element in an extension file, and all custom panels must be defined inside this element.

panel

Use panel elements to define individual add-ons and property panels to display to users. Within the panels element you can insert any number of individual panel elements that define the add-ons or property panels to be displayed in Composer. You must have one panel element for every add-on or property panel you want to display.

Table B–11 describes the attributes of the panel element.

Table B–11 panel Element Attributes

Attribute	Description
name	An identifier that is used while referencing the new add-on in adf-config.xml, or a property panel in the property-panels section. This must be unique in the application.
title	The title to display on the button used to invoke the task flow in Composer. You can use EL for this property to show a localized title. For custom property panels, the title to display on the new tab for that panel.
icon	The icon that appears next to the title on the button. This is optional.
taskflow-id	The ID of the task flow that defines the add-on or property panel.
help-topic-id	A help topic ID that links to a custom help topic from the add-on or property panel. This is optional.

When a panel element is deleted from the file, that add-on or property panel is not displayed on the page.

The following example shows how to use the addon-config, panels, and panel elements:

```
<addon-config>
  <panels>
    <panel name="oracle.fod.custom.panel" title="About FOD"
           icon="adf/webcenter/images/about.gif"
           taskflow-id="/WEB-INF/about-fod.xml#about-fod"
    />
  </panels>
</addon-config>
```

For more information about add-ons, see Section 19.2, "Creating Composer Add-Ons."

Optionally, to register an event handler for a specific add-on panel, you can also add an `event-handlers` element inside a `panel` element, as shown in the following example:

```
<event-handlers>
  <event-handler event="close">
    oracle.fod.custom.TaskFlowEventHandler
  </event-handler>
</event-handlers>
```

The XML code is the same as for any generic event handler. For more information, see Section B.2.1.4, "event-handlers."

B.2.1.2 property-panels

Use the `property-panels` element to register custom property panels. Add the `property-panels` element within the `addon-config` element. For information about custom property panels, see Section 19.3, "Creating Custom Property Panels." You can have only one `property-panels` element in an extension file.

property-panel

Use the `property-panel` element to define a custom property panel to display for a particular component in Composer. Within the `property-panels` element you can insert any number of individual `property-panel` elements to define custom property panels to display as tabs in the Component Properties dialog. To specify the component or task flow for which you want to register a custom property panel, you must add a `component` or `taskflow-id` element respectively within the `property-panel`.

Table B–12 describes the `property-panel` element attributes.

Table B–12 property-panel Element Attributes

Attribute	Description
`name`	An identifier for the custom property panel you want to display in the Component Properties dialog.
`rendered`	Whether this panel is displayed to users in the Component Properties dialog. This can take an EL value.

component

Use the `component` element to specify the fully qualified class name of the component for which you are registering the custom property panel. You can have only one `component` inside a `property-panel` element.

taskflow-id

Use the taskflow-id element to specify the name of the task flow for which you are registering the custom property panel. You can have only one taskflow-id inside a property-panel element.

panel

Use the panel element to specify a custom property panel to display as a tab in the Component Properties or Page Properties dialog for the component. Within a property-panel element, you can have any number of panel elements. Table B–13 describes the attributes of a panel element.

Table B–13 panel Element Attributes

Attribute	Description
name	Name with which you declared the panel in the addon-config section.
rendered	Whether the custom property panel must be rendered or not.
parameter	Parameters to be passed to the implementing task flow. Takes an EL only and must return a Map<String, String>.

When a panel element is deleted from the file, that property panel is no longer displayed in the Component Properties dialog.

The following example shows how to register a custom property panel for a Command Button component:

```
<property-panels>
  <property-panel name="cmdbtn">
    <component>oracle.rich.CommandButton</component>
    <panel name="prop.panel.cmdbtn"/>
  </property-panel>
</property-panels>
```

The following example shows how to register a custom property panel for a task flow:

```
<property-panels>
  <property-panel name="dashboard">
    <taskflow-id>/WEB-INF/dashboard-taskflow#prop-panel</taskflow-id>
    <panel name="dashboard.prop-panel" />
  </property-panel>
</property-panels>
```

B.2.1.3 lov-config

Use the lov-config element to register a custom List of Values or picker for a task flow parameter. Add the lov-config element directly under the pe-extension tag. You can have only one lov-config element in an extension file. Within this element, you can add a task-flow-definition element for each task flow that you want to register for LOV usage. Add an input-parameter-definition for each parameter that provides an LOV. Use enumeration elements to list the LOV options for a parameter, as shown in the following example:

```
<lov-config>
  <task-flow-definition
taskflow-id="/WEB-INF/employee-details.xml#employee-details">
    <input-parameter-definition>
      <name>Designation</name>
        <enumeration>
```

```
          <item>
            <name>Accounts Manager</name>
            <value>Accounts Manager</value>
            <description>Accounts Manager</description>
          </item>
          <item>
            <name>Accounts Assistant</name>
            <value>Accounts Assistant</value>
            <description>Accounts Assistant</description>
          </item>
          <item>
            <name>Payroll Executive</name>
            <value>Payroll Executive</value>
            <description>Payroll Executive</description>
          </item>
          <item>
            <name>Senior Manager</name>
            <value>Senior Manager</value>
            <description>Senior Manager</description>
          </item>
        </enumeration>
    </input-parameter-definition>
  </task-flow-definition>
</lov-config>
```

For more information, see Section 19.5, "Configuring Custom LOVs or Pickers for Task Flow Parameters."

B.2.1.4 event-handlers

Use the `event-handlers` element to register handlers for events generated by Composer. Add the `event-handlers` element directly under the `pe-extension` tag. You can have only one `event-handlers` element under `pe-extension`.

Alternatively, to register an event handler for a specific Composer add-on panel, you can also add an `event-handlers` element inside a `panel` element under the `addon-config` section. For more information, see Section B.2.1.1, "addon-config."

event-handler

Use the `event-handler` element to register an event handler in Composer. Within `event-handlers` you can have any number of `event-handler` elements to register handlers for save, close, deletion, addition, and selection events. For example, if you have implemented the `processSave` method in a Java class called `SaveHandler` to perform a specific action when a Save event is invoked, then you can register that implementation in Composer by adding an `event-handler` entry in the `pe_ext.xml` file as follows:

```
<event-handlers>
  <event-handler event="save">view.SaveHandler</event-handler>
</event-handlers>
```

For information about configuring event handlers, see Section 19.6, "Configuring Event Handlers for Composer UI Events."

B.2.1.5 drop-handlers

Use the `drop-handlers` element to register drop handlers to handle addition of components to the page from the resource catalog. Add the `drop-handlers` element directly under the pe-extension tag. You can have only one drop-handlers element in an extension file.

drop-handler

Use the drop-handler element to register a drop handler in Composer. Within drop-handlers you can have any number of drop-handler elements to register drop handlers that you created in the application. For example, if you created a drop handler called TestDropHandler to handle addition of XML components on the page, then you can register that implementation in Composer by adding a drop-handler entry in the pe_ext.xml file as follows:

```
<drop-handlers>
  <drop-handler>test.TestDropHandler</drop-handler>
</drop-handlers>
```

For more information, see Section 19.7, "Configuring Drop Handlers in the Resource Catalog."

B.2.1.6 filter-config

Use the filter-config element to define property filters for components that can be edited at runtime. For a selected component, the Component Properties dialog displays properties that can be edited. If you do not want to expose all properties for editing, you can filter specific properties so that they are not displayed in the Component Properties dialog. You can specify global-level filters to filter common attributes across all components, or you can define tag-level filters to filter properties for a particular component only.

Add the filter-config element directly under the pe-extension tag. You can have only one filter-config element in an extension file.

For information about property filters, see Section 19.8, "Defining Property Filters."

global-attribute-filter

Use the global-attribute-filter element to filter specific properties across all components. You can have only one global-attribute-filter element in the extension file. Within this element you can include any number of attribute elements to define property filters for components from different libraries.

taglib-filter

Use the taglib-filter element to define property filters for components within a particular library. You can include multiple taglib-filter elements to filter properties for components in different libraries. Within this element you can include tag elements for every component belonging to the library.

Table B–14 describes the attribute the taglib-filter element can take.

Table B–14 tag Element Attribute

Attribute	Description
namespace	Namespace of the tag library containing the component whose properties you want to filter.

tag

Use the tag element to specify a component whose properties you want to filter. You can include multiple tag elements within a taglib-filter element. Within this element you can include attribute elements for all properties you want to filter.

Table B–15 describes the attribute the tag element can take.

Table B–15 tag Element Attribute

Attribute	Description
name	Name of the component whose properties you want to filter, for example, commandButton, portlet.

attribute

Use the attribute element to specify a property to filter either across all components or for the specified component only. To define global-level filters, you must include attribute elements inside the global-attribute-filter. To define property filters for a particular component, you must include attribute elements inside the taglib-filter element.

Table B–16 describes the attributes the attribute element can take.

Table B–16 attribute Element Attributes

Attribute	Description
name	Name of the property you want to filter.
filtered	Whether the property must be filtered or not. Takes a value of true or false. To filter the property in a specific view, use the view attribute.
label	The label for the property in the UI. To retrieve localized strings or show a different label depending on the view, use EL.
view	(Optional) The view in which to show/hide this property. Takes a value of design or source.

The following example shows how you can define global and component-level property filters:

```
<filter-config>
   <global-attribute-filter>
    <attribute name="readOnly" filtered="false" label="Read Only"/>
    <attribute name="required" filtered="false" label="Mandatory"/>
    <attribute name="shortDesc" filtered="false" label="#{composerBundle.PNL_TB_
SHORTDESC}"/>
  </global-attribute-filter>

  <taglib-filter namespace="http://xmlns.oracle.com/adf/faces/rich">
    <tag name="goLink">
      <attribute name="accessKey" view="design"/>
      <attribute name="targetFrame" filtered="false" view="source"/>
      <attribute name="destination" filtered="false"
label="#{pageEditorPanelBean.layoutView ?  'Where do you want to surf?' :
'Destination'}"/>
    </tag>
    <tag name="inputText">
      <attribute name="all" view="design"/>
      <attribute name="label" label="Field Name" filtered="false" />
      <attribute name="readOnly" filtered="false" />
      <attribute name="required" filtered="false" />
      <attribute name="rendered" filtered="false" />
      <attribute name="wrap" filtered="false" />
    </tag>
  </taglib-filter>
```

```
</filter-config>
```

B.2.1.7 elbuilder-config

Use the elbuilder-config element to configure custom values for the expression builder. The expression builder invoked from Composer's Component Properties dialog enables users to specify EL values for component properties. Users can either select for a set of predefined values or enter an EL value in the text box. You can customize the expression builder to provide more options to users. For more information, see Section 19.4, "Extending the Expression Builder."

Add the elbuilder-config element directly under the pe-extension tag. You can have only one elbuilder-config element in an extension file.

selector

Use selector elements to define and include custom options, as shown in the following example:

```
<elbuilder-config>
  <!-- define selector -->
  <selector id="CustomELParameter">
    view.CustomELParameter
  </selector>

  <!-- include selector -->
  <selectors>
    <selector id="CustomELParameter"/>
  </selectors>
</elbuilder-config>
```

You can include many selector elements inside a selectors element.

B.2.1.8 selection-config

Use the selection-config element to enable or disable direct select for specific components and define associated operations. To make a component selectable, you must define operations within this tag. For more information, see Section 19.11, "Enabling Direct Select in Design or Add Content View."

Within the <selection-config> tag, you can configure selection globally using <global-filter> and by namespace and tag using <selection-taglib-filter>.

selection

The selection tag is used to enable direct select view.

operation

Available operations are defined within <operation> tags under each specific component. The following elements are used to define operations:

- name: Defines the operation to be executed. (Use standard or custom operations.)
- label (optional): Overrides the operation name as the tab label in the popup window.
- filtered: Set to false to include the operation in the popup window.

```
<selection-config>
  <global-filter>
    <selection view="design" enabled="false"/>
  </global-filter>
  <selection-taglib-filter
   namespace="http://xmlns.oracle.com/adf/faces/customizable">
    <tag name="showDetailFrame">
      <selection view="design" enabled="true"/>
      <operation name="oracle.adf.pageeditor.pane.sdfprop"
                 label="SDF Change Property"
                 filtered="false"/>
    </tag>
  </selection-taglib-filter>
</selection-config>
```

B.2.1.9 Sample pe_ext.xml File

Example B–1 shows a sample `pe_ext.xml` file with different elements used to extend Composer capabilities.

Example B–1 Sample pe_ext.xml File

```
<pe-extension xmlns="http://xmlns.oracle.com/adf/pageeditor/extension">

<addon-config>
<!-- Composer add-on panels configuration -->
  <panels>
    <panel name="oracle.fod.custom.panel" title="About FOD"
           icon="adf/webcenter/images/about.gif"
           taskflow-id="/WEB-INF/about-fod.xml#about-fod"/>
  </panels>

<!-- Composer property panels configuration -->
  <property-panels>
    <property-panel name="cmdbtn">
      <component>oracle.rich.CommandButton</component>
      <panel name="prop.panel.cmdbtn" />
    </property-panel>
  </property-panels>
</addon-config>

<Save event handler configuration -->
  <event-handlers>
    <event-handler event="save">view.SaveHandler</event-handler>
  </event-handlers>

<!-- Test drop handler configuration -->
  <drop-handlers>
    <drop-handler>test.TestDropHandler</drop-handler>
  </drop-handlers>

<!-- Property filter configuration. Properties defined here are not displayed in
Composer. -->
  <filter-config>
    <global-attribute-filter>
      <attribute name="accessKey" />
      <attribute name="attributeChangeListener" />
      <attribute name="autoSubmit" />
      <attribute name="binding" />
    </global-attribute-filter>
    <taglib-filter namespace="http://xmlns.oracle.com/adf/faces/rich">
      <tag name="commandButton">
        <attribute name="text" />
        <attribute name="icon" />
      </tag>
  </filter-config>
</pe-extension>
```

B.2.2 adf-config.xml

The `adf-config.xml` file specifies application-level settings that are usually determined at deployment and are often changed at runtime. This file is created when you create your application and is located in the `ADF META-INF` folder under `Descriptors` in the Application Resources panel. The following example shows the minimal `adf-config.xml` file created when you create a Portal Framework application:

```
<?xml version="1.0" encoding="windows-1252" ?>
<adf-config xmlns="http://xmlns.oracle.com/adf/config"
            xmlns:adf="http://xmlns.oracle.com/adf/config/properties">
  <adf:adf-properties-child xmlns="http://xmlns.oracle.com/adf/config/properties">
    <adf-property name="adfAppUID" value="Application4-2138"/>
  </adf:adf-properties-child>
</adf-config>
```

When you add the `Page Customizable` component to a page, certain required configurations are added to the `adf-config.xml` file.

You must update the `adf-config.xml` file when you perform tasks such as registering new add-ons and custom property panels, selectively rendering add-ons, creating customization layers, enabling and disabling the Composer sandbox, creating custom resource catalogs, and disabling Structure view. The following sections describe the various `adf-config.xml` elements used for Composer-specific configurations.

This section contains the following subsections:

- Section B.2.2.1, "page-editor-config"
- Section B.2.2.2, "addon-panels"
- Section B.2.2.3, "sandbox-namespaces"
- Section B.2.2.4, "session-options-factory"
- Section B.2.2.5, "enable-design-views"
- Section B.2.2.6, "allow-el and protect-el"
- Section B.2.2.7, "rcv-config"
- Section B.2.2.8, "customizableComponentsSecurity"
- Section B.2.2.9, "mds-config"
- Section B.2.2.10, "resource-string-editor"
- Section B.2.2.11, "enable-source-view"
- Section B.2.2.12, "enable-zoom"
- Section B.2.2.13, "persistent-change-manager"
- Section B.2.2.14, "taglib-config"
- Section B.2.2.15, "security-config"
- Section B.2.2.16, "Sample adf-config.xml File"

B.2.2.1 page-editor-config

Use the `<pe:page-editor-config>` element to include Composer-specific configurations such as add-on panel registration, sandbox configuration, resource string editor configuration, and so on. Add the `<pe:page-editor-config>` element within the `adf-config` tag as shown in the following example:

```
<adf-config xmlns="http://xmlns.oracle.com/adf/config"
            xmlns:adf="http://xmlns.oracle.com/adf/config/properties"
            xmlns:mdsC="http://xmlns.oracle.com/adf/mds/config">
. . .
  <pe:page-editor-config xmlns="http://xmlns.oracle.com/adf/pageeditor/config">
    . . .
  </pe:page-editor-config>
</adf-config>
```

B.2.2.2 addon-panels

Use the `<pe:addon-panels>` element to register custom add-ons and property panels in Composer. Insert the `<pe:addon-panels>` element within `<pe:page-editor-config>`. You can have only one `<pe:addon-panels>` element in the file, however, within `<pe:addon-panels>` you can have any number of `<pe:addon-panel>` elements to register custom panels. For more information about Composer add-ons and property panels, see Section 19.2, "Creating Composer Add-Ons" and Section 19.3, "Creating Custom Property Panels."

addon-panel

Use a `<pe:addon-panel>` element to register an add-on in the `adf-config.xml` file. A `<pe:addon-panel>` element must only be included inside the `<pe:addon-panels>` element. You can have any number of `<pe:addon-panel>` elements to register custom panels. The following example shows how you can register a new add-on using these elements:

```
<pe:page-editor-config xmlns="http://xmlns.oracle.com/adf/pageeditor/config">
  <pe:addon-panels>
    <!-- Page Properties add-on -->
    <pe:addon-panel name="oracle.adf.pageeditor.addonpanels.page-settings" />

    <!-- Page Reset add-on -->
    <pe:addon-panel name="oracle.adf.pageeditor.addonpanels.page-reset" />

    <pe:addon-panel name="oracle.fod.custom.panel" />

  </pe:addon-panels>
  . . .
</pe:page-editor-config>
```

The `<pe:addon-panel>` element also supports the `rendered` attribute. This attribute can take an EL value and specifies whether the panel must be rendered in Composer or not.

When registering custom add-ons, you must also include entries for the default add-ons. If the default add-ons are not registered, then only your custom add-on is available in Composer.

The `<pe:addon-panel>` element supports the following parameters:

- **rendered**: Use to specify whether the add-on must be rendered or not. The `rendered` attribute can take `true`, `false`, or an EL value. Use this attribute to display an add-on conditionally based on specific criteria.

- **parameters**: Use to declaratively pass parameters to the add-on task flow. The `parameters` attribute takes an EL value as shown in the following example:

  ```
  <pe:addon-panels>
    <pe:addon-panel
  name="oracle.adf.pageeditor.addonpanels.customization-manager"
  parameters="#{AppUtilBean.customizationManagerParams}"/>
      . . .
  </pe:addon-panels>
  ```

  where `AppUtilBean` provides the logic to pass parameters to the add-on task flow.

B.2.2.3 sandbox-namespaces

Use the `<pe:sandbox-namespaces>` element to register namespaces for all metadata for which you want to enable sandbox creation at runtime. For more information about enabling sandbox creation, see Section 21.2.1, "How to Enable Composer Sandbox Creation."

Insert the `<pe:sandbox-namespaces>` element within the `<pe:page-editor-config>` element. The following example shows how to use the `sandbox-namespaces` element:

```
<pe:page-editor-config xmlns="http://xmlns.oracle.com/adf/pageeditor/config">
  . . .
  <pe:sandbox-namespaces>
    <pe:namespace path="/pages"/>
    <pe:namespace path="/pageDefs"/>
  </pe:sandbox-namespaces>
</pe:page-editor-config>
```

B.2.2.4 session-options-factory

When creating customization layers in your application, use the `<pe:session-options-factory>` element to register the `ComposerSessionOptionsFactory` implementation with Composer. This class contains the logic to save customizations in different layers based on the specified criteria. For more information, see Section 21.3, "Adding Customization Layers to View and Edit Modes: Example."

The following example shows how to register a class named `AppsSessionOptionsFactoryImpl`:

```
<pe:page-editor-config xmlns="http://xmlns.oracle.com/adf/pageeditor/config">
  . . .

<pe:session-options-factory>view.AppsSessionOptionsFactoryImpl</pe:session-options
-factory>
</pe:page-editor-config>
```

B.2.2.5 enable-design-views

To enable Composer direct select, you must first enable Select view. For more information on direct select functionality, see Section 19.11, "Enabling Direct Select in Design or Add Content View." Add the `<pe:enable-design-views>` tag inside the `<pe:page-editor-config>` tag to define the available views. The possible values are: `design`, `add-content`, `select`, `source`, `preview`, and `all`. The `all` value will show `design`, `select`, `source`, and `preview` only since `add-content` is a subset of `design`.

B.2.2.6 allow-el and protect-el

You can configure Composer to disable EL or protect existing EL from overwrite. Use `<pe:allow-el>` to define whether or not EL can be run in application pages. The default is true. Use `<pe:protect-el>` to define whether or not EL in form elements can be edited. The default is false. For more information, see Section 19.4.2, "How to Protect Expression Language."

The following example disables EL:

```
<pe:page-editor-config xmlns="http://xmlns.oracle.com/adf/pageeditor/config">
  . . .
  <pe:allow-el>false</pe:allow-el>
</pe:page-editor-config>
```

B.2.2.7 rcv-config

Use the `<rcv-config>` element to register custom resource catalogs with Composer and to register the `ResourceCatalogSelector` implementation when using multiple resource catalogs.

If you want to display a custom resource catalog to users in place of the default one, you must first create a catalog definition file with the required content and then register this catalog definition in the Composer extension file and `adf-config.xml` file. The custom resource catalog is then displayed when a user clicks an Add Content button on the page. For more information, see Section 14.2, "Creating a Resource Catalog."

Insert the `<rcv-config>` element within the `adf-config` tag. The following example shows how you can use the `<rcv-config>` element to register a custom catalog called `users-catalog`:

```
<adf-config xmlns="http://xmlns.oracle.com/adf/config"
            xmlns:adf="http://xmlns.oracle.com/adf/config/properties"
            xmlns:mdsC="http://xmlns.oracle.com/adf/mds/config">
  . . .
  <rcv-config xmlns="http://xmlns.oracle.com/adf/rcs/viewer/adf-config">
    <default-catalog catalog-name="users-catalog"/>
  </rcv-config>
</adf-config>
```

You can also configure multiple resource catalogs with Composer so that different catalogs are displayed to different users depending on the specified criteria. When configuring multiple resource catalogs, use the `<rcv-config>` element with a `<catalog-selector>` element to register the `ResourceCatalogSelector` implementation, which contains the logic for selecting a resource catalog.

The following example shows how you can use the `<rcv-config>` element to register a `ResourceCatalogSelector` implementation called `CatalogSelector`:

```
<adf-config xmlns="http://xmlns.oracle.com/adf/config"
            xmlns:adf="http://xmlns.oracle.com/adf/config/properties"
            xmlns:mdsC="http://xmlns.oracle.com/adf/mds/config">
  . . .
  <rcv-config xmlns="http://xmlns.oracle.com/adf/rcs/viewer/adf-config">
    <catalog-selector class-name="webcenter.CatalogSelector"/>
    <default-catalog catalog-name="default-catalog"/>
  </rcv-config>
</adf-config>
```

B.2.2.8 customizableComponentsSecurity

Use the <customizableComponentsSecurity> element to apply restrictions on Show Detail Frame actions. Insert the <customizableComponentsSecurity> element within the adf-config tag.

Within the <customizableComponentsSecurity> element, you can specify the <enableSecurity>, <actionsCategory>, <actions>, and <custom-actions> elements.

enableSecurity

Use the <enableSecurity> element to override the security inheritance behavior on Show Detail Frame actions. This element can take a value of true or false. If set to true, then the ability for a user to modify a component is first determined from the page permissions and then adjusted according to the current set of actions defined for that type of permission. If set to false, then all actions are available to users. A user's page permissions and actions configured in adf-config.xml are ignored.

actionsCategory

Use the <actionsCategory> element to apply restrictions on a group of Show Detail Frame actions simultaneously. Within the <actionsCategory> element, you can have <actionCategory> elements for the supported categories. For more information about action categories, see Section 22.5.2, "Defining Security at the Actions Category Level."

The following example shows how actionsCategory can be used:

```
<adf-config xmlns="http://xmlns.oracle.com/adf/config"
            xmlns:adf="http://xmlns.oracle.com/adf/config/properties"
            xmlns:mdsC="http://xmlns.oracle.com/adf/mds/config">
  . . .
  <cust:customizableComponentsSecurity
xmlns="http://xmlns.oracle.com/adf/faces/customizable/config">
    <cust:enableSecurity value="true"/>

    <cust:actionsCategory>
      <cust:actionCategory name="personalizeActionsCategory" value="false"/>
      <cust:actionCategory name="editActionsCategory" value="true"/>
    </cust:actionsCategory>

    <cust:actions>
      . . .
    </cust:actions>

  </cust:customizableComponentsSecurity>
</adf-config>
```

actions

Use the <actions> element to apply restrictions on individual actions. Within each actions element, you can have <action> elements for all supported actions.

The following example shows how <actions> can be used:

```
<adf-config xmlns="http://xmlns.oracle.com/adf/config"
            xmlns:adf="http://xmlns.oracle.com/adf/config/properties"
            xmlns:mdsC="http://xmlns.oracle.com/adf/mds/config">
  . . .
  <cust:customizableComponentsSecurity
xmlns="http://xmlns.oracle.com/adf/faces/customizable/config">
    <cust:enableSecurity value="true"/>

    <cust:actionsCategory>
```

```
      . . .
    </cust:actionsCategory>

    <cust:actions>
      <cust:action name="showMinimizeAction" value="true"/>
      <cust:action name="showMoveAction" value="false"/>
    </cust:actions>

  </cust:customizableComponentsSecurity>
<adf-config>
```

For more information about applying action-level restrictions, see Section 22.5, "Applying Action-Level Restrictions on Panel Customizable and Show Detail Component Actions."

custom-actions

Use the <custom-actions> element to define custom actions to display along with the other Show Detail Frame actions. You must add only one <custom-actions> element inside the customizableComponentsSecurity section. Within this you can add any number of <custom-action> elements to define individual custom actions.

> **Note:** Alternatively, you can add a <custom-actions> element inside an <adf-config-child> element instead of inside the <customizableComponentsSecurity> section.

For more information about custom actions, see Section 20.3.2, "How to Enable Custom Actions on a Show Detail Frame Enclosing a Task Flow."

B.2.2.9 mds-config

When defining type-level application customization restrictions on components, use the <mds-config> element to register a standalone XML file describing the restrictions to be applied on specific components. For information about applying type-level restrictions, see Section 22.1.1, "How to Define Type-Level Customization Policies."

Insert the <mds-config> element within the <adf-config> tag. You can add the <mds-config> element as follows:

```
<mds-config xmlns="http://xmlns.oracle.com/mds/config">
  <type-config>
    <standalone-definitions>
      <file>Directory_Name/standalone.xml</file>
    </standalone-definitions>
  </type-config>
</mds-config>
```

B.2.2.10 resource-string-editor

Use a <pe:resource-string-editor> element to enable resource string editing in your application. Insert the <pe:resource-string-editor> element within the <pe:page-editor-config> section, as shown in the following example:

```
<pe:page-editor-config xmlns="http://xmlns.oracle.com/adf/pageeditor/config">
  . . .
  <pe:resource-string-editor>
    <pe:enabled>true</pe:enabled>
  </pe:resource-string-editor>
</pe:page-editor-config>
```

For more information, see Section 20.12, "Configuring Runtime Resource String Editing."

B.2.2.11 enable-source-view

Use the <pe:enable-source-view> element to enable or disable Structure view in Composer. Insert the <pe:enable-source-view> element within the <pe:page-editor-config> section. Structure view is enabled by default in Composer. You can disable it by setting <pe:enable-source-view> to false, as shown in the following example:

```
<pe:page-editor-config xmlns="http://xmlns.oracle.com/adf/pageeditor/config">
  . . .
  <pe:enable-source-view>false</pe:enable-source-view>
</pe:page-editor-config>
```

For more information, see Section 20.8, "Disabling Structure View for the Application."

B.2.2.12 enable-zoom

Use the <pe:enable-zoom> element to enable or disable the capability to zoom into task flows in Composer. Insert the <pe:enable-zoom> element within a <pe:source-view> tag in the <pe:page-editor-config> section. Task flow zoom is enabled by default in Composer. You can disable it by setting <pe:enable-zoom> to false, as shown in the following example:

```
<pe:page-editor-config xmlns="http://xmlns.oracle.com/adf/pageeditor/config">
  . . .
  <pe:source-view>
    <pe:enable-zoom>false</pe:enable-zoom>
  </pe:source-view>
</pe:page-editor-config>
```

For more information, see Section 20.9, "Disabling Task Flow Zoom Capability."

B.2.2.13 persistent-change-manager

Use this to configure the change manager to be used for persisting changes made in Composer. Insert the <persistent-change-manager> element within the <adf-faces-config> section. You must set <persistent-change-manager> to MDSDocumentChangeManager as follows if you want to persist application customizations to MDS:

```
<adf-faces-config xmlns="http://xmlns.oracle.com/adf/faces/config">
  <persistent-change-manager>

<persistent-change-manager-class>oracle.adf.view.rich.change.MDSDocumentChangeMana
ger</persistent-change-manager-class>
  </persistent-change-manager>
. . .
</adf-faces-config>
```

For more information about change persistence in Composer, see Section 20.11, "Configuring the Persistence Change Manager."

For more information about the <persistent-change-manager> element, see *Fusion Developer's Guide for Oracle Application Development Framework*.

B.2.2.14 taglib-config

Use the `<taglib-config>` element to specify the component tags that must be persisted by default. This element is relevant only when you define change persistence using `<persistent-change-manager>` in your `adf-config.xml` file.

When you add Composer components to the page, the `adf-config.xml` file is populated with the `<taglib-config>` element containing a list of tags and attributes that must be persisted. You can add more elements and attributes to the default list.

For more information about this element, see *Fusion Developer's Guide for Oracle Application Development Framework*.

Insert the `<taglib-config>` element within the `<adf-faces-config>` section. The `<taglib-config>` element appears as shown in the following example:

```
<adf-faces-config xmlns="http://xmlns.oracle.com/adf/faces/config">
  . . .
  <taglib-config>
    <taglib uri="http://xmlns.oracle.com/adf/faces/customizable">
      <tag name="showDetailFrame">
        <persist-operations>all</persist-operations>
        <attribute name="expansionMode">
          <persist-changes>true</persist-changes>
        </attribute>
        <attribute name="contentStyle">
          <persist-changes>true</persist-changes>
        </attribute>
      </tag>
      <tag name="panelCustomizable">
        <persist-operations>all</persist-operations>
      </tag>
    </taglib>
  </taglib-config>
</adf-faces-config>
```

For more information, see Section 20.11, "Configuring the Persistence Change Manager."

B.2.2.15 security-config

Use this to override Composer-specific security configurations, specifically if you want to override the default security policies with application-level checks. Insert the `<pe:security-config>` element inside the `<pe:page-editor-config>` section. Within the `security-config` element, you can define `<pe:security-policies>`, `<pe:security-policy>`, `<pe:policy-class>`, and `<pe:task-flow-security>` elements.

security-policies

Use this to encompass all the security policies and policy overrides for Composer. You can have only one `<pe:security-policies>` element under the `<pe:page-editor-config>` section.

security-policy

Use this to override an existing policy. Add one `<pe:security-policy>` element for each policy that you want to override.

The `<pe:security-policy>` element supports the `name` and `override` attributes, where `name` is used to specify a name with which to register the custom policy and `override` is used to specify the name of the default policy that you want to override.

policy-class

Use this to specify the name of the custom security policy.

task-flow-security

Use this element, along with the `check-permission` attribute, to enable Composer to check for a task flow's permissions so that only users with appropriate privileges are allowed to edit or customize the task flow at runtime.

For more information, see Section 22.6, "Implementing Task Flow Security."

B.2.2.16 Sample adf-config.xml File

Example B–2 shows a sample `adf-config.xml` file with Composer-specific configurations.

Example B–2 Sample adf-config.xml File with Composer-Specific Configurations

```
<?xml version="1.0" encoding="windows-1252" ?>
<adf-config xmlns="http://xmlns.oracle.com/adf/config"
            xmlns:adf="http://xmlns.oracle.com/adf/config/properties"
            xmlns:mdsC="http://xmlns.oracle.com/adf/mds/config">
  <adf:adf-properties-child xmlns="http://xmlns.oracle.com/adf/config/properties">
    <adf-property name="adfAppUID" value="configfilesapp-7198"/>
  </adf:adf-properties-child>

  <mdsC:adf-mds-config version="11.1.1.000">
    <mds-config xmlns="http://xmlns.oracle.com/mds/config">
      <persistence-config>
        <metadata-namespaces>
          <namespace path="/oracle/adf/rc/metadata"
                     metadata-store-usage="WebCenterFileMetadataStore"/>
          <namespace path="/persdef/"
                     metadata-store-usage="WebCenterFileMetadataStore"/>

          <!-- Namespace definitions for Composer sandbox -->
          <!-- Your jspx customizations alone go here -->
          <namespace path="/pages"
metadata-store-usage="WebCenterFileMetadataStore">
            <namespace-restriction type="CUSTOMIZATIONS"/>
          </namespace>
          <!-- Your pagedef customizations alone go here -->
          <namespace path="/pageDefs"
metadata-store-usage="WebCenterFileMetadataStore">
            <namespace-restriction type="CUSTOMIZATIONS"/>
          </namespace>
        </metadata-namespaces>
        <metadata-store-usages>
          <metadata-store-usage id="WebCenterFileMetadataStore"
                                default-cust-store="true">
            <metadata-store
class-name="oracle.mds.dt.persistence.stores.file.SrcControlFileMetadataStore">
              <property name="metadata-path" value="../../mds"/>
            </metadata-store>
          </metadata-store-usage>
        </metadata-store-usages>
      </persistence-config>
      <cust-config>
        <match>
          <customization-class name="oracle.adf.share.config.SiteCC"/>
        </match>
      </cust-config>
      <cache-config>
        <max-size-kb>100000</max-size-kb>
      </cache-config>

      <!-- Registration of a standalone XML file used for type-level customization
policies -->
      <type-config>
        <standalone-definitions>
          <file>Directory_Name/standalone.xml</file>
        </standalone-definitions>
      </type-config>
    </mds-config>
  </mdsC:adf-mds-config>

  <pe:page-editor-config xmlns="http://xmlns.oracle.com/adf/pageeditor/config">

    <!-- Composer add-on panel configuration -->
    <pe:addon-panels>
      <pe:addon-panel name="oracle.adf.pageeditor.addonpanels.page-settings" />
      <pe:addon-panel name="oracle.adf.pageeditor.addonpanels.page-reset" />
      <pe:addon-panel name="oracle.fod.custom.panel" />
    </pe:addon-panels>

    <!-- Composer sandbox configuration -->

    <pe:enable-source-view>false</pe:enable-source-view>

  </pe:page-editor-config>

  <!-- Multiple resource catalog configuration -->
  <rcv-config xmlns="http://xmlns.oracle.com/adf/rcs/viewer/adf-config">
    <catalog-selector class-name="webcenter.CatalogSelector"/>
    <default-catalog catalog-name="users-catalog"/>
  </rcv-config>

  <!-- Composer and WebCenter Portal Customizable Components actions security
configuration -->
  <cust:customizableComponentsSecurity
xmlns="http://xmlns.oracle.com/adf/faces/customizable/config">
    <cust:enableSecurity value="true"/>
    <cust:actionsCategory>
      <cust:actionCategory name="personalizeActionsCategory" value="false"/>
      <cust:actionCategory name="editActionsCategory" value="true"/>
    </cust:actionsCategory>
    <cust:actions>
      <cust:action name="showMinimizeAction" value="true"/>
      <cust:action name="showMoveAction" value="false"/>
    </cust:actions>
  </cust:customizableComponentsSecurity>

  <adf-faces-config xmlns="http://xmlns.oracle.com/adf/faces/config">

    <!-- Composer persistence change manager configuration -->
      <persistent-change-manager>

<persistent-change-manager-class>oracle.adf.view.rich.change.MDSDocumentChangeMana
ger</persistent-change-manager-class>
      </persistent-change-manager>

    <!-- Composer default persistence configuration -->
    <taglib-config>
      <taglib uri="http://xmlns.oracle.com/adf/faces/customizable">
        <tag name="showDetailFrame">
          <persist-operations>all</persist-operations>
          <attribute name="expansionMode">
            <persist-changes>true</persist-changes>
          </attribute>
          <attribute name="contentStyle">
            <persist-changes>true</persist-changes>
          </attribute>
        </tag>
        <tag name="panelCustomizable">
          <persist-operations>all</persist-operations>
        </tag>
      </taglib>
    </taglib-config>
  </adf-faces-config>
</adf-config>
```

B.2.3 adf-settings.xml

The adf-settings.xml file, in addition to holding generic project- and library-level settings, can also be used to define custom actions on task flows. This section describes the adf-settings.xml configurations specific to Composer.

B.2.3.1 custComps-config

Use the custComps-config element to define custom actions on task flows consumed in the application. At runtime, the custom actions configurations in the application's adf-config.xml and adf-settings.xml files are picked up and appropriate actions are displayed on the Show Detail Frame component surrounding a task flow. For more information, see Section 20.3, "Enabling Custom Actions on a Task Flow."

Insert the custComps-config element within the adf-settings tag. Within the custComps-config element, you can specify the customActions element.

customActions

Use the customActions element in the adf-settings.xml file to define actions that you want to display on task flows. The custom actions defined here will be displayed along with the other actions on the surrounding Show Detail Frame component. You must add only one customActions element inside the custComps-config section. Within the customActions element you can add any number of customAction elements to define individual custom actions, as shown in the following example:

```
  <customActions>
   <customAction action="next" location="chrome"
                 rendered="true"
                 icon="/adf/webcenter/editheader_ena.png"
                 text="Next"

taskFlowId="/WEB-INF/task-flow-definition.xml#task-flow-definition"
                 shortDesc="next"/>
    <customAction action="prev" location="chrome"
                 rendered="true"
                 icon="/adf/webcenter/editheader_ena.png"
                 text="Previous"
 taskFlowId="/WEB-INF/task-flow-definition.xml#task-flow-definition"
                 shortDesc="prev"/>
  </customActions>
```

B.2.4 web.xml

The web.xml file is a Java EE standard descriptor that contains details about web applications. When you add a Page Customizable component to your page, the web.xml file available in the *Application_Root**Project_Name*\public_html\WEB-INF directory is updated to enable change persistence among other settings.

You must update web.xml further when creating an application that uses multiple customization layers and when enabling Composer sandbox. The following sections describe the web.xml configurations specific to Composer.

B.2.4.1 CHANGE_PERSISTENCE Context Parameter

The CHANGE_PERSISTENCE context parameter in the application's web.xml file specifies how application customizations are persisted. To enable changes in a Composer-enabled page to be persisted in MDS, you must ensure that the CHANGE_PERSISTENCE context parameter is set to ComposerChangeManager, as shown in the following example:

```
<context-param>
  <param-name>org.apache.myfaces.trinidad.CHANGE_PERSISTENCE</param-name>

<param-value>oracle.adf.view.page.editor.change.ComposerChangeManager</param-value
>
</context-param>
```

This context parameter registers the ChangeManager class to be used to ensure persistence to MDS. This configuration happens automatically when you add a Page Customizable component to a page in a new Portal Framework application. However, in an existing ADF application, this context parameter may be set to some other value, for example session or oracle.adf.view.rich.change.FilteredPersistenceChangeManager. Therefore, when you add Composer components to such an application, you must ensure that the CHANGE_PERSISTENCE parameter is set to ComposerChangeManager.

For more information, see Section 20.11, "Configuring the Persistence Change Manager."

B.2.4.2 WebCenterComposerFilter

Use WebCenterComposerFilter in the web.xml file to register Composer's ComposerSessionOptionsFactory with Oracle ADF for every HTTP request. The request is then handled depending on your implementation of ComposerSessionOptionsFactory. This filter can be defined as shown in the following example:

```
<filter-mapping>
<filter-name>WebCenterComposerFilter</filter-name>
  <url-pattern>/faces/*</url-pattern>
  <dispatcher>FORWARD</dispatcher>
  <dispatcher>REQUEST</dispatcher>
</filter-mapping>
```

You must use WebCenterComposerFilter if you are performing the following tasks:

- Creating customization layers. For information, see Section 21.3, "Adding Customization Layers to View and Edit Modes: Example."
- Enabling sandbox creation in Composer. For more information, see Section 21.2.1, "How to Enable Composer Sandbox Creation."

B.3 Composer Default Add-Ons and Property Panels

This section lists the add-ons and property panels available by default in Composer.

B.3.1 Default Add-Ons

This section lists the add-ons available in Composer and provides the names with which these add-ons are registered in the adf-config.xml file. It is useful to know these names as you will need them to enable or disable the display of the add-ons in your application.

- **Page Properties**

  Used to edit page properties and create page parameters.

  This add-on is registered with the name oracle.adf.pageeditor.addonpanels.page-settings in the adf-config.xml file.

- **Reset Page**

  Used to reset page customizations.

  This add-on is registered with the name oracle.adf.pageeditor.addonpanels.page-reset in the adf-config.xml file.

- **Customization Manager**

  Used to manage customizations made to pages and task flows.

  This add-on is registered with the name oracle.adf.pageeditor.addonpanels.customization-manager in the adf-config.xml file.

The Page Properties and Reset Page add-ons are rendered by default. If you create custom add-ons in your application, while registering those add-ons in adf-config.xml, you must also include the entries for the default add-ons. Without these, the default add-ons are not displayed in Composer. For information about add-ons, see Section 19.2, "Creating Composer Add-Ons."

B.3.2 Default Property Panels

This section lists the property panels available by default in the Component Properties and Page Properties dialogs and provides the names with which these panels are registered in the `pe_ext.xml` file. These names are useful if you choose to override the default panels with custom property panels, or hide some or all of the default panels. You can also enable specific panels for display in Composer Add Content or Design view; for details, see Section 19.11, "Enabling Direct Select in Design or Add Content View."

For information about creating property panels, see Section 19.3, "Creating Custom Property Panels."

- **Display Options**

  Used to define display-related behavior of a component. This panel is displayed in the Component Properties dialog for all components.

  In the `pe_ext.xml` file, this panel is referenced with the name `oracle.adf.pageeditor.pane.generic-property-inspector`.

- **Display Options (Show Detail Frame)**

  Used to define display-related behavior of a `Show Detail Frame` component. This panel is displayed in the Component Properties dialog for a `Show Detail Frame` component only.

  In the `pe_ext.xml` file, this panel is referenced with the name `oracle.adf.pageeditor.pane.sdfprop`.

- **Tabs**

  Used to define the display properties and order of tabs on a `Panel Customizable` or `Box` component. This panel is displayed in the Component Properties dialog for a `Panel Tabbed` or `Panel Customizable` component. The panel is displayed for a `Panel Customizable` component only if the component has tabs on it.

  In the `pe_ext.xml` file, this panel is referenced with the name `oracle.adf.pageeditor.pane.panel-tabbed`.

- **Style**

  Used to define the appearance of the component instance. This panel is displayed in the Component Properties dialog for all components.

  In the `pe_ext.xml` file, this panel is referenced with the name `oracle.adf.pageeditor.pane.inline-style-editor`.

- **Content Style**

  Used to define the appearance of content inside a component instance. This panel is displayed in the Component Properties dialog for all components.

  In the `pe_ext.xml` file, this panel is referenced with the name `oracle.adf.pageeditor.pane.content-style-editor`.

- **Events**

  Used to wire a contextual event to an action handler to enable the passing of values from a producer component to a consumer component when the event is triggered on the producer. This panel displays in the Component Properties dialog for all components.

  In the `pe_ext.xml` file, this panel is referenced with the name `oracle.adf.pageeditor.pane.events`.

- **Region Parameters**

  Used to define parameters for the task flow region. This panel displays in the Component Properties dialog only for task flow regions.

  In the `pe_ext.xml` file, this panel is referenced with the name `oracle.adf.pageeditor.pane.region-param`.

- **Portlet Parameters**

  Used to define portlet parameters. This panel displays in the Component Properties dialog only for portlets.

  In the `pe_ext.xml` file, this panel is referenced with the name `oracle.adf.pageeditor.pane.portlet-param`.

- **Layout Customizable**

  Used to define the layout for page components by selecting from a set of predefined layouts. This panel displays in the Component Properties dialog only for `Layout Customizable` components.

  In the `pe_ext.xml` file, this panel is referenced with the name `oracle.adf.pageeditor.pane.layout-cust-prop`.

- **Child Components**

  Used to rearrange and show or hide child components inside a `Panel Customizable` component. This panel displays only for `Panel Customizable` components

  In the `pe_ext.xml` file, this panel is referenced with the name `oracle.adf.pageeditor.pane.child-navigator`.

- **Page Parameters**

  Used to define the page parameters that can be wired to components on the page. This panel displays in the Page Properties dialog.

  In the `pe_ext.xml` file, this panel is referenced with the name `oracle.webcenter.page.pane.page-param`.

- **Page Security**

  Used to define page permissions. This panel displays in the Page Properties dialog for secured application pages.

  In the `pe_ext.xml` file, this panel is referenced with the name `oracle.webcenter.page.pane.page-sec`.

B.4 Composer Components Style-Specific Properties

This section includes a series of tables that describe the style selectors associated with Composer components. Additionally, it describes how to use the `background` property to choose one of three skin-defined looks for these components.

This section contains the following subsections:

- Section B.4.1, "Style Selectors for Composer Components"
- Section B.4.2, "Style Attributes"

B.4.1 Style Selectors for Composer Components

Use a style selector to describe an element's appearance by identifying the element and defining styles for it.

This section contains the following subsections:

- Global Style Selectors
- Composer Status Indicator Style Selectors
- Page Customizable Style Selectors
- Layout Customizable Style Selectors
- Panel Customizable Style Selectors
- Show Detail Frame Style Selectors

B.4.1.1 Global Style Selectors

Use global style selectors to define styles for multiple components within the application. Table B–17 lists and describes the global style selectors relevant to Composer components.

Table B–17 Global Style Selectors

Style Selector	Description
`.ComposerDark:alias`	Specifies the default color for toolbars, headers, and so on in Composer, with a color scheme of *dark*.
`.ComposerLight:alias`	Specifies the default color for toolbars, headers, and so on in Composer, with a color scheme of *light*.
`.ComposerBackground`	Specifies the color scheme for Composer dialogs, such as the Component Properties and Page Properties dialogs.
`.ComposerBorder`	Specifies the border, width, and so on for Composer dialogs, such as the Component Properties and Page Properties dialogs.
`.PEClickableImageAnchor:alias`	An alias for rendering a clickable icon in a table cell. Specifies the CSS properties needed to display an image which is clickable and which has inline-mode display. For example, you can specify this as a common property for all action icons on a `Show Detail Frame` header. By default, this alias is included in style selectors that use 16x16 images and have to display inline background-images for both IE and Firefox. To customize, you can include this alias in your selector and override its properties. For example, you can change font-size and padding-right for an image with different height and width, or you can set "display: block" with height, width attributes to display in block mode.
`.ChildPanelFacetWarning`	Specifies the style for the warning message displayed in the child navigator in the Component Properties dialog.

B.4.1.2 Composer Status Indicator Style Selectors

Use the style selectors in Table B–18 to skin the status indicator component in the Composer toolbar.

Table B–18 Status Indicator Style Selectors

Style Selector	Description
af|statusIndicator.ComposerStatus	Specifies the style for the status indicator component. You can use this to specify a fixed height for the status indicator.
af|statusIndicator.ComposerStatus::idle-icon	Specifies the icon that represents the idle state. This icon is generally a non-animated icon that indicates communication is NOT occurring with the server.
af|statusIndicator.ComposerStatus::processing-icon	Specifies the icon that represents the processing state. This icon is generally an animated icon that indicates communication IS occurring with the server.
af|statusIndicator.ComposerStatus::connecting-icon	Specifies the icon that displays when the Active Data Service is in the process of connecting. This icon is generally an animated icon.
af|statusIndicator.ComposerStatus::connected-icon	Specifies the icon that displays when the Active Data Service is in the connected state. This icon is generally a non-animated icon and may be the same as the idle state icon.
af|statusIndicator.ComposerStatus::reconnecting-icon	Specifies the icon that displays when the Active Data Service has lost connection and is attempting to reconnect. This icon is generally an animated icon.
af|statusIndicator.ComposerStatus::disconnected-icon	Specifies the icon that displays when the Active Data Service is in the disconnected state. This icon is generally a non-animated icon used to indicate that no further reconnection attempts will be made without use interaction.

B.4.1.3 Page Customizable Style Selectors

Use the style selectors in Table B–19 to skin `Page Customizable` components.

Table B–19 Page Customizable Style Selectors

Style Selector	Description
af|pageCustomizable	Specifies the default size of a `Page Customizable` component when not being stretched by its parent container.
af|pageCustomizable af|toolbox.ComposerToolbox	Specifies the style for the main dark gray toolbar displayed in Edit mode. This toolbar contains a message about the page being edited and the various buttons.
af|pageCustomizable af|toolbox.ComposerToolbox af|panelGroupLayout.ComposerConcurrency	Specifies the style for the concurrency toolbar that appears below the main Composer toolbar when two or more users are editing a page at the same time in the same customization layer.
af|pageCustomizable af|toolbox.ComposerToolbox af|toolbar af|pageCustomizable af|toolbox.ComposerToolbox af|toolbar::separator af|pageCustomizable af|toolbox.ComposerToolbox af|toolbox::body af|pageCustomizable af|toolbox.ComposerToolbox af|toolbox::body af|toolbox::row af|pageCustomizable af|toolbox.ComposerToolbox af|toolbox::body af|toolbox::last-row af|pageCustomizable af|toolbox.ComposerToolbox af|toolbox::body af|toolbox::row af|toolbox::leading-cell	Specifies the styles for the different areas in the toolbar.

Table B–19 (Cont.) Page Customizable Style Selectors

Style Selector	Description

`af|pageCustomizable af|toolbox.ComposerToolbox af|commandToolbarButton::text`
`af|pageCustomizable af|toolbox.ComposerToolbox af|commandToolbarButton:hover`
`af|pageCustomizable af|toolbox.ComposerToolbox af|commandToolbarButton:depressed`
	Specify the styles for the Composer toolbar buttons such as Page Properties and Reset Page.

`af|pageCustomizable af|toolbox.ComposerToolbox af|menuBar::body`
`af|pageCustomizable af|toolbox.ComposerToolbox af|menuBar::body:rtl`
	Specifies the style for the body of the View menu on the toolbar.

`af|pageCustomizable af|toolbox.ComposerToolbox af|menuBar af|menu::bar-item-text`	Specifies the style for the text on the View menu.
`af|pageCustomizable af|toolbox.ComposerToolbox af|menuBar af|menu::bar-item:highlighted`	Specifies the style for the View menu when the mouse hovers over it.
`af|pageCustomizable af|toolbox.ComposerToolbox af|menuBar af|menu::bar-item:depressed`	Specifies the style for the View menu when it is clicked.
`af|pageCustomizable af|toolbox.ComposerToolbox af|menuBar af|menu::bar-item-open-icon-style`	Specifies the style for the dropdown icon appearing on the View menu.
`af|pageCustomizable af|toolbox.ComposerToolbox af|menuBar af|menu:depressed af|menu::bar-item-open-icon-style`	Specifies the style for the dropdown icon when it is clicked on the View menu.
`af|pageCustomizable af|toolbox.ComposerToolbox af|menuBar af|menu:highlighted af|menu::bar-item-open-icon-style`	Specifies the style for the dropdown icon when the mouse hovers over it.
`af|pageCustomizable af|toolbar.SourceView`	Specifies the style for the toolbar in Composer Structure view.
`af|pageCustomizable af|toolbar.SourceView af|menuBar`	Specifies the style for the menu bar in Structure view.

`af|dialog.ComposerDialog::content-start`
`af|dialog.ComposerDialog::content-start:rtl`
`af|dialog.ComposerDialog::content`
`af|dialog.ComposerDialog::content:rtl`
`af|dialog.ComposerDialog::content-end`
	Specify the styles for the dialogs invoked using Composer toolbar buttons. Available alias is `:rtl`, which can be used when the component must be rendered right-to-left.

`af|pageCustomizable af|breadCrumbs.ComposerBreadcrumbs`
`af|pageCustomizable af|breadCrumbs.ComposerBreadcrumbsHidden:step`
	Specify the styles for Composer breadcrumbs.

`af|pageCustomizable:edit af|panelGroupLayout.ComposerSplitHorz`
`af|pageCustomizable:edit af|panelGroupLayout.ComposerSplitVert`
	Specifies the style for `Panel Customizable` components that are split horizontally or vertically. Typically, these selectors are used to specify the height in case of a horizontal split, or width in case of a vertical split.

Table B–19 (Cont.) Page Customizable Style Selectors

Style Selector	Description
af|pageCustomizable:edit, af|pageCustomizable:stretched	Specifies the style for the Page Customizable component in Edit mode. This selector ensures that in Edit mode, a Page Customizable always stretches. In View mode, it will flow if being flowed, or stretch if being stretched.
af|pageCustomizable:printable	Specifies the style for the Page Customizable in printable mode. It suppresses the height and width of the Page Customizable.
af|pageCustomizable af|panelGroupLayout.ComposerCutComp af|tree::node-stamp-text	Specifies the style for the dotted line border around components that are cut.

B.4.1.4 Layout Customizable Style Selectors

Use the style selectors in Table B–20 to skin `Layout Customizable` components.

Table B–20 Layout Customizable Style Selectors

Style Selector	Description
af|layoutCustomizable::menu:edit	Specifies the style for the **Change Layout** button in Edit mode.
af|layoutCustomizable::menu:edit af|commandImageLink::text af|layoutCustomizable::menu:edit af|commandImageLink::text:hover	Specify the styles for the text on the **Change Layout** button in Edit mode.
af|layoutCustomizable.AFStretchWidth	Specifies the width to which the component can stretch horizontally.

B.4.1.5 Panel Customizable Style Selectors

Use the style selectors listed in Table B–21 to skin `Panel Customizable` components.

Note: Some style selectors in Table B–21 have three color-scheme selections: *light*, *medium*, and *dark*. Using these you can define three distinct looks in your CSS and specify which one to use through the `background` property in the JDeveloper Property Inspector. Depending on which value is specified for a component instance's `background` property, the skin applies the relevant style.

Table B–21 Panel Customizable Style Selectors

Style Selector	Description
af|panelCustomizable	Specifies the style for the root element of the component.
af|panelCustomizable.PEStretched	Specifies the style for the component, when it is stretched.
af|panelCustomizable:edit	Specifies the style for the container in Edit mode.
af|panelCustomizable:edit:drop-target	Specifies the style for this component when you drag another component on the page and hover over this component to drop it in.

Table B–21 (Cont.) Panel Customizable Style Selectors

Style Selector	Description
af|panelCustomizable::edit-mode-content-style	Specifies the style for the area containing the Edit and Delete icons.
af|panelCustomizable::add-icon-style af|panelCustomizable::add-icon-style:active af|panelCustomizable::add-icon-style:hover af|panelCustomizable::add-icon-style:rtl	Specify the styles for the Add Content button on the component.
af|panelCustomizable::edit-icon-style af|panelCustomizable::edit-icon-style:active af|panelCustomizable::edit-icon-style:hover	Specify the styles for the Edit icon on the component.
af|panelCustomizable::delete-icon-style af|panelCustomizable::delete-icon-style:active af|panelCustomizable::delete-icon-style:hover	Specify the styles for the Delete icon on the component.
.PanelCustomizableDropProxy	Specifies the style for the placeholder area inside this component when you drag another component on the page and hover over this component to drop it in.
af|panelCustomizable:edit:inline-selected .p_AFActiveInlineEditableContainer af|panelCustomizable:edit:hover-target	Specifies the styles for the components in the inline editable subtree in the `Panel Customizable` component.
af|panelCustomizable::add-icon-link af|panelCustomizable::add-icon-link:active af|panelCustomizable::add-icon-link:hover	Specify the styles for the Add icon in the `Panel Customizable` component.
af|panelCustomizable::addtab-icon-style af|panelCustomizable::addtab-icon-style:active af|panelCustomizable::addtab-icon-style:hover	Specify the styles for the Add Tab icon in the `Panel Customizable` component.
af|panelCustomizable::split-up-icon-style af|panelCustomizable::split-up-icon-style:active af|panelCustomizable::split-up-icon-style:hover af|panelCustomizable::split-down-icon-style af|panelCustomizable::split-down-icon-style:active af|panelCustomizable::split-down-icon-style:hover af|panelCustomizable::split-left-icon-style af|panelCustomizable::split-left-icon-style:active af|panelCustomizable::split-left-icon-style:hover af|panelCustomizable::split-right-icon-style af|panelCustomizable::split-right-icon-style:active af|panelCustomizable::split-right-icon-style:hover	Specify styles for the icons available on a `Panel Customizable` component to split it horizontally and vertically.
.PanelCustomizableDropProxy	Specifies the style for a component being dragged and dropped inside a `Panel Customizable` component.

B.4.1.6 Show Detail Frame Style Selectors

Use the style selectors listed in Table B–22 to skin portlets and `Show Detail Frame` components.

In Portal Framework applications, each portlet is rendered with portlet *chrome*. The portlet chrome shares the same chrome rendering mechanism as a `Show Detail Frame` component. Thus, the style and icon selectors that apply to `Show Detail Frame` also apply to the portlet chrome. In other words, in addition to defining styles for `Show Detail Frame` components, use `Show Detail Frame` style and icon selectors to define styles for portlets.

> **Note:** Some `Show Detail Frame` style selectors in Table B–22 have *light*, *medium*, *dark*, and *core:default* color scheme options. Using these you can define four distinct looks in your CSS and specify which one to use through the `background` property in the JDeveloper Property Inspector. Depending on which value is specified for a component instance's `background` property, the skin applies the relevant style.

Table B–22 Show Detail Frame Style Selectors

Style Selector	Description
`af|showDetailFrame`	Specifies the style for the root element of the component.

`af|showDetailFrame::container:light`
`af|showDetailFrame::container:medium`
`af|showDetailFrame::container:dark`
`af|showDetailFrame::container:core:default`
	Specify the styles for the element containing the contents within the component.

`af|showDetailFrame.p_AFStretched`	Specifies the style for the root element when the component is stretched.

`af|showDetailFrame::content`
`af|showDetailFrame::content:light`
`af|showDetailFrame::content:medium`
`af|showDetailFrame::content:dark`
`af|showDetailFrame::content:core:default`
	Specify the styles to render for the content region of the component.

`af|showDetailFrame::header`
`af|showDetailFrame::header:light`
`af|showDetailFrame::header:medium`
`af|showDetailFrame::header:dark`
`af|showDetailFrame::header:core:default`
	Specify the styles for the header element. This element surrounds the header text, icon, and actions regions.

`af|showDetailFrame::header-center`
`af|showDetailFrame::header-center:light`
`af|showDetailFrame::header-center:medium`
`af|showDetailFrame::header-center:dark`
`af|showDetailFrame::header-center:core:default`
	Specify the styles for the region on the component header containing the icons, title, and actions menu.

`af|showDetailFrame::header-start`
`af|showDetailFrame::header-start:rtl`
`af|showDetailFrame::header-start:light`
`af|showDetailFrame::header-start:light:rtl`
`af|showDetailFrame::header-start:medium`
`af|showDetailFrame::header-start:medium:rtl`
`af|showDetailFrame::header-start:dark`
`af|showDetailFrame::header-start:dark:rtl`
`af|showDetailFrame::header-start:core:default`
`af|showDetailFrame::header-start:core:default:rtl`
	Specify the styles for the small cap-like area at the start of the header. Available alias is `:rtl`, which can be used when the component must be rendered right-to-left.

Table B–22 (Cont.) Show Detail Frame Style Selectors

Style Selector	Description
af|showDetailFrame::header-end af|showDetailFrame::header-end:rtl af|showDetailFrame::header-end:light af|showDetailFrame::header-end:light:rtl af|showDetailFrame::header-end:medium af|showDetailFrame::header-end:medium:rtl af|showDetailFrame::header-end:dark af|showDetailFrame::header-end:dark:rtl af|showDetailFrame::header-end:core:default af|showDetailFrame::header-end:core:default:rtl	Specify the styles for the small cap-like area at the end of the header. Available alias is `:rtl`, which can be used when the component must be rendered right-to-left.
af|showDetailFrame::footer-start af|showDetailFrame::footer-start:rtl af|showDetailFrame::footer-start:light af|showDetailFrame::footer-start:light:rtl af|showDetailFrame::footer-start:medium af|showDetailFrame::footer-start:medium:rtl af|showDetailFrame::footer-start:dark af|showDetailFrame::footer-start:dark:rtl af|showDetailFrame::footer-start:core:default af|showDetailFrame::footer-start:core:default:rtl	Specify the styles for the small cap-like area at the start of the footer. Available alias is `:rtl`, which can be used when the component must be rendered right-to-left.
af|showDetailFrame::footer-center af|showDetailFrame::footer-center:light af|showDetailFrame::footer-center:medium af|showDetailFrame::footer-center:dark af|showDetailFrame::footer-center:core:default	Specify the styles for the central region of the `Show Detail Frame` component's footer element.
af|showDetailFrame::footer-end af|showDetailFrame::footer-end:rtl af|showDetailFrame::footer-end:light af|showDetailFrame::footer-end:light:rtl af|showDetailFrame::footer-end:medium af|showDetailFrame::footer-end:medium:rtl af|showDetailFrame::footer-end:dark af|showDetailFrame::footer-end:dark:rtl af|showDetailFrame::footer-end:core:default af|showDetailFrame::footer-end:core:default:rtl	Specify the styles for the small cap-like area at the end of the footer. Available alias is `:rtl`, which can be used when the component must be rendered right-to-left.
af|showDetailFrame::shadowbox af|showDetailFrame::shadowbox:rtl af|showDetailFrame::shadowbox_div1 af|showDetailFrame::shadowbox_div1:rtl af|showDetailFrame::shadowbox_div2 af|showDetailFrame::shadowbox_div2:rtl	Specify styles for the shadow cast by the `Show Detail Frame` component.
af|showDetailFrame::toolbar af|showDetailFrame::toolbar:rtl	Specifies the styles for a floating toolbar on the `Show Detail Frame` component.
af|showDetailFrame::icon-style	Specifies the style for the icon on the `Show Detail Frame` header, if the `icon` attribute is set on the component.
af|showDetailFrame::header-text af|showDetailFrame::header-text:rtl	Specifies the style for the title available on the component header. Available alias is `:rtl`, which can be used when the component must be rendered right-to-left.
af|showDetailFrame::header-actions	Specifies the style for icons such as delete and the actions menu on the component header.

Table B–22 (Cont.) Show Detail Frame Style Selectors

Style Selector	Description
af|showDetailFrame::toolbar-container af|showDetailFrame::toolbar-container:light af|showDetailFrame::toolbar-container:medium af|showDetailFrame::toolbar-container:dark af|showDetailFrame::toolbar-container:core:default	Specify styles for the container element of the floating toolbar. Available aliases are `:light`, `:medium`, and `:dark`.
af|showDetailFrame::collapse-icon-style af|showDetailFrame::collapse-icon-style:active af|showDetailFrame::collapse-icon-style:hover af|showDetailFrame::collapse-icon-style.PEDisplayNone	Specify styles for the Collapse icon on the component header. Available aliases are `:active` and `:hover` that you can use to specify styles for the Collapse icon when clicked or when the mouse hovers over it. You can use `PEDisplayNone` to hide the Collapse icon.
af|showDetailFrame::disclose-icon-style af|showDetailFrame::disclose-icon-style:active af|showDetailFrame::disclose-icon-style:hover af|showDetailFrame::disclose-icon-style.PEDisplayNone	Specify the styles for the Disclose icon on the component header. You can use `PEDisplayNone` to hide the Disclose icon.
af|showDetailFrame::actionmenu-icon-style af|showDetailFrame::actionmenu-icon-style:active af|showDetailFrame::actionmenu-icon-style:hover	Specify the styles for the action menu icon. This style has a background-image that you can override.
af|showDetailFrame::remove-icon-style af|showDetailFrame::remove-icon-style:active af|showDetailFrame::remove-icon-style:hover	Specify the styles for the Delete icon.
af|showDetailFrame::edit-icon-style af|showDetailFrame::edit-icon-style:active af|showDetailFrame::edit-icon-style:hover	Specify the styles for the Edit icon.
af|showDetailFrame::preview-icon-style af|showDetailFrame::preview-icon-style:active af|showDetailFrame::preview-icon-style:hover	Specify styles for the Preview icon.
af|showDetailFrame::edit-mode-content-style af|showDetailFrame::edit-mode-content-style:light	Specify the styles for the area that contains the edit and remove icons.
af|showDetailFrame::edit-mode-edit-icon-style af|showDetailFrame::edit-mode-edit-icon-style:active af|showDetailFrame::edit-mode-edit-icon-style:hover	Specify the styles for the Edit icon on the component header in Edit mode.
af|showDetailFrame::edit-mode-remove-icon-style af|showDetailFrame::edit-mode-remove-icon-style:active af|showDetailFrame::edit-mode-remove-icon-style:hover	Specify the styles for the Delete icon on the component header in Edit mode.
af|showDetailFrame::edit-text-link af|showDetailFrame::edit-text-link:rtl af|showDetailFrame::edit-text-link:hover	Specify the styles for the Edit Text link in Edit mode when the component includes a Rich Text Editor component as a child.
af|showDetailFrame::resize af|showDetailFrame::resize:rtl	Specifies the style for the resize handler on the component. Available alias is `:rtl`, which can be used when component must be rendered right-to-left.

Table B–22 (Cont.) Show Detail Frame Style Selectors

Style Selector	Description
af|showDetailFrame::content.PEWrapsRTE > af|richTextEditor af|toolbox > af|toolbox::body, af|showDetailFrame::content.PEWrapsRTE > af|richTextEditor af|toolbox > af|toolbox::body > af|toolbox::row, af|showDetailFrame::content.PEWrapsRTE > af|richTextEditor af|toolbox > af|toolbox::body > af|toolbox::last-row, af|showDetailFrame::content.PEWrapsRTE > af|richTextEditor af|richTextEditor::content-input-container af|showDetailFrame::content.PEWrapsRTE > af|richTextEditor af|richTextEditor::content-input, af|showDetailFrame::content.PEWrapsRTE > af|richTextEditor af|richTextEditor::content-input-container af|showDetailFrame::content:medium.PEWrapsRTE af|showDetailFrame::content:light.PEWrapsRTE af|showDetailFrame::content.PEWrapsRTE > af|richTextEditor af|toolbox	Specify styles for the areas surrounding and inside a nested Rich Text Editor component. For example, to ensure that the background color of the Rich Text Editor component is transparent in Edit mode, or to provide borders around the component.
af|showDetailFrame::content.PEStretched	Specifies the height when the `Show Detail Frame` component stretches its content.
af|showDetailFrame::content.PEStretched:printable	Ensures that the `Show Detail Frame` does not restrict the height of its content in printable mode.
af|showDetailFrame::dynamic-help-icon-container af|showDetailFrame::dynamic-help-icon-container:rtl	Specifies the styles for the help icon container on the component header.
af|showDetailFrame::dynamic-help-icon-style af|showDetailFrame::dynamic-help-icon-style:active af|showDetailFrame::dynamic-help-icon-style:hover	Specify the styles for the help icon on the component header.
.PEShowDetailFrameAnimIcon	Specifies the animation icon to be used to show busy status on the component, for example, when you expand it.
.PEIconAndTextInHeading:alias .PEIconAndTextInHeading:alias:rtl	Specify the styles for rendering an icon with text in the component header.

B.4.2 Style Attributes

Table B–23 provides a quick reference for the style attributes available for WebCenter Portal Customizable Components and Composer components through the JDeveloper Property Inspector. Note that portlets also use these style attributes.

For detailed information about style properties, see the CSS Specifications page at:

http://www.w3.org/TR/CSS21/

Table B–23 Style Attributes of Composer and WebCenter Portal Customizable Components

Attribute	Description
`background-color`	The background color of the component. Choose from a list of colors, or click the Edit icon to select from a color palette.
`background-image`	The image that is displayed in the component background. Select to inherit from a parent component or to display no image, or click the Edit icon to select an image.
`background-repeat`	Specify whether and how the background image should repeat. Choose from: ■ `<none>`: Forgo repeating the image. ■ `no-repeat`: Forgo repeating the image. ■ `repeat`: Repeat the image to fill the container. ■ `repeat-x`: Repeat the image horizontally but not vertically. ■ `repeat-y`: Repeat the image vertically but not horizontally. ■ `inherit`: Inherit this setting from a parent component.
`border-color`	The color of the border that surrounds the component. Choose from a list of colors, or click the Edit icon to select from a color palette.
`border-style`	The style of border to draw around the component. Choose from: ■ `<none>`: Apply no style to the border. ■ `none`: Do not display a border (use `border-style:none` on the `ContentStyle` property to turn off portlet borders. Using this attribute with `InlineStyle` does not turn off portlet borders.) ■ `hidden`: Hide the border. ■ `dotted`: Display the border as a line of dots. ■ `double`: Display the border as a double line. ■ `groove`: Display the border as a grooved line. ■ `ridge`: Display the border as a ridged line. ■ `inset`: Display the border as a concave line. ■ `outset`: Display the border as a convex line. ■ `dashed`: Display the border as a line of dashes. ■ `solid`: Display the border as a solid line. ■ `inherit`: Inherit the border style from a parent component.
`border-width`	The thickness of the component border. Select `thick`, `medium`, `thin`, or `inherit` to determine the thickness of the border or inherit border width from a parent component. Alternatively, click the Edit icon and define a thickness in your preferred unit of measurement.
`color`	The color of the component text. Select from a list, or click the Edit icon to select from a color palette.
`font-family`	The font family (such as Arial, Helvetica, or sans-serif) for the component text. Enter this value manually.

Table B–23 (Cont.) Style Attributes of Composer and WebCenter Portal Customizable Components

Attribute	Description
`font-size`	The size of component text. Choose from: ■ `Choose Length`: Specify an absolute value for the `font-size` in your preferred unit of measurement. ■ `Choose Percentage`: Specify font size as a percentage of the normal text size defined for the browser. ■ `inherit`: Inherit font size from a parent component. ■ `large`: Select the next size larger than the font associated with the parent component. ■ `larger`: Increase the font size to larger than the font associated with the parent component (`larger` is larger than `large`). ■ `medium`: Set the font size to the default font size of the parent component. ■ `small`: Set the font size to smaller than the default font size of the parent component. ■ `smaller`: Set the font size to smaller than the default font size of the parent component (`smaller` is smaller than `small`).
`font-style`	The font style of the component text. Choose from: ■ `<none>`: Apply no style to the font. ■ `normal`: The font is not italic. ■ `italic`: The font is italic. ■ `oblique`: The font is slanted to look italic, though the font family may not have a formal italic member. ■ `inherit`: Inherit font style from a parent component.
`font-weight`	The thickness of the component text. Choose from: ■ `<none>`: Specify no weight for the component text. ■ `normal`: Apply same weight as the parent component's default font weight. ■ `bold`: Set component text in bold. ■ `bolder`: Set component text darker than bold. ■ `light`: Set component text lighter than normal. ■ `lighter`: Set component text lighter than light. ■ `100-900`: Specify a value for text darkness—`100` is lightest and `900` is darkest—`400` is normal weight; `700` is bold. ■ `inherit`: Inherit font weight from a parent component.
`height`	The spacing to apply between lines of continuous text (also known as *leading*). Specify a height by choosing from: ■ `Choose Length`: Specify an absolute value in your preferred unit of measurement. ■ `Choose Percentage`: Specify a value as a percentage of the value set for a parent component. ■ `auto`: Set line height automatically, usually about 2 points larger than font size. ■ `inherit`: Inherit line height from the parent component.
`list-style-image`	An image to use as an indicator of a list item. Specify an image instead of defining a `list-style-type`. Choose from: ■ `inherit`: Inherit a list style image from a parent component. ■ `none`: Use no image as an indicator of a list item. Or click the Edit icon and select an image.

Table B–23 (Cont.) Style Attributes of Composer and WebCenter Portal Customizable Components

Attribute	Description
`list-style-type`	The type of indicator to use for items on a list. Use this instead of specifying a image through `list-style-image`. Select from among many styles offered on the list, including `<none>`, which means the browser's default style is used, and `inherit`, which means the `list-style-type` is inherited from a parent component.
`margin`	The border of space surrounding the component content. Choose from: ■ `Choose Length`: Specify an absolute value for all margins. ■ `Choose Percentage`: Set a value as a percentage of the margin of a parent component. ■ `inherit`: Inherit margin value from a parent component. ■ `auto`: Set the value automatically according to browser defaults.
`padding`	The amount of space between the component and its margin or, if there is a border, between the component and its border. Choose from: ■ `Choose Length`: Specify an absolute value in your preferred unit of measurement. ■ `Choose Percentage`: Specify the value as a percentage of the padding set for a parent component. ■ `inherit`: Inherit the value from a parent component.
`text-align`	The horizontal alignment of the component text. Choose from: ■ `<none>`: Use browser default. ■ `left` ■ `right` ■ `center` ■ `justify`: Align text so that all lines start and end at the same point left and right. ■ `auto`: Apply a value automatically, either left or right. ■ `inherit`: Inherit alignment from a parent component.

Table B–23 (Cont.) Style Attributes of Composer and WebCenter Portal Customizable Components

Attribute	Description
`text-decoration`	The decorative value to apply to component text. Choose from: ■ `<none>`: Use the browser default for hyperlinks; otherwise, no text decoration. ■ `none`: No text decoration, including no underscore for hyperlinks. ■ `underline`: Draw a line under all component text. ■ `overline`: Draw a line over all component text. ■ `line-through`: Draw a line through the middle of all component text. ■ `blink`: Make component text blink. ■ `inherit`: Inherit text decoration from a parent component.
`vertical-align`	The vertical alignment of component text. Choose from: ■ `Choose Length`: Specify an absolute value in your preferred unit of measurement. ■ `Choose Percentage`: Specify a value as a percentage of the value set for a parent component. ■ `inherit`: Inherit the value from a parent component. ■ `baseline`: Set the text on the baseline of the text row. ■ `middle`: Set the text in the middle of the text row. ■ `text-bottom`: Set the text on the bottom of the text row, lower than the baseline. ■ `text-top`: Set the text at the top of the text row, above the baseline. ■ `sub`: Set the text as subscript. ■ `super`: Set the text as superscript.
`width`	The spacing between text. Specify a width by choosing from: ■ `Choose Length`: Specify an absolute value in your preferred unit of measurement. ■ `Choose Percentage`: Specify a value as a percentage of the value set for a parent component. ■ `auto`: Set line height automatically, usually about 2 points larger than font size. ■ `inherit`: Inherit line height from the parent component.

B.5 Customizable Components (HTML) Properties

Customizable Components (HTML) are similar in function to customizable components from the 10.1.3.2.0 release and can be used to add more customizable components to your migrated 10.1.3.2.0 application page. These customizable components are available from the Customizable Components (HTML) tag library in JDeveloper. When you add customizable components to the page, default values are assigned to certain attributes and you can define values for the remaining attributes as required.

Customizable components enable users to minimize or maximize, hide or show, or move any component on the page at runtime.

> **Note:** The Customizable Components (HTML) library is available only to support applications created in release 10.1.3.2.0. Adding these components to new applications is not supported.
>
> It is recommended that you replace Customizable Components (HTML) in existing applications with their rich counterparts (from the Composer tag library) whenever possible.

B.5.1 Panel Customizable (HTML) Component

Use the `Panel Customizable (HTML)` component as a container for page content that can be customized at runtime. Components added inside a `Panel Customizable (HTML)` can be maximized, minimized, or rearranged.

Use this component only to perform runtime customizations on child components. If you just want a container to arrange components at design time, then it is recommended that you use an ADF Faces container like `Panel Group Layout`.

Table B–24 describes the attributes of a `Panel Customizable (HTML)` component.

Table B–24 Attributes of a Panel Customizable (HTML) Component

Attribute	Type	Supports EL?	Description
Common Attributes			
id	String	No	The identifier for the component. The identifier must follow a subset of the syntax allowed in HTML: ■ Must not be a zero-length String. ■ First character must be an ASCII letter (A-Za-z) or an underscore ('_'). ■ Subsequent characters must be an ASCII letter or digit (A-Za-z0-9), an underscore ('_'), or a dash ('-').
rendered	Boolean	Yes	Specifies whether the component is rendered. When set to `false`, no output is delivered for this component (the component is not in any way rendered, and cannot be made visible on the client). The default value is `true`.

Table B–24 (Cont.) Attributes of a Panel Customizable (HTML) Component

Attribute	Type	Supports EL?	Description
layout	List of values `horizontal/vertical`	Yes	Specifies how the children of the `Panel Customizable` (HTML) are laid out. The default value is `vertical`. Depending on the value of the layout attribute, child components are laid out as follows: If you select `vertical`, then the child components are displayed one below the other and can be moved either up or down within the layout. If you select `horizontal`, then the child components are displayed adjacent to each other and can be moved either to the left or right within the layout.
Style Attributes			
styleClass	String	Yes	A CSS style class to use for this component. The style class can be defined in your JSPX page or in a skinning CSS file, for example.
inlineStyle	String	Yes	The CSS styles to use for this component. This is intended for basic style changes. The `inlineStyle` is a set of CSS styles that are applied to the root DOM element of the component. If the `inlineStyle`'s CSS properties do not affect the DOM element you want affected, then you must create a skin and use the skinning keys which are meant to target particular DOM elements, like `::label` or `::icon-style`.
Advanced Attributes			
binding	String	Yes	An EL reference that stores the component instance in a bean. This can be used to give programmatic access to a component from a backing bean, or to move creation of the component to a backing bean. For example: `binding="#{yourManagedBean.Binding}"`

Table B–24 (Cont.) Attributes of a Panel Customizable (HTML) Component

Attribute	Type	Supports EL?	Description
Customization Attributes			
customizationAllowed	Boolean		Specifies whether customizations are allowed on this component. Available values are `true` and `false`. The default value is `true`.
customizationAllowedBy	String		Specifies the roles for which customization is enabled.
Other Attribute			
customizationId			This attribute has been deprecated. Use the `id` attribute.

B.5.2 Show Detail Frame (HTML) Component

Add `Show Detail Frame (HTML)` components inside `Panel Customizable (HTML)` components to enable user customizations like maximizing, moving, minimizing, restoring, and deleting child components. You can perform these customizations only if you add `Show Detail Frame (HTML)` components inside `Panel Customizable (HTML)` components.

Table B–25 describes the attributes of a `Show Detail Frame (HTML)` component.

Table B–25 Attributes of a Show Detail Frame (HTML) Component

Attribute	Type	Supports EL?	Description
Common Attributes			
id	String	No	The identifier for the component. The identifier must follow a subset of the syntax allowed in HTML: ■ Must not be a zero-length String. ■ First character must be an ASCII letter (A-Za-z) or an underscore ('_'). ■ Subsequent characters must be an ASCII letter or digit (A-Za-z0-9), an underscore ('_'), or a dash ('-').
rendered	Boolean	Yes	Specifies whether the component is rendered. When set to `false`, no output is delivered for this component (the component is not in any way rendered, and cannot be made visible on the client). The default value is `true`.
text	String	Yes	A title for the `Show Detail Frame` (HTML) component.

Table B–25 (Cont.) Attributes of a Show Detail Frame (HTML) Component

Attribute	Type	Supports EL?	Description

icon	String	Yes	If you want to add an icon on the header of the `Show Detail Frame` component, then this specifies the URI for the image to be used.
			For example:
			`icon="http://source-pc/images/accessability.gif"`
			Note: An image that is stored at the document root does not require a full path. For example:
			`icon="detail.gif"`

Appearance Attributes			
text	String	Yes	A title for the `Show Detail Frame` (HTML) component.
shortDesc	String	Yes	The short description of the component. This text is commonly used by user agents to display tooltip help text, in which case the behavior for the tooltip is controlled by the user agent, for example, Firefox 2 truncates long tooltips. For form components, the `shortDesc` is displayed in a note window.

icon	String	Yes	If you want to add an icon on the header of the `Show Detail Frame` component, then this specifies the URI for the image to be used.
			For example:
			`icon="http://source-pc/images/accessability.gif"`
			Note: An image that is stored at the document root does not require a full path. For example:
			`icon="detail.gif"`

background	List of values `light/medium/dark`	Yes	Working with the skin CSS, provides a means of applying a different look and feel for this `Show Detail Frame (HTML)` instance. The default value is `medium`.

Table B–25 (Cont.) Attributes of a Show Detail Frame (HTML) Component

Attribute	Type	Supports EL?	Description
displayHeader	Boolean	Yes	Indicates whether the header of the `Show Detail Frame` (HTML) is displayed. The default value is `true`. If you set `displayHeader` to `false` and if you have exposed some actions on the component, then a toolbar is displayed when you move the mouse over the component area. The toolbar contains a drop down icon, which displays a menu of available options. This toolbar is rendered only if there are actions available on the component. The toolbar display is also affected by the `isSeededInteractionAvailable` attribute. As the default value for `isSeededInteractionAvailable` is `false`, the toolbar is not displayed. It can be displayed by setting `isSeededInteractionAvailable` to `true`.
expansionMode	List of values `maximized/minimized/normal`	Yes	The default state of the `Show Detail Frame (HTML)`. The default display mode is `normal`.
rendered	Boolean	Yes	Specifies whether the component is rendered. When set to `false`, no output is delivered for this component (the component is not in any way rendered, and cannot be made visible on the client). The default value is `true`.
Actions Attributes			
showMoveAction	List of values `menu/none`	Yes	Specifies whether the Move action is displayed in the Actions menu. The default value is `menu`.
showMinimizeAction	List of values `chrome/none`	Yes	Specifies whether the minimize action is displayed on the header. The default is `chrome`.
showMaximizeAction	List of values `menu/none`	Yes	Specifies whether the minimize action is displayed on the header. The default value is `menu`.
Style Attributes			
contentStyle	String	Yes	The CSS style to apply to the `Show Detail Frame (HTML)` content area. Manually enter any style in compliance with CSS version 2.0 or later.

Table B–25 (Cont.) Attributes of a Show Detail Frame (HTML) Component

Attribute	Type	Supports EL?	Description
styleClass	String	Yes	A CSS style class to use for this component. The style class can be defined in your JSPX page or in a skinning CSS file, for example.
inlineStyle	String	Yes	The CSS styles to use for this component. This is intended for basic style changes. The `inlineStyle` is a set of CSS styles that are applied to the root DOM element of the component. If the `inlineStyle`'s CSS properties do not affect the DOM element you want affected, then you must create a skin and use the skinning keys which are meant to target particular DOM elements, like `::label` or `::icon-style`.
Behavior Attributes			
partialTriggers	String	Yes	The IDs of the components that should trigger a partial update. This component listens on the trigger components. If a trigger component receives an event that causes it to update in some way, this component requests to be updated too. Identifiers are relative to the source component (this component), and must account for NamingContainers. If your component is inside of a naming container, you can use a single colon to start the search from the root of the page, or multiple colons to move up through the NamingContainers - "`::`" pops out of the component's naming container (or itself if the component is a naming container) and begin the search from there, "`:::`" pops out of two naming containers (including itself if the component is a naming container) and begin the search from there.
disclosureListener	`javax.el.MethodExpression`	Yes	A method reference to a disclosure listener. A disclosure event is fired when the disclosure state changes.
Advanced Attributes			

Table B–25 (Cont.) Attributes of a Show Detail Frame (HTML) Component

Attribute	Type	Supports EL?	Description
binding	String	Yes	An EL reference that stores the component instance in a bean. This can be used to give programmatic access to a component from a backing bean, or to move creation of the component to a backing bean. For example: `binding="#{yourManagedBean.Binding}"`
attributeChangeListener	`javax.el.MethodExpression`	Yes	A method reference to an attribute change listener. Attribute change events are not delivered for any programmatic change to a property. They are only delivered when a renderer changes a property without the application's specific request. An example of an attribute change events might include the width of a column that supported client-side resizing.
Customization Attributes			
customizationAllowed	Boolean		Specifies whether customizations are allowed on this component. Available values are `true` and `false`. The default value is `true`.
customizationAllowedBy	String		Specifies the roles for which customization is enabled.
Other Attribute			
customizationId			This attribute has been deprecated. Use the `id` attribute.

The **Expression Builder** option available when setting these attributes enables you to bind the component instance to a managed bean property.

Show Detail Frame Facets

You can use the `Show Detail Frame (HTML)` facets to define and display custom actions on `Show Detail Frame (HTML)` components. Table B–26 describes the facets that enable you to display custom actions supported by the `Show Detail Frame (HTML)` component.

Table B–26 Show Detail Frame (HTML) Facets

Facet	Description
titleBarAction	Used if an action is to be associated with title of the `Show Detail Frame` (HTML) component.
additionalActions	Used if some additional actions are to be added to the list of actions available on the `Show Detail Frame (HTML)` header.

JDeveloper displays all facets available to the `Show Detail Frame (HTML)` component in the Structure window. However, only those that contain UI components appear activated.

B.5.3 Customizable Components (HTML) Style Selectors

The tables in this section describe the style selectors that you can use to skin WebCenter Portal Customizable Components.

This section contains the following subsections:

- Panel Customizable (HTML) Style Selectors
- Show Detail Frame (HTML) Style Selectors
- Property Keys
- Icon Selectors

B.5.3.1 Panel Customizable (HTML) Style Selectors

Use the style selectors listed in Table B–27 to skin `Panel Customizable (HTML)` components. For icon selectors relevant to the `Panel Customizable` component, see Section B.5.3.4, "Icon Selectors."

Table B–27 Panel Customizable (HTML) Style Selector

Style Selector	Description
`afh|panelCustomizable::no-header-content`	Specifies the style to render for all four component borders when the component header is turned off.

B.5.3.2 Show Detail Frame (HTML) Style Selectors

Use the style selectors listed in Table B–28 to skin the `Show Detail Frame (HTML)` components.

> **Note:** In addition to defining styles for `Show Detail Frame` components, the `Show Detail Frame` style and icon selectors define styles for portlets.

Table B–28 Show Detail Frame (HTML) Style Selectors

Style Selector	Description

`afh|showDetailFrame::header-top-border-light`
`afh|showDetailFrame::header-top-border-medium`
`afh|showDetailFrame::header-top-border-dark`
	Specifies the style for the top and bottom border of a component header and, also the header background color.

`afh|showDetailFrame::container`	Specifies the style for the component's container.

`afh|showDetailFrame::header-light`
`afh|showDetailFrame::header-medium`
`afh|showDetailFrame::header-dark`
	Specifies the style for text in the component's header. The header is usually a banner of color that contains a title and links to menus and other types of actions.
	Define the header background color with the `af|showDetailFrame::header-top-border-[light,medium,dark]` style element. Use icon selectors to specify the icons to use in the component header and, also the shape of the header's left and right sides.

Table B–28 (Cont.) Show Detail Frame (HTML) Style Selectors

Style Selector	Description
afh|showDetailFrame::content-light afh|showDetailFrame::content-medium afh|showDetailFrame::content-dar	Specifies the style for the component's left, right, and bottom borders.
afh|showDetailFrame::main-menu-container	Specifies the style for the component's main menu container.
afh|showDetailFrame::sub-menu-container	Specifies the style for the component's submenu container.
afh|showDetailFrame::menu-item	Specifies the style for an individual item on the component's main menu.
afh|showDetailFrame::menu-item:hover	Specifies the style to render when the mouse hovers over a component main menu item.
afh|showDetailFrame::sub-menu-item	Specifies the style for an individual item on the component's submenu.
afh|showDetailFrame::sub-menu-item:hover	Specifies the style to render when the mouse hovers over a component submenu item.
afh|showDetailFrame::actions-image-separator	Specifies the amount of padding to provide around the component's Actions, Minimize, and Restore icons. For more information, see also Section B.5.3.4, "Icon Selectors".
afh|showDetailFrame::menu-item-separator	Specifies the style for the line that separates a command or groups of commands on the component's Actions menu. In the default case, a separator appears to be a single thick line. This is achieved using `border-top` and `border-bottom` elements to style the separator. A user who creates a custom skin can style the separator differently. For example, a user can create a separator that displays as a rectangular bar with a colorful background.
A.afh|showDetailFrame::title-clickable	Specifies the style to render for the component's title when the title is a link.
afh|showDetailFrame::no-header-content afh|showDetailFrame::no-header-content-light afh|showDetailFrame::no-header-content-medium afh|showDetailFrame::no-header-content-dark	Specifies the style to render for all four component borders when the component header is turned off.

B.5.3.3 Property Keys

Use property keys to control the display of custom menu items and component action icons. Though you include property keys in your custom skin, they are not represented in the generated CSS that results from the skin.

To explain, skins go through a process that results in a generated CSS. In turn, the generated CSS is consumed by the application. Most style selectors for `Panel Customizable` and `Show Detail Frame` components are represented in the generated CSS. Property keys are the exception. Although they affect the application as much as any other component style selector, they are not represented in the final generated CSS.

Table B–29 lists and describes property keys relevant to `Panel Customizable` and `Show Detail Frame` components.

Table B–29 Property Keys of Panel Customizable and Show Detail Frame Components

Property Key	Description

`showDetailFrame`
`{-ora-additional-actions-position-last:true}`
	Positions additional actions relative to seeded actions on the component's Actions menu.
	Set to `false` to position additional actions before seeded actions. By default, additional actions are positioned after seeded actions.
	The default value is `true`.

`showDetailFrame`
`{-ora-menu-icon-display:false}`
	Controls the display of icons next to their related commands on a `Show Detail Frame` Actions menu.
	Set to `true` to display icons to the left of each action on the Actions menu. By default, no icons are displayed to the left of individual actions.
	The default value is `false`.
	For information about specifying the icons to use when this property key is set to `true`, see Section B.5.3.4, "Icon Selectors."

B.5.3.4 Icon Selectors

Icons are either displayed or not displayed depending on whether the component's `ora-menu-icon-display` property key is set to `true` or `false`. Property keys are described in Section B.5.3.3, "Property Keys."

Each icon selector has a *light*, *medium*, and *dark* scheme. Using these you can define three distinct looks in your CSS and specify which one to use through the `background` property in the JDeveloper Property Inspector. Depending on which value is specified for a component instance's `background` property, the skin applies the relevant style.

For easy, error-free portability, store all application icons under the Portal Framework application's root folder.

The selectors described in Table B–30 apply to the icons used with `Panel Customizable (HTML)` and `Show Detail Frame (HTML)` components.

Table B–30 Icon Selectors for WebCenter Portal Customizable Components

Selector	Description
showDetailFrame showDetailFrame::light-ActionsIcon:alias showDetailFrame::medium-ActionsIcon:alias showDetailFrame::dark-ActionsIcon:alias **panelCustomizable** panelCustomizable::light-ActionsIcon:alias panelCustomizable::medium-ActionsIcon:alias panelCustomizable::dark-ActionsIcon:alias	This icon represents the Actions menu. The Actions menu lists the actions a user can perform on the component. In a Portal Framework application, the Actions icon is rendered on the right corner of the component header.
showDetailFrame showDetailFrame::light-MinimizeIcon:alias showDetailFrame::medium-MinimizeIcon:alias showDetailFrame::dark-MinimizeIcon:alias **panelCustomizable** panelCustomizable::light-MinimizeIcon:alias panelCustomizable::medium-MinimizeIcon:alias panelCustomizable::dark-MinimizeIcon:alias	This icon represents the Minimize option. Minimize collapses the view of the component like a window shade. In a Portal Framework application, the Minimize icon is rendered on the left side of the component header. See also, `showDetailFrame::light-ExpandIcon:alias`.
showDetailFrame showDetailFrame::light-MaximizeIcon:alias showDetailFrame::medium-MaximizeIcon:alias showDetailFrame::dark-MaximizeIcon:alias	This is applicable only for the `Show Detail Frame (HTML)` component. The rich variant of this component does not support the maximize action. This icon represents the Maximize option, which expands the `Show Detail Frame (HTML)` component to the dimensions of the `Panel Customizable (HTML)` component that contains it. Where multiple `Show Detail Frame (HTML)` components display in the same container, these are displaced while the maximized `Show Detail Frame (HTML)` remains maximized. In a Portal Framework application, the Maximize icon is displayed to the left of the Maximize command on the component's Actions menu.
panelCustomizable panelCustomizable::light-MaximizeIcon:alias panelCustomizable::medium-MaximizeIcon:alias panelCustomizable::dark-MaximizeIcon:alias	This is applicable only for the `Panel Customizable (HTML)` component. The rich variant of this component does not provide any actions. This icon represents the Maximize option, which expands component display to the dimensions of the container. Where multiple components display in the same container, these are displaced by the maximized component. In a Portal Framework application, the Maximize icon is displayed to the left of the Maximize command on the component's Actions menu.
showDetailFrame showDetailFrame::light-RestoreIcon:alias showDetailFrame::medium-RestoreIcon:alias showDetailFrame::dark-RestoreIcon:alias **panelCustomizable** panelCustomizable::light-RestoreIcon:alias panelCustomizable::medium-RestoreIcon:alias panelCustomizable::dark-RestoreIcon:alias	This icon represents the Restore option, which restores maximized views to their default display modes. In a Portal Framework application, the Restore icon is rendered to the left of the Restore command on the component's Actions menu.

Table B–30 (Cont.) Icon Selectors for WebCenter Portal Customizable Components

Selector	Description
showDetailFrame showDetailFrame::light-ExpandIcon:alias showDetailFrame::medium-ExpandIcon:alias showDetailFrame::dark-ExpandIcon:alias **panelCustomizable** panelCustomizable::light-ExpandIcon:alias panelCustomizable::medium-ExpandIcon:alias panelCustomizable::dark-ExpandIcon:alias	The Expand icon represents the action that expands a component that has been minimized. The Expand icon toggles with the Minimize icon. That is, when the component is minimized, the Expand icon is displayed; when the component is expanded, the Minimize icon is displayed. In a Portal Framework application, the Expand icon is displayed on the left side of the component header.
showDetailFrame showDetailFrame::light-MoveIcon:alias showDetailFrame::medium-MoveIcon:alias showDetailFrame::dark-MoveIcon:alias **panelCustomizable** panelCustomizable::light-MoveIcon:alias panelCustomizable::medium-MoveIcon:alias panelCustomizable::dark-MoveIcon:alias	This icon represents the Move option, which enables rearrangement of a component's location in relation to the other components on the page. In a Portal Framework application, the Move icon is displayed to the left of the Move command on the component's Actions menu.
showDetailFrame showDetailFrame::light-MoveLeftIcon:alias showDetailFrame::medium-MoveLeftIcon:alias showDetailFrame::dark-MoveLeftIcon:alias **panelCustomizable** panelCustomizable::light-MoveLeftIcon:alias panelCustomizable::medium-MoveLeftIcon:alias panelCustomizable::dark-MoveLeftIcon:alias	This icon represents the Move Left option on the component submenu. Move Left rearranges the component horizontally, one position closer to the left boundary of the page. For example, imagine three horizontally arranged components. You select Move Left on the right-most component. It becomes the middle component. In a Portal Framework application, the Move Left icon is displayed to the left of the Move Left submenu item on the component's Actions menu.
showDetailFrame showDetailFrame::light-MoveRightIcon:alias showDetailFrame::medium-MoveRightIcon:alias showDetailFrame::dark-MoveRightIcon:alias **panelCustomizable** panelCustomizable::light-MoveRightIcon:alias panelCustomizable::medium-MoveRightIcon:alias panelCustomizable::dark-MoveRightIcon:alias	This icon represents the Move Right option on the component submenu. Move Right rearranges the component horizontally, one position closer to the right boundary of the page. For example, imagine three horizontally arranged components. You select Move Right on the left-most component. It becomes the middle component. In a Portal Framework application, the Move Right icon is displayed to the left of the Move Right submenu item on the component's Actions menu.
showDetailFrame showDetailFrame::light-MoveUpIcon:alias showDetailFrame::medium-MoveUpIcon:alias showDetailFrame::dark-MoveUpIcon:alias **panelCustomizable** panelCustomizable::light-MoveUpIcon:alias panelCustomizable::medium-MoveUpIcon:alias panelCustomizable::dark-MoveUpIcon:alias	This icon represents the Move Up option on the component submenu. Move Up rearranges the component vertically in relation to the other components on the page. For example, imagine three vertically arranged components. You select Move Up on the middle component. It becomes the topmost component. In a Portal Framework application, the Move Up icon is displayed to the left of the Move Up submenu item on the component's Actions menu.

Table B–30 (Cont.) Icon Selectors for WebCenter Portal Customizable Components

Selector	Description

showDetailFrame
`showDetailFrame::light-MoveDownIcon:alias`
`showDetailFrame::medium-MoveDownIcon:alias`
`showDetailFrame::dark-MoveDownIcon:alias`
panelCustomizable
`panelCustomizable::light-MoveDownIcon:alias`
`panelCustomizable::medium-MoveDownIcon:alias`
`panelCustomizable::dark-MoveDownIcon:alias`
	This icon represents the Move Down option on the component submenu. Move Down rearranges the component vertically in relation to the other components on the page. For example, imagine three vertically arranged components. You select Move Down on the middle component. It becomes the bottommost component.
	In a Portal Framework application, the Move Down icon is displayed to the left of the Move Down submenu item on the component's Actions menu.

showDetailFrame
`showDetailFrame::light-HeaderLeftIcon:alias`
`showDetailFrame::medium-HeaderLeftIcon:alias`
`showDetailFrame::dark-HeaderLeftIcon:alias`
panelCustomizable
`panelCustomizable::light-HeaderLeftIcon:alias`
`panelCustomizable::medium-HeaderLeftIcon:alias`
`panelCustomizable::dark-HeaderLeftIcon:alias`
	This icon provides an image for the top-left corner of the component header.

showDetailFrame
`showDetailFrame::light-HeaderRightIcon:alias`
`showDetailFrame::medium-HeaderRightIcon:alias`
`showDetailFrame::dark-HeaderRightIcon:alias`
panelCustomizable
`panelCustomizable::light-HeaderRightIcon:alias`
`panelCustomizable::medium-HeaderRightIcon:alias`
`panelCustomizable::dark-HeaderRightIcon:alias`
	This icon provides the image for the top-right corner of the component header.

showDetailFrame
`showDetailFrame::light-ToolbarLeftIcon:alias`
`showDetailFrame::medium-ToolbarLeftIcon:alias`
`showDetailFrame::dark-ToolbarLeftIcon:alias`
panelCustomizable
`panelCustomizable::light-ToolbarLeftIcon:alias`
`panelCustomizable::medium-ToolbarLeftIcon:alias`
`panelCustomizable::dark-ToolbarLeftIcon:alias`
	This icon provides the left portion of the component's FadeIn-FadeOut toolbar.
	The FadeIn-FadeOut toolbar comes into play when the `adfp:portlet` tag attribute `isSeededInteractionAvailable` is set to `true` and `displayHeader` is set to `false`.
	The toolbar contains the Actions menu that would otherwise be displayed on the header. To invoke the toolbar, users move their mouse over the component content area.
	If the page design is very simple, then the FadeIn-FadeOut toolbar may not display, even when `displayHeader` is set to `false` and `isSeededInteractionAvailable` is set to `true`.

`showDetailFrame`
`showDetailFrame::light-ToolbarRightIcon:alias`
`showDetailFrame::medium-ToolbarRightIcon:alias`
`showDetailFrame::dark-ToolbarRightIcon:alias`
panelCustomizable
`panelCustomizable::light-ToolbarRightIcon:alias`
`panelCustomizable::medium-ToolbarRightIcon:alias`
`panelCustomizable::dark-ToolbarRightIcon:alias`
	This icon provides the right portion of the component's FadeIn-FadeOut toolbar.
	See the description for `showDetailFrame::light-ToolbarLeftIcon:alias` for an explanation of the FadeIn-FadeOut toolbar.

Table B–30 (Cont.) Icon Selectors for WebCenter Portal Customizable Components

Selector	Description
showDetailFrame showDetailFrame::light-ToolbarCenterIcon:alias showDetailFrame::medium-ToolbarCenterIcon:alias showDetailFrame::dark-ToolbarCenterIcon:alias **panelCustomizable** panelCustomizable::light-ToolbarCenterIcon:alias panelCustomizable::medium-ToolbarCenterIcon:alias panelCustomizable::dark-ToolbarCenterIcon:alias	This icon provides the center portion of the component's FadeIn-FadeOut toolbar. See the description for `showDetailFrame::light-ToolbarLeftIcon:alias` for an explanation of the FadeIn-FadeOut toolbar.
showDetailFrame showDetailFrame::light-EditIcon:alias showDetailFrame::medium-EditIcon:alias showDetailFrame::dark-EditIcon:alias **panelCustomizable** panelCustomizable::light-EditIcon:alias panelCustomizable::medium-EditIcon:alias panelCustomizable::dark-EditIcon:alias	This icon represents the Edit option on the component menu. In a Portal Framework application, the Edit icon is displayed to the left of the Edit menu item on the component's Actions menu.
showDetailFrame showDetailFrame::light-HelpIcon:alias showDetailFrame::medium-HelpIcon:alias showDetailFrame::dark-HelpIcon:alias **panelCustomizable** panelCustomizable::light-HelpIcon:alias panelCustomizable::medium-HelpIcon:alias panelCustomizable::dark-HelpIcon:alias	This icon represents the Help option on the component menu. In a Portal Framework application, the Help icon is displayed to the left of the Help menu item on the component's Actions menu.

C

Resource Catalog Properties and Files

This appendix describes the configuration, location, and attributes of the default catalog definition file.

This appendix includes the following topics:

- Section C.1, "Configuration and Location of Catalog Definitions"
- Section C.2, "XML Schema"
- Section C.3, "Catalog Definition Attributes"
- Section C.4, "Factory Classes Available for Adding Dynamic Resources to the Catalog"

This information is useful while performing the tasks described in Part III, "Customizing Your Application and Extending Customization Options."

For detailed information about resource catalogs, see Chapter 14, "Developing Resource Catalogs."

C.1 Configuration and Location of Catalog Definitions

The `rcv-config` section of your `adf-config.xml` file defines the name of the default catalog. The `rcv-config` element is not available by default in your application's `adf-config.xml` file. You must add it if you want to change the name of the default catalog or, if you have chosen to implement multiple catalogs, specify a catalog selector class.

```
<rcv:rcv-config>
  <rcv:catalog-selector class-name=""/>
  <rcv:default-catalog
catalog-name="/oracle/webcenter/portalapp/catalogs/default-catalog.xml"/>
</rcv:rcv-config>
```

The resource catalog service stores catalog definition files in MDS at the *`resource-catalog-root`* directory. The *`resource-catalog-root`* is defined as an MDS namespace, hence the exact location depends on your MDS configuration. The default *`resource-catalog-root`* is defined by the `default-scope` attribute in the `adf-rcs-config` element in your `adf-config.xml`. This attribute is set to "**`/`**" implying that a catalog ID is expressed as fully the qualified MDS path:

```
<rcs:adf-rcs-config>
  <rcs:rcs-config>
    <rcs:catalog-config default-scope="/"

default-registry="/oracle/webcenter/portalapp/catalogs/catalog-registry.xml"/>
    . . .
    <rcs:security-manager
class-name="oracle.webcenter.portalframework.genericsiteresources.internal.securit
y.CatalogSecurityManager"/>
  </rcs:rcs-config>
```

The `security-manager` element defines the security manager implementation.

C.2 XML Schema

Example C–1 provides the catalog definition XML schema for your reference.

Example C–1 XML Schema for Catalog Definition

```
<xsd:schema elementFormDefault="qualified"
            targetNamespace="http://xmlns.oracle.com/adf/rcs/catalog"
            xmlns:rcs="http://xmlns.oracle.com/adf/rcs/catalog"
            xmlns:md="http://xmlns.oracle.com/bali/xml/metadata"
            xmlns:mds="http://xmlns.oracle.com/mds"
            xmlns:xsd="http://www.w3.org/2001/XMLSchema"
            xmlns:jaxb="http://java.sun.com/xml/ns/jaxb" jaxb:version="1.0">

  <xsd:annotation>
    <xsd:appinfo>
      <jaxb:schemaBindings>
        <jaxb:package name="oracle.adfinternal.rc.catalog.xml"/>
      </jaxb:schemaBindings>
    </xsd:appinfo>
  </xsd:annotation>

  <!-- declare all elements as top-level elements so they appear in the
       component palette pages generated by XMLEF -->

  <!-- IMPORTANT: catalogDefinition & navigationModel CANNOT share a common type
-->
  <!--            MDS cannot handle it. -->
  <xsd:element name="catalogDefinition" type="rcs:catalogDefinitionType">
    <xsd:annotation>
      <xsd:appinfo>
        <md:elementMetadata>
          <mds:customizationAllowed>true</mds:customizationAllowed>
        </md:elementMetadata>

```

C.3 Catalog Definition Attributes

The catalog definition schema provides a rich set of elements through which you can specify the structure and content of your resource catalogs.

This section includes the following topics:

- Section C.3.1, "catalogDefinition"
- Section C.3.2, "folder"
- Section C.3.3, "url"
- Section C.3.4, "includeCatalog"
- Section C.3.5, "component"
- Section C.3.6, "customFolder"
- Section C.3.7, "customContent"
- Section C.3.8, "attributes"
- Section C.3.9, "attribute"
- Section C.3.10, "parameters"
- Section C.3.11, "schema"
- Section C.3.12, "resource"

For an example of creating a custom catalog definition file, see Section 14.2, "Creating a Resource Catalog."

C.3.1 catalogDefinition

The `catalogDefinition` element defines the overall characteristics of the catalog, such as the location of translated strings.

Example C–2 illustrates the use of `catalogDefinition`.

Example C–2   Example of catalogDefinition

```
<catalogDefinition id="DefaultCatalog" visible="#{true}"
                   resourceBundle="portal.catalog.DefaultCatalogBundle"
                   definitionFilter="portal.catalog.DefaultCatalogFilter"
                   xmlns="http://xmlns.oracle.com/adf/rcs/catalog">
```

Table C–1 describes the keywords of the catalogDefinition element. For information about including attributes, such as title, subject, and description for elements, see Section C.3.8, "attributes."

Table C–1   catalogDefinition Keywords

Keyword	Description
xmlns	http://xmlns.oracle.com/adf/rcs/catalog
id	The identifier used when referring to this catalog definition.
visible	Whether the resource catalog must be available for selection at runtime. This attribute takes an EL value and can be used to conditionally display the catalog to specific users or groups. The default value is #{true}, which means that the catalog is displayed at all times.
resourceBundle	The name of the resource bundle to be used for obtaining translated attribute values, where <attribute.... isKey="true"/>. The resourceBundle attribute can also be used at lower levels in the document, such as on individual attributes elements. Refer to the XSD for further details.
definitionFilter	The fully qualified name of a Java class that implements the oracle.adf.rc.spi.plugin.catalog.CatalogDefinitionFilter. You can use a definition filter to dynamically exclude entries from a catalog at runtime. One common use of a definition filter is to provide different views of the same catalog to users with different roles. For example, WebCenter Portal uses a definition filter to hide entries for services that the administrator has disabled.

C.3.2 folder

The folder element defines a catalog folder, used to organize content in the catalog. Folders can contain any number of entries including other folders. You can mix different types of catalog elements in the same folder.

Folders can have attributes just like any other entry. For information about including attributes for elements, see Section C.3.8, "attributes."

Example C–3 illustrates the use of the folder element.

Example C–3   Example of folder

```
<folder visible="#{true}" id="webDevFolder">
  <attributes>
    <attribute value="WEB_DEV_FOLDER.TITLE" attributeId="Title"
               isKey="true"/>
    <attribute value="WEB_DEV_FOLDER.DESCRIPTION" attributeId="Description"
               isKey="true"/>
    <attribute value="WEB_DEV_FOLDER.KEYWORDS" attributeId="Subject"
               isKey="true"/>
    <attribute value="/adf/webcenter/folderlayout_qualifier.png"
               isKey="false" attributeId="IconURI"/>
  </attributes>
  <contents/>
```

```
<folder>
```

Table C–2 describes the keywords of the `folder` element.

Table C–2 folder Keywords

Keyword	Description
`id`	The unique identifier used when referring to this folder.
`visible`	Whether the resource must be rendered in the catalog. This attribute takes an EL value and can be used to conditionally display the resource to specific users or groups. The default value is `#{true}`, which means that the resource is displayed in the catalog at all times.

Rather than adding the code to the catalog definition source, you may find it easier to add a folder in Design view of the catalog definition file. For more information, see Section 14.3.4, "How to Add a Folder to a Resource Catalog."

C.3.3 url

The `url` element is used to define the following types of links in a catalog:

- **Task Flow**: Link to a WebCenter Portal tools and services task flow or a custom task flow created in JDeveloper.
- **Portlet**: Link to any registered portlet producer.
- **Content**: Link to a file or directory from an existing Content Repository connection.
- **Other**: Link to a custom component that you create by providing the XML code for that component.

Example C–4 illustrates the use of the `url` element.

Example C–4 Example of a url Resource

```
<url visible="#{true}"

factoryClass="oracle.webcenter.portalframework.sitestructure.rc.TaskFlowResourceFa
ctory"
     id="tagCloud"

url="taskflow://oracle/webcenter/tagging/controller/taskflows/tag-selection.xml#ta
g-selection">
  <attributes>
    <attribute value="TAG_CLOUD.TITLE" attributeId="Title" isKey="true"/>
    <attribute value="TAG_CLOUD.DESCRIPTION" attributeId="Description"
               isKey="true"/>
    <attribute value="TAG_CLOUD.KEYWORDS" attributeId="Subject"
               isKey="true"/>
    <attribute value="oracle.webcenter.tagging"
               attributeId="WEBCENTER_SERVICE_ID" isKey="false"/>
    <attribute value="/adf/webcenter/label_qualifier.png"
               attributeId="IconURI"/>
    <attribute value="height:211px" attributeId="attr.contentStyle"
               isKey="false"/>
  </attributes>
  <contents/>
</url>
```

Table C–3 describes the keywords for the url element.

Table C–3 url Keywords

Keyword	Description
id	The unique identifier used when referring to this link.
visible	Whether the resource must be rendered in the catalog. This attribute takes an EL value and can be used to conditionally display the resource to specific users or groups. The default value is #{true}, which means that the resource is displayed in the catalog at all times.
factoryClass	If you are adding a custom component, then specify the factory class of the component. For all other resource types, the Factory Class value is populated as soon as you select the type in Design mode. The factory classes for the available resource types are as follows: ■ Task flow: oracle.webcenter.portalframework.sitestructure.rc.TaskFlowResourceFactory ■ Portlet: oracle.webcenter.portalframework.sitestructure.rc.PortletResourceFactory ■ Content: oracle.webcenter.content.model.rc.ContentUrlResourceFactory ■ Data control: oracle.webcenter.datacomposer.internal.adapter.datacontrol.DataControlContextFactory
url	The URL to access the resource. Different link types support different URL formats. For more information, see Table 14–1.

Resource links can have attributes, such as title, subject, and description, and parameters. For more information, see Section C.3.8, "attributes" and Section C.3.10, "parameters."

Rather than adding the code to the catalog definition source, you may find it easier to add a link in Design view of the catalog definition file. For more information, see Section 14.3.3, "How to Add a Link to a Resource Catalog."

C.3.4 includeCatalog

The includeCatalog element is used to include a reference to another catalog definition file.

Example C–5 illustrates the use of the includeCatalog element.

Example C–5 Example of a Nested Resource Catalog

```
<includeCatalog visible="#{true}" scope="/" id="users-catalog"

catalogId="/oracle/webcenter/portalapp/catalogs/users-catalog.xml">
 <attributes>
   <attribute value="catalog" isKey="false" attributeId="Title"/>
 </attributes>
</includeCatalog>
```

The includeCatalog element supports the same keywords as the catalogDefinition element. See Table C–1 for the keywords on the includeCatalog element.

A catalog can have attributes, such as title, subject, and description. For information about including attributes for elements, see Section C.3.8, "attributes."

Rather than adding the code to the catalog definition source, you may find it easier to add a catalog in Design view of the catalog definition file. For more information, see Section 14.3.8, "How to Add a Resource Catalog to Another Resource Catalog."

C.3.5 component

The component element is used to include a custom XML resource, such as a simple ADF Faces component or raw HTML, in the catalog. The component element must be located within the contents section. You can add multiple component elements in a catalog definition file.

The component element must contain a parameters element with a nested parameter element. Set the id for the parameter element to xml. Include the XML fragment inside this parameter element. To generate an ADF Faces ID for the component at runtime, set the ID on the component to # (hash symbol).

Example C–6 shows the code to add a Box component to the resource catalog.

Example C–6 Panel Customizable Component in the Catalog Definition File

```
<component id="pc" visible="#{true}"
           factoryClass="oracle.adf.rc.component.XmlComponentFactory">
  <attributes>
    <attribute attributeId="Title" value="BOX" isKey="true"/>
    <attribute attributeId="Description" value="BOX.DESCRIPTION"
               isKey="true"/>
    <attribute attributeId="Subject" value="BOX.KEYWORDS" isKey="true"/>
    <attribute attributeId="IconURI"
               value="/adf/webcenter/panelcustomizable_qualifier.png"/>
  </attributes>
<parameters>
  <parameter id="xml">&lt;cust:panelCustomizable id="#"
xmlns:cust="http://xmlns.oracle.com/adf/faces/customizable"/&gt;
  </parameter>
</parameters>
  </parameters>
</component>
```

Table C–4 describes the keywords of the component element. For information about including attributes for elements, see Section C.3.8, "attributes."

Table C–4 component Keywords

Keyword	Description
id	The unique identifier for the component in the catalog definition.
visible	Whether the resource must be rendered in the catalog. This attribute takes an EL value and can be used to conditionally display the resource to specific users or groups. The default value is #{true}, which means that the resource is displayed in the catalog at all times.

Table C–4 (Cont.) component Keywords

Keyword	Description
`factoryClass`	The name of a Java class that implements the `oracle.adf.rc.component.ComponentFactory` interface and generates a resource catalog item based on a set of parameters. Each `ComponentFactory` implementation defines the set of parameters it requires. For example, `XmlComponentFactory` requires a single parameter named `xml` and the value of the parameter is a block of XML representing a component or components that can be inserted into a page.

A custom component can have attributes, such as title, subject, and description, and parameters. For more information, see Section C.3.8, "attributes" and Section C.3.10, "parameters."

You may find it easier to add a custom component in Design view of the catalog definition file. For more information, see Section 14.3.5, "How to Add a Custom Component to a Resource Catalog."

C.3.6 customFolder

The `customFolder` element defines content generated using resource catalog adapters. This element renders a folder that is populated with content dynamically at runtime. The catalog displays the folder even if there are no resources inside it.

Example C–7 illustrates the use of the `customFolder` element to render task flows from the Analytics service.

Example C–7 Example of a customFolder Resource

```
<customFolder
factoryClass="oracle.webcenter.analytics.view.rc.ASServiceContextFactory"
id="analyticsServiceFolder" visible="#{true}">
         <attributes
resourceBundle="oracle.webcenter.spaces.resource.DefaultGroupSpaceCatalogBundle">
            <attribute attributeId="Description" isKey="true"
resourceBundle="oracle.webcenter.spaces.resource.DefaultGroupSpaceCatalogBundle"
value="ANALYTICS_FOLDER.DESCRIPTION"/>
            <attribute attributeId="IconURI" isKey="false"
value="/adf/webcenter/folderanalytics_qualifier.png"/>
            <attribute attributeId="Subject" isKey="true"
resourceBundle="oracle.webcenter.spaces.resource.DefaultGroupSpaceCatalogBundle"
value="ANALYTICS_FOLDER.KEYWORDS"/>
            <attribute attributeId="WEBCENTER_SERVICE_ID" isKey="false"
value="oracle.webcenter.analytics"/>
            <attribute attributeId="attr.text" isKey="false" value="#{uib_o_w_s_r_
DefaultGroupSpaceCatalog['ANALYTICS_FOLDER.TITLE']}"/>
            <attribute attributeId="Title" isKey="true"
resourceBundle="oracle.webcenter.spaces.resource.DefaultGroupSpaceCatalogBundle"
value="ANALYTICS_FOLDER.TITLE"/>
         </attributes>
         <parameters/>
      </customFolder>
```

Table C–5 describes the keywords for the `customFolder` element.

Table C–5 customFolder Keywords

Keyword	Description
`id`	The unique identifier used when referring to this folder.
`visible`	Whether the resource must be rendered in the catalog. This attribute takes an EL value and can be used to conditionally display the resource to specific users or groups. The default value is `#{true}`, which means that the resource is displayed in the catalog at all times.
`factoryClass`	The factory class of the service. See Section C.4, "Factory Classes Available for Adding Dynamic Resources to the Catalog" for information about the supported factory classes.

A custom folder can have attributes, such as title, subject, and description, and parameters. For more information, see Section C.3.8, "attributes" and Section C.3.10, "parameters."

Rather than adding the code to the catalog definition source, you may find it easier to add a custom folder in Design view of the catalog definition file. For more information, see Section 14.3.6, "How to Add a Custom Folder to a Resource Catalog."

C.3.7 customContent

The `customContent` element defines content generated using resource catalog adapters. This element renders a folder that contains resources that are generated dynamically at runtime. Unlike the `customFolder` element, the `customContent` element renders a folder in the catalog only if the folder contains resources.

Example C–8 illustrates the use of the `customContent` element.

Example C–8 Example of a customContent Resource

```
<customContent
contentProviderClass="com.oracle.ensemble.interop.adf.EnsembleContentProvider"
               id="ensembleContentProvider" visible="true">
  <attributes
resourceBundle="oracle.webcenter.spaces.resource.DefaultGroupSpaceCatalogBundle"/>
</customContent>
```

Table C–6 describes the keywords for the `customContent` element.

Table C–6 customContent Keywords

Keyword	Description
`id`	The unique identifier used when referring to this folder.
`visible`	Whether the resource must be rendered in the catalog. This attribute takes an EL value and can be used to conditionally display the resource to specific users or groups. The default value is `#{true}`, which means that the resource is displayed in the catalog at all times.
`contentProviderClass`	The fully qualified name of a class that implements the interface `oracle.adf.rc.spi.plugin.catalog.CustomContentProviderV2.`

A custom content provider can have attributes, such as title, subject, and description, and parameters. For more information, see Section C.3.8, "attributes" and

Section C.3.10, "parameters."

Rather than adding the code to the catalog definition source, you may find it easier to add a custom content folder in Design view of the catalog definition file. For more information, see Section 14.3.7, "How to Add a Custom Content Provider to a Resource Catalog."

C.3.8 attributes

Entries in a resource catalog have associated attributes that describe the entry. Values for some attributes can be obtained directly from the resources or from the `name` and `description` attributes on each XML element in the catalog definition. However, these values may not always be appropriate for displaying to end users, and often they are not available in different languages. Attributes defined using the `attributes` element in the catalog definition let you override those available from other sources. In addition, these attributes can be defined in terms of a key to a resource bundle so the actual values displayed reflect the current user's locale.

Within the `attributes` element you can insert any number of individual `attribute` elements that define the attributes you want to apply to a resource catalog entry.

Example C–9 illustrates the use of the `attributes` element.

Example C–9 Example of attributes and attribute Elements

```
<attributes>
 <attribute value="ANNOUNCEMENTS_MAIN_VIEW.TITLE" attributeId="Title"
  isKey="true"/>
 <attribute value="ANNOUNCEMENTS_MAIN_VIEW.DESCRIPTION" attributeId="Description"
  isKey="true"/>
 <attribute value="ANNOUNCEMENTS_MAIN_VIEW.KEYWORDS" attributeId="Subject"
  isKey="true"/>
 <attribute value="oracle.webcenter.collab.announcement"
  attributeId="WEBCENTER_SERVICE_ID" isKey="false"/>
</attributes>
```

Table C–7 describes the keywords of the `attributes` element.

Table C–7 attributes Keywords

Keyword	Description
`resourceBundle`	The name of the resource bundle to be used for obtaining translated attribute values.

C.3.9 attribute

The `attribute` element defines an attribute for a resource catalog entry that corresponds to a descriptor in the `schema` element. For information about attributes, see Section C.3.8, "attributes." Composer uses the following attributes:

- Title
- Description
- Subject
- IconURI
- ToolTip

You should include at least a `Title` and `Description` attribute for each catalog entry. A `Subject` attribute is also highly recommended to facilitate keyword searching of the resource catalog. The Title attribute overrides the name attribute on the parent element and is used to declare a display name that is translated through a resource bundle. Similarly, the Description attribute overrides the description attribute on the parent element and is used to declare a description that is translated through a resource bundle.

You can declare your own attributes by including them in the schema element. For more information, see Section C.3.11, "schema."

Example C–10 illustrates the use of the attribute element.

Example C–10 Example of attributes and attribute Elements

```
<attributes>
 <attribute value="ANNOUNCEMENTS_MAIN_VIEW.TITLE" attributeId="Title"
  isKey="true"/>
 <attribute value="ANNOUNCEMENTS_MAIN_VIEW.DESCRIPTION" attributeId="Description"
  isKey="true"/>
 <attribute value="ANNOUNCEMENTS_MAIN_VIEW.KEYWORDS" attributeId="Subject"
  isKey="true"/>
 <attribute value="oracle.webcenter.collab.announcement"
  attributeId="WEBCENTER_SERVICE_ID" isKey="false"/>
</attributes>
```

Table C–8 describes the keywords of the attribute element.

Table C–8 attribute Keywords

Keyword	Description
attributeId	The identifier of the attribute as declared in the schema element.
value	The value of the attribute.
isKey	A flag indicating whether the value is a literal value (false) or a key to a resource bundle (true). In most cases, attributes should be resource bundle keys and the values translated through a resource bundle. The resource bundle can be declared at the catalog level or on various lower level elements such as attributes.
resourceBundle	The name of the resource bundle to be used for obtaining translated attribute values.

For task flows included in your resource catalog, you can use the attribute element to pass task flow parameters and attributes of the enclosing Show Detail Frame component. You can do this by prefixing the attributeId values for the task flow parameters and Show Detail Frame attributes with **parameter.** and **attr.** respectively as shown in the following example:

```
<attributes>
  <attribute value="dark" attributeId="attr.background"
   isKey="false"/>
  <attribute value="#{myBean.myParam1}" attributeId="parameter.myParam1"
   isKey="false"/>
</attributes>
```

For more information, see Section 14.7, "Defining Task Flow Parameters and Attributes of the Enclosing Show Detail Frames for Task Flows."

C.3.10 parameters

A few of the resource catalog components, such as links, custom components, and custom folders, support parameters. Parameters are used to provide the XML code for a custom component or bind the resource to other artifacts in the application. You can use the `parameters` element to define parameters on a resource. The `parameters` element must be included inside the tag for the resource. Each `parameters` element can have multiple `parameter` tags. You must provide an ID and a value for each parameter that you define.

When you define a parameter for a custom XML component, you must specify the parameter ID to be `xml` and the value is the code for the custom component. In the code, the component's ID must be `#` so that it is generated at runtime. In addition, you must specify the namespace for the component.

Example C–11 illustrates the use of the `parameters` element in a custom XML component definition.

Example C–11 Example of parameters and parameter Elements

```
<parameters>
  <parameter id="xml">&lt;cust:panelCustomizable id="#"
xmlns:cust="http://xmlns.oracle.com/adf/faces/customizable"/&gt;
  </parameter>
</parameters>
```

C.3.11 schema

The `schema` element contains one or more `descriptor` elements. The `descriptor` elements provide the resource catalog service with information about the attributes used within the catalog, such as whether they are searchable. Out-of-the-box, the attributes Title, Description, Subject, ToolTip, and IconURI are supported for a resource. You can add other custom attributes that you want to expose on the resource.

Example C–12 illustrates the use of the `schema` element.

Example C–12 Example of schema

```
<schema resourceBundle="oracle.adf.rc.attribute.nls.AttributeBundle"
          xmlns="http://xmlns.oracle.com/adf/rcs/catalog">
    <descriptor labelKey="TITLE.PROMPT_KEY" endUserVisible="true"
                multivalue="false" searchable="true" attributeId="Title"
                shortLabelKey="TITLE.SHORT_PROMPT_KEY"
                xmlns="http://xmlns.oracle.com/adf/rcs/catalog"/>
    <descriptor labelKey="DESCRIPTION.PROMPT_KEY" endUserVisible="true"
                multivalue="false" searchable="true" attributeId="Description"
                shortLabelKey="DESCRIPTION.SHORT_PROMPT_KEY"
                xmlns="http://xmlns.oracle.com/adf/rcs/catalog"/>
    <descriptor labelKey="SUBJECT.PROMPT_KEY" endUserVisible="true"
                multivalue="false" searchable="true" attributeId="Subject"
                shortLabelKey="SUBJECT.SHORT_PROMPT_KEY"
                xmlns="http://xmlns.oracle.com/adf/rcs/catalog"/>
    <descriptor labelKey="TOOL_TIP.PROMPT_KEY" endUserVisible="true"
                multivalue="false" searchable="false" attributeId="ToolTip"
                shortLabelKey="TOOL_TIP.SHORT_PROMPT_KEY"
                xmlns="http://xmlns.oracle.com/adf/rcs/catalog"/>
    <descriptor labelKey="ICON_URI.PROMPT_KEY" endUserVisible="false"
                multivalue="false" searchable="false" attributeId="IconURI"
                shortLabelKey="ICON_URI.SHORT_PROMPT_KEY"
                xmlns="http://xmlns.oracle.com/adf/rcs/catalog"/>
</schema>
```

Table C–9 describes the keywords of the `descriptor` element.

Table C–9 descriptor Keywords

Keyword	Description
`attributeId`	The identifier of the attribute being described.
`searchable`	Indicates whether the attribute is included in resource catalog searches (`true`) or not (`false`).
`multivalue`	Indicates whether the attribute can have multiple values (`true`) or not (`false`).
`endUserVisible`	Indicates whether the attribute should be exposed to end users (`true`) or not (`false`).
`resourceBundle`	The name of the resource bundle used to translate the label keys.
`labelKey`	The resource bundle key for the attribute's label.
`shortLabelKey`	The resource bundle key for the attribute's short label.

C.3.12 resource

The `resource` element is used to declare an individual resource, such as a task flow, in the catalog. You would need to use this element if you are using a standalone version of Composer (that is, Composer without WebCenter Portal Framework).

> **Note:** The `url` element, discussed in Section C.3.3, "url," also enables you to declare a resource in the catalog. However, `url` is available only if you have installed WebCenter Portal Framework and have the associated shared libraries.

Example C–13 illustrates the use of the `resource` element.

Example C–13 Example of resource

```
<resource id="weatherTF"
      repository="application.classpath"
      path="TaskFlow.jar/ADF_
TaskFlow/oracle+composer+internal+test+weather-tfdefn.xml#weather_tf_defn"
      visible="#{true}">
  <attributes>
    <attribute value="/images/bulbgauge_ena.png" attributeId="IconURI"/>
    <attribute value="never" attributeId="attr.showResizer"/>
    <attribute value="Weather in Bangalore is rainy"
               attributeId="parameter.message"/>
    <attribute value="WeatherBee" isKey="false" attributeId="Title"/>
    <attribute value="Displays the weather of your city" isKey="false"
               attributeId="Description"/>
    <attribute value="Weather widget" isKey="false" attributeId="ToolTip"/>
  </attributes>
  <parameters/>
</resource>
```

Table C–10 describes the keywords of the `resource` element. For information about including `attributes` for elements, see Section C.3.8, "attributes."

Table C–10 resource Keywords

Keyword	Description
`id`	The identifier for the element in the catalog. Identifiers are required and must be unique at the folder level.
`repository`	The path to access ADF libraries included in your classpath.

`path`	The path to the resource. For a task flow in an ADF Library, the path is of the following form:
	`path_to_jar/ADF_TaskFlow/task_flow_path`
	To obtain the `task_flow_path`, create a file system connection in Application Connections and navigate to the task flow in your ADF Library. The tooltip for the task flow shows the fully qualified ID of the task flow. Take this value and replace all occurrences of "/" with "+".
	For example, if the tooltip is:
	`oracle/webcemter/collab/announcement/view/taskflows/main-view-definition.xml#announcement-main-view`
	then `task_flow_path` would be:
	`oracle+webcenter+collab+announcement+view+taskflows+main-view-definition.xml#announcement-main-view`

C.4 Factory Classes Available for Adding Dynamic Resources to the Catalog

Resource catalog adapters are used to add resources to a catalog dynamically, for example, a folder to display all available content repository connections to users. As the content of such a folder cannot be determined when you create the catalog, the adapter ensures that the folder is populated dynamically. To use an adapter, you must specify the factory class as part of the resource definition while adding the resource.

This section describes the supported factory classes. It includes the following topics:

- Section C.4.1, "XMLComponentFactory"
- Section C.4.2, "ContentUrlResourceFactory"
- Section C.4.3, "CustomFolderContextFactory"
- Section C.4.4, "DefaultFolderContextFactory"
- Section C.4.5, "ContentListFactory"
- Section C.4.6, "EnsembleContentProvider"

C.4.1 XMLComponentFactory

Use the `oracle.adf.rc.component.XmlComponentFactory` class inside a `<component>` construct to include an XML component in the catalog. The `XmlComponentFactory` class requires a single parameter named `xml` and the value of the parameter is a block of XML representing one or more components that can be added to a page. The following example shows the code to add a `Panel Customizable` component to the resource catalog:

```
<component id="pc" factoryClass="oracle.adf.rc.component.XmlComponentFactory">
  <attributes>
    <attribute attributeId="Title" value="Box"/>
    <attribute attributeId="Description" value="Container for other objects"/>
    <attribute attributeId="IconURI" value="/adf/webcenter/panelcustomizable_
```

```
qualifier.png"/>
  </attributes>
  <parameters>
    <parameter id="xml">
      <cust:panelCustomizable id="#"
xmlns:cust="http://xmlns.oracle.com/adf/faces/customizable"/>
    </parameter>
  </parameters>
</component>
```

For the detailed steps, see Section 14.3.5, "How to Add a Custom Component to a Resource Catalog."

C.4.2 ContentUrlResourceFactory

The ContentUrlResourceFactory class is used to include portal framework content from UCM connections. It is used when you add a URL resource of type Content to the catalog. The following example shows how the ContentUrlResourceFactory class can be used:

```
<url id="contentItem"
     factoryClass="oracle.webcenter.content.model.rc.ContentUrlResourceFactory"
     url="content://UCM/PersonalSpaces/weblogic/content.xml">
<attributes>
  <attribute value="Personal Document" isKey="false" attributeId="Title"/>
</attributes>
<parameters>
  <parameter id="templateView">SpaceTemplate</parameter>
  </parameters>
</url>
```

where id is the unique identifier for the resource, and url is the URL to access the resource. The URL must begin with content: if you use ContentUrlResourceFactory. In addition, you can add a templateView parameter to specify the Content Presenter display template to be used.

For more information, see Section 14.3.3, "How to Add a Link to a Resource Catalog."

C.4.3 CustomFolderContextFactory

The ContentFolderContextFactory class is used to list all the Content Repository connections available to the application. You can add a customFolder resource to the catalog and specify this factory class, as shown in the following example:

```
<customFolder id="AllConnections"

factoryClass="oracle.webcenter.content.model.rc.CustomFolderContextFactory" />
```

For more information about custom folders, see Section 14.3.6, "How to Add a Custom Folder to a Resource Catalog."

C.4.4 DefaultFolderContextFactory

In the WebCenter Portal context, the DefaultFolderContextFactory class is used to render the folder for the current portal. If the user is in the Home portal, then the user's personal folder is rendered. You can add a customFolder resource to the catalog and specify this factory class, as shown in the following example:

```
<customFolder id="GroupDocuments"
```

```
factoryClass="oracle.webcenter.doclib.model.rc.DefaultFolderContextFactory" />
```

For more information about custom folders, see Section 14.3.6, "How to Add a Custom Folder to a Resource Catalog."

C.4.5 ContentListFactory

The `ContentListFactory` class is used to add a dynamic list of folders to the catalog. You can add a `customFolder` resource to the catalog and specify this factory class, as shown in the following example:

```
<customFolder id="customFolder-folder" visible="#{true}" path=""
              factoryClass="oracle.webcenter.content.model.rc.ContentListFactory">
  <attributes>
    <attribute attributeId="Title" value="Folders List" isKey="false"/>
  </attributes>
  <parameters>
    <parameter id="datasource">UCM#dCollectionID:60</parameter>
    <parameter id="datasourceType">dsTypeFolderContents</parameter>
  </parameters>
 </customFolder>
```

The `ContentListFactory` class supports the following parameters:

- `datasource`: The data source of the content. The value depends on the value of `datasourceType`.
- `datasourceType`: The data source type of the content. Valid values are `dsTypeSingleNode`, `dsTypeFolderContents`, `dsTypeQueryExpression`, `dsTypeMultiNode`, and `dsTypeScenarioResults`.
- `templateView`: To specify the Content Presenter display template to be used.

For more information about using Content Presenter, see Chapter 29, "Adding Content Task Flows and Document Components to a Portal Page."

C.4.6 EnsembleContentProvider

The `EnsembleContentProvider` class is used to display a dynamic list of all registered pagelet producers. You can add a `customContent` resource to the catalog and specify this factory class, as shown in the following example:

```
<customContent
contentProviderClass="com.oracle.ensemble.interop.adf.EnsembleContentProvider"
               id="ensembleContentProvider" visible="true">
  <attributes
resourceBundle="oracle.webcenter.spaces.resource.DefaultGroupSpaceCatalogBundle"/>
</customContent>
```

For more information about custom content providers, see Section 14.3.7, "How to Add a Custom Content Provider to a Resource Catalog."

D

Guidelines for Creating Task Flows to Be Used in Composer-Enabled Pages

This appendix describes the guidelines for creating and consuming task flows effectively in your applications by implementing task flow parameters and customization and personalization options.

This appendix includes the following topics:

- Section D.1, "Guidelines for Effective Geometry Management and Pagination"
- Section D.2, "Guidelines for Efficient Use of Task Flow Parameters and Customization and Personalization Options"
- Section D.3, "Example of a Portal Framework Application Containing a Task Flow Created By Following the Guidelines"
- Section D.4, "Conclusion"

Task flows are reusable building blocks in Oracle ADF. Oracle WebCenter Portal provides task flows for you, or you can build your own task flows and add them to your Portal Framework application pages. When you add task flows to customizable pages (that is, Composer-enabled pages), users can personalize, customize, and edit these task flows at runtime. It is imperative that you design your task flows according to the rules set forth in Oracle WebCenter Portal publications. Failure to do so can result in problems when the task flows are consumed in portal pages, such as too much white space, too many scroll bars, or slow, jerky, and unpredictable responses when displaying large data sets.

To prevent these issues and provide a consistent user experience in terms of look and feel, layout design, and interaction, follow the instructions in this document for:

- Creating highly performant, cost-effective task flows
- Consuming these task flows effectively in your application by implementing task flow parameters and customization and personalization options

D.1 Guidelines for Effective Geometry Management and Pagination

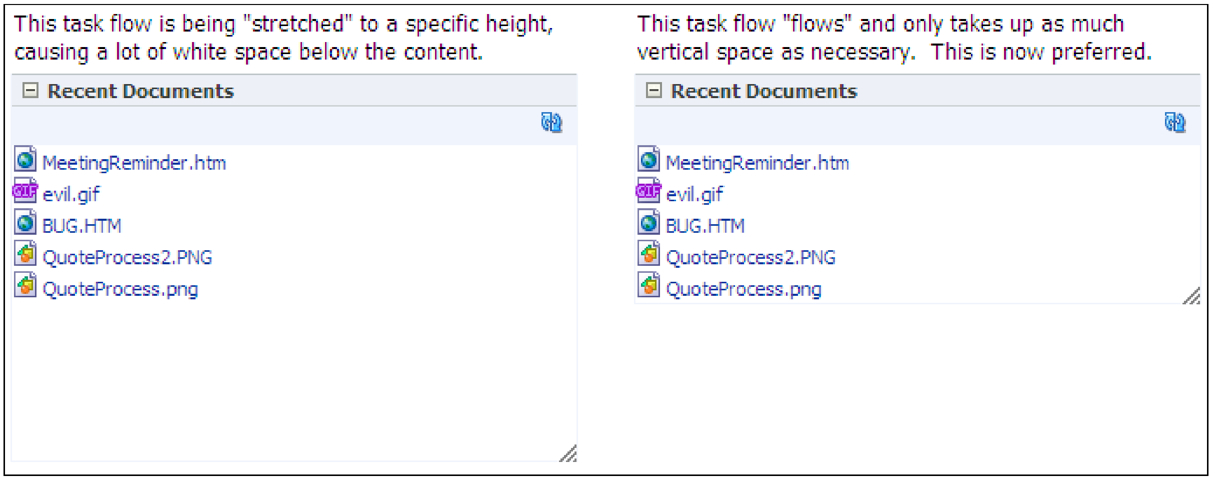
Effective geometry management results in efficient sizing and placement of task flows on the page. If the task flows are not designed properly, you end up with pages that have a slow response time or lots of unnecessary scroll bars or white spaces between components. For example, if you include a task flow containing very little data inside a container that stretches it (for example, a `Show Detail Frame` component), there is a lot of white space below the data in the task flow. Poor design can also cause scrolling to be slow and unpredictable in a task flow with a table displaying a large amount of data. To avoid such issues, be sure to design your task flows so that they flow and use a conventional pagination model when displaying large data sets.

Follow the guidelines in this section when designing new task flows for Portal Framework applications. Also, be sure to adhere to these guidelines when you edit existing Portal Framework application task flows.

D.1.1 Guideline 1: Create Task Flows that Flow

To avoid unnecessary white spaces in your task flows, you must ensure that the task flow content flows and is not stretched by the task flow container. A *stretching* task flow is one that is stretched to the height of the container, whereas a *flowing* task flow is one whose height is determined by its content, rather than by a stretching container or by itself having a fixed height. A flowing task flow with a small amount of data is shorter than one with large amounts of data, as shown in Figure D–1.

Figure D–1 Difference Between a Task Flow that Stretches and One that Flows



This task flow is being "stretched" to a specific height, causing a lot of white space below the content.

This task flow "flows" and only takes up as much vertical space as necessary. This is now preferred.

To design a flowing task flow, you must ensure that:

- The child component of the task flow does not have a fixed height.
- The `Show Detail Frame` component surrounding the task flow region does not have a fixed height (specified using its `contentStyle` attribute).

The following two examples illustrate how you might include flowing components inside task flows.

D.1.1.1 Example 1: Oracle ADF Faces Table Component with Its autoHeightRows Attribute Set to a Specific Value

Add an Oracle ADF Faces `Table` component within the task flow and set the `autoHeightRows` attribute on the `Table` to a specific value. By defining this attribute, the table height is adjusted according to the content (flow behavior), rather than the table having a fixed height or being stretched into a container (stretch behavior). The `autoHeightRows` attribute setting results in table data being displayed as follows:

- If you provide a value `H` for `autoHeightRows`, the table grows to a maximum of `H` rows.
- If the number of records returned from the data source is less than `H`, the table height wraps to that number.

- If the number of records is more than H, the table displays H rows and provides a scrollbar to view the remaining rows.
- If the autoHeightRows attribute is not used, the table displays at a fixed default height irrespective of the amount of data displayed.

Instead of specifying a fixed value for the autoHeightRows attribute, you can also provide an EL value so that the attribute is populated based on some logic you specify. You can enable customization and personalization on the task flow and provide an option for users to specify a value for this attribute. A value specified using the personalization option overrides a value specified using the customization option.

Example D–1 shows the attributes of a sample ADF Faces table component that is included inside a task flow called recent-pages-task-flow-definition. The autoHeightRows attribute is set to an EL expression that references a Java bean, recentPagesBean. This bean contains the logic to populate this attribute with a value provided by the end user (either as a personalization or a customization).

Example D–1 The autoHeightRows Attribute on a Sample ADF Faces Table

```
<af:table value="#{pageFlowScope.recentPagesBean.pages}"
          var="row" rowBandingInterval="0" id="t1"
          rowSelection="none" columnBandingInterval="0"
          width="100%" inlineStyle="border:none;width:100%;"
          columnStretching="last" horizontalGridVisible="true"
          verticalGridVisible="false"
          autoHeightRows="#{pageFlowScope.recentPagesBean.number_of_items_to_show_
at_a_time}"
            contentDelivery="immediate"
           fetchSize="#{pageFlowScope.recentPagesBean.number_of_items_to_query}">
      .
      .
      .
</af:table>
```

For a detailed description of the sample task flow displaying personalization and customization options for specifying the autoHeightRows value, see Section D.3, "Example of a Portal Framework Application Containing a Task Flow Created By Following the Guidelines."

To learn more about the autoHeightRows attribute, including requirements such as setting the contentDelivery attribute to immediate, see the tag documentation for <af:table> in *Tag Reference for Oracle ADF Faces*.

D.1.1.2 Example 2: Oracle ADF Faces Iterator Component Inside a Panel Group Layout with a Scrolling Layout

Add a Panel Group Layout component within the task flow and set its layout attribute to scroll. Then add an Iterator inside the Panel Group Layout. Add your content inside the Iterator. The content from the Iterator flows inside the Panel Group Layout.

Since the height of the Panel Group Layout depends on the content from the Iterator, specify a minimum and maximum height for the component by using min-height and max-height in the Panel Group Layout's inlineStyle attribute.

D.1.2 Guideline 2: Limit the Number of Records Displayed in a Task Flow

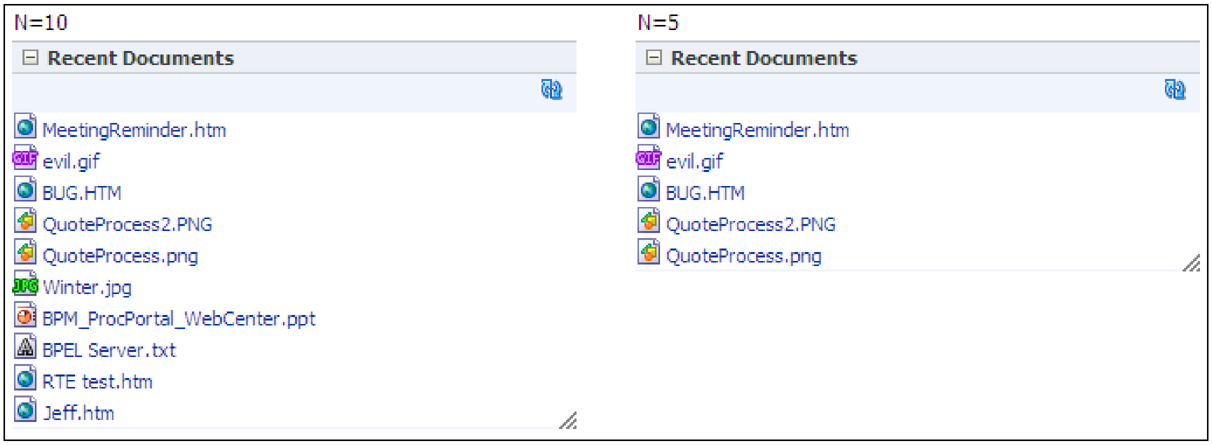
To avoid a slow and jerky response when scrolling large data sets in your task flow, you must limit the number of records to be fetched from the data source at a time. For example, if you have included an ADF faces `Table` component inside your task flow, limit the number of records to be displayed in the table. Use the `fetchSize` attribute on the `Table` to specify the number of records to be fetched from the data source in a single query. If you specify a fetch size of `N`, only `N` records are sent to the client from the data source.

The `fetchSize` and `autoHeightRows` attributes together control the number of rows displayed in the table. The relationship between these attributes is as follows:

- If `fetchSize` equals `autoHeightRows`, all records are displayed in the table.
- If `fetchSize` is less than `autoHeightRows`, the table is cropped at the `fetchSize` value.
- If `fetchSize` is greater than `autoHeightRows`, you can decide whether to display only as many records as the `autoHeightRows` value or provide pagination controls to display the remaining records. For example, you might include a More link at the bottom of the task flow or include pagination using Previous and Next links. For more information, see Section D.3, "Example of a Portal Framework Application Containing a Task Flow Created By Following the Guidelines."

Figure D–2 shows the difference between two task flows containing tables with equal `autoHeightRows` and `fetchSize` values of 10 and 5. The task flows wrap to the number of records displayed.

Figure D–2 Difference Between Task Flows with Different Fetch Size Values



Instead of specifying a fixed value for `fetchSize`, you can provide an EL value so that the attribute is populated based on some logic you specify. You can enable customization and personalization on the task flow and provide an option for users to specify a value for this attribute. A value specified using the personalization option overrides a value specified using the customization option.

The following example shows the attributes of a sample ADF Faces `Table` component that is included inside a task flow called `recent-pages-task-flow-definition`. The `fetchSize` attribute is set to an EL expression that references a Java bean, `recentPagesBean`. This bean contains the logic to populate this attribute with a customization value provided by the end user.

```
<af:table value="#{pageFlowScope.recentPagesBean.pages}"
          var="row" rowBandingInterval="0" id="t1"
          rowSelection="none" columnBandingInterval="0"
          width="100%" inlineStyle="border:none;width:100%;"
          columnStretching="last" horizontalGridVisible="true"
          verticalGridVisible="false"
```

```
           autoHeightRows="#{pageFlowScope.recentPagesBean.number_of_items_to_
show_at_a_time}"
          contentDelivery="immediate"
           fetchSize="#{pageFlowScope.recentPagesBean.number_of_items_to_query}">
      .
      .
      .
</af:table>
```

For a detailed description of the sample task flow displaying a customization option for specifying the `fetchSize` value, see Section D.3, "Example of a Portal Framework Application Containing a Task Flow Created By Following the Guidelines."

To learn more about the `fetchSize` attribute, see the tag documentation for `<af:table>` in *Tag Reference for Oracle ADF Faces*.

D.1.3 Guideline 3: Specify a Minimum Height for the Task Flow

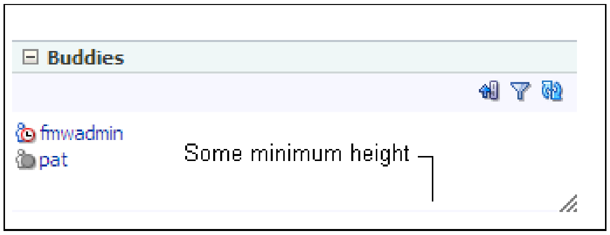
You can ensure that the task flow wraps to the height of the content by adhering to the first guideline, described in Section D.1.1, "Guideline 1: Create Task Flows that Flow."

To prevent the task flow from collapsing completely when there are no records, or seeming too short when there are only one or two records, specify a minimum height for the content.

For example, if your task flow contains a table with an `autoHeightRows` value specified, you can specify a `min-height` value using the table's `inlineStyle` attribute.

Figure D–3 shows a task flow displayed with a reasonable height even though it has only two rows.

Figure D–3 Task Flow with a Minimum Height Specified



D.1.4 Guideline 4: Include UI for Accessing Data Beyond the Display Limit

If a task flow is showing ten records, but the data source contains 100 records, you can design the task flow to do one of the following depending on the nature of data in the task flow:

- Display only ten records.

  For example, a Popular Discussion Topics task flow may use this first option if it is considered sufficient to show the ten most popular topics and not necessary to let users see even the eleventh most popular topic.

- Show a More link at the bottom of the task flow that opens a view with the ability to show more records.

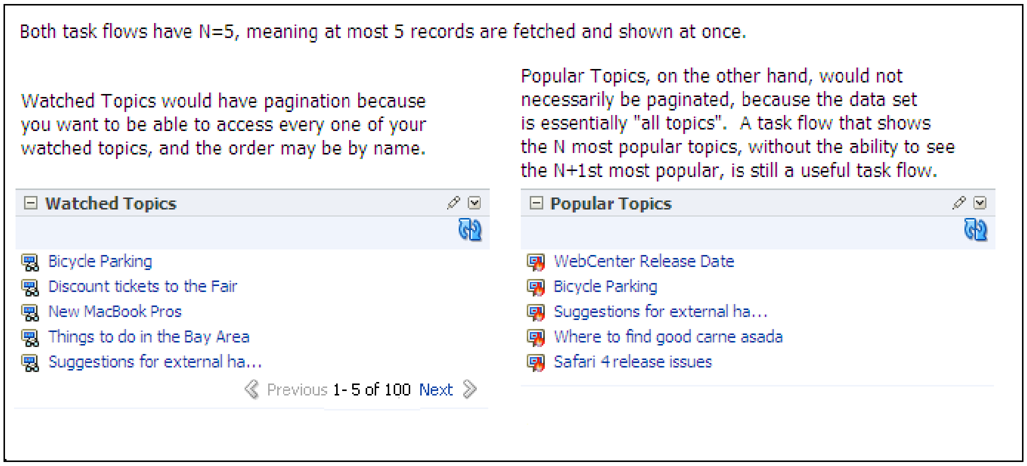
  For example, the People Connections task flow on a WebCenter Portal page displays a More link at the bottom.

- Show a pagination control with Previous and Next links.

For example, a Watched Discussion Topics task flow may display pagination controls, as users typically want to see all of their watched topics. Pagination is a common choice for task flows in which the data is not inherently ranked in order of importance or can be sorted in different ways, and where it is important to be able to access any record in the data set. The pagination control can be placed either above or below the content, depending on the nature of the content.

Figure D–4 shows the Watched Topics and Popular Topics task flows containing tables having a `fetchSize` of 5 but both having more than five records in the data source. The Watched Topics task flow displays five records with pagination at the bottom, but the Popular Topics task flow displays only five records with no UI option to view other records.

Figure D–4 Task Flows With and Without Pagination Controls



Both task flows have N=5, meaning at most 5 records are fetched and shown at once.

Watched Topics would have pagination because you want to be able to access every one of your watched topics, and the order may be by name.

Popular Topics, on the other hand, would not necessarily be paginated, because the data set is essentially "all topics". A task flow that shows the N most popular topics, without the ability to see the N+1st most popular, is still a useful task flow.

Watched Topics

Pagination Specifics

Here are a few simple recommendations for creating a pagination control:

- Add a pagination message in the format `1 to N of M [prev][next]`.
- Align the pagination elements to the right so that the Previous and Next links do not move as you navigate pages.
- Ensure that the Next or Previous option is grayed out when it is not required.

For an example of how to use pagination controls, see Section D.3, "Example of a Portal Framework Application Containing a Task Flow Created By Following the Guidelines."

You can customize pagination controls using the following parameters:

- Position of Previous and Next links
- Labels for Previous and Next links, for example, Newer and Older
- Icons used with Previous and Next links
- The words or symbols used to represent to and of, for example, `1-5 of 100`
- Options for permitting random access, for example, `Prev 1 2 3 ... Next Last`

D.2 Guidelines for Efficient Use of Task Flow Parameters and Customization and Personalization Options

While creating a task flow, you can create parameters and provide options for users to customize and personalize the task flow. You can enable privileged users to customize the task flow for all users (customization) and edit the task flow's properties and parameters in Composer. You can enable all users viewing the page to customize their view of the page (personalization). This section provides guidelines for implementing task flow parameters and the customization and personalization options.

Table D–1 provides an overview of the various task flow editing options available to users.

Table D–1 Options Used to Define Task Flow Appearance and Behavior

Option	Description	When to Use	Who can See It
Parameters	A small set of ideally scalar values, used to program a task flow or set its context. Each parameter must have a good display name and description (which must include possible values and examples).	Use for a context like the city or pin code so that you can add multiple instances of the task flow, each showing different information or programmed to show information based on receiving a value from the page, programmatically or using the URL. In WebCenter Portal, you can use a parameter for a context like portal name. Precedence: 3 This value overrides built-in values in the task flow.	Users with Edit or Customize permission can see parameters in Composer's Component Properties dialog while editing a page. In WebCenter Portal, moderators can see and edit task flow parameters. When a task flow is exposed as a portlet, page designers can see these parameters while setting up the portlet.

Table D–1 (Cont.) Options Used to Define Task Flow Appearance and Behavior

Option	Description	When to Use	Who can See It
Customization/ Preferences	These two are synonymous. Customizations are typically considered changes a business user makes to the task flow. These changes are available to all viewers of the page and are used to specify values for options defined in the task flow. For example, users can decide whether to display the author name or revision date for a document. Preferences are referred to as a definition of the content in the task. For example, a query definition in the Document Viewer task flow, or a query in OmniPortlet.	Use these when the task flow must provide a user interface that assists the user in defining the task flow behavior. That is, when Lists of Values or specific UI components such as images or radio buttons guide the user better, or when the task flow setup is a multiple step wizard-style interface. Such assistance cannot be provided through parameters because they are strictly scalar values, with no assistance other than a description. Precedence: 2 If there is an identical parameter value (for example, portal name), customization overrides that value.	Users with can see the customization or preferences options. Typically, customization or preferences options are available on the chrome surrounding the task flow in Edit mode. However, users can also see these options on the chrome in View mode of the page. When a task flow is exposed as a portlet, the page designer sees these as Edit Defaults options while setting up the portlet.
Personalization	A subset of the customization and preferences options. You cannot have personalization options that are not also customization options.	Use these to allow all viewers of the page to tweak and tune the visual aspects of the task flow or the amount of data shown to them. For example, to set the number of items to display. Precedence: 1 If there is an identical customization value (for example, number of items), personalization overrides that value.	All end users with View permission can see these options. Personalization options are available on the chrome surrounding the task flow. When WebCenter Portal task flows are exposed as portlets, the Personalization options allow end users to tweak the same visual aspects.
Implicit Personalization	Options that are persisted for end users from session to session. Implicit personalization options are not available on the chrome surrounding the task flow, but are actions that can be performed directly in the body of the task flow. For example, sorting and column resizing are implicit personalization options.	Use these options sparingly and only for options that are frequently changing. Options like column resizing and sorting are available for free from Oracle ADF.	All end users with View permission on the page can perform personalizations.

To improve application performance, follow the guidelines in this section while implementing parameters and customization and personalization options in task flows.

D.2.1 Guidelines for Implementing Task Flow Parameters

At design time (in JDeveloper), you can create parameters by defining them in the task flow definition XML file. At runtime, users with Edit or Customize permission can edit task flow parameters in the Component Properties dialog in Composer. To provide a good user experience, you must adhere to the following guidelines when creating parameters:

- Provide a display name that is meaningful.
- Provide a description for each parameter, along with examples and the possible values it can take.

The following example shows the code to define a parameter called `layoutStyle` in the task flow definition file:

```
<input-parameter-definition>
  <name>layoutStyle</name>
  <description> Used to control whether the documents must display as a list, with
icons, or with document details.
Allowed values are list, icon, and detail.</description>
  <display-name>Layout Style</display-name>
</input-parameter-definition>
```

D.2.2 Guidelines for Implementing Customization

Users with Edit or Customize permission can access customization options from the chrome surrounding the task flow.

You must adhere to the following guidelines while implementing customization in your task flow:

- Customization options must be a subset of the task flow's parameters.
- Implement a view fragment within the task flow and expose an outcome to open this view in a separate dialog. For example, the control flow rule to invoke a view called `advancedEditPopupView` in a dialog is as follows:

  ```
  <control-flow-case>
    <from-outcome>dialog:advancedEditPopup</from-outcome>
    <to-activity-id>advancedEditPopupView</to-activity-id>
  </control-flow-case>
  ```

  Adhering to this guideline is mandatory for new task flows.
- Implement a view fragment within the task flow and expose an outcome to transition inline to this view. For example, the control flow rule to invoke a view called `advancedEditView` within the same screen is as follows:

  ```
  <control-flow-case>
    <from-outcome>advancedEdit</from-outcome>
    <to-activity-id>advancedEditView</to-activity-id>
  </control-flow-case>
  ```

  Although you can implement a task flow in this way, it is recommended that you expose an outcome to open the view in a dialog.
- Ensure that customizations are saved in the MDS level set up by the application. Unlike task flow parameters, which are stored in the task flow definition itself, customizations are saved in the Metadata Storage (MDS). If you do not explicitly specify the MDS layer to be used to save task flow customizations, customization metadata and the consuming application metadata may get stored in different layers.

  To ensure that customizations are saved to the same layer as application metadata, you must clone the application's MDS session in the task flow's preference file and reference that while configuring customization. For an example of how this is implemented, see Section D.3, "Example of a Portal Framework Application

Containing a Task Flow Created By Following the Guidelines."

D.2.3 Guidelines for Implementing Personalization

All users viewing the page can access personalization options from the chrome surrounding the task flow in View mode of the page.

You must adhere to the following guidelines while implementing personalization in your task flow:

- Ensure that personalization options are a subset of the customization options you define on the task flow.
- If a key aspect of the task flow is to show objects—for example, documents, users, or requests—then you must include a personalization option for users to set the maximum number of objects to display.
- Implement a view fragment within the task flow, and expose an outcome to open this view in a dialog. For example, the control flow rule to invoke a view called simpleEditPopupView in a dialog is as follows:

  ```
  <control-flow-case>
    <from-outcome>dialog:simpleEditPopup</from-outcome>
    <to-activity-id>simpleEditPopupView</to-activity-id>
  </control-flow-case>
  ```

  Adhering to this guideline is mandatory for new task flows.
- Implement a view fragment within the task flow and expose an outcome to transition inline to the view. For example, the control flow rule to invoke a view called simpleEditView within the same screen is as follows:

  ```
  <control-flow-case>
    <from-outcome>simpleEdit</from-outcome>
    <to-activity-id>simpleEditView</to-activity-id>
  </control-flow-case>
  ```

  Although you can implement a task flow in this way, it is recommended that you make a transition to bring this view up as a dialog.
- Ensure that personalizations are written to the MDS level set up by the application. Unlike task flow parameters, which are stored in the task flow definition itself, personalizations are saved in MDS. If you do not explicitly specify the MDS layer to be used to save personalizations, personalization metadata and application metadata may get stored in different layers.

  To ensure that personalizations are saved to the same layer as application metadata, you must clone the application's MDS session in the task flow's preference file and reference that while configuring personalization. For an example of how this is implemented, see Section D.3, "Example of a Portal Framework Application Containing a Task Flow Created By Following the Guidelines"

D.2.4 Guidelines for Implementing Implicit Personalization

Users perform implicit personalizations while using the task flow itself, by way of resizing, sorting table columns, and so on. Personalization options in this case are not invoked using dialogs and users may not even be aware that they are actually personalizing a page.

Adhere to the following guidelines while implementing implicit personalization:

- Do not overload the task flow with implicit personalization attributes. Select a few key, frequently used attributes to expose as implicit. Infrequently used or complex attributes can be handled with explicit personalization.
- Do not implement implicit personalization such that a dialog is invoked. Implicit personalization must be performed in the body of the task flow itself.

D.3 Example of a Portal Framework Application Containing a Task Flow Created By Following the Guidelines

As a companion to this document, a sample Portal Framework application was developed. This sample application, called `RecentPages`, is used as an example to illustrate how you can build a near-perfect task flow by adhering to the guidelines in this document. The `RecentPages` application contains a customizable page, `Welcome.jspx`, which contains a task flow named `recent-pages-taskflow-definition` created by following all the required guidelines.

This section only provides a high-level description of how the task flow was implemented. For detailed information about using task flows and Composer, see the following guides:

- *Fusion Developer's Guide for Oracle Application Development Framework*, for information about creating task flows.
- *Building Portals with Oracle WebCenter Portal*, for information about editing, customizing, and personalizing task flows in Composer.

The `RecentPages` sample application is available for download from the Oracle WebCenter Portal 11g Demonstrations and Samples page on OTN at `http://webcenter.oracle.com`. Click the link named "Sample Application with Optimal Task Flows" under Oracle Composer Samples.

The `RecentPages` application contains the following projects:

- A Model project
- A Portal project named `RecentPagesTaskFlow` that contains the `recent-pages-task-flow-definition` task flow
- Another Portal project named `WebPages` that contains the JSPX page in which the task flow is consumed

D.3.1 The RecentPagesTaskFlow Project

This project contains the task flow created by following the guidelines. The files of significance in this project are as follows:

- The `recent-pages-task-flow-definition.xml` file
- The `mainView.jsff` fragment
- The `simpleEditPopupView.jspx` page
- The `advancedEditPopupView.jspx` page
- The `recentPagesBean` Java bean
- The `Preference` Java bean

D.3.1.1 The recent-pages-task-flow-definition.xml File

This is an Oracle ADF task flow definition containing three views: `mainView`, `simpleEditPopupView`, and `advancedEditPopupView`. The task flow is designed such that `mainView` displays a list of recently created pages in the application, `simpleEditPopupView` displays a personalization option to all users, and `advancedEditPopupView` displays customization options to users with Edit or Customize permission.

The following table breaks down the code in `recent-pages-task-flow-definition.xml` and explains each snippet.

The outcomes from `mainView` to `simpleEditPopupView` and `advancedEditPopupView` are called `dialog:simpleEditPopupview` and `dialog:advancedEditPopupView` respectively. This is to ensure that the views open in separate dialogs, not inline. In addition, this task flow provides Refresh, Previous, and Next outcomes on `mainView`. The `simpleEditPopupView` and `advancedEditPopupView` views provide Save and Cancel outcomes.

Table D–2 describes significant sections of code in the `recent-pages-task-flow-definition.xml` file.

Table D–2 Sections Of Code in the Task Flow Definition File

Code	Description
`<default-activity>mainView</default-activity>`	Defining the default view for the task flow: `mainView`

`<managed-bean>`
`  <managed-bean-name>recentPagesBean</managed-bean-name>`
`  <managed-bean-class>view.RecentPangesBean</managed-bean-class>`
`  <managed-bean-scope>pageFlow</managed-bean-scope>`
`</managed-bean>`
	Referencing the `recentPagesBean` Java bean that is associated with the task flow definition. This bean was created as part of the `view` package.

`<view id="mainView">`
`  <page>/mainView.jsff</page>`
`</view>`
`  <view id="simpleEditPopupView">`
`  <page>/simpleEditPopupView.jspx</page>`
`</view>`
`  <view id="advancedEditPopupView">`
`  <page>/advancedEditPopupView.jspx</page>`
`</view>`
	Mapping task flow views to pages or page fragments. For example, `mainView` is associated with `mainView.jsff`.

Table D–2 (Cont.) Sections Of Code in the Task Flow Definition File

Code	Description

<control-flow-rule>
   <from-activity-id>mainView</from-activity-id>
   <control-flow-case>
       <from-outcome>refresh</from-outcome>
       <to-activity-id>mainView</to-activity-id>
   </control-flow-case>
   <control-flow-case>
       <from-outcome>dialog:simpleEditPoup</from-outcome>
       <to-activity-id>simpleEditPopupView</to-activity-id>
   </control-flow-case>
   <control-flow-case>
       <from-outcome>next</from-outcome>
        <to-activity-id>mainView</to-activity-id>
   </control-flow-case>
   <control-flow-case>
        <from-outcome>previous</from-outcome>
        <to-activity-id>mainView</to-activity-id>
   </control-flow-case>
   <control-flow-case>
         <from-outcome>dialog:advancedEditPopup</from-outcome>
         <to-activity-id>advancedEditPopupView</to-activity-id>
   </control-flow-case>
</control-flow-rule>
	Control flow rules from `mainView`. Each control flow case defines an outcome and a corresponding target view.

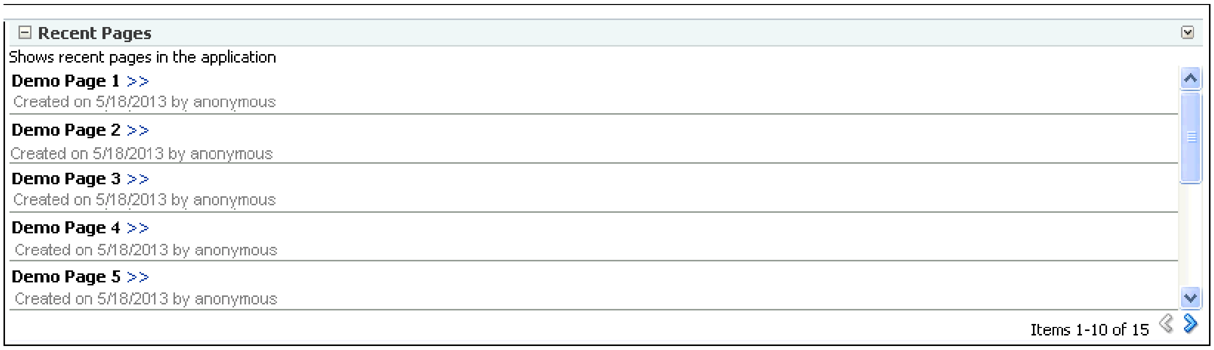
<control-flow-rule>
  <from-activity-id>simpleEditPopupView</from-activity-id>
   <control-flow-case>
        <from-outcome>save</from-outcome>
        <to-activity-id>mainView</to-activity-id>
   </control-flow-case>
   <control-flow-case>
         <from-outcome>cancel</from-outcome>
         <to-activity-id>mainView</to-activity-id>
   </control-flow-case>
</control-flow-rule>
	Control flow rules from `simpleEditPopupView`. Each control flow case defines an outcome and a corresponding target view.

<control-flow-rule> <from-activity-id>advancedEditPopupView</from-activity-id> <control-flow-case> <from-outcome>save</from-outcome> <to-activity-id>mainView</to-activity-id> </control-flow-case> <control-flow-case> <from-outcome>cancel</from-outcome> <to-activity-id>mainView</to-activity-id> </control-flow-case> </control-flow-rule>	Control flow rules from `advancedEditPopupView`. Each control flow case defines an outcome and a corresponding target view.

D.3.1.2 The mainView.jsff Fragment

Figure D–5 displays a list of recently created pages in the application. At runtime, the list looks like this:

Figure D–5 The mainView Fragment in the Task Flow



⊟ Recent Pages

Shows recent pages in the application

Items 1-10 of 15

The design features of this view fragment are as follows:

- The `autoHeightRows` attribute is defined on the table to control the number of items displayed in the table. The task flow then wraps to the height of the items displayed.
- The `fetchSize` attribute is defined to control the number of items to be fetched from the data source and displayed in the table.
- Pagination controls are included to display a message in the format "`Items 1-4 of 25`" along with previous and next icons.

Table D–3 describes significant sections of code in the `mainView.jsff` fragment.

Table D–3 The mainView Fragment Code

Code	Description

`<af:panelGroupLayout id="pgl1" layout="vertical">`
`    <af:outputText value="Shows recent pages in the application" id="ot1"/>`
	A single top-level component-`Panel Group Layout`. This component is designed to ensure that the task flow content flows vertically and always stretches horizontally. This allows geometry management.

`<af:table value="#{pageFlowScope.recentPagesBean.pages}" var="row"`
`   rowBandingInterval="0" id="t1" rowSelection="none"`
`    columnBandingInterval="0" width="100%"`
`    inlineStyle="border:none;width:100%;" columnStretching="last"`
`    horizontalGridVisible="true" verticalGridVisible="false"`
`autoHeightRows="#{pageFlowScope.recentPagesBean.number_of_items_to_show_at_a_time}"`
`    contentDelivery="immediate"`
`fetchSize="#{pageFlowScope.recentPagesBean.number_of_items_to_query}">`
	A table component that is a child of the `Panel Group Layout`.
	Table attributes:
	`autoHeightRows` (`N`): The number of items to display in the table at one time. An EL value is specified here such that a Java bean, `recentPagesBean`, populates this attribute with a value specified by the user at runtime.
	If there are more than `N` items to display, a scrollbar appears on the task flow.

Table D–3 (Cont.) The mainView Fragment Code

<table>
<tr><th>Code</th><th>Description</th></tr>
<tr><td></td><td>fetchSize (M): The maximum number of items to be fetched from the data source. An EL value is specified here such that a Java bean, recentPagesBean, populates this attribute with a value specified by the user at runtime.
If M is greater than N, pagination controls appear on the task flow to enable users to view the remaining items.</td></tr>
<tr><td><pre>
<af:column sortable="false" headerText="#{null}"
align="start" id="c1">
  <af:panelGroupLayout id="pgl11" styleClass="nowrap"
inlineStyle="padding-top:2px; font-weight:bold;">
    <af:outputText value="#{row.title}" id="ot4"/>

`  </f:facet>`
`</af:panelStretchLayout>`
	A single top-level `Panel Stretch Layout` component with a group component in its center facet. Within this group are a `Panel Form Layout` and a `Panel Group Layout`.
	The `Panel Form Layout` contains two `Input Text` components and a `Select Boolean Checkbox`. These components are populated with values returned by `recentPagesBean`.
	The `Panel Group Layout` contains two `Command Button` components called Save and Close, which are wired to events defined in `recentPagesBean`.

D.3.1.5 The recentPagesBean Java Bean

This Java bean contains the logic for the following:

- Displaying a specific number of items in the table based on user input.
- Handling the Save and Cancel events triggered from the `simpleEditPopupView` and `advancedEditPopupView` pages.
- Rendering Previous and Next icons while implementing pagination.
- Displaying the pagination message after retrieving the total number of pages.
- Referencing the `Preference` bean that defines where customizations and personalizations must be saved.

You can find the code for this bean in the `RecentPages` application.

Table D–6 describes significant sections of code in the `recentPagesBean.java` file.

Table D–6 The recentPagesBean Java Bean Code

Code	Description

`    }`
`    return total_page_num;`
`  }`
	Logic to return the total number of pages.

`public String getFooterText()`
`  {`
`    return "Items " + (this.getStart() + 1) + "-"`
`+ this.getEnd() +`
`" of " + " " + this.getTableSize() + " ";`
`  }`
	Logic for returning pagination text in the format `Items 1-4 of 25.`

D.3.1.6 The Preference Bean

This Java bean is a wrapper that provides APIs to get and set attributes in the task flow preference file. It contains the logic for saving personalizations and customizations on this task flow instance in the same MDS layer as that used by the application. In this sample application, portal-level customizations are stored in the `mds/mdssys/cust/site/site` directory. Therefore, the code in the `Preference` bean ensures that the application's MDS session is cloned and the task flow personalizations and customizations are stored in the same directory.

You can find the code for this bean in the `RecentPages` sample application.

Table D–7 describes significant sections of code in the `Preference.java` file.

Table D–7 The Preference Java Bean Code

Code	Description
private static MDSSession _getClonedMDSSession()	Logic to clone the application's MDS session.

{
MDSInstance instance = (MDSInstance)
ADFContext.getCurrent().getMDSInstanceAsObject();
MDSSession mdsSession = (MDSSession)
ADFContext.getCurrent().getMDSSessionAsObject();
mdsSession =
instance.createSession(mdsSession.getSessionOptions(),
mdsSession.getUserStateHandler());
return mdsSession;
}
	Logic to clone the application's MDS session.

private static MetadataObject _readPreference(MDSSession mdsSession,
String preferenceFileName)
{
MetadataObject mo = null;
try
{
mo =
mdsSession.getMutableMO(MOReference.create(preferenceFileName));
}
catch (MetadataNotFoundException mnfe)
{
_LOG.warning("Creating a new preference file " +
preferenceFileName);
}
catch (ReferenceException re)
{
_LOG.warning("Creating a new preference file " +
preferenceFileName);
}
catch (Exception e)
{
throw new RuntimeException(e);
}
	Logic to read the preference file in the MDS session or create one, if required.

Table D–7 (Cont.) The Preference Java Bean Code

Code	Description

// preference file is not available create a new one
    if (mo == null)
    {
      try
      {
        DocumentBuilderFactory builderFactory =
          DocumentBuilderFactory.newInstance();
        builderFactory.setNamespaceAware(true);
        builderFactory.setValidating(false);
       DocumentBuilder builder =
 builderFactory.newDocumentBuilder();
        Document document =
          builder.parse(new
ByteArrayInputStream(CONTENTS.getBytes()));
        mo =
 mdsSession.createMetadataObject(preferenceFileName, document);
        mdsSession.flushChanges();
        mo =
 mdsSession.getMutableMO(MOReference.create(preferenceFileName));
      }
      catch (Exception e)
      {
        throw new RuntimeException(e);
      }
    }
    return mo;
  }
	Logic to read the preference file in the MDS session or create one, if required.

public static void setNumberOfItemsToShow(String preferenceFileName,
int numberOfItemsToShow)
  {
    MDSSession session = _getClonedMDSSession();
    MetadataObject mo = _readPreference(session,
preferenceFileName);
 	
mo.getDocument().getDocumentElement().setAttribute("numberOfItemsToS
how",
Integer.toString(numberOfItemsToShow));
   _flushChanges(session);
  }
  public static int getNumberOfItemsToShow(String
preferenceFileName)
  {
    MDSSession session = _getClonedMDSSession();
    MetadataObject mo = _readPreference(session,
preferenceFileName);
    String show =
 	
mo.getDocument().getDocumentElement().getAttribute("numberOfItemsToS
how");
    return Integer.parseInt(show);
  }
	Logic to get and set the number of items to show in the table at a time.

Table D–7 (Cont.) The Preference Java Bean Code

<table>
<tr><th>Code</th><th>Description</th></tr>
<tr><td><pre>
public static void setNumberOfItemsToQuery(String
preferenceFileName,
int _numberOfItemsToQuery)
  {
    MDSSession session = _getClonedMDSSession();
    MetadataObject mo = _readPreference(session,
preferenceFileName);

mo.getDocument().getDocumentElement().setAttribute("numberOfItemsToQ
uery",
Integer.toString(_numberOfItemsToQuery));
    _flushChanges(session);
  }
  public static int getNumberOfItemsToQuery(String
preferenceFileName)
  {
    MDSSession session = _getClonedMDSSession();
   MetadataObject mo = _readPreference(session, preferenceFileName);
    String query =

mo.getDocument().getDocumentElement().getAttribute("numberOfItemsToQ
uery");
    return Integer.parseInt(query);
  }
</pre></td><td>Logic to get and set the number of items to query from the data source.</td></tr>
</table>

Table D–7 (Cont.) The Preference Java Bean Code

Code	Description

public static void setShowPageControl(String preferenceFileName,
boolean showPageControl)
  {
    MDSSession session = _getClonedMDSSession();
    MetadataObject mo = _readPreference(session,
preferenceFileName);
 	
mo.getDocument().getDocumentElement().setAttribute("showPageControl"
,
Boolean.toString(showPageControl));
    _flushChanges(session);
  }
public static boolean getShowPageControl(String preferenceFileName)
  {
    MDSSession session = _getClonedMDSSession();
    MetadataObject mo = _readPreference(session,
preferenceFileName);
    String pageControl =
 	
mo.getDocument().getDocumentElement().getAttribute("showPageControl"
);
    return Boolean.parseBoolean(pageControl);
  }
	Logic to get and set whether to show page control on the task flow.

private static void _flushChanges(MDSSession session)
  {
    try
    {
      session.flushChanges();
    }
    catch (Exception e)
    {
      throw new RuntimeException(e);
    }
  }
	Logic to save changes made to the task flow into the MDS session. If a sand box is set up in the MDS session, the changes are saved to the sand box. Else, they are permanently written to MDS.

private static final String CONTENTS =
 "<preference numberOfItemsToShow='5'
              numberOfItemsToQuery='10'
              showPageControl='true'
   xmlns='http://xmlns.oracle.com/apps/preference'/>";
}
	Logic to display defaults in the Number of Items to show at a time and `Number of Items to query fields` and the `Show Page Control` check box. When a user first accesses an instance of the `RecentPages` task flow, a new preference file is created with this content.

The `RecentPages` project containing all these files is deployed to Oracle ADF and the task flow is then consumed in the customizable `Welcome.jspx` page in the `WebPages` project.

D.3.2 The WebPages Project

This project contains the `Welcome.jspx` page in which the `recent-pages-task-flow-definition` task flow is consumed.

D.3.2.1 The Welcome.jspx File

Welcome.jspx is a customizable page containing a Panel Stretch Layout component. The top facet of the Panel Stretch Layout contains a Change Mode Link and a Page Create task flow. The center facet contains a Page Customizable with a child Panel Customizable, which in turn contains a Show Detail Frame component with the recent-pages-task-flow-definition task flow.

The stretchContent and showResizer attributes on the Show Detail Frame are set to false and never respectively to ensure that this component does not stretch its child task flow.

Also, the refresh attribute is set to ifNeeded in the task flow binding. This is to ensure that customizations made to the page at runtime are reflected when users perform a refresh.

The Welcome.jspx page contains the following code:

```
<?xml version='1.0' encoding='US-ASCII'?>
<jsp:root xmlns:jsp="http://java.sun.com/JSP/Page" version="2.1"
          xmlns:f="http://java.sun.com/jsf/core"
          xmlns:h="http://java.sun.com/jsf/html"
          xmlns:af="http://xmlns.oracle.com/adf/faces/rich"
          xmlns:pe="http://xmlns.oracle.com/adf/pageeditor"
          xmlns:cust="http://xmlns.oracle.com/adf/faces/customizable">
  <jsp:directive.page contentType="text/html;charset=US-ASCII"/>
  <f:view>
    <af:document id="d1">
      <af:form id="f1">
        <af:panelStretchLayout id="psl1">
          <f:facet name="top">
            <af:panelGroupLayout layout="horizontal"
      xmlns:af="http://xmlns.oracle.com/adf/faces/rich"
                                 id="pgl2">
              <pe:changeModeLink id="cml1"/>
              <af:spacer width="10" height="10" id="s2"/>
              <af:region value="#{bindings.pagecreatepage1.regionModel}"
                         id="r1"/>
              <af:panelGroupLayout id="pgl1"/>
            </af:panelGroupLayout>
          </f:facet>
          <f:facet name="center">
            <pe:pageCustomizable id="pageCustomizable1">
              <cust:panelCustomizable id="panelCustomizable1" layout="scroll">
                <cust:showDetailFrame text="Recent Pages" id="sdf1"
                 stretchContent= "never" showResizer="never">
                  <af:region
value="#{bindings.recentpagestaskflowdefinition1.regionModel}"
                             id="r2"/>
                </cust:showDetailFrame>
              </cust:panelCustomizable>
              <f:facet name="editor">
                <pe:pageEditorPanel id="pep1"/>
              </f:facet>
            </pe:pageCustomizable>
          </f:facet>
          <f:facet name="start"/>
          <f:facet name="end"/>
        </af:panelStretchLayout>
      </af:form>
    </af:document>
  </f:view>
```

```
</jsp:root>
```

D.3.2.2 The adf-config.xml File

You can add a task flow inside a `Show Detail Frame` component and display the task flow's outcomes as actions on the chrome of the parent `Show Detail Frame` component. This is possible by defining custom actions on the parent `Show Detail Frame` component. You can define custom actions at the instance level where `Custom Action` components are added as child components of the `Show Detail Frame`, or at the global level where `Custom Action` elements are defined in the application's `adf-config.xml` file. Global custom actions are enabled on all `Show Detail Frame` instances in the application, but are displayed only when a `Show Detail Frame` instance contains the task flow as its child.

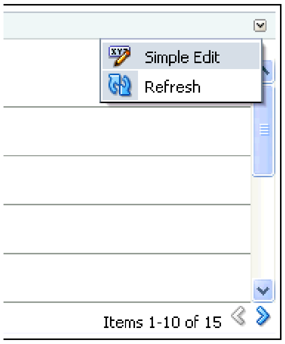
In this application, custom actions corresponding to the task flow's outcomes, `dialog:simpleEditPopupView` and `dialog:advancedEditPopupView`, are defined globally in the `adf-config.xml` file as follows:

```
<customizableComponentsSecurity
xmlns="http://xmlns.oracle.com/adf/faces/customizable/config">
    <enableSecurity value="true"/>
    <customActions>
      <customAction action="refresh" text="Refresh"
                    shortDesc="Refresh"
                    location="menu" rendered="true"
                    icon="/adf/pe/images/refresh_ena.png"/>
      <customAction action="dialog:simpleEditPoup"
                    text="Simple Edit"
                    shortDesc="Simple Edit"
                    location="menu"
                    rendered="#{!changeModeBean.inEditMode}"
                icon="/adf/pe/images/editproperties_ena.png"/>
      <customAction action="dialog:advancedEditPopup"
                    text="Advanced Edit"
                    shortDesc="Advanced Edit" location="menu"
                    rendered="#{changeModeBean.inEditMode}"
                icon="/adf/pe/images/editproperties_ena.png"/>
    </customActions>
  </customizableComponentsSecurity>
```

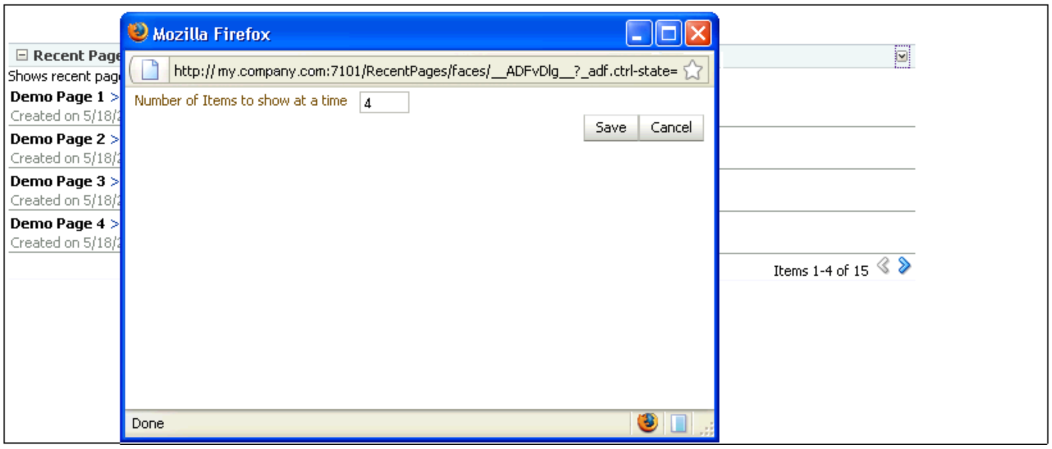
D.3.3 Runtime Behavior

This configuration results in the following behavior at runtime:

- All users see a Simple Edit action on the chrome surrounding the task flow while viewing the page.

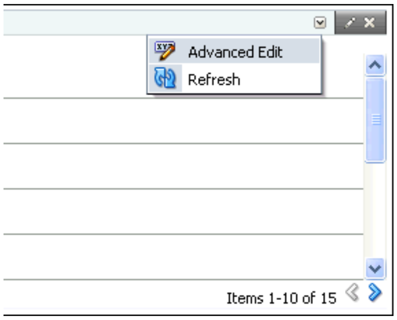


Clicking this action displays the personalization option in a separate dialog.

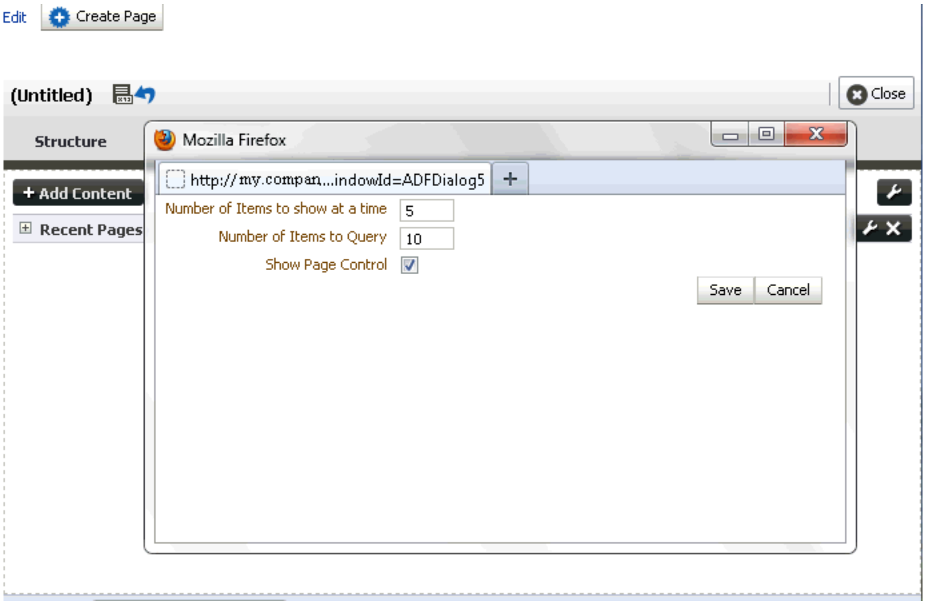


Number of Items to show at a time 4

- Users with Edit or Customize permission see an Advanced Edit action on the chrome surrounding the task flow while editing the page.



Clicking this action displays customization options in a separate dialog.



Number of Items to show at a time 5

Number of Items to Query 10

Show Page Control ☑

D.4 Conclusion

In Portal Framework application pages containing task flows, task flow design can have a significant impact on application performance. Also, slow response time and inconsistent UI can lead to an unpleasant experience for application users. To ensure better performance and a good user experience for Portal Framework application users, follow the guidelines in this document while implementing task flows to be consumed in the application.

E

Using ADF JavaScript Partitioning for Performance

This appendix describes how to get optimal performance when using JavaScript with WebCenter Portal pages.

This appendix contains the following topics:

- Section E.1, "Using JavaScript Partitioning"
- Section E.2, "Using Partitioning for Performance"

E.1 Using JavaScript Partitioning

ADF UI components are complex entities, each containing one or more HTML, CSS, and JavaScript (JS) elements. When a component is rendered, the HTML tags are stamped on the page with right CSS style classes attached. ADF is smart enough to download only the JS files belonging to the components rendered on the page. If individual JS files are downloaded, however, it will cause a lot of network traffic per page, slowing down the page performance. The solution is to use JavaScript Partitions.

ADF's JavaScript Partitioning feature helps combine individual JS files from ADF components together into buckets, thereby reducing the number of downloads. By default, all ADF pages need the `boot.js` and `core.js` files to operate. Additionally, JS files are downloaded either combined as partitions or one for each component (if no partition is defined). For more information about JavaScript partitioning, see "Using JavaScript Library Partitioning" in *Web User Interface Developer's Guide for Oracle Application Development Framework*.

E.2 Using Partitioning for Performance

The general rules to get optimal JS performance are:

- Keep the number of static file downloads less to avoid network latency
- Keep individual file size to be around the same else the largest file will delay the page load.
- Construct the home page carefully so that subsequent browser pages need fewer file downloads

Keeping these general rules in mind, follow these steps to tune the JS partitions for optimal performance:

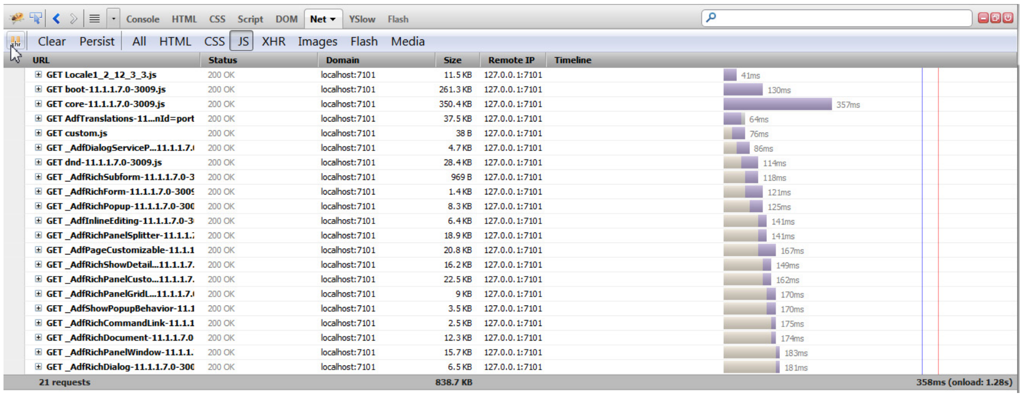
1. Create a new file called `adf-js-partitions.xml` file in WEB-INF and add the XML as described in the "How to Create JavaScript Partitions" section in Web User Interface Developer's Guide for Oracle Application Development Framework.

2. Remove all the features from the core partition that start with `Adf*`.

> **Note:** Remember to redeploy the application and clear the browser cache every time you test the `adf-js-partitions.xml` file.

3. Test the home page and note the JS files downloaded. Figure E–1 shows the results using Firebug.

Figure E–1 Initial results for downloaded files for the home page



URL	Status	Domain	Size	Remote IP	Timeline
GET Locale1_2_12_3_3.js	200 OK	localhost:7101	11.5 KB	127.0.0.1:7101	41ms
GET boot-11.1.1.7.0-3009.js	200 OK	localhost:7101	261.3 KB	127.0.0.1:7101	130ms
GET core-11.1.1.7.0-3009.js	200 OK	localhost:7101	350.4 KB	127.0.0.1:7101	357ms

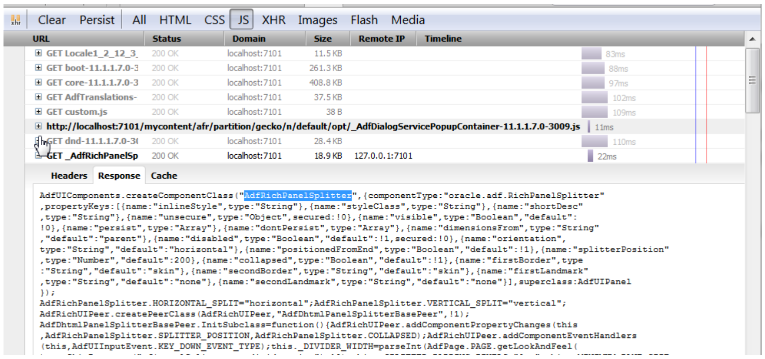
GET custom.js	200 OK	localhost:7101	38 B	127.0.0.1:7101	76ms
GET _AdfDialogServiceP...11.1.1.7.	200 OK	localhost:7101	4.7 KB	127.0.0.1:7101	86ms
GET dnd-11.1.1.7.0-3009.js	200 OK	localhost:7101	28.4 KB	127.0.0.1:7101	114ms
GET _AdfRichSubform-11.1.1.7.0-3	200 OK	localhost:7101	969 B	127.0.0.1:7101	118ms
GET _AdfRichForm-11.1.1.7.0-300	200 OK	localhost:7101	1.4 KB	127.0.0.1:7101	121ms
GET _AdfRichPopup-11.1.1.7.0-300	200 OK	localhost:7101	8.3 KB	127.0.0.1:7101	125ms
GET _AdfInlineEditing-11.1.1.7.0-3	200 OK	localhost:7101	6.4 KB	127.0.0.1:7101	141ms
GET _AdfRichPanelSplitter-11.1.1.	200 OK	localhost:7101	18.9 KB	127.0.0.1:7101	141ms
GET _AdfPageCustomizable-11.1.1	200 OK	localhost:7101	20.8 KB	127.0.0.1:7101	167ms
GET _AdfRichShowDetail...11.1.1.7.	200 OK	localhost:7101	16.2 KB	127.0.0.1:7101	149ms
GET _AdfRichPanelCusto...11.1.1.7.	200 OK	localhost:7101	22.5 KB	127.0.0.1:7101	162ms
GET _AdfRichPanelGridL...11.1.1.7.	200 OK	localhost:7101	9 KB	127.0.0.1:7101	170ms
GET _AdfShowPopupBehavior-11.1	200 OK	localhost:7101	3.5 KB	127.0.0.1:7101	170ms
GET _AdfRichCommandLink-11.1.1	200 OK	localhost:7101	2.5 KB	127.0.0.1:7101	175ms
GET _AdfRichDocument-11.1.1.7.0	200 OK	localhost:7101	12.3 KB	127.0.0.1:7101	174ms
GET _AdfRichPanelWindow-11.1.1.	200 OK	localhost:7101	15.7 KB	127.0.0.1:7101	183ms
GET _AdfRichDialog-11.1.1.7.0-300	200 OK	localhost:7101	6.5 KB	127.0.0.1:7101	181ms
21 requests			838.7 KB		358ms (onload: 1.28s)

4. To create partitions, examine the individual JS files downloaded by your page. The files starting with `Adf` don't have partitions defined, while files such as `dnd-11.1.1.7` are partitions. Remove (or comment out) all those partitions as well in the `adf-js-partitions.xml` file.

5. To find the feature name, open the JS file in Firebug or similar tool. The `createComponentClass` usually contains the feature name as shown in Figure E–2.

Figure E–2 Finding the feature name



URL	Status	Domain	Size	Remote IP	Timeline
GET Locale1_2_12_3_	200 OK	localhost:7101	11.5 KB		83ms
GET boot-11.1.1.7.0-3	200 OK	localhost:7101	261.3 KB		88ms
GET core-11.1.1.7.0-3	200 OK	localhost:7101	408.8 KB		97ms
GET AdfTranslations-	200 OK	localhost:7101	37.5 KB		102ms
GET custom.js	200 OK	localhost:7101	38 B		109ms
http://localhost:7101/mycontent/afr/partition/gecko/n/default/opt/_AdfDialogServicePopupContainer-11.1.1.7.0-3009.js					11ms
GET dnd-11.1.1.7.0-3	200 OK	localhost:7101	28.4 KB		110ms
GET _AdfRichPanelSp	200 OK	localhost:7101	18.9 KB	127.0.0.1:7101	22ms

```
AdfUIComponents.createComponentClass("AdfRichPanelSplitter",{componentType:"oracle.adf.RichPanelSplitter"
,propertyKeys:[{name:"inlineStyle",type:"String"},{name:"styleClass",type:"String"},{name:"shortDesc"
,type:"String"},{name:"unsecure",type:"Object",secured:!0},{name:"visible",type:"Boolean","default":
!0},{name:"persist",type:"Array"},{name:"dontPersist",type:"Array"},{name:"dimensionsFrom",type:"String"
,"default":"parent"},{name:"disabled",type:"Boolean","default":!1,secured:!0},{name:"orientation",
type:"String","default":"horizontal"},{name:"positionedFromEnd",type:"Boolean","default":!1},{name:"splitterPosition"
,type:"Number","default":200},{name:"collapsed",type:"Boolean","default":!1},{name:"firstBorder",type
:"String","default":"skin"},{name:"secondBorder",type:"String","default":"skin"},{name:"firstLandmark"
,type:"String","default":"none"},{name:"secondLandmark",type:"String","default":"none"}],superclass:AdfUIPanel
});
AdfRichPanelSplitter.HORIZONTAL_SPLIT="horizontal";AdfRichPanelSplitter.VERTICAL_SPLIT="vertical";
AdfRichUIPeer.createPeerClass(AdfRichUIPeer,"AdfDhtmlPanelSplitterBasePeer",!1);
AdfDhtmlPanelSplitterBasePeer.InitSubclass=function(){AdfRichUIPeer.addComponentPropertyChanges(this
,AdfRichPanelSplitter.SPLITTER_POSITION,AdfRichPanelSplitter.COLLAPSED);AdfRichUIPeer.addComponentEventHandlers
(this,AdfUIInputEvent.KEY_DOWN_EVENT_TYPE);this._DIVIDER_WIDTH=parseInt(AdfPage.PAGE.getLookAndFeel(
```

6. Create a new partition (for example, `custom-webcenter`), and using the technique above, add all the downloaded features to the new partition as shown in Example E–1. Note that this is only an example, and that your partition will be different depending on the content of the home page.

Example E–1 Sample JavaScript partition

```
<partition>
<partition-name>custom-webcenter</partition-name>
<feature>AdfRichDialog</feature>
```

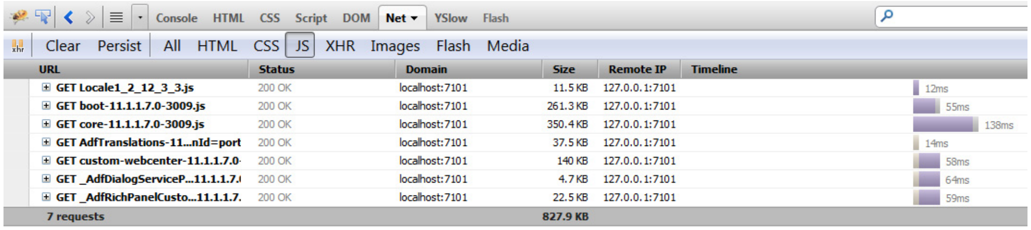
```
<feature>AdfRichSubform</feature>
<feature>AdfRichForm</feature>
<feature>AdfRichPopup</feature>
<feature>AdfInlineEditing</feature>
<feature>AdfRichPanelSplitter</feature>
<feature>AdfPageCustomizable</feature>
<feature>AdfRichShowDetailFrame</feature>
<feature>AdfRichPanelGridLayout</feature>
<feature>AdfShowPopupBehavior</feature>
<feature>AdfRichCommandLink</feature>
<feature>AdfRichCommandButton</feature>
<feature>AdfRichDocument</feature>
<feature>AdfRichPanelWindow</feature>
<feature>AdfDragAndDrop</feature>
<feature>AdfRichPanelCustomizable</feature>
<feature>AdfDialogServicePopupContainer</feature>
</partition>
```

Note: There is a dependency between `AdfUIEditableValue` and `AdfRichOutputLabel`, and consequently `AdfRichOutputLabel` should be in the core partition even when an output label is not used on the page. If this is not done, the following error is produced:

```
<FeatureUtils> <_resolveFeatures> Ignoring
feature-dependency on feature "AdfDvtCommon". No such
feature exists.
```

7. Remove the features which you added to custom from the existing partitions and re-run the application to see the difference in number of downloads and (more importantly) the time to render.

Figure E–3 Results for downloaded files for the home page after partitioning



URL	Status	Domain	Size	Remote IP	Timeline
GET Locale1_2_12_3_3.js	200 OK	localhost:7101	11.5 KB	127.0.0.1:7101	12ms
GET boot-11.1.1.7.0-3009.js	200 OK	localhost:7101	261.3 KB	127.0.0.1:7101	55ms
GET core-11.1.1.7.0-3009.js	200 OK	localhost:7101	350.4 KB	127.0.0.1:7101	138ms
GET AdfTranslations-11...nId=port	200 OK	localhost:7101	37.5 KB	127.0.0.1:7101	14ms
GET custom-webcenter-11.1.1.7.0-	200 OK	localhost:7101	140 KB	127.0.0.1:7101	58ms
GET _AdfDialogServiceP...11.1.1.7.	200 OK	localhost:7101	4.7 KB	127.0.0.1:7101	64ms
GET _AdfRichPanelCusto...11.1.1.7.	200 OK	localhost:7101	22.5 KB	127.0.0.1:7101	59ms
7 requests			827.9 KB		

8. Repeat the process for any other complex pages. Note that since the home page will have downloaded most of the JS files they will be cached by the browser and this time there will be a lot less features to partition.

F

Reuse of Oracle Portal Components

This appendix describes how to reuse components from your existing Oracle Portal application in an application built with Oracle WebCenter Portal Framework.

This appendix includes the following topics:

- Section F.1, "Introduction to Oracle Portal Components"
- Section F.2, "Reusing Portlets"
- Section F.3, "Reusing Items"

F.1 Introduction to Oracle Portal Components

The two most basic building blocks of Oracle Portal are as follows:

- Portlets are the fundamental building blocks of a portal page. Portlets can be deployed to Oracle Portal through three producer (known in Oracle Portal as provider) types:

  – **Web (or Oracle PDK-Java) producers** use open standards, such as XML, SOAP, HTTP, or J2EE for deployment, definition, and communication with applications. The Oracle PDK-Java provides a framework that simplifies the task of building Web producers.

  – **WSRP producers** serve as the containers for standards-based portlets.

  – **Database producers** own one or more database portlets. Examples of database portlets include, portlets built using the Oracle PDK-PL/SQL, Portlet Builder portlets (charts, forms, reports, and so on), and Oracle Portal page portlets).

  In WebCenter Portal Framework, you can make Web and WSRP portlets available by registering their producers with the application. For more information, see Section F.2.1, "How to Reuse JSR 286 and Oracle PDK-Java Portlets."

  You can also make database portlets available to Portal Framework applications by using the Federated Portal Adapter. For more information, see Section F.2.8, "How to Use the Federated Portal Adapter to Reuse Database Portlets."

- Items are individual pieces of content (text, hyperlink, image, and so on) that reside on a page in an item region. Users with an appropriate privilege level can add items to a page. Item content and metadata are stored in the Oracle Portal schema of the Metadata Repository. Items are rendered on the page according to the layout, style, and attribute display defined for the item region.

  Because items are stored in a content repository, you can retrieve them with Java Content Repository (JCR) data controls. A default adapter for the Oracle Portal content repository is provided with WebCenter Portal Framework. For more information, see Section F.3, "Reusing Items."

Given the technical differences between Oracle Portal and WebCenter Portal, there is no direct upgrade available across the platform. However, key components of your portal can be exposed within WebCenter Portal.

F.2 Reusing Portlets

You can make the portlets used in your portal available to your Portal Framework applications.

This section includes the following topics:

- Section F.2.1, "How to Reuse JSR 286 and Oracle PDK-Java Portlets"
- Section F.2.2, "What You May Need to Know About Events"
- Section F.2.3, "What You May Need to Know About Mobile Portlets"
- Section F.2.4, "What You May Need to Know About the Portlet Chrome"
- Section F.2.5, "What You May Need to Know About Personalizations and Customizations"
- Section F.2.6, "What You May Need to Know About Oracle Portal System Resources"
- Section F.2.7, "What You May Need to Know About Partner and External Applications"
- Section F.2.8, "How to Use the Federated Portal Adapter to Reuse Database Portlets"
- Section F.2.9, "What You May Need to Know About Troubleshooting the Federated Portal Adapter"
- Section F.2.10, "What You May Need to Know About Limitations of the Federated Portal Adapter"
- Section F.2.11, "How to Reuse Oracle PDK-Java Producers from Earlier Oracle Application Server Versions"

F.2.1 How to Reuse JSR 286 and Oracle PDK-Java Portlets

To reuse JSR 286 and Oracle PDK-Java portlets in your Portal Framework application, simply register the producers in the same way as any other producer.

To reuse JSR 286 and Oracle PDK-Java portlets:

1. In Oracle JDeveloper, access the WSRP or Oracle PDK-Java Producer Registration wizard.
2. Step through the wizard providing information about the producer, including the URL endpoint.
3. Open the page to which you to add the portlet.
4. Drag the portlet from the registered producer to the appropriate part of the page.

For more detailed information about consuming portlets in a Portal Framework application, see Chapter 63, "Consuming Portlets."

F.2.2 What You May Need to Know About Events

Oracle PDK-Java events are not supported in WebCenter Portal Framework. If you have Oracle PDK-Java portlets that use events and you deploy them in an WebCenter Portal Framework environment, then the events are ignored.

F.2.3 What You May Need to Know About Mobile Portlets

Mobile portlets are not supported in WebCenter Portal Framework. If you have Oracle PDK-Java mobile portlets, then they do not work in a WebCenter Portal Framework environment.

F.2.4 What You May Need to Know About the Portlet Chrome

In WebCenter Portal Framework, the portlet does not provide the chrome. The consuming application provides the chrome. This behavior conforms to the WSRP convention, but it is a change from Oracle Portal, where Oracle PDK-Java provided the chrome for portlets. Hence, the Oracle PDK-Java portlet header is filtered out in the WebCenter Portal Framework environment.

As part of this filtering process, WebCenter Portal Framework parses the title area of PDK-Java portlets to preserve the title and add the necessary portlet mode links. The filtering algorithm is as follows:

- If the portlet has multiple tables, then the title area is considered to be the first table. If the portlet has only one table, then the title area is considered to be the first row in that table.
- The first text in the title area is considered to be the title. If the portlet has no tables or a discernible title, then the title is taken from the `adfp:portlet` component.
- Any link that contains the fragment `_mode=` *`parameter`* is considered to be a portlet mode link. These links are moved into the portlet menu by WebCenter Portal Framework.

If you want to bypass the rendition of the header section of your portlet chrome and reuse its original, Oracle PDK-Java header, then you can set the `displayHeader` attribute of the `adfp:portlet` tag to `false` and `retainPortletHeader` as `true` in the associated portlet bindings of the page definition XML. Setting `retainPortletHeader=true` in the page definition portlet binding retains the portlet header in the portlet response. Setting `displayHeader=false` in the `adf:portlet` tag suppresses the application's header for the portlet chrome, and hides the icons and links normally displayed in the header.

F.2.5 What You May Need to Know About Personalizations and Customizations

Portlet customizations and personalizations that you or your users applied to your portlets in Oracle Portal are not carried over to your Portal Framework application. In a Portal Framework application, your Oracle Portal portlets are treated as new instances. Hence, previous personalizations and customizations are not available.

F.2.6 What You May Need to Know About Oracle Portal System Resources

Portlets built with a target consumer of Oracle Portal in mind tend to make invalid assumptions about the runtime environment. For example, the portlet might assume the presence of Oracle Portal resources, such as images or JavaScript functions. In WebCenter Portal Framework, these resources are not available. Hence, you must bundle the resources the portlet needs with the producer to ensure that the portlet runs properly in the WebCenter Portal Framework environment.

Another common issue with portlets designed for Oracle Portal consumption is the portlet assuming the Oracle Portal URL format and the presence of Oracle Portal parameters. The page URL of an Oracle ADF application is different from that of Oracle Portal. Therefore, portlet developers cannot make assumptions about the page URL and must prepare their Oracle PDK-Java portlets for execution in the WebCenter Portal Framework environment by using the proper portlet APIs.

F.2.7 What You May Need to Know About Partner and External Applications

Partner applications are not supported. External applications are supported. Automatic login is supported through an external application automated login servlet, which is automatically configured in your application when you register a producer.

F.2.8 How to Use the Federated Portal Adapter to Reuse Database Portlets

The Federated Portal Adapter is a component of Oracle Portal that enables Oracle Portal instances to share their database portlets through the Web portlet interface. The Federated Portal Adapter receives the SOAP messages for a Web producer, parses the SOAP and then dispatches the messages to a database producer as PL/SQL procedure calls. In effect, the Federated Portal Adapter makes a database producer behave in the same way as a Web producer. You can make Oracle Portal database portlets, including PL/SQL portlets, Portlet Builder portlets, and page portlets, available for use in your Portal Framework applications.

Note: You can also expose Oracle Portal pages in WebCenter Portal through the Federated Portal Adapter by publishing them as portlets in Oracle Portal.

Implementing the Federated Portal Adapter for your portal exposes the Oracle Portal portlets through the Oracle PDK-Java Web producer protocol making it possible to register them as PDK-Java producers. Registering the producer with a Portal Framework application causes the portlets to appear in the Component Palette, and you can then drag and drop them onto pages in the same way as any other portlet. Without the Federated Portal Adapter, you cannot access these producers from a Portal Framework application.

For more information about the Federated Portal Adapter, see the "Using the Federated Portal Adapter" chapter in the *Administrator's Guide for Oracle Portal*.

To register a Federated Portal Adapter producer with WebCenter Portal:

1. Set up the Oracle Portal environment for the Federated Portal Adapter. For more information, see the "Setting Up the Environment to Use the Federated Portal Adapter" section in the *Administrator's Guide for Oracle Portal*.
2. To register an instance of Oracle Portal through the Federated Portal Adapter, the portal must have a user named "PORTAL" in Oracle Internet Directory. To create this user:
   a. Log in to the Oracle Portal instance as the portal administrator user.
   b. In the **User** portlet, click **Create New Users.**

      By default, the **User** portlet is on the **Administer** tab of the **Portal Builder** page, on the **Portal** subtab.
   c. In the **Last Name** field, enter `PORTAL`.

d. In the **User ID** field, enter `PORTAL`.

e. In the **Password** and **Confirm Password** fields, enter an appropriate password.

f. In the **Email Address** field, enter an appropriate email address.

g. Click **Submit,** then **Done.**

h. In the **Portal User Profile** portlet, enter `PORTAL` in the **Name** field, and click **Edit.**

   By default, the **Portal User Profile** portlet is on the **Administer** tab of the **Portal Builder** page, on the **Portal** subtab.

i. In the **Default Group** field, enter `PORTLET_PUBLISHERS`.

j. Click **OK.**

3. If you want to display Oracle Portal pages in your Portal Framework applications, you must first publish each of those pages as portlets. To display Oracle Portal pages, edit the page properties and select **Publish As Portlet** on the **Optional** tab. For more information, see the "Placing One Page Onto Another" section in the *User's Guide for Oracle Portal*.

4. Confirm that the users of the Portal Framework application have appropriate privileges on the portlets and pages exposed through the Federated Portal Adapter, and that they map to the users of the Oracle Portal instance. The user name for a person on the Portal Framework application should map to the user name of the same person in Oracle Portal. For example, JSMITH should represent the same person in both the Portal Framework application and Oracle Portal.

5. In Oracle JDeveloper, register the producer as an Oracle PDK-Java producer using the Federated Portal Adapter URL and Service ID:

```
http://host:port/adapter/dad/schema
```

   To verify the URL, enter it in a browser. If the URL is correct you should see the following message:

```
Congratulations - you got to the adapter test page
```

   If you are logged in you should see a list of producers, their service IDs, and the portlets each provides. If you are logged in as an Oracle Portal administrator, you should also see additional details about page portlets and Oracle Portal HMAC registrations.

   When you register the producer, ensure that you select the **Establish Producer Sessions** check box on the Specify Connection Details page of the wizard. This is so that the WebCenter Portal user information is correctly propagated to Oracle Portal.

   For more information, see Section 63.2.2, "Registering an Oracle PDK-Java Portlet Producer with a WebCenter Portal Framework Application."

6. You can drag and drop the producer's portlets onto a page.

7. To secure communication between the Oracle Portal instance and WebCenter Portal, provide a shared key using Hash Message Authentication Code (HMAC):

   a. Go to SQL*Plus and log in as the portal schema owner.

   b. Run:

```
@wwc/proadssr.sql http://www.oracle.com/adapter/portal
```

Note that, for Portal Framework applications, the adapter URL is always the same:

```
http://www.oracle.com/adapter/portal
```

c. Enter a shared key code.

d. In Oracle JDeveloper, enter this shared key code into the **Shared Key** field on the Specify Additional Registration Details step of the Create/Edit Oracle PDK-Java Portlet Producer wizard or dialog.

> **Note:** To remove the shared key from the Oracle Portal instance use:
>
> ```
> @wwc/proadsdr.sql
> ```

8. Certain portlets built in Oracle Portal, such as page portlets and several sample database portlets, assume that the set of images shipped in the portal middle tier are available in the path `/images` in the Web server of the portal page. These images are not available by default for your Portal Framework applications. For these images to display correctly:

   a. Download the following zip file:

   `http://download.oracle.com/otndocs/tech/portal/files/portal-images.zip`

   b. Extract the contents of the zip file and mount the contents under the URL `/images`.

9. You can now run the page that contains the portlet.

F.2.9 What You May Need to Know About Troubleshooting the Federated Portal Adapter

The following information may help when trying to resolve issues with the Federated Portal Adapter in WebCenter Portal.

This section includes the following topics:

- Section F.2.9.1, "On Registration"
- Section F.2.9.2, "During Runtime"

F.2.9.1 On Registration

Error occurred trying to register producer

The shared key has not been set up in the Oracle Portal instance or it does not match that given in Oracle JDeveloper, or the service ID has not been entered.

Could not Contact Producer

Either the portal registration URL is not correct, the service ID given in Oracle JDeveloper does not match a provider in the Oracle Portal instance, the Oracle Portal instance could not be contacted (for example, it is behind a firewall or is not available), or the users in Oracle JDeveloper do not match those in Oracle Portal. The details of the message should give further information about the cause:

- 404 Not Found: The Oracle Portal instance could not be contacted or has timed out. Try increasing the time out period.

- 406 Not Acceptable: The provider with the given service ID could not be found in this Oracle Portal instance or HMAC authentication has either failed or been incorrectly configured.
- 503 Service Unavailable: the PORTAL user could not be found in Oracle Internet Directory. The Oracle Portal administrator may not have added the PORTAL user to Oracle Internet Directory.

F.2.9.2 During Runtime

Could not Contact Producer

Either the portal registration URL is not correct, the service ID given in Oracle JDeveloper does not match a provider in the Oracle Portal instance, the Oracle Portal could not be contacted (for example, if it is behind a firewall or not available), or the users in Oracle JDeveloper do not match those in Oracle Portal. The details of the message should give further information about the cause:

- 404 Not Found: The Oracle Portal instance could not be contacted or has timed out. Try increasing the time out period.
- 406 Not Acceptable: The provider with the given service ID could not be found in this Oracle Portal instance or HMAC authentication has either failed or been incorrectly configured.
- 503 Service Unavailable: the PORTAL user could not be found in Oracle Internet Directory. The Oracle Portal administrator may not have added the PORTAL user to Oracle Internet Directory.

Portlet does not render properly

- If images are missing or appear as links, see the instructions for downloading the images zip file provided in Section F.2.8, "How to Use the Federated Portal Adapter to Reuse Database Portlets."
- If navigation does not work properly, try editing the page and setting `RenderPortletInIframe` to `true`. Some portlets work better in their own inline frame (IFRAME).
- If the portlet responds with the following message, try putting the portlet in an IFRAME, by setting `RenderPortletInIframe` to `true`:

  ```
  The portlet attempted to issue a redirect in response to a render request.
  ```

- If popups, lists of values, and so on do not work in the portlet, it may be because JavaScript exceptions are raised in an attempt to avoid XSS attacks. The popup must have the same server URL as the Portal Framework application.
- If a portlet renders a blank screen for Customize or Personalize, it may be that the user does not have permission to edit the portlet. Check the Portal log files.

F.2.10 What You May Need to Know About Limitations of the Federated Portal Adapter

The following limitations apply when using the Federated Portal Adapter with WebCenter Portal:

- Deep linking may not work. In some cases, putting the portlet in an IFRAME helps (setting `RenderPortletInIframe` to `true`).
- Links rendered by the portlet must be absolute URLs.
- If a page portlet displays a page with tabs it should be placed into an IFRAME.

- Refresh, Collapse, and Remove portlet links do not work in portlets displayed in page portlets.
- Not all objects are returned by the Federated Portal Adapter, and thus are not visible in WebCenter Portal. For a full list, see the "Oracle Portal - Limitations" section in *Administering Oracle WebCenter Portal*.

F.2.11 How to Reuse Oracle PDK-Java Producers from Earlier Oracle Application Server Versions

If you have a producer that you designed and deployed on Oracle Application Server Release 2 (10.1.2) or earlier, then you can reuse it in either one of two ways:

- You can consume a portlet from a producer running on an Oracle Application Server Release 2 (10.1.2.0.2) middle tier. In this case, the producer's code is running on Release 2 (10.1.2.0.2) while the application consuming the producer is running on Release 11.
- You can redeploy the producer application as an EAR file on Oracle WebLogic Server and consume its portlets in other Portal Framework applications. In this case, both the producer's code and the consuming application run on Release 11.

In either of these cases, you must take some additional steps to get the producer's portlets to operate correctly. Portlets built for Oracle Portal expect certain boilerplate images to be present on the page assembly servlet and they break if those images are not available. These images were included in the middle-tier servlet by default in Oracle Application Server Release 2 (10.1.2.0.2), but for WebCenter Portal Framework you must manually ensure that the images can be found by portlets.

This section includes the following topics:

- Section F.2.11.1, "Consuming a Portlet from Oracle Portal"
- Section F.2.11.2, "Redeploying PDK-Java Producers from Oracle Portal"

F.2.11.1 Consuming a Portlet from Oracle Portal

In WebCenter Portal, to consume a portlet running on a page in an Oracle Portal instance, you can do either of the following:

- Obtain the Oracle Portal images zip file from the Oracle Technology Network and unzip it inside the ADFP servlet.
- Properly configure the resource servlet as follows:

1. Add an initialization parameter to the Web servlet as shown is Example F–1.

Example F–1 Web Servlet Initialization Parameters

```
<servlet>
 <servlet-name>SOAPServlet</servlet-name>
 <display-name>SOAPServlet</display-name>
 <description>Extended Portal SOAP Server</description>
 <servlet-class>oracle.webdb.provider.v2.adapter.SOAPServlet</servlet-class>
 ...
 <init-param>
   <param-name>resourceServletMapping</param-name>
   <param-value>/pdkresource</param-value>
 </init-param>
</servlet>
```

2. Add a servlet definition for the resource servlet as shown in Example F–2.

Example F–2 Servlet Definition for Resource Servlet

```
<servlet>
 <servlet-name>ResourceServlet</servlet-name>
  <display-name>ResourceServlet</display-name>
  <description>Image resource servlet</description>
  <servlet-class>oracle.webdb.provider.v2.adapter.ResourceServlet</servlet-class>
</servlet>
```

3. Add a servlet mapping for the resource servlet as shown in Example F–3.

Example F–3 Servlet Mapping for Resource Servlet

```
<servlet-mapping>
 <servlet-name>ResourceServlet</servlet-name>
 <url-pattern>/pdkresource/*</url-pattern>
</servlet-mapping>
```

4. Now you can register this PDK-Java producer in the same way as any other PDK-Java producer. For more information about registering PDK-Java producers, see Section 63.2.2, "Registering an Oracle PDK-Java Portlet Producer with a WebCenter Portal Framework Application."

F.2.11.2 Redeploying PDK-Java Producers from Oracle Portal

If you choose to take a PDK-Java producer built for Oracle Portal and redeployed on Oracle WebLogic Server, then you must enable the resource servlet as follows:

1. Add an initialization parameter to the Web servlet as shown in Example F–4.

Example F–4 Web Servlet Initialization Parameter

```
<servlet>
 <servlet-name>SOAPServlet</servlet-name>
 <display-name>SOAPServlet</display-name>
 <description>Extended Portal SOAP Server</description>
 <servlet-class>oracle.webdb.provider.v2.adapter.SOAPServlet</servlet-class>
 ...
 <init-param>
   <param-name>resourceServletMapping</param-name>
   <param-value>/pdkresource</param-value>
 </init-param>
</servlet>
```

2. Add a servlet definition for the resource servlet as shown in Example F–5.

Example F–5 Servlet Definition for Resource Servlet

```
<servlet>
 <servlet-name>ResourceServlet</servlet-name>
  <display-name>ResourceServlet</display-name>
  <description>Image resource servlet</description>
  <servlet-class>oracle.webdb.provider.v2.adapter.ResourceServlet</servlet-class>
</servlet>
```

3. Add a servlet mapping for the resource servlet as Example F–6.

Example F–6 Servlet Mapping for Resource Servlet

```
<servlet-mapping>
 <servlet-name>ResourceServlet</servlet-name>
 <url-pattern>/pdkresource/*</url-pattern>
</servlet-mapping>
```

4. Now you can register this PDK-Java producer in the same way as any other PDK-Java producer. For more information about registering PDK-Java producers, see Section 63.2.2, "Registering an Oracle PDK-Java Portlet Producer with a WebCenter Portal Framework Application."

F.3 Reusing Items

Items from Oracle Portal have no equivalent in WebCenter Portal Framework. As such, creating, maintaining, and publishing items is not supported in WebCenter Portal Framework. To replicate the behavior of items with WebCenter Portal Framework, you can use JCR data controls to include content from Oracle Portal. Oracle Portal is a content repository that WebCenter Portal Framework supports out of the box in the Create a Content Repository Data Control dialog in JDeveloper. For more information about integrating content from Oracle Portal, see Chapter 25, "Configuring Content Repository Connections."

G

Expression Language Expressions

This appendix describes the Expression Language (EL) expressions that you can use in your portals built with WebCenter Portal and Portal Framework applications built with JDeveloper.

This appendix includes the following topics:

- Section G.1, "Introduction to Expression Language (EL) Expressions"
- Section G.2, "Expression Language Example Use Case"
- Section G.3, "ELs Related to Applications"
- Section G.4, "ELs Related to Security"
- Section G.5, "ELs Related to General Settings"
- Section G.6, "ELs Related to Portal Resources"
- Section G.7, "ELs Related to Navigation"
- Section G.8, "ELs Related to Tools and Services"
- Section G.9, "ELs Related to Documents"
- Section G.10, "ELs Related to People Connections"
- Section G.11, "ELs Related to Personalization"
- Section G.12, "ELs Related to Impersonation"
- Section G.13, "EL Expressions Relevant to Composer"
- Section G.14, "EL Expressions Relevant Only to WebCenter Portal"
- Section G.15, "EL Expressions Related to Device Settings"

> **See Also:** For additional information about EL APIs, see *Java API Reference for Oracle WebCenter Portal*.

G.1 Introduction to Expression Language (EL) Expressions

When configuring page components or assets, you can express values as variables that take advantage of the current application context. For example, you can use variables to obtain the name of the current user, the user's assigned role, the state of the current page, and so on. Such flexibility is made possible by using EL expressions.

This section includes the following subsections:

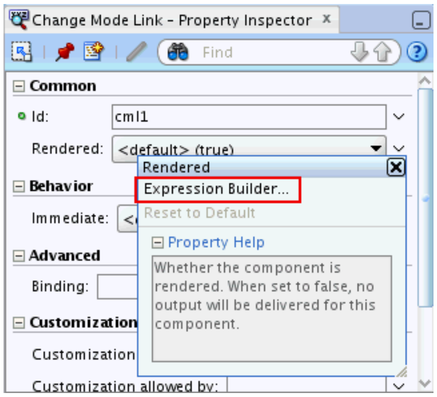
- Section G.1.1, "Introducing the Expression Builder"
- Section G.1.2, "Introducing the Expression Editor in WebCenter Portal"

G.1.1 Introducing the Expression Builder

You use EL expressions throughout a Portal Framework application to bind attributes to object values determined at runtime. At runtime, the value of certain components is determined by their value attribute. While a component can have static text as its value, typically the value attribute will contain an EL expression that the runtime infrastructure evaluates to determine what data to display.

You can create EL expressions using the JDeveloper Expression Builder. You can access the builder from the Property Inspector. In the Property Inspector, locate the attribute you wish to modify and click the Property Menu icon, and select choose **Expression Builder** from the popup (Figure G–1).

Figure G–1 Accessing the Expression Builder



Id: cml1

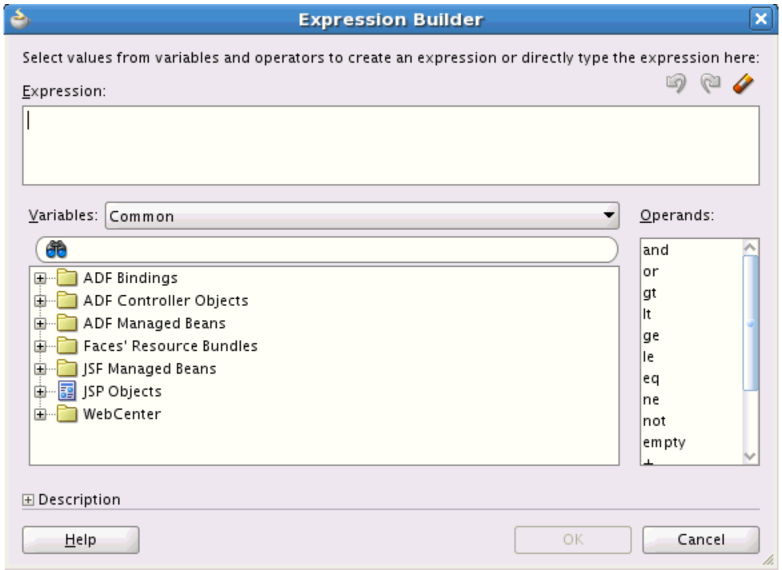
Rendered: <default> (true)

Whether the component is rendered. When set to false, no output will be delivered for this component.

In the Expression Builder dialog (Figure G–2), you can directly type your EL expression in the Expression box. You can also use the Variables drop-down list to select items that you want to include in the expression. Use the operator buttons to add logical or mathematical operators to the expression.

For more information about Expression Builder, see the "Getting Started with ADF Faces" chapter in *Web User Interface Developer's Guide for Oracle Application Development Framework*.

Figure G–2 Expression Builder Dialog



Select values from variables and operators to create an expression or directly type the expression here:

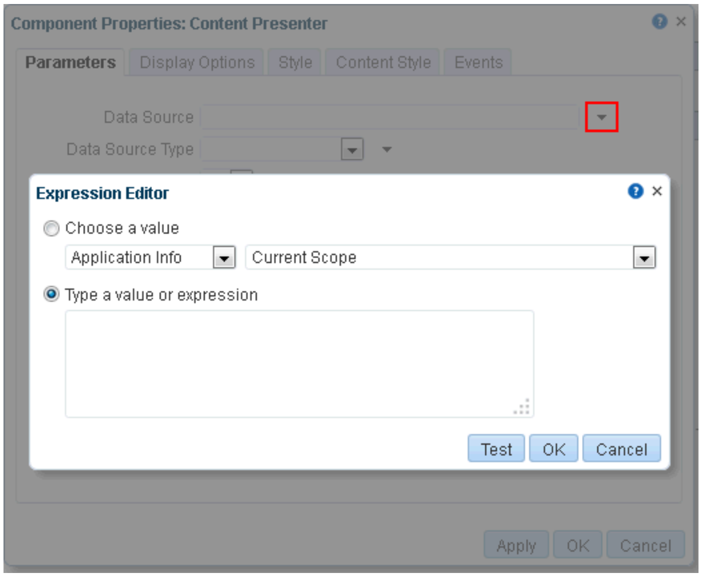
Variables: Common

G.1.2 Introducing the Expression Editor in WebCenter Portal

WebCenter Portal provides a simple Expression Language (EL) editor, called the Expression Editor. Use the Expression Editor when you want to formulate a dynamic computation for an otherwise unknown property value, for example, to specify the current user, the current page mode, and so on.

The Expression Editor is available through the administration and editing screens in WebCenter Portal. You can open the Expression Editor by clicking the **Advanced Edit Options** icon next to a field, check box or drop-down list, and then clicking **Expression Builder**. (Figure G–3).

Figure G–3 Advanced Edit Options Icon Next to a Parameter Value Field and the Resulting Editor



○ Choose a value

Application Info | Current Scope

● Type a value or expression

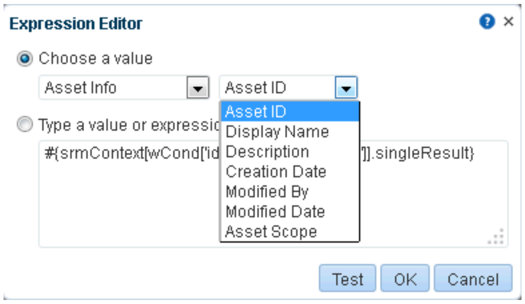
> **See Also:** For information about accessing component properties, see the "Modifying Component Properties" section in *Building Portals with Oracle WebCenter Portal*.

The Expression Editor provides two options for entering expressions:

- **Choose a value**, for selecting a seeded EL expression
- **Type a value or expression**, for entering an expression manually

The options under **Choose a value** are categorized according to the type of information an expression returns. Select a category from the first menu, and then select the type of value you want returned from the second menu (Figure G–4).

Figure G–4 Options Under Choose a Value in the Expression Builder



● Choose a value

Asset Info | Asset ID

Asset ID
Display Name
Description
Creation Date
Modified By
Modified Date
Asset Scope

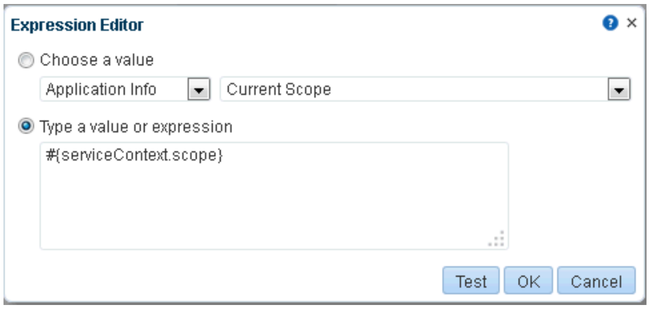
○ Type a value or expressic

#{srmContext[wCond['id ']].singleResult}

> **See Also:** For information about seeded EL expressions, see Section G.14.2, "Seeded Expressions in the Expression Editor."

The option **Type a value or expression** is followed by a text box, which you can use to manually enter the expression you intend (Figure G–5).

Figure G–5 Text Box Under Type a value or expression in the Expression Editor



○ Choose a value

Application Info | Current Scope

● Type a value or expression

```
#{serviceContext.scope}
```

Many expressions in the tables in this appendix are building blocks for narrowing down the object or objects you want returned. That is, they are not necessarily meant to be used by themselves, but rather in an assembly of ELs to form the desired query.

For example, the following expression uses three asset-related ELs to form a single query that returns a particular portal template. It retrieves the template `storesMasterTemplate` from the parent portal `stores`:

```
#{srmContext.resourceScope['stores'].resourceType['siteTemplate'].displayName['sto
resMasterTemplate'].singleResult}
```

In the Expression Editor, you can either:

- Select **Choose a value**, then select predefined values from the drop-down lists.
- Select **Type a value or expression**, then enter a value or EL expression. Use the following formats:
  - a literal number: `#{123}`
  - a literal string: `#{'string'}`
  - a literal Boolean: `#{true}`
  - a Java Bean called to return a value: `#{generalSettings.preferredTimeStyle}`

  The editor provides a **Test** button for validating your EL entry. The **Test** button is available for expressions entered in the text box under **Type a value or expression**.

Validation checks the EL syntax and evaluates the expression. Because expression values vary according to the context in which they are executed, the resulting value that appears in the editor may differ from the value returned during actual use.

Note, however, that only EL syntax is validated when you click **Test**; other types of values are not validated. Test results are shown in a popup.

> **Note:** When you enter EL in the generic **Display Options** tab in the Component Properties dialog, the parser reports an error only if it detects invalid syntax, such as a missing closing bracket. Validation is performed only on syntax, not on the expression value. Generic Display Options are those cataloged in the "Display Options Properties" table in *Building Portals with Oracle WebCenter Portal*.
>
> EL validation is not performed on non-generic display options.

G.2 Expression Language Example Use Case

This section provides an example of using EL expressions to display something based on a user's role, permissions, and so on.

In this example, we will use Expression Language to reveal or hide an item in the navigation model based on the user's role. Because there is Expression Language for almost every piece of metadata maintained by Oracle WebCenter Portal, using ELs to personalize the user's experience is an extremely powerful tool.

You can use the following EL to determine a user's role:

```
#{WCSecurityContext.userInScopedRole['Role 1'] or
WCSecurityContext.userInScopedRole['Role 2']}
```

This EL compares the current user's credentials (in this case, the *role*), against what is specified in the EL. If the result is `true`, that is, if the user is assigned one of the specified roles then the navigation item is visible to the user. If the result is `false`, the navigation item is hidden from the user.

The roles referred to in EL can be a system role (such as `Administrator`, `Moderator`, or `Participant`) or a custom role.

Notice that this EL joins two conditions with the use of an `OR` clause; that is, the user must have either Role 1 OR Role 2 to be able to see the navigational item.

These steps demonstrate how to add a navigational item (a page query for another portal) that is visible only to user assigned the role `Moderator`.

> **Note:** This exercise assumes you have applied a custom navigation model to your portal. You cannot edit a seeded navigation model.

To personalize navigation in a portal:

1. In the portal administration, go to the Assets page, then click Navigations in the left pane

   You can also enter the following URL in your browser to navigate directly to the Assets page:

   ```
   http://host:port/webcenter/portal/portalName/admin/assets
   ```

2. Click the **Edit** quick link for the navigation model that the portal is using.

   > **Tip:** To find out which navigation model the current portal is using, go to the portal's administration settings, and look for the value in the **Navigation** field.

3. In the Edit - *navigation model* dialog, expand the **Add** menu, and select **Pages Query**.
4. On the **Target** tab:
   - In the **Name** field, enter a name for your query, for example, `moderatorQuery`.
   - Next to **Find Page in**, select **Portal**, and ensure that the current portal name appears in the field.
   - Click the **Advanced Edit Options** icon next to the **Visible** check box, and select **Expression Builder**.
5. Select **Choose a value**, and then select **Portal Info** from the first drop-down list, and **CurrentPortal Role - Moderator** from the second list.

   The expression `#{WCSecurityContext.userInScopedRole['Moderator']}` appears in the text field.

   > **Tip:** If you are working with a custom role, select **CurrentPortal Role - Custom**. In the text area, highlight `CustomRole`, then type in the name of your custom role.

6. Click **OK** until you return to the **Assets** tab.
7. Click **Save**.

To test this, add a member to the portal, and assign this user any role other than `Moderator`. Log off and log back in as that user. You should not see the Pages Query navigational item.

G.3 ELs Related to Applications

Table G–1 lists the EL expression relevant to an application and describes the type of functionality it provides. The listed EL applies to both portals built with WebCenter Portal and Portal Framework applications built with JDeveloper.

For information about EL expressions relevant only to WebCenter Portal, see Section G.14.3, "EL Expressions Relevant to WebCenter Portal Information."

Table G–1 EL Expression Relevant to an Application

Expression	Function
`#{requestContext.skinFamily}`	Returns the name of the ADF Faces skin family being used for the current web request, depending on factors such as what has been configured at the application level, the current user's preference setting, and so on. Returns the same value as `#{adfFacesContext.skinFamily}`.

G.4 ELs Related to Security

Table G.4 lists EL expressions relevant to application security and describes the types of functionality they provide. Some of these expressions can be used in both Portal Framework applications and portals built with WebCenter Portal. The **Context** column indicates whether the EL is exclusive to Framework applications, exclusive to WebCenter Portal, or can be used with both (Both).

Table G–2 EL Expressions Relevant to Security

Expression	Function	Context
`#{security.authenticated}`	Returns `true` when the current user is authenticated in the context in which the EL is being invoked, otherwise `false`.	Both
`#{securityContext.userName}`	Returns the user name of the currently logged in user. If the current user is not logged in, this expression returns no value.	Both
`#{WCSecurityContext.currentUser['`*`userName`*`']}`	Returns the value `true` if the current user is the specified user, otherwise `false`.	Both
`#{WCSecurityContext.userInAppRole['`*`role`*`']}`	Returns the value `true` if the current user is assigned the specified OPSS application role. This expression is useful in Portal Framework applications that are scope unaware (that is, that do not support portals). Example: `#{WCSecurityContext.userInAppRole['AppConnectionManager']}`	Framework applications
`#{WCSecurityContext.userInGroup['`*`group`*`']}`	Returns the value *true* if the current user is assigned the specified group, for example: `#{WCSecurityContext.userInGroup['Administrators']}`	Both
`#{security.pageContextCommunityModerator}`	Returns the value *true* if the current user is a moderator of the current portal.	WebCenter Portal
`#{WCSecurityContext.userInScopedRole['`*`role`*`']}`	Returns the value *true* if the current user is assigned the specified role in the current scope. Role can be `Moderator`, `Participant`, `Viewer`, or a custom role defined in that scope. The scope is implicitly resolved to be the current scope. If you use this EL in the Home portal, it resolves to Home portal GUID and roles defined at the application level. If you use this EL in a portal scope, it resolves to roles defined for the portal.	WebCenter Portal

G.4.1 Example: Restricting Access to Structure View in Composer Using EL Expressions

This section provides an example of using EL expressions to display something based on a user's role. In the example, you will create a page style and edit its source code to add an EL expression that allows only users granted the `AdvancedEdit` role to be able to access Structure view of Composer in the Home portal.

To restrict access to Structure view in Composer in the Home portal:

1. Log on to WebCenter Portal with administrative privileges, and navigate to the **Security** tab in WebCenter Portal Administration.
2. Create a new role called `AdvancedEdit`, and assign it to the user, `weblogic`.

   For information about application-level roles and permissions in WebCenter Portal, see the "Managing Security Across Portals" chapter in *Administering Oracle WebCenter Portal*.

The user `weblogic` will now have two roles: `Administrator` and `AdvancedEdit`.

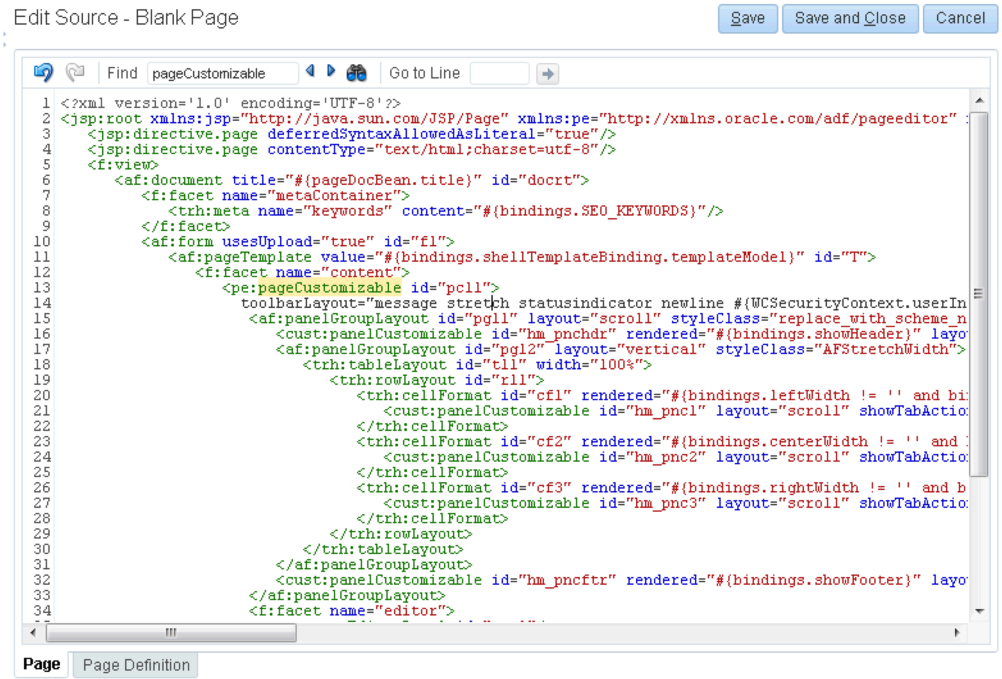
3. Create a new page style, say Blank Page (For information about creating page styles, see the "Creating a Page Style" section in *Building Portals with Oracle WebCenter Portal*.)

4. To grant access to Composer's Structure view only to the users with the `AdvancedEdit` role, edit the source code of the page style and add the following attribute to the `<pe: pageCustomizable>` tag (Figure G–6):

```
toolbarLayout="message stretch statusindicator newline designViews="design
#{WCSecurityContext.userInScopedRole['AdvancedEdit'] ? 'source' : '}"
addonpanels stretch help button"
```

   For information about editing the source code, see the "Editing the Source Code of an Asset" section in *Building Portals with Oracle WebCenter Portal*.

Figure G–6 Editing Source Code of a Page Style



```
<?xml version='1.0' encoding='UTF-8'?>
<jsp:root xmlns:jsp="http://java.sun.com/JSP/Page" xmlns:pe="http://xmlns.oracle.com/adf/pageeditor"
   <jsp:directive.page deferredSyntaxAllowedAsLiteral="true"/>
   <jsp:directive.page contentType="text/html;charset=utf-8"/>
   <f:view>
      <af:document title="#{pageDocBean.title}" id="docrt">
         <f:facet name="metaContainer">
            <trh:meta name="keywords" content="#{bindings.SEO_KEYWORDS}"/>
         </f:facet>
         <af:form usesUpload="true" id="f1">
            <af:pageTemplate value="#{bindings.shellTemplateBinding.templateModel}" id="T">
               <f:facet name="content">
                  <pe:pageCustomizable id="pcl1">
                    toolbarLayout="message stretch statusindicator newline #{WCSecurityContext.userIn
                     <af:panelGroupLayout id="pgl1" layout="scroll" styleClass="replace_with_scheme_n
                        <cust:panelCustomizable id="hm_pnchdr" rendered="#{bindings.showHeader}" layo
                        <af:panelGroupLayout id="pgl2" layout="vertical" styleClass="AFStretchWidth">
                           <trh:tableLayout id="tl1" width="100%">
                              <trh:rowLayout id="rl1">
                                 <trh:cellFormat id="cf1" rendered="#{bindings.leftWidth != '' and bi
                                    <cust:panelCustomizable id="hm_pnc1" layout="scroll" showTabActio
                                 </trh:cellFormat>
                                 <trh:cellFormat id="cf2" rendered="#{bindings.centerWidth != '' and
                                    <cust:panelCustomizable id="hm_pnc2" layout="scroll" showTabActio
                                 </trh:cellFormat>
                                 <trh:cellFormat id="cf3" rendered="#{bindings.rightWidth != '' and b
                                    <cust:panelCustomizable id="hm_pnc3" layout="scroll" showTabActio
                                 </trh:cellFormat>
                              </trh:rowLayout>
                           </trh:tableLayout>
                        </af:panelGroupLayout>
                        <cust:panelCustomizable id="hm_pncftr" rendered="#{bindings.showFooter}" layo
                     </af:panelGroupLayout>
                     <f:facet name="editor">
```

5. Log in as a user other than `weblogic`, and in the Home portal create a page using the Blank Page page style. When you open the page in Composer, the page appears in Design view, and no Structure tab is available because the user is not granted the `AdvancedEdit` role.

   Applying this technique to all page styles available to users in the Home portal completely controls access to Structure view. You can follow the same technique for other portals.

G.5 ELs Related to General Settings

Table G.5 lists EL expressions relevant to general application settings and describes the types of functionality they provide. All listed ELs apply to both portals built with WebCenter Portal and Portal Framework applications built with JDeveloper.

Table G–3 EL Expressions Relevant to General Settings

Expression	Function
`#{generalSettings.userTimeZone}`	Returns the time zone the current user has selected in application preferences.
`#{generalSettings.preferredDateStyle}`	Returns the date format the current user has selected in application preferences.
`#{generalSettings.preferredDatePattern}`	Returns the current user's preferred date format pattern if it has been set, else, returns `null`. Note that date + pattern is applicable only to Portal Framework applications, where they take precedence over date + style if they are set.
`#{generalSettings.preferredTimeStyle}`	Returns the time format the current user has selected in application preferences.
`#{generalSettings.preferredTimePattern}`	Returns the current user's preferred time format pattern if it has been set, else, returns `null`.
`#{generalSettings.preferredDateTimePattern}`	Returns the current user's preferred date and time format pattern if it has been set, else, returns `null`.
`#{generalSettings.preferredAccessibilityMode}`	Returns the current user's preferred accessibility mode (either `default`, `inaccessible`, or `screenReader`)
`#{generalSettings.preferredSkinName}`	The current user's preferred skin name if one is specified, otherwise the default value.
`#{generalSettings.formattedCurrentDate}`	Returns the current date in the current user's selected locale.
`#{generalSettings.formattedCurrentTime}`	Returns the current time in the current user's selected locale.
`#{generalSettings.formattedCurrentDateTime}`	Returns the current date and time in the current user's selected locale.
`#{requestContext.skinFamily}`	Returns the name of the ADF Faces skin family being used for the current web request, depending on factors such as what has been configured at the application level, the current user's preference setting, and so on.

G.6 ELs Related to Portal Resources

Use the expressions in this section to query for portal resources. Querying for a portal resource through an EL expression is similar to querying for it through an API call. That is, you must set query parameters in the format `.`*`property`*`['`*`value`*`']`, where *`property`* is the name of the property, for example, `id`, `resourceScope`, and so on, and *`value`* is the search value for the attribute.

A query can result in single or multiple results. The query designer must decide what is wanted. The query designer determines whether to return one or multiple results by encountering one of the following values in the expression:

- `singleResult`—Returns a single portal resource. When no matching resource is found, null is returned.
- `resultList`—Returns a list of portal resources. When no matching portal resources are found, an empty list is returned.

> **Note:** Occurrences of `singleResult` or `resultList` in the expression are used internally as the query end point, and, after this, the query is executed immediately. Anything set after the end point can result in unexpected behavior.

The following example returns the first page template portal resource found with a display name that contains `myPage`:

```
#{srmContext.resourceType['siteTemplate'].displayName['myPage'].singleResult}
```

The following example returns a list of page template portal resources residing in the directory `resourceDir`, with a description that contains `sampleDesc`:

```
#{srmContext.resourceType['siteTemplate'].description['sampleDesc'].contentDirecto
ry['resourceDir'].resultList}
```

A property of this class includes any attribute of this class. Example properties include: `Id`, `DisplayName`, `iconURI`, `contentDirectory`, and so on.

The property value can be an explicit value or an EL expression that returns that type of value. For example, the following two queries return the same result:

```
#{srmContext.id['resourceId'].singleResult}

#{srmContext.id['spacesContext.currentSpace.uiMetadata.siteTemplateId'].singleResu
lt}
```

You can use any property of this class in an EL-based query in the format *`property`*`['`*`value`*`']` and in any order. For example, the following two queries return the same result:

```
#{srmContext.resourceScope['scopeName'].id['resourceId'].singleResult}

#{srmContext.id['resourceId'].resourceScope['scopeName'].singleResult}
```

Table G–4 lists EL expressions relevant to portal resources and describes the types of functionality each provides. Many of the expressions in Table G–4 are building blocks for narrowing down the portal resource or resources you want returned. That is, they are not necessarily meant to be used by themselves, but rather in an assembly of ELs to form the desired query.

For example, the following expression uses three portal resource-related ELs to form a single query that returns a particular portal template. It retrieves the template `storesMasterTemplate` from the parent portal `stores`:

```
#{srmContext.resourceScope['stores'].resourceType['siteTemplate'].displayName['sto
resMasterTemplate'].singleResult}
```

For information about EL expressions relevant only to WebCenter Portal assets, see Section G.14.4, "EL Expressions Relevant to Assets."

Table G–4 ELs Relevant to Portal Resources

EL	Function
#{srmContext.id['*resourceGUID*']}	Returns the portal resource with the specified ID
#{srmContext.displayName['*resourceDisplayName*']}	Returns any portal resources with the specified display name
#{srmContext.displayNameKey['*displayNameKey*']}	Returns any portal resources with the specified display name key
#{srmContext.description['*resourceDescription*'].singleResult}	Returns one result of a portal resource that contains the specified value in its description To get multiple results, use resultList in lieu of singleResult.
#{srmContext.descriptionKey[*descriptionKey*].singleResult}	Returns one result of a portal resource with the specified description key The description key is the key in the xsrt file for the portal resource description. To get multiple results, use resultList in lieu of singleResult.
#{srmContext.createdDate['*resourceCreationDate*']}	Returns any portal resource with the specified creation date
#{srmContext.modifiedBy['*resourceLastModifiedBy*']}	Returns any portal resource that was last modified by the user with the specified user name
#{srmContext.modifiedDate['*resourceLastModifiedDate*']}	Returns any portal resource that was last modified by the specified date
#{srmContext.resourceScope['*resourceScope*']}	Returns any portal resource that falls within the specified scope
#{srmContext.category['*categoryName*']}	Returns any portal resource that falls within the specified category For example: #{srmContext.category['siteTemplates']}
#{srmContext.contentDirectory['*contentDirectory*']}	Returns any portal resource that is stored within the specified directory
#{srmContext.metadataFile['*metadataFileLocation*']}	Returns portal resource metadata from the specified metadata file For example, the following expression returns resource metadata from the following file /home/metadata/data.xml: #{srmContext.metadataFile['/home/metadat/data.xml']}
#{srmContext.jspx['*jspxFileLocation*']}	Returns any jspx file in the specified location For example, the following expression returns the page.jspx file: #{srmContext.jspx['/home/web/page.jspx']}
#{srmContext.pageDef['*pageDefinition*']}	Returns any jspx file with the specified page definition
#{srmContext.iconURI['*iconURI*']}	Returns the icon at the specified icon URI

Table G–4 (Cont.) ELs Relevant to Portal Resources

EL	Function
`#{srmContext.excludeFrom['`*`excludeFromScopes`*`']}`	In a larger expression, returns all specified portal resources except those available in the excluded scopes
`#{srmContext.usesCustomSecurity['`*`usesCustomSecurity`*`']}`	In a larger expression, returns any portal resource that either does or does not use custom security Set *`usesCustomSecurity`* to `TRUE` or `FALSE`. For example: `#{srmContext.usesCustomSecurity['TRUE']}`
`#{srmContext.seeded['`*`seeded`*`']}`	In a larger expression, returns any portal resource that is or is not seeded, depending on the provided value Set *`seeded`* to `TRUE` or `FALSE`. For example: `#{srmContext.seeded['TRUE']}`
`#{srmContext.visibleType['`*`visibleType`*`']}`	In a larger expression, returns any portal resource that is of the specified type of visibility Set *`visibleType`* to `TRUE`, `FALSE`, or `NEVER` to indicate that the portal resource is never shown. For example, the following expression returns portal resources that are visible, that is, portal resources that are set to **Show**: `#{srmContext.visibleType['TRUE']}`
`#{srmContext.visible['`*`visible`*`']}`	In a larger expression, returns one or multiple portal resources with visibility set to either `TRUE` or `FALSE`
`#{srmContext.createdBy['`*`resourceCreator`*`']}`	In a larger expression, returns any portal resource created by the specified user
`#{srmContext.resourceType['`*`resourceType`*`']}`	In a larger expression, returns one or multiple portal resources of the specified type For example, the following expression searches for a portal resource of the type `SITE_TEMPLATE`: `#{srmContext.resourceType['SITE_TEMPLATE']}` Note that all resource types are listed in *Java API Reference for Oracle WebCenter Portal*, in the `GenericSiteResourceTypes` class.

Table G–4 (Cont.) ELs Relevant to Portal Resources

EL	Function
`#{srmContext.version['version']}`	In a larger expression, returns one or multiple portal resources available in the application of the specified version
`#{srmContext.resourceScope['scopeName']}`	In a larger expression, returns one or multiple portal resources available in the specified scope For example, the following expression searches for portal resources in the scope (in this instance, the portal) `MyPortal`: `#{srmContext.resourceScope['MyPortal']}` To search in the default scope, that is, the application scope, use `defaultScope`.
`#{srmContext.searchType['searchType']}`	In a larger expression, returns one or multiple portal resources that contain or equal the values set by other included expressions Set *searchType* to `CONTAINS` or `EQUALS`.

G.7 ELs Related to Navigation

Table G.7 lists EL expressions relevant to application navigation and describes the types of functionality they provide. All listed navigation ELs apply to both portals built with WebCenter Portal and Portal Framework applications built with JDeveloper.

Table G–5 EL Expressions Relevant to Navigation

Expression	Function
Navigation Context Expressions	
`#{navigationContext.defaultNavigationModel}`	Returns default navigation model. It gets the value from the preference bean. The preference bean gets the value based on the preference setting in `adf-config.xml`, `static value`. The following example returns the specified default tree model: `#{navigationContext.defaultNavigationModel.defaultTreeModel}` You can also use `defaultMenuModel` and `defaultListModel` (see next listing).
`#{navigationContext.currentNavigationModel}`	Returns the navigation model used to navigate to the current view (that is, the current page) There may be a number of navigation models on the page. Only the one used to navigate to the page is the current navigation model. The current navigation model is set only when the `processAction` is called. The following example returns the default tree model for the current navigation model: `#{navigationContext.currentNavigationModel.defaultTreeModel}` You can also use `defaultMenuModel` and `defaultListModel`. **See Also:** `#{navigationContext.processAction}`.

Table G–5 (Cont.) EL Expressions Relevant to Navigation

Expression	Function

`#{navigationContext.navigationModel['`*`model_path`*`']}`	Returns the navigation model specified by path.
	Example:
	`#{navigationContext.navigationModel['/oracle/webcenter/portalapp/navigations/default-navigation-model']}`
	User can simply enter the path in the square bracket without having to remember the parameter name. For backward compatibility, comma-separated parameters are also supported. Available parameters (with examples) are:
	■ `modelPath=/oracle/webcenter/portalapp/navigations/default-navigation-model`
	■ `modelScope=/oracle/webcenter/portalapp/navigation`
	■ `modelId=default-navigation-model`
	Note: `modelScope` and `modelId` are used together, for example:
	`#{navigationContext.navigationModel['modelScope=/oracle/webcenter/portalapp/navigations,modelId=default-navigation-model']}`

Table G–5 (Cont.) EL Expressions Relevant to Navigation

Expression	Function

`#{navigationContext.processAction}`	Returns the default navigation method for binding to UI component's `actionListener` attribute. This assumes that the target resource to navigate to is passed in through the action UI component's `node` or `path` attribute.
	The `node` attribute is typically used for the iterative case; while the `path` attribute is typically used to create a static link. If both are specified, the `node` attribute is used. Note that when using the `path` attribute, you must also specify the `model` attribute to pass in the navigation model object. If the `model` attribute is not specified, the current navigation model is used.
	Example using the `node` attribute:
	`<af:forEach var="node" varStatus="vs"`
	`  items="#{navigationContext.defaultNavigationModel.roo`
	`tNode.children}">`
	`    <af:subform id="pt_sfm1">`
	`      <af:commandLink id="pt_cl1"`
	`        text="#{node.title}"`
	`        inlineStyle="font-size:small;color:White;"`
	`        actionListener="#{navigationContext.processActio`
	`n}"`
	`        action="pprnav">`
	`      <f:attribute name="node" value="#{node}"/>`
	`        <af:showPopupBehavior popupId="menuPopup"`
	`          align="afterStart"`
	`          triggerType="mouseOver"/>`
	`    </af:commandLink>`
	Example using the `path` attribute:
	`<af:commandLink id="pt_cl1" text="Prescriptions"`
	`    inlineStyle="font-size:small; color:White;"`
	`    actionListener="#{navigationContext.processAction}"`
	`    action="pprnav">`
	`<f:attribute name="path" value="/prescriptions"/>`
	`<f:attribute name="model"`
	`    value="#{navigationContext.defaultNavigationModel}"`
	`/>`
	`</af:commandLink>`

Navigation Model Expressions	

`#{navigationContext.defaultNavigationModel.defaultTreeModel}`
`#{navigationContext.defaultNavigationModel.defaultMenuModel}`
`#{navigationContext.defaultNavigationModel.defaultListModel}`
`#{navigationContext.defaultNavigationModel.defaultSiteMap}`
	Returns a tree/menu/list model based on the default settings
	The default values for the settings are specified in the next row. For example, the default value for `depth` is `0`.
	For `defaultSiteMap`, it returns the XML for the site map of the navigation based on the default settings.
	This expression returns a model of type:
	■ `ChildPropertyTreeModel`—used in `<af:tree>` component
	■ `ChildPropertyMenuModel`—used in `<af:breadcrumbs>` or <af:menu> component
	■ `List`*`NavigationResource`*—used in `<af:foreach>`

Table G–5 (Cont.) EL Expressions Relevant to Navigation

Expression	Function

`#{navigationContext.defaultNavigationModel.treeModel['`*`parameters`*`']}`
`#{navigationContext.defaultNavigationModel.menuModel['`*`parameters`*`']}`
`#{navigationContext.defaultNavigationModel.listModel['`*`parameters`*`']}`
`#{navigationContext.defaultNavigationModel.siteMap['`*`parameters`*`']}`
	Returns tree/menu/list model based on the specified comma-separated parameters. Available parameters (with default values as examples) are:
	■ `startNode=/`—specify the starting node of the model (do not need "/" prefix unless requesting the root node, for example, `home`).
	■ `includeStartNode=true`—specify `true` if you want to include the starting node (for example, the root node above) or `false` to start from its children.
	■ `depth=0`—defines the initial depth of fetching. "0" means fetch the entire tree, which may take a long time. In which case, use "1" to fetch on demand (when users click the **Expand** icon).
	■ `prefetchOnly=false`—by default (`true`), it returns nodes up to the depth level requested initially; deeper level nodes are returned on demand. Use `false` if you want only the initial sets of nodes. In which case, it does not return deeper nodes later on when requested, even when there are deeper nodes.
	For `siteMap`, the available parameters are `startNode` and `includeStartNode`.
	Example:
	`#{navigationContext.defaultNavigationModel.treeModel['`
	`startNode=home,includeStartNode=false,depth=2']}`

`#{navigationContext.defaultNavigationModel.rootNode}`	Returns a root node (of type `NavigationResource`) of the navigation model.
	Example:
	`<af:commandLink id="pt_cl1" text="Prescriptions"`
	`   inlineStyle="font-size:small; color:White;"`
	`   actionListener="#{navigationContext.processAction}"`
	`   action="pprnav">`
	`  <f:attribute name="node"`
	`       value="#{navigationContext.`
	`       defaultNavigationModel.`
	`       rootNode.children[2]"/>`
	`</af:commandLink>`

`#{navigationContext.defaultNavigationModel.node['`*`path`*`']}`	Returns a node (of type `NavigationResource`) based on the path specified (you do not need "/" prefix unless you are requesting the root node, for example, `'/'`)
	Example:
	`#{navigationContext.defaultNavigationModel.node['home/`
	`page1']}`

`#{navigationContext.defaultNavigationModel.currentSelection}`	Returns currently selected navigation portal resource.

Table G–5 (Cont.) EL Expressions Relevant to Navigation

Expression	Function

`#{navigationContext.defaultNavigationModel.newCurrentSelection['path']}`	Sets the current selection to a node specified by the given path (you do not need "/" prefix unless you are requesting the root node, for example, `'/'`). If successful, returns the newly selected node of type `NavigationResource`.
	The user must have the ability to explicitly set the current selection without having to actually navigate to a node.
	This can be used where the user enters a page directly, and no selection is set. It provides a mechanism for the user to control what is the default when there is no current selection.
	Example:
	`<c:set`
	`  value="${navigationContext.defaultNavigationModel.new`
	`CurrentSelection['home/page1']}"`
	`  var="currSel" scope="session"/>`
	`<c:if test="${currSel!=null}">`
	`  <af:forEach items="#{currSel.children}"`
	`    var="cnode" varStatus="cnodestatus">`
	`...`
	`</c:if>`

`#{navigationContext.defaultNavigationModel.attributes.Description}`
`#{navigationContext.defaultNavigationModel.attributes['Description']}`
	Returns the value of the specified attribute of the navigation model.

`#{navigationContext.defaultNavigationModel.properties['`propertyName`']}`	Returns the value of the specified property of the navigation model, where propertyName is either `rootNode` or `currentSelection`.
Navigation Portal Resource Expressions	

`#{node.attributes.Description}`
`#{node.attributes['Description']}`
	Returns the value of the specified attribute of the navigation portal resource.

`#{node.parameters.StockSymbol}`
`#{node.parameters['StockSymbol']}`
	Returns the value of the specified parameter of the navigation portal resource.

`#{node.parametersRaw.StockSymbol}`
`#{node.parametersRaw['StockSymbol']}`
	Returns the raw value of the specified parameter of the navigation portal resource (before it is evaluated).

`#{node.title}`	Returns the title of the navigation portal resource.
`#{node.path}`	Returns the path to the navigation portal resource.
`#{node.externalURL}`	Returns the URL for the navigation portal resource of type `External Link`.
`#{node.prettyUrl}`	Returns the identifying path for this navigation portal resource.

`#{node.prettyUrlPath}`
`#{node.prettyUrlPath[N]}`
	Returns a collection of identifying paths by depth to enable its use as a starting path to drive another navigation view.
	For example, assuming the `currentSelection` is `home/company/products/applications`, the following EL returns `home/company/products`:
	`#{node.prettyUrlPath[3]}`

Table G–5 (Cont.) EL Expressions Relevant to Navigation

Expression	Function

`#{`*node*`.goLinkPretty Url}`	Returns the identifying path for this navigation portal resource suitable for `goLink` destination
	`<af:goLink id="pt_gl2" text="#{node.title}"`
	`     destination="#{node.goLinkPrettyUrl}"`
	`     targetFrame="#{node.attributes['Target']}"`
	`     inlineStyle="font-size:small;#{node.selected ?`
	`     'font-weight:bold;' : ''}"/>`

`#{`*node*`.separator ? ... : ...}`	Returns whether this portal resource is a separator item.
`#{`*node*`.navigable ? ... : ...}`	Returns whether it is possible to navigate to this portal resource.
`#{`*node*`.selected ? ... : ...}`	Returns whether this portal resource is currently selected.
`#{`*node*`.currentlySelected ? ... : ...}`	Returns whether the portal resource is the currently selected portal resource and the model is the currently selected model.

`#{`*node*`.onSelectedPath ? ... : ...}`	Returns whether this node lies on the selected path. This is useful for highlighting the selected tab, for example.
	For example, assuming the currently selected node is `home/company/products/applications`, the following EL highlights the `home` tab.
	`<c:set`
	`  value="${navigationContext.defaultNavigationModel.nod`
	`e['home']}"`
	`  var="home" scope="session"/>`
	`    <af:commandImageLink id="cil1"`
	`        icon="#{(home.onSelectedPath) ?`
	`        '/images/caremark/nav/HomeSelected.png' :`
	`        '/images/caremark/nav/HomeIcon.png'}"`
	`        actionListener="#{navigationContext.processActio`
	`n}"`
	`        action="pprnav">`
	`    <f:attribute name="node" value="#{home}"/>`
	`</af:commandImageLink>`

`#{`*node*`.leaf ? ... : ...}`	Returns whether this resource is a leaf node.
`#{`*node*`.parent}`	Returns the parent node (of type `NavigationResource`) of this node. For the root node, `null` is returned.
`#{`*node*`.ancestors}`	Returns the hierarchy list of ancestors of this node (of type NavigationResource) starting with the root node. For example, assuming the current node is `home/company/products/applications`, the following ELs return the following values: ■ `#{node.ancestors[1]}` returns the node for `home` ■ `#{node.ancestors[3]}` returns the node for home/company/products
`#{`*node*`.depth}`	Returns the depth of this node from the root node. Root node has a depth of zero.
`#{`*node*`.siblings}`	Returns the list of siblings (of type `NavigationResource`) of this node (inclusive).

Table G–5 (Cont.) EL Expressions Relevant to Navigation

Expression	Function

`#{`*node*`.nextSibling}`	Returns the next sibling in the list (of type `NavigationResource`) of this node.
	For example, the following code ensures that you do not output two separators in a row:
	`<c:if test="${(node.separator) && (!node.nextSibling.separator}">`
	`   <af:separator id="s166"/>`
	`</c:if>`

`#{`*node*`.previousSibling}`	Returns the previous sibling in the list (of type `NavigationResource`) of this node.
`#{`*node*`.index}`	Returns the zero-relative index of this node relative to its siblings.

`#{`*node*`.children}`
`#{`*node*`.children[`*N*`].title}`
`#{`*node*`.children[`*N*`].children[`*N*`].title}`
	Returns a collection of child resources.

`#{`*node*`.childCount}`	Returns the number of children of this node.
`#{`*node*`.childByIndex['index']}`	Returns the child node (of type `NavigationResource`) specified by the zero-relative index. If not found, this returns `null`.
`#{`*node*`.childByPath['admin']}`	Returns the child node (of type `NavigationResource`) specified by the path relative to this node. The path can be deeper than one level and does not need the `'/'` prefix. If not found, this returns `null`.
#{*node*`.properties['propertyName']}`	Returns the value of the specified property of the navigation portal resource, where `propertyName` is one of the following: `separator`, `title`, `prettyUrl`, `prettyUrlPath`, `depth`, `leaf`, `childCount`, `navigable`, `selected`, or `currentlySelected`.

G.7.1 Example: Using EL Expressions for Navigation

This section provides an example of using a navigation model to monitor activities of two subportals from a shared page in the parent portal. In this example, you use a page containing the Activity Stream task flow. The content of the task flow is determined by a parameter passed to the page. The navigation model includes two links that link to the page. The first link passes `subportal1` as the parameter so that the Activity Stream task flow shows activities of `subportal1`. The second link passes `subportal2` as the parameter. So, the content of the page is different depending on which link you click in the navigation.

To build a navigation model that uses ELs to monitor subportal activity from a parent portal:

1. In WebCenter Portal, create a portal, and two subportals. While creating subportals, note down the internal name used (for example, `subportal1` and `subportal2`).
2. In your portal, create a page called `Subportal Activity`, and add the Activity Stream task flow to the page. For information about adding a task flow, see the "Adding Components to a Page" section in *Building Portals with Oracle WebCenter Portal*.

3. Create a page parameter, say `subportalName`, for the newly created page. For information, see the "Adding or Modifying Page Parameters" section in *Building Portals with Oracle WebCenter Portal*.

   Use the following EL as the value of the parameter:

   ```
   #{empty
   navigationContext.currentNavigationModel.currentSelection.parameters.subspaceNa
   me ? 'subportal1' :
   navigationContext.currentNavigationModel.currentSelection.parameters.subspaceNa
   me}
   ```

   where '`subportal1`' is the value to be used for the page parameter if none is passed to it from the navigation.

4. Edit the settings of the Activity Stream task flow. In the Component Properties dialog, on the **Parameters** tab, for the **Spaces** parameter, open the Expression Builder, and for **Page Parameter**, select **subportalName**.

5. On the **Display Options** tab, for the **Text** field, specify a value that shows the name of the subportal whose activity is shown. For example, use the following EL:

   ```
   #{bindings.subspaceName} Activity
   ```

6. Build a navigation that passes the portal to show your page:

   a. Create a navigation based on **Portal Default Navigation Model**.

   b. Edit the navigation by adding a Link navigation item.

   c. On the **Target** tab, in the **Name** field, specify the name of the Link item as `Sub Portal 1`.

   d. In the **Path** field, select the `Subportal Activity` page.

   e. On the **Parameters** tab, for the `subportalName` field, specify the internal name of the first subportal, `subportal1`.

7. Copy the newly created link, and edit it to make a link for the second subportal, `subportal2`.

   While editing, on the **Target** tab you only need to change the **Name** of the link. On the **Parameters** tab, you only need to change the value of the **subportalName** parameter to `subportal2` (the internal name of the second subportal).

8. Make sure the newly created navigation is set as the current navigation for your portal.

9. You now have two links that take you to the shared `Subportal Activity` page, passing different values for the portal depending on the link you click.

G.8 ELs Related to Tools and Services

Table G.8 lists EL expressions relevant to tools and services and describes the types of functionality they provide. All listed ELs apply to both portals built with WebCenter Portal and Portal Framework applications built with JDeveloper.

Table G–6 EL Expressions Relevant to Tools and Services

Expression	Function
`#{webcenterService['`*`serviceId`*`']}`	An `oracle.webcenter.framework.service.Service` object representing the WebCenter Portal tool or service represented by the service ID `serviceId`. For example, the following EL returns *Documents Service*: `#{webcenterService['oracle.webcenter.doclib']}` For service IDs, see Table G–7.
`#{webcenterService['`*`serviceId`*`'].configured}`	Returns a Boolean value that indicates whether the WebCenter Portal tool or service represented by the service ID *`serviceId`* is configured for use in the current Portal Framework application. For example, the following EL returns `true` if discussions can be used in the application, `false` otherwise: `#{webcenterService['oracle.webcenter.collab.forum'].configured}` For service IDs, see Table G–7.
`#{sessionContext['oracle.webcenter.collab.forum'].groupInfo['`*`portalName`*`'].forumId}`	Returns the forum ID of the specified portal discussion forum. Enter the portal name in lieu of *`portalName`*.
`#{sessionContext['oracle.webcenter.collab.forum'].groupInfo['`*`portalName`*`'].categoryId}`	Returns the category ID of the specified portal discussion forums. Enter the portal name in lieu of *`portalName`*.

Table G–7 lists service IDs associated with WebCenter Portal tool and services.

Table G–7 Service and Tool IDs

Service/Tool	ID
Announcements	oracle.webcenter.collab.announcement
Discussions	oracle.webcenter.collab.forum

G.9 ELs Related to Documents

Table G–8 lists EL expressions relevant to documents and describes the types of functionality they provide. All listed ELs apply to both portals built with WebCenter Portal and Portal Framework applications built with JDeveloper.

Table G–8 EL Expressions Relevant to Documents

Expression	Function
`#{documentsService.defaultConnectionName}`	Gets the default content repository connection name. Returns `null` if no connection name is defined.
`#{documentsService.configured}`	Checks whether the documents feature is configured. Returns `true` if the documents feature is configured, otherwise `false`.

G.10 ELs Related to People Connections

Table G–9 lists EL expressions relevant to the Profile feature of the people connections and describes the types of functionality they provide. All listed ELs apply to both portals built with WebCenter Portal and Portal Framework applications built with JDeveloper.

> **Note:** The entry `securityContext.userName`, included in every Profile expression, returns the name of the current user. Note also that information is returned only if it is present in the user's profile. If the information is not included in the profile, a null value is returned.

Table G–9 EL Expressions Relevant to People Connections (Profile)

Expression	Function

`#{webCenterProfile[`*`userName`*`].ManagerDisplayName}`
`#{webCenterProfile[securityContext.userName].ManagerDisplayName}`
	The display name of the specified user's manager if the current user is allowed to know it.

`#{webCenterProfile[`*`userName`*`].employeeNumber}`
`#{webCenterProfile[securityContext.userName].employeeNumber}`
	The specified user's employee number if the current user is allowed to know it.

`#{webCenterProfile[`*`userName`*`].businessPOBox}`
`#{webCenterProfile[securityContext.userName].businessPOBox}`
	The post office box number associated with the specified user if the current user is allowed to know it.

Table G–9 (Cont.) EL Expressions Relevant to People Connections (Profile)

Expression	Function

`#{webCenterProfile[`*userName*`].timeZone}`
`#{webCenterProfile[securityContext.userName].timeZone}`
	The time zone in which the specified user's home office is located if the current user is allowed to know it.

`#{webCenterProfile[`*userName*`].description}`
`#{webCenterProfile[securityContext.userName].description}`
	A description of the specified user (from Profile "About Me") if the current user is allowed to know it.

`#{webCenterProfile[`*userName*`].department}`
`#{webCenterProfile[securityContext.userName].department}`
	The department to which the specified user belongs if the current user is allowed to know it.

`#{webCenterProfile[`*userName*`].businessPager}`
`#{webCenterProfile[securityContext.userName].businessPager}`
	The specified user's business pager number if the current user is allowed to know it.

`#{webCenterProfile[`*userName*`].businessCity}`
`#{webCenterProfile[securityContext.userName].businessCity}`
	The city in which the specified user is located if the current user is allowed to know it.

`#{webCenterProfile[`*userName*`].maidenName}`
`#{webCenterProfile[securityContext.userName].maidenName}`
	The specified user's surname or last name before marriage if the current user is allowed to know it.

`#{webCenterProfile[`*userName*`].businessFax}`
`#{webCenterProfile[securityContext.userName].businessFax}`
	The specified user's business fax number if the current user is allowed to know it.

`#{webCenterProfile[`*userName*`].dateofHire}`
`#{webCenterProfile[securityContext.userName].dateofHire}`
	The specified user's date of hire if the current user is allowed to know it.

`#{webCenterProfile[`*userName*`].nameSuffix}`
`#{webCenterProfile[securityContext.userName].nameSuffix}`
	Additional information appended to the user's name, such as `Esq.`, `Jr.`, and so on if the current user is allowed to know it.

`#{webCenterProfile[`*userName*`].middleName}`
`#{webCenterProfile[securityContext.userName].middleName}`
	The specified user's middle name if the current user is allowed to know it.

`#{webCenterProfile[`*userName*`].homePhone}`
`#{webCenterProfile[securityContext.userName].homePhone}`
	The specified user's home phone number if the current user is allowed to know it.

`#{webCenterProfile[`*userName*`].employeeType}`
`#{webCenterProfile[securityContext.userName].employeeType}`
	The specified user's employee type classification, for example, `IC4` if the current user is allowed to know it.

`#{webCenterProfile[`*userName*`].lastName}`
`#{webCenterProfile[securityContext.userName].lastName}`
	The specified user's surname or last name if the current user is allowed to know it.

`#{webCenterProfile[`*userName*`].dateofBirth}`
`#{webCenterProfile[securityContext.userName].dateofBirth}`
	The specified user's birthday if the current user is allowed to know it.

`#{webCenterProfile[`*userName*`].businessState}`
`#{webCenterProfile[securityContext.userName].businessState}`
	The state in which the specified user's home office is located if the current user is allowed to know it.

Table G–9 (Cont.) EL Expressions Relevant to People Connections (Profile)

Expression	Function

`#{webCenterProfile[`*`userName`*`].homeAddress}`
`#{webCenterProfile[securityContext.userName].homeAddress}`
	The specified user's home street address if the current user is allowed to know it.

`#{webCenterProfile[`*`userName`*`].businessStreet}`
`#{webCenterProfile[securityContext.userName].businessStreet}`
	The street on which the specified user's home office is located if the current user is allowed to know it.

`#{webCenterProfile[`*`userName`*`].businessPostalCode}`
`#{webCenterProfile[securityContext.userName].businessPostalCode}`
	The specified user's postal or ZIP code if the current user is allowed to know it.

`#{webCenterProfile[`*`userName`*`].initials}`
`#{webCenterProfile[securityContext.userName].initials}`
	The specified user's initials if the current user is allowed to know it.

`#{webCenterProfile[`*`userName`*`].firstName}`
`#{webCenterProfile[securityContext.userName].firstName}`
	The specified user's first name if the current user is allowed to know it.

`#{webCenterProfile[`*`userName`*`].organizationalUnit}`
`#{webCenterProfile[securityContext.userName].organizationalUnit}`
	The organizational unit to which the specified user belongs, for example, `D10`, if the current user is allowed to know it.

`#{webCenterProfile[`*`userName`*`].wirelessAcctNumber}`
`#{webCenterProfile[securityContext.userName].wirelessAcctNumber}`
	The specified user's wireless account number if the current user is allowed to know it.

`#{webCenterProfile[`*`userName`*`].businessPhone}`
`#{webCenterProfile[securityContext.userName].businessPhone}`
	The specified user's business telephone number if the current user is allowed to know it.

`#{webCenterProfile[`*`userName`*`].businessCountry}`
`#{webCenterProfile[securityContext.userName].businessCountry}`
	The country in to which the specified user is assigned if the current user is allowed to know it.

`#{webCenterProfile[`*`userName`*`].preferredLanguage}`
`#{webCenterProfile[securityContext.userName].preferredLanguage}`
	The specified user's preferred language if the current user is allowed to know it.

`#{webCenterProfile[`*`userName`*`].displayName}`
`#{webCenterProfile[securityContext.userName].displayName}`
	The specified user's display name if the current user is allowed to know it.

`#{webCenterProfile[`*`userName`*`].userName}`
`#{webCenterProfile[securityContext.userName].userName}`
	The specified user's actual name if the current user is allowed to know it.

`#{webCenterProfile[`*`userName`*`].title}`
`#{webCenterProfile[securityContext.userName].title}`
	The specified user's job title if the current user is allowed to know it.

`#{webCenterProfile[`*`userName`*`].businessEmail}`
`#{webCenterProfile[securityContext.userName].businessEmail}`
	The specified user's business email address if the current user is allowed to know it.

Table G–9 (Cont.) EL Expressions Relevant to People Connections (Profile)

Expression	Function

`#{webCenterProfile[userName].organization}`
`#{webCenterProfile[securityContext.userName].organization}`
	The organization to which the specified user belongs, for example, `Sales`, if the current user is allowed to know it.

`#{webCenterProfile[userName].businessMobile}`
`#{webCenterProfile[securityContext.userName].businessMobile}`
	The specified user's cell or mobile phone number if the current user is allowed to know it.

`#{webCenterProfile[userName].expertise}`
`#{webCenterProfile[securityContext.userName].expertise}`
	The specified user's business expertise if the current user is allowed to know it.

G.11 ELs Related to Personalization

Table G–10 lists EL expressions relevant to personalization and describes the types of functionality they provide. All listed ELs apply to both portals built with WebCenter Portal and Portal Framework applications built with JDeveloper.

Table G–10 EL Expressions Relevant to Personalization

Expression	Function

`#{p13nContext.reset}`	Clears the state of the context object in which it is invoked.
	Other examples:
	`#{p13nContext.conductor['ConductorConnection'].reset}`
	`#{p13nContext.conductor['ConductorConnection'].namespaces['MyNamespace'].reset}`
	`#{p13nContext.properties['PropertiesConnection'].namespaces['MyNamespace'].setDefinitions['MyPropertySetDefinition'].set['MyPropertySet'].reset}`

`#{p13nContext.properties['PropertiesConnection'].namespaces['MyNamespace'].setDefinitions['MyPropertySetDefinition'].set['MyPropertySet'].update}`	Updates the property set with new values if bound to a form. The `update` method applies only to the context `PropertySetContext`, and can be called only as part of a form-based action.

`#{p13nContext.properties['PropertiesConnection'].namespaces['MyNamespace'].setDefinitions['MyPropertySetDefinition'].set['MyPropertySet'].results}`	Retrieves the results of the context object. In the case of `PropertySetContext`, it retrieves the property set by name and property set definition, if they exist.
	In the case of `ScenarioExecutionContext` and `ParameterizedScenarioExecutionContext`, the scenario results are retrieved.
	Other examples:
	`#{p13nContext.conductor['ConductorConnection'].namespaces['MyNamespace'].scenario['MyScenario'].results}`
	`#{p13nContext.conductor['ConductorConnection'].namespaces['MyNamespace'].scenario['MyScenario'].withInput['input1=val1;input2=value2;input3=value3'].results}`

`#{p13nContext.conductor['PropertiesConnection'].namespaces['MyNamespace'].scenario['MyScenario'].results}`	Executes a scenario by name.

Table G–10 (Cont.) EL Expressions Relevant to Personalization

Expression	Function
`#{p13nContext.conductor['ConductorConnection'].namespaces['MyNamespace'].scenario['MyScenario'].withInput['input1=val1;input2=value2;input3=value3'].results}`	Executes a scenario by name with input parameters. Input parameters must be in the following format: `<paramOne>=<valueOne>;<paramTwo>=<valueTwo>;<paramThree>=<valueThree>` Where each parameter name and value is separated by semicolon. The `withInput` method applies only to the context `ScenarioExecutionContext`.
`#{p13nContext.conductor['ConductorConnection'].namespaces[myManagedBean.namespace].scenario[myManagedBean.scenario].isError}`	Determines if an error has occurred in the current context object. The `isError` method applies only to `PropertySetContext` and `~ScenarioExecutionContext`. Other examples: `#{p13nContext.properties['PropertiesConnection'].namespaces['MyNamespace'].setDefinitions['MyPropertySetDefinition'].set['MyPropertySet'].isError}`
`#{p13nContext.conductor['ConductorConnection'].namespaces['myManagedBean.namespace'].scenario['myManagedBean.scenario'].errorMessage}`	Returns the error message if an error has occurred in the current context object. The errorMessage method applies only to `PropertySetContext` and `~ScenarioExecutionContext`. Other examples: `#{p13nContext.properties['PropertiesConnection'].namespaces['MyNamespace'].setDefinitions['MyPropertySetDefinition'].set['MyPropertySet'].errorMessage}`

G.12 ELs Related to Impersonation

Table G–11 lists EL expressions relevant to WebCenter Portal Impersonation and describes the types of functionality they provide. All listed ELs apply to both portals built with WebCenter Portal and Portal Framework applications built with JDeveloper.

For more information about using these ELs, see Section 74.19, "Using WebCenter Portal Impersonation ELs and APIs."

Table G–11 EL Expressions Relevant to Impersonation

Expression	Function
`#{WCSecurityContext.impersonationConfigured}`	Returns whether or not impersonation has been enabled for the current domain. This EL can be useful when determining if an error was caused by an impersonation session ending prematurely, or to provide an additional indicator that a session has ended.
`#{WCSecurityContext.userInImpersonationSession}`	Returns whether the current user is in an impersonation session or not. You can use this EL to protect content and render it inaccessible during an impersonation session. For example, you could map the rendered attribute of an administration task flow on a page to this EL only rendering the task flow if the user is not viewing the task flow in an impersonation session.
`#{WCSecurityContext.currentImpersonator}`	This EL could be used to modify the page template to display the impersonator or render content accessible only to a particular impersonator.

G.13 EL Expressions Relevant to Composer

Table G–12 lists EL expressions relevant to Composer. These EL expressions can be used both in portals built with WebCenter Portal and Portal Framework applications built with Oracle JDeveloper.

Table G–12 EL Expressions Relevant to Composer

Expression	Function

`#{composerContext.inEditMode}`	Determines whether the current page is in View mode or Edit mode.
	For example:
	`<af:outputText id="ot1"`
	`   value="#{composerContext.inEditMode ne`
	`   true ? 'View mode' : 'Edit mode'} />`
	This example shows an ADF Faces `outputText` component that returns `View mode` when the page is in View mode and `Edit mode` when the page is in Edit mode.

`#{changeModeBean.inEditMode}`	The `childCreation` attribute determines whether the children of popup dialogs can be viewed in Composer. By default, this attribute is set to `deferred` and users are unable to see the children of popup dialogs. Setting the value to `immediate` allows users to view the children of popup dialogs.
	For example:
	`<af:popup childCreation="#{changeModeBean.inEditMode`
	`   ? 'immediate' : 'deferred'}" />`
	There is a performance impact by setting the `childrenCreation` attribute to `immediate`. If you do not need to use the popup on the page, using the default setting of `deferred` will avoid the penalty of CPU and memory usage when it is not needed. Note that the popup will be shown non-modally, thus, the application must be able to handle that fact without error.

G.13.1 Example: Using EL Expressions for Composer

This section provides an example of using an EL expression to display different pages in View mode and Edit mode. Consider that you want one of your pages, `Page1`, to display another page, `Page2`, in View mode. However, while editing `Page1`, instead of `Page2`, you want to display a website, `www.example.com`. You can use the EL of the following format:

```
#{ composerContext.inEditMode ? 'http://www.example.com' : 'url_of_Page2' }
```

This EL displays the specified website when your page is in Edit mode, and shows `Page2` when in View mode.

The following steps demonstrate how to display different pages depending on the page mode.

1. Open a page named `Page1` in the page editor (Composer).
2. In Design view, in the resource catalog, click **Web Development**.
3. Click **Add** displayed next to **Web Page**.
4. Click the Edit icon for the newly added Web Page.
5. In the Component Properties dialog, on the **Display Options** tab, in the **Source** field, enter the value as per the following format:

   ```
   #{ composerContext.inEditMode ? 'website_url' : 'url_of_Page2' }
   ```

6. Click **OK**.

   In Composer, `Page1` should now display the website you specified. Save and close the page. `Page1` should now show `Page2`.

G.14 EL Expressions Relevant Only to WebCenter Portal

This section contains the following subsections:

- Section G.14.2, "Seeded Expressions in the Expression Editor"
- Section G.14.3, "EL Expressions Relevant to WebCenter Portal Information"
- Section G.14.4, "EL Expressions Relevant to Assets"
- Section G.14.5, "EL Expressions Relevant to Specific Portals"
- Section G.14.6, "EL Expressions Relevant to Specific Pages"
- Section G.14.7, "EL Expressions Relevant to Portal Event Contexts"
- Section G.14.8, "Utilitarian EL Expressions"

G.14.1 Desupport of Freeform JPQL WHERE and SORT Clauses in Portal Queries

In WebCenter Portal, if you have introduced an EL expression for querying portals based on a JPQL `WHERE` clause, you should know that the freeform JPQL `WHERE` clause is desupported. Instead, use a structured `WHERE` clause. Freeform `SORT` clauses are also desupported. Instead, specify sort criteria on a portal query in a structured way.

For example, suppose that you have used the following syntax to form a `WHERE` clause on a portal query:

```
#{spaceContext.spacesQuery.unionOf['ALL_QUERIABLE'].
whereClause['sp.keywords like \'forquery%\' and not
(sp.discoverable is null or sp.discoverable =  \'N\')'].listSpaces}
```

Going forward, you must use the following syntax to form a `WHERE` clause:

```
#{spaceContext.spacesQuery.unionOf['ALL_QUERIABLE'].
where[wCond['sp.keywords']['like']['forquery']['and'][wCond['sp.discoverable']
['is']['null']['or'][wCond['sp.discoverable']['=']['N']]['not']]].listSpaces}
```

Where:

- `wCond` is an atomic condition that can be expressed as `wCond[`*`p`*`][`*`op`*`][`*`v`*`]`.

  Where:

  – *`p`* is a portal attribute (a field in `WcSpaceHeader`, see the following bullet list).

  – *`op`* is one among a restricted set of JPQL comparison operators ('`=`', '`like`', '`!=`', '<', '>', '<=', '>=', '`is`').

  – *`v`* is a string whose interpretation depends on the operator *`op`*.

    If the operator is `is`, *`v`* can be the string `'null'` or `'not null'`, and the condition is understood as the attribute being checked for null or not null respectively in JPQL. If the operator is anything else, *`v`* is interpreted as a literal, and the condition is understood to be the attribute being compared with the literal value.

  You can use any field defined in `WcSpaceHeader` in the `WHERE` clause, including:

  – `closed`

  – `createDate`

  – `createdBy`

  – `description`

  – `discoverable`

  – `displayName`

  – `keywords`

  – `icon`

  – `logo`

  – `lastUpdateDate`

  – `selfSubEnabled`

  – `rssEnabled`

  – `spaceGuid`

  – `spaceId`

  – `spaceOffline`

  – `spacePublic`

  – `spacesType`

  – `spacesUser`

  – `updatedBy`

  – `version`

  – `parentGuid`

  – `securityParentGuid`

   - `ancestorPath`
   - `seeded`
   - `groupSpaceMemCount`

- `sp` represents the JPA entity for a portal, `WcSpaceHeader`.

  For example, you can use the following condition to create a filter for all portals created by users having user names starting with `monty` on which self subscription is enabled:

  ```
  sp.createdBy like 'monty%' and not (sp.selfSubEnabled is null or
  sp.selfSubEnabled = 'N')
  ```

- `and`, `or`, `not` (along with `wCond`) are types of conditions.

  Where:

   - `and` represents a conjunction of two conditions. You can express a conjunction condition as *cond1*`['and'][`*cond2*`]` where *cond1* and *cond2* are the expressions for the two conditions being conjoined.
   - `or` represents a disjunction condition. You can express a disjunction condition as *cond1*`['or'][`*cond2*`]` where *cond1* and *cond2* are the expressions for the two conditions being disjoined.
   - `not` represents a negation condition. You can express a negation condition as *cond*`['not']` where *cond* is the expression for the condition being conjoined.

For example, the following EL returns a list of all portals (to which the current user has access) that are created by users having names starting with `monty` and on which self subscription is enabled:

```
#{spaceContext.spacesQuery.unionOf.ALL_QUERIABLE.where[wCond['sp.createdBy']
['like']['monty%'] ['and'] [wCond['sp.selfSubEnabled']['is']['null'] ['or']
[wCond['sp.selfSubEnabled']['=']['N']] ['not'] ] ].listSpaces}
```

Now imagine that you have used the following syntax to specify `SORT` criteria on a portal query:

```
#{spaceContext.spacesQuery.unionOf['ALL_QUERIABLE'].sortCriteria
['sp.discoverabledesc, sp.keywords'].listSpaces}
```

Going forward, you must use the following syntax to specify `SORT` criteria on a portal query:

```
#{spaceContext.spacesQuery.unionOf['ALL_QUERIABLE'].sort['sp.discoverable']
['desc'].sort['sp.keywords']['asc'].listSpaces}
```

Where:

- `sp` represents the JPA entity for a portal, `WcSpaceHeader` (see previous bullet list for fields defined in `WcSpaceHeader`).
- `desc` and `asc` define sort order, descending and ascending, respectively.

For example, the following query returns a list of portals to which the user has access and sorts the result set on the fields `discoverable` and `lastUpdateDate`.

```
#{spaceContext.spacesQuery.unionOf['ALL_QUERIABLE'].sort['sp.discoverable']
['asc'].sort['sp.lastUpdateDate']['desc'].listSpaces}
```

Oracle *strongly* recommends that you convert all existing freeform JPQL `WHERE` and `SORT` clauses to the new syntax.

If for any reason you must retain the existing syntax, your WebCenter Portal administrator must explicitly enable support for freeform JPQL in the `webcenter-config.xml.xml` file by setting the following global flag:

```
oracle.webcenter.spaces.query.DIRECT_JPQL_CLAUSE_SUPPORTED
```

> **Note:** The `webcenter-config.xml.xml` file is the customization document for `webcenter-config.xml`.

Set this flag to `true` for continued support of legacy freeform `WHERE` and `SORT` clauses. When this option is set to `true`, WebCenter Portal log files will contain warnings.

To set this flag in `webcenter-config.xml.xml`:

1. Export the latest `webcenter-config.xml.xml` from MDS.

   For example:

   ```
   exportMetadata(application='webcenter', server='WC_Spaces',
   toLocation='/tmp/mydata',docs='/oracle/webcenter/webcenterapp/metadata/mdssys/c
   ust/site/webcenter/webcenter-config.xml.xml')
   ```

2. Open the file in a text editor and modify settings, as required.

   For example:

   ```
   <mds:insert parent="webcenter(xmlns(webcenter=http://
        xmlns.oracle.com/webcenter/webcenterapp))/webcenter:custom-attributes"
        position="last">
             <attribute name=
                  "oracle.webcenter.spaces.query.DIRECT_JPQL_CLAUSE_SUPPORTED"
                  xmlns="http://xmlns.oracle.com/webcenter/webcenterapp">
                       <description/>
                       <type>java.lang.String</type>
                       <value>true</value>
                       <visible/>
             </attribute>
   </mds:insert>
   ```

3. Save and close `webcenter-config.xml.xml`.
4. Import the updated `webcenter-config.xml.xml` file to WebCenter Portal.

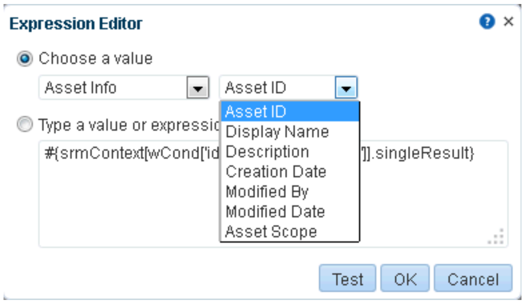
   For example:

   ```
   importMetadata(application='webcenter', server='WC_Spaces',
   fromLocation='/tmp/mydata',
   docs='/oracle/webcenter/webcenterapp/metadata/mdssys/cust/site/webcenter/webcen
   ter-config.xml.xml')
   ```

G.14.2 Seeded Expressions in the Expression Editor

In the Expression Editor, when you select the option **Choose a value** you can populate the text box in the dialog with a seeded EL expression. First, select an expression category, and then select the type of information you want the expression to return. Your selection's associated EL appears in the text box at the bottom of the dialog (Figure G–7).

Figure G–7 Options Under Choose a value in the Expression Editor



#{srmContext[wCond['id ...]].singleResult}

This section is broken into subsections for each category. Each subsection lists and describes the ELs associated with that category.

This section includes the following subsections:

- Section G.14.2.1, "Application Info Seeded ELs"
- Section G.14.2.2, "Asset Info Seeded ELs"
- Section G.14.2.3, "Page Info Seeded ELs"
- Section G.14.2.4, "Page Parameter Seeded ELs"
- Section G.14.2.5, "Portal Info Seeded ELs"
- Section G.14.2.6, "Portal Page Info Seeded Paths"
- Section G.14.2.7, "System Seeded ELs"
- Section G.14.2.8, "User Info Seeded ELs"
- Section G.14.2.9, "WebCenter Events Seeded ELs"

G.14.2.1 Application Info Seeded ELs

Application Info seeded EL expressions return values related to WebCenter Portal. For example, the expression `#{WCAppContext.application.applicationConfig.title}`, returns the application name specified on the General page in WebCenter Portal administration.

> **See Also:** For additional EL expressions related to the application, see Section G.14.3, "EL Expressions Relevant to WebCenter Portal Information."

Table G–13 lists the seeded EL expressions available under the category Application Info and provides an example of the types of values they return.

Table G–13 Seeded EL Expressions Under Application Info

Option	Expression	Example of Returned Value
Current Scope	`#{serviceCtx.scope}`	`Scope[name=standards, guid=sa78185d3_9d65_49ab_ac1d_4809380d0b30]`
Current Page Template Scope	`#{WCAppContext.currentScope}`	`Scope[name=standards, guid=sa78185d3_9d65_49ab_ac1d_4809380d0b30]`
Previously Set Page Template	`#{WCAppContext.previouslySetPageTemplate}`	`Fusion Side Navigation`

Table G–13 (Cont.) Seeded EL Expressions Under Application Info

Option	Expression	Example of Returned Value
Application	`#{WCAppContext.application}`	`oracle.webcenter.webcenterapp.internal.view.shell.WCApplication`
Application URL	`#{WCAppContext.applicationURL}`	`http://host:port/webcenter`
Current WebCenter Portal URI	`#{WCAppContext.currentWebCenterURI}`	`/oracle/webcenter/page/scopedMD/GUID/businessRolePages/Page3.jspx?wc.contextURL=%2Fspaces`
Application Config	`#{WCAppContext.application.applicationConfig}`	`oracle.webcenter.webcenterapp.beans.WebCenterMetadataImpl@123db9d`
Application Config Title	`#{WCAppContext.application.applicationConfig.title}`	`WebCenter`
Application Config Logo	`#{WCAppContext.application.applicationConfig.logo}`	`/oracle/webcenter/webcenterapp/metadata/images/logo.gif`
Application Config HelpPage	`#{WCAppContext.application.applicationConfig.helpPage}`	`/webcenterhelp/spaces?topic=welcome_main`
Application Config CopyrightMessage CustomValue	`#{WCAppContext.application.applicationConfig.copyrightMessage.customValue}`	`http://www.example.com/html/copyright.html`
Application Config Privacy Policy URL	`#{WCAppContext.application.applicationConfig.privacyPolicyUrl}`	`http://www.example.com/html/privacy.html`
Application Config Skin	`#{WCAppContext.application.applicationConfig.skin}`	`webcenterfx`

For example, consider that you want a link to appear in all pages of a portal that lets you copy and share the current page's URL. You can add an HTML Markup item to a page template, and add the EL that returns page URL.

These steps demonstrate how to use ELs to retrieve page URLs:

1. Open a custom page template in Edit mode.
2. In Design view, in the resource catalog, click **Web Development**.
3. Click **Add** next to **HTML Markup**.
4. Click the Edit icon for the newly added HTML Markup.
5. In the Component Properties dialog, on the **Display Options** tab, in the **Value** field, enter the following EL:

```
<a href="javascript:{
    var returnvalue = prompt( '#{pageDocBean.title}
URL','#{WCAppContext.applicationURL}/faces#{WCAppContext.currentWebCenterURI}')
;
}">Share Link</a>
```

6. Click **OK**.
7. Apply the page template to your portal.

G.14.2.2 Asset Info Seeded ELs

Asset Info seeded EL expressions return values related to WebCenter Portal resources, such as templates, styles, resource catalogs, and so on. For example, the expression `#{srmContext.id['`*`ResourceID`*`'].singleResult}`, returns the asset with the specified GUID.

> **See Also:** For additional asset-related EL expressions, see Section G.14.4, "EL Expressions Relevant to Assets."

Table G–14 lists the seeded EL expressions available under the category Asset Info and provides an example of the types of values each returns.

Table G–14 Seeded EL Expressions Under Asset Info

Option	Expression	Example of Returned Value
Asset ID	`#{srmContext[wCond['id']['like']['ResourceID']].singleResult}`	`id:gsr3396194a_3a72_44d6_90b4_57fd6efe4ff7 resourceScope:Scope[name=defaultScope, guid=s8bba98ff_4cbb_40b8_beee_296c916a23ed] resourceType:siteTemplate serviceId:oracle.webcenter.siteresources.sitetemplate category: displayName:Fusion Side Navigation displayNameKey:SITE_TEMPLATE_FUS_SIDE_STRETCH_NAV_DN description:Stretching Page Layout with Side Navigation. Display Name	`#{srmContext[wCond['displayName']['like']['DisplayName']].singleResult}`	See Asset ID for an example of a returned value.
Description	`#{srmContext[wCond['description']['like']['Description']].singleResult}`	See Asset ID for an example of a returned value.
Creation Date	`#{srmContext[wCond['createdDate']['like']['CreationDate']].singleResult}`	See Asset ID for an example of a returned value.

Table G–14 (Cont.) Seeded EL Expressions Under Asset Info

Option	Expression	Example of Returned Value
Modified By	`#{srmContext[wCond['modifiedBy']['like']['UserName']].singleResult}`	See Asset ID for an example of a returned value.
Modified Date	`#{srmContext[wCond['modifiedDate']['like']['ModifiedDate']].singleResult}`	See Asset ID for an example of a returned value.
Asset Scope	`#{srmContext[wCond['resourceScope']['like']['ResourceScope']].singleResult}`	See Asset ID for an example of a returned value.

G.14.2.3 Page Info Seeded ELs

Page Info seeded EL expressions return values related to WebCenter Portal pages. For example, the expression `#{pageDocBean.createdBy}`, returns the user name of the person who created the current page.

Table G–15 lists the seeded EL expressions available under the category Page Info and provides an example of the types of values each returns.

Table G–15 Seeded EL Expressions Under Page Info

Option	Expression	Example of Returned Value
Title	`#{pageDocBean.title}`	`Welcome Page (BRP)`
Created By	`#{pageDocBean.createdBy}`	j.doe
Create Date String	`#{pageDocBean.createDateString}`	`2010-11-17T13:27:52`
Last Updated By	`#{pageDocBean.lastUpdatedBy}`	`j.smith`
Last Update Date String	`#{pageDocBean.lastUpdateDateString}`	`2010-11-17T13:27:52`
Page Path	`#{pageDocBean.pagePath}`	`/oracle/webcenter/page/scopedMD/GUID/businessRolePages/Page3.jspx`
Name	`#{pageDocBean.name}`	`Page3.jspx`
UI CSS Style	`#{pageDocBean.UICSSStyle}`	`WCSchemeCustom`
UI Scheme BG Image	`#{pageDocBean.UISchemeBGImage}`	`#{facesContext.externalContext.requestContextPath}/adf/oracle/webcenter/page/images/clouds.png`
UI Scheme BG Color String	`#{pageDocBean.UISchemeBGColorString}`	null
Page Permission	`#{pageDocBean.pagePermission}`	`oracle.webcenter.page.model.security.CustomPagePermission`
Page Security Target	`#{pageDocBean.pageSecurityTarget}`	`oracle_webcenter_page_scopedMD_sa78185d3_9d65_49ab_ac1d_4809380d0b30_COIHomePageDef`

G.14.2.4 Page Parameter Seeded ELs

Page Parameter seeded EL expressions return values related to WebCenter Portal page parameters. The editor lists all parameters that are defined for the current page. If no parameters are defined, the Page Parameter category is not available.

For example, the seeded page style **Three Column** provides five seeded page parameters (see Table G–16). The `width` parameters describe the percentage of total width allotted to each column. The `show` parameters specify whether a page header and footer are rendered. Of the seeded page styles, **Blank**, **Home Page**, **Left Narrow**, and **Right Narrow** all provide the same seeded page parameters (see Table G–16). Additionally, any page may have its own custom page parameters.

Whether seeded or custom, available page parameters are exposed in the Expression Editor under the Page Parameter category.

> **See Also:** For more information about creating and using page parameters, see the "Wiring Components and Page Parameters" section in *Building Portals with Oracle WebCenter Portal*.

Table G–16 lists the EL expressions available under the Page Parameter category for pages based on the styles Three Column, Blank, Home Page, Left Narrow, and Right Narrow. It provides an example of the types of values each returns.

Table G–16 Seeded EL Expressions Under Page Parameter

Option	Expression	Example of Returned Value
leftWidth	`#{bindings.leftWidth}`	`25%`
centerWidth	`#{bindings.centerWidth}`	`50%`
rightWidth	`#{bindings.rightWidth}`	`25%`
showHeader	`#{bindings.showHeader}`	`false`
showFooter	`#{bindings.showFooter}`	`false`

G.14.2.5 Portal Info Seeded ELs

Portal Info seeded EL expressions return values related to portals (other than the Home portal). For example, the expression `#{spaceContext.space['`*`portalName`*`'].children}`, returns a list of the subportals under the named parent portal.

> **See Also:** For additional portal-related EL expressions, see Section G.14.5, "EL Expressions Relevant to Specific Portals."

Table G–17 lists the seeded EL expressions available under the category Portal Info and provides an example of the types of values each returns.

> **Note:** Use the EL expressions listed in Table G–17 only in the context of portals other than the Home portal.

Table G–17 Seeded EL Expressions Under Portal Info

Option	Expression	Example of Returned Value
NamedPortal	`#{spaceContext.space['`*`portalName`*`']}`	`oracle.webcenter.spaces.internal.model.SpaceImpl@15fc839`
CurrentPortal	`#{spaceContext.currentSpace}`	`oracle.webcenter.spaces.internal.model.SpaceImpl@d5e197`
CurrentPortal Name	`#{spaceContext.currentSpaceName}`	`standards`
NamedPortal Metadata Path	`#{spaceContext.space['`*`portalName`*`'].metadataPath}`	`/oracle/webcenter/space/metadata/spaces/portalName/space.xml`
CurrentPortal Metadata Path	`#{spaceContext.currentSpace.metadataPath}`	`/oracle/webcenter/space/metadata/spaces/standards/space.xml`

Table G–17 (Cont.) Seeded EL Expressions Under Portal Info

Option	Expression	Example of Returned Value
NamedPortal Metadata	`#{spaceContext.space['`*`portalName`*`'].metadata}`	`oracle.webcenter.spaces.beans.SpaceMetadataImpl@1d7320a`
CurrentPortal Metadata	`#{spaceContext.currentSpace.metadata}`	`oracle.webcenter.spaces.beans.SpaceMetadataImpl@1096c64`
NamedPortal Metadata DisplayName	`#{spaceContext.space['`*`portalName`*`'].metadata.displayName}`	`Standards`
CurrentPortal Metadata DisplayName	`#{spaceContext.currentSpace.GSMetadata.displayName}`	`Sales`
NamedPortal Metadata Icon	`#{WCPrepareImageURL[spaceContext.space['portalName'].metadata.icon]['']}`	`/webcenter-spaces-resources/oracle/webcenter/space/metadata/spacetemplate/PortalSite/images/portal_icon.png`
CurrentPortal Metadata Icon	`#{WCPrepareImageURL[spaceContext.currentSpace.metadata.icon]['']}`	`/webcenter-spaces-resources/oracle/webcenter/space/metadata/spaces/Test_Space/images/wc_prj_icon.png`
NamedPortal Metadata Description	`#{spaceContext.space['`*`portalName`*`'].metadata.description}`	`Central point for all standards, templates, and stylesheets for company collateral`
CurrentPortal Metadata Description	`#{spaceContext.currentSpace.GSMetadata.description}`	`Sales Force Team Site`
NamedPortal Metadata CreationDate	`#{spaceContext.space['`*`portalName`*`'].metadata.creationDate}`	`java.util.GregorianCalendar[time=1290103432242,areFieldsSet=true,areAllFieldsSet=false,lenient=false,zone=java.util.SimpleTimeZone[id=,offset=-28800000,dstSavings=3600000,useDaylight=false,startYear=0, startMode=0,startMonth=0,startDay=0,startDayOfWeek=0,startTime=0,startTimeMode=0,endMode=0,endMonth=0,endDay=0,endDayOfWeek=0,endTime=0,endTimeMode=0],firstDayOfWeek=1,minimalDaysInFirstWeek=1,ERA=1, YEAR=2010,MONTH=10,WEEK_OF_YEAR=?,WEEK_OF_MONTH=?,DAY_OF_MONTH=18,DAY_OF_YEAR=?,DAY_OF_WEEK=?,DAY_OF_WEEK_IN_MONTH=?,AM_PM=0,HOUR=10,HOUR_OF_DAY=10,MINUTE=3,SECOND=52,MILLISECOND=242,ZONE_OFFSET=?,DST_OFFSET=?]`

Table G–17 (Cont.) Seeded EL Expressions Under Portal Info

Option	Expression	Example of Returned Value
CurrentPortal Metadata CreationDate	#{spaceContext.currentSpace.metadata.creationDate}	`java.util.GregorianCalendar[time=1290103432242,areFieldsSet=true,areAllFieldsSet=false,lenient=false,zone=java.util.SimpleTimeZone[id=,offset=-28800000,dstSavings=3600000,useDaylight=false,startYear=0, startMode=0,startMonth=0,startDay=0,startDayOfWeek=0,startTime=0,startTimeMode=0,endMode=0,endMonth=0,endDay=0,endDayOfWeek=0,endTime=0,endTimeMode=0],firstDayOfWeek=1,minimalDaysInFirstWeek=1,ERA=1,YEAR=2010,MONTH=10, WEEK_OF_YEAR=?,WEEK_OF_MONTH=?,DAY_OF_MONTH=18,DAY_OF_YEAR=?,DAY_OF_WEEK=?,DAY_OF_WEEK_IN_MONTH=?,AM_PM=0,HOUR=10,HOUR_OF_DAY=10,MINUTE=3,SECOND=52,MILLISECOND=242,ZONE_OFFSET=?,DST_OFFSET=?]`
NamedPortal Metadata CreatedBy	`#{spaceContext.space['`*`portalName`*`'].metadata.createdBy}`	`j.doe`
NamedPortal Metadata Keywords	`#{spaceContext.space['`*`portalName`*`'].metadata.keywords}`	`standards templates style sheets collateral`
CurrentPortal Metadata Keywords	`#{spaceContext.currentSpace.metadata.keywords}`	`sales salesReports salesNews salesTeam`
NamedPortal Metadata Offline	`#{spaceContext.space['`*`portalName`*`'].metadata.offline}`	`false` or `true`, depending on whether the named portal is offline
CurrentPortal Metadata Offline	`#{spaceContext.currentSpace.metadata.offline}`	`false` or `true`, depending on whether the current portal is offline
NamedPortal Metadata Closed	`#{spaceContext.space['`*`portalName`*`'].metadata.offline}`	`false` or `true`, depending on whether the named portal is closed
CurrentPortal Metadata Closed	`#{spaceContext.currentSpace.metadata.closed}`	`false` or `true`, depending on whether the current portal is closed
NamedPortal Metadata SelfRegistration	`#{spaceContext.space['`*`portalName`*`'].metadata.selfRegistration}`	`false` or `true`, depending on whether self registration is enabled for the named portal
CurrentPortal Metadata SelfRegistration	`#{spaceContext.currentSpace.metadata.selfRegistration}`	`false` or `true`, depending on whether self registration is enabled for the current portal
NamedPortal Metadata Discoverable	`#{spaceContext.space['`*`portalName`*`'].metadata.discoverable}`	`false` or `true`, depending on whether the named portal is discoverable
CurrentPortal Metadata Discoverable	`#{spaceContext.currentSpace.metadata.discoverable}`	`false` or `true`, depending on whether the current portal is discoverable
NamedPortal Metadata PublishRSS	`#{spaceContext.space['`*`portalName`*`'].metadata.publishRSS}`	`false` or `true`, depending on whether the named portal can be published in an RSS reader
CurrentPortal Metadata PublishRSS	`#{spaceContext.currentSpace.metadata.publishRSS}`	`false` or `true`, depending on whether the current portal can be published in an RSS reader
NamedPortal Distribution List	`#{spaceContext.space['`*`portalName`*`'].distributionList}`	`standardsGroup@myCompany.com`

Table G–17 (Cont.) Seeded EL Expressions Under Portal Info

Option	Expression	Example of Returned Value
CurrentPortal Distribution List	`#{spaceContext.currentSpace.distributionList}`	`salesTeam@myCompany.com`
NamedPortal Metadata CustomAttributes	`#{spaceContext.space['`*`portalName`*`'].metadata.customAttributes['`*`attributeName`*`']}`	Returns the value provided for the named custom attribute **Note:** If you use this EL to provide a value for a field in WebCenter Portal Administration, clicking the **Test** button may return a blank value. However, the value will resolve correctly in the running portal.
CurrentPortal Metadata CustomAttributes	`#{spaceContext.currentSpace.metadata.customAttributes['`*`attributeName`*`']}`	Returns the value provided for the named custom attribute **Note:** If you use this EL to provide a value for a field in WebCenter Portal Administration, clicking the **Test** button may return a blank value. However, the value will resolve correctly in the running portal.
CurrentPortal Metadata Logo	`#{WCPrepareImageURL[spaceContext.currentSpace.metadata.logo]['']}`	`/webcenter-spaces-resources/oracle/webcenter/space/metadata/spacetemplate/PortalSite/images/portal_logo.png`
CurrentPortal Role - Moderator	`#{WCSecurityContext.userInScopedRole['Moderator']}`	`false` or `true`, depending whether any users in the current scope are assigned the role `Moderator`
CurrentPortal Role - Participant	`#{WCSecurityContext.userInScopedRole['Participant']}`	`false` or `true`, depending whether any users in the current scope are assigned the role `Participant`
CurrentPortal Role - Viewer	`#{WCSecurityContext.userInScopedRole['Viewer']}`	`false` or `true`, depending whether any users in the current scope are assigned the role `Viewer`
CurrentPortal Role - Custom	`#{WCSecurityContext.userInScopedRole['`*`CustomRole`*`']}`	`false` or `true`, depending on if any users in the current scope are assigned the named custom role
NamedPortal Children	`#{spaceContext.space['`*`portalName`*`'].children}`	`[oracle.webcenter.spaces.internal.model.SpaceImpl@5705f4, oracle.webcenter.spaces.internal.model.SpaceImpl@147d658]` **Note:** The braces ([]) denote a set.
CurrentPortal Children	`#{spaceContext.currentSpace.children}`	`[oracle.webcenter.spaces.internal.model.SpaceImpl@5705f4, oracle.webcenter.spaces.internal.model.SpaceImpl@147d658]` **Note:** The braces ([]) denote a set.
NamedPortal Parent	`#{spaceContext.space['`*`portalName`*`'].parent}`	`oracle.webcenter.spaces.internal.model.SpaceImpl@15fc839`
CurrentPortal Parent	`#{spaceContext.currentSpace.parent}`	`oracle.webcenter.spaces.internal.model.SpaceImpl@15fc839`
NamedPortal Security Parent	`#{spaceContext.space['`*`portalName`*`'].securityParent}`	`oracle.webcenter.spaces.internal.model.SpaceImpl@1392793`

Table G–17 (Cont.) Seeded EL Expressions Under Portal Info

Option	Expression	Example of Returned Value
CurrentPortal Security Parent	#{spaceContext.currentSpace.securityParent}	oracle.webcenter.spaces.internal.model.SpaceImpl@1392793
All visible root level spaces	#{spaceContext.spacesQuery.unionOf['ALL_QUERIABLE,DISCOVERABLE,PUBLIC_ACCESSIBLE,ALLUSER_ACCESSIBLE,USER_JOINED,USER_MODERATED'].shape['ROOT_LEVEL']}	oracle.webcenter.spaces.query.SpacesQueryParameters@ae34c8
All children and descendent portals for specified Parent Portal GUID	#{spaceContext.spacesQuery.parentSpaceGuid['*portalGuid*'].shape['RECURSIVE_FLATTENED']}	oracle.webcenter.spaces.query.SpacesQueryParameters@4da22f
Immediate Sub Portals for specified Parent Portal name	#{spaceContext.spacesQuery.parentSpaceName['*portalGuid*'].shape['ROOT_LEVEL']}	oracle.webcenter.spaces.query.SpacesQueryParameters@1089971
List of Portals matching given Portal Names	#{spaceContext.spacesQuery.containingNames['*portal1, portal2,portal3*']}	oracle.webcenter.spaces.query.SpacesQueryParameters@68e467
List of Portals matching given Portal GUID	#{spaceContext.spacesQuery.containingGuids['*portalGuid1, portalGuid2*']}	oracle.webcenter.spaces.query.SpacesQueryParameters@1c56009
List of Portals sorted based on criteria	#{spaceContext.spacesQuery.unionOf.ALL_QUERIABLE.sort['sp.lastUpdateDate']['desc']}	oracle.webcenter.spaces.query.SpacesQueryParameters@6c3def
List of Portals based on search pattern	#{spaceContext.spacesQuery.unionOf.ALL_QUERIABLE.search['*searchKeyword*']}	oracle.webcenter.spaces.query.SpacesQueryParameters@19b2cf3
List of Portals with limited page size	#{spaceContext.spacesQuery.unionOf.USER_JOINED.itemsPerPage[*n*].pageNumber[*n*]}	oracle.webcenter.spaces.query.SpacesQueryParameters@4f8818
List of portals matching the where clause	#{spaceContext.spacesQuery.unionOf.USER_JOINED.where[wCond['sp.createdBy']['=']['userName']]}	oracle.webcenter.spaces.query.SpacesQueryParameters@1ba816d

G.14.2.6 Portal Page Info Seeded Paths

Rather than EL expressions, the selections under Portal Page Info are directory paths to different application pages. Use them, for example, to provide navigation information to a specified page.

Table G–18 lists the seeded directory paths available under the category Portal Page Info and provides an example of the types of values each returns. The number of values in the dropdown list depends on the template used and the pages created by users.

Table G–18 Seeded Paths Under Portal Page Info

Option	Path	Destination
PortalSiteHome.jspx	`/faces/oracle/webcenter/page/scopedMD/se2dff4fb_202a_4f4c_b56d_c7cf59ad1c04/PortalSiteHome.jspx`	Path to the Home page of the current portal
GroupSpaceDocLibMainView.jspx	`/faces/oracle/webcenter/page/scopedMD/s8bba98ff_4cbb_40b8_beee_296c916a23ed/businessRolePages/GroupSpaceDocLibMainView.jspx`	Path to the Documents page in the current portal
ForumMainView.jspx	`/faces/oracle/webcenter/page/scopedMD/s8bba98ff_4cbb_40b8_beee_296c916a23ed/businessRolePages/ForumMainView.jspx`	Path to Discussions page in the current portal
AnnouncementsMainView.jspx	`/faces/oracle/webcenter/page/scopedMD/s8bba98ff_4cbb_40b8_beee_296c916a23ed/businessRolePages/AnnouncementsMainView.jspx`	Path to Announcements page in current portal
ListsMainView.jspx	`/faces/oracle/webcenter/page/scopedMD/s8bba98ff_4cbb_40b8_beee_296c916a23ed/businessRolePages/ListsMainView.jspx`	Path to Lists page in current portal
EventsMainView.jspx	`/faces/oracle/webcenter/page/scopedMD/s8bba98ff_4cbb_40b8_beee_296c916a23ed/businessRolePages/EventsMainView.jspx`	Path to Events page in current portal
GroupSpaceActivityStreamMainView.jspx	`/faces/oracle/webcenter/page/scopedMD/s8bba98ff_4cbb_40b8_beee_296c916a23ed/businessRolePages/GroupSpaceActivityStreamMainView.jspx`	Path to Activity Stream page in current portal

G.14.2.7 System Seeded ELs

System seeded EL expressions return values related to system settings, such as the user name of the current user or the current user's specified locale. For example, the expression `#{securityContext.userName}`, returns the name of the currently logged in user. For example, if user j.doe is viewing a page where this expression is used, the returned value in j.doe's view is `j.doe`. If user j.smith is looking at the same page, the value returned in j.smith's view is `j.smith`.

> **See Also:** For additional utilitarian EL expressions, see Section G.14.8, "Utilitarian EL Expressions."

Table G–19 lists the seeded EL expressions available under the category System and provides an example of the types of values each returns.

Table G–19 Seeded EL Expressions Under System

Option	Expression	Example of Returned Value
User	`#{securityContext.userName}`	The current user's user name
Locale	`#{facesContext.externalContext.requestLocale}`	The current user's specified locale This may be taken from application or portal-level settings or user Preferences, whichever is taking precedence. For example: `en_US`

G.14.2.8 User Info Seeded ELs

User Info seeded EL expressions return values related to a given user's Profile. For example, the expression `#{webCenterProfile[securityContext.userName].description}`, returns the content of the About Me attribute of the current user's Profile.

See Also: For additional user-related expressions, see Section G.10, "ELs Related to People Connections."

Table G–20 lists the seeded EL expressions available under the category User Info and provides an example of the types of values each returns.

Table G–20 Seeded EL Expressions Under User Info

Option	Expression	Example of Returned Value
About Me	`#{webCenterProfile[securityContext.userName].description}`	Returns the content of the About Me attribute of the current user's Profile
Username	`#{webCenterProfile[securityContext.userName].userName}`	The user name specified in the current user's Profile Compare this with the current user's display name.
First Name	`#{webCenterProfile[securityContext.userName].firstName}`	The current user's first name
Middle Name	`#{webCenterProfile[securityContext.userName].middleName}`	The current user's middle name
Last Name	`#{webCenterProfile[securityContext.userName].lastName}`	The current user's last name
Initials used	`#{webCenterProfile[securityContext.userName].initials}`	The current user's initials
Display Name	`#{webCenterProfile[securityContext.userName].displayName}`	The current user's display name Compare this with the current user's user name.
Email	`#{webCenterProfile[securityContext.userName].businessEmail}`	The current user's business email address
Department	`#{webCenterProfile[securityContext.userName].department}`	The current user's department
Job Title/Designation	`#{webCenterProfile[securityContext.userName].title}`	The current user's job title or designation

Table G–20 (Cont.) Seeded EL Expressions Under User Info

Option	Expression	Example of Returned Value
Manager	`#{webCenterProfile[securityContext.userName].managerDisplayName}`	The current user's manager's display name
Time zone	`#{webCenterProfile[securityContext.userName].timeZone}`	The time zone associated with the current user
Employee type	`#{webCenterProfile[securityContext.userName].employeeType}`	The current user's employee type
Employee Number	`#{webCenterProfile[securityContext.userName].employeeNumber}`	The current user's employee number
Preferred Language Code	`#{webCenterProfile[securityContext.userName].preferredLanguage}`	The current user's preferred language
Organization	`#{webCenterProfile[securityContext.userName].organization}`	The company organization to which the current user belongs
Organizational Unit	`#{webCenterProfile[securityContext.userName].organizationalUnit}`	The unit of the company organization to which the current user belongs
Expertise	`#{webCenterProfile[securityContext.userName].expertise}`	The current user's expertise, for example, `Application, system, and database administration`
Business Fax	`#{webCenterProfile[securityContext.userName].businessFax}`	The current user's business fax number
Business Mobile Number	`#{webCenterProfile[securityContext.userName].businessMobile}`	The current user's business mobile or cell phone number
Business Phone	`#{webCenterProfile[securityContext.userName].businessPhone}`	The current user's business phone number
Business Pager Number	`#{webCenterProfile[securityContext.userName].businessPager}`	The current user's business pager number
Business Street	`#{webCenterProfile[securityContext.userName].businessStreet}`	The street address of the current user's business office
Business City	`#{webCenterProfile[securityContext.userName].businessCity}`	The city where the current user's business office is located
Business State	`#{webCenterProfile[securityContext.userName].businessState}`	The state where the current user's business office is located
Business PO Box	`#{webCenterProfile[securityContext.userName].businessPOBox}`	The current user's business Post Office Box number
Business Postal Code	`#{webCenterProfile[securityContext.userName].businessPostalCode}`	The postal or ZIP code of the current user's business office
Business Country	`#{webCenterProfile[securityContext.userName].businessCountry}`	The country where the current user's business office is located
Home Address	`#{webCenterProfile[securityContext.userName].homeAddress}`	The current user's home address
Home phone	`#{webCenterProfile[securityContext.userName].homePhone}`	The current user's home phone number
Date of Birth	`#{webCenterProfile[securityContext.userName].dateofBirth}`	The current user's date of birth
Maiden Name	`#{webCenterProfile[securityContext.userName].maidenName}`	The current user's maiden name

Table G–20 (Cont.) Seeded EL Expressions Under User Info

Option	Expression	Example of Returned Value
Date of hire	`#{webCenterProfile[securityContext.userName].dateofHire}`	The date the current user was hired by the company
Name Suffix	`#{webCenterProfile[securityContext.userName].nameSuffix}`	Titles or credentials appended to the current user's name, for example, `MD`, `Esq`, and so on
Wireless Account Number	`#{webCenterProfile[securityContext.userName].wirelessAcctNumber}`	The account number for the current user's wireless internet account

G.14.2.9 WebCenter Events Seeded ELs

WebCenter Events seeded EL expressions return values related to document-related events, such as the name of the selected document, the document's creator, the date the document was last modified, and so on. For example, the expression `#{wcEventContext.events.WebCenterResourceSelected.name}`, returns the name of the currently selected document.

Table G–21 lists the seeded EL expressions available under the category WebCenter Events and provides an example of the types of values each returns.

Table G–21 Seeded EL Expressions Under WebCenter Events

Option	Expression	Example of Returned Value
Selected User Name	`#{wcEventContext.events.WebCenterUserSelected.UserName}`	The user name of the currently selected user
Selected Document Name	`#{wcEventContext.events.WebCenterResourceSelected.name}`	The name of the currently selected document
Selected Document Creator	`#{wcEventContext.events.WebCenterResourceSelected.createdBy}`	The name of the user who created the currently selected document
Selected Document Last Modified By	`#{wcEventContext.events.WebCenterResourceSelected.lastModifiedBy}`	The date the selected document was last modified

G.14.3 EL Expressions Relevant to WebCenter Portal Information

Table G–22 lists EL expressions relevant to WebCenter Portal information and describes the types of functionality it provides.

Table G–22 EL Expressions Relevant to WebCenter Portal Information

Expression	Function
`#{WCAppContext}`	An `oracle.webcenter.webcenterapp.context.WCApplicationContext` object that provides an access point in the current web request for all WebCenter Portal-related information.
`#{WCAppContext.currentWebCenterURI}`	Returns a URL representing the current web request with bookmarkable WebCenter Portal URL parameters of the request appended to the end (parameters are not necessarily in a fixed order). Example: `http://www.example.com/webcenter/faces/oracle/webcenter/page/scopedMD/someguid/SomePage.jspx?wc.contextURL=/spaces/somename&wc.pageScope=1234`
`#{WCAppContext.application.applicationConfig}`	An `oracle.webcenter.webcenterapp.beans.WebCenterType` bean with a payload of metadata from WebCenter Portal.
`#{WCAppContext.application.applicationConfig.title}`	Returns the display name of the current WebCenter Portal application (as configured through WebCenter Portal Administration settings). Out of the box, this returns *WebCenter Portal*.
`#{WCAppContext.application.applicationConfig.logo}`	If an application logo was uploaded through WebCenter Portal Administration settings, this expression returns the URL to the application logo image. Out of the box, this returns *null*.
`#{WCAppContext.application.applicationConfig.helpPage}`	Returns the URL to the Help application used for WebCenter Portal (as configured through WebCenter Portal Administration settings). Out of the box, this returns */webcenterhelp/spaces*.
`#{WCAppContext.application.applicationConfig.copyrightMessage.customValue}`	If a copyright message was configured through WebCenter Portal Administration settings, this expression returns the application copyright message. Out of the box, this returns `null`.

Table G–22 (Cont.) EL Expressions Relevant to WebCenter Portal Information

Expression	Function
`#{WCAppContext.application.applicationConfig.privacyPolicyUrl}`	Returns the URL to the document that contains the application's privacy policy (as configured through WebCenter Portal Administration settings). Out of the box, this returns `http://www.oracle.com/html/privacy.html`
`#{WCAppContext.application.applicationConfig.skin}`	Returns the name of the default ADF Faces skin family to use for rendering pages in the application (as configured through WebCenter Portal Administration settings). This expression represents only the application-level setting that may not necessarily be used in all web requests. For example, you cannot use it successfully if a user has chosen to override the skin through application Preferences.
`#{requestContext.skinFamily}`	Returns the name of the ADF Faces skin family being used for the current web request, depending on factors such as what has been configured at the application level, the current user's preference setting, and so on. Returns the same value as `#{adfFacesContext.skinFamily}`. This EL can be used both in portals built using WebCenter Portal and Portal Framework applications built with Oracle JDeveloper.

G.14.4 EL Expressions Relevant to Assets

Use the expressions in this section to query for assets. Querying for an asset through an EL expression is similar to querying for it through an API call. That is, you must set query parameters in the format `['`*`property`*`']['like']['`*`value`*`']`, where *`property`* is the name of the property, for example, `id`, `resourceScope`, and so on, and *`value`* is the search value for the attribute.

A query can result in single or multiple results. The query designer must decide what is wanted. The query designer determines whether to return one or multiple results by encountering one of the following values in the expression:

- `singleResult`—Returns a single asset. When no matching asset is found, null is returned.
- `resultList`—Returns a list of assets. When no matching assets are found, an empty list is returned.

> **Note:** Occurrences of `singleResult` or `resultList` in the expression are used internally as the query end point, and, after this, the query is executed immediately. Anything set after the end point can result in unexpected behavior.

The following example returns the first page template asset found with a display name that contains `myPage`:

```
#{srmContext[wCond['resourceType']['like']['siteTemplate']]['and'][wCond['displayN
ame']['like']['myPage']].singleResult}
```

The following example returns a list of page template assets residing in the directory `resourceDir`, with a description that contains `sampleDesc`:

```
#{srmContext[wCond['resourceType']['like']['siteTemplate']]['and'][wCond['descript
ion']['like']['sampleDesc']]['and'][wCond['contentDirectory']['like']['resourceDir
'].resultList}
```

A property of this class includes any attribute of this class. Example properties include: `Id`, `DisplayName`, `iconURI`, `contentDirectory`, and so on.

The property value can be an explicit value or an EL expression that returns that type of value. For example, the following two queries return the same result:

```
#{srmContext[wCond['id']['like']['resourceId']].singleResult}

#{srmContext[wCond['id']['like']['spacesContext.currentSpace.uiMetadata.siteTempla
teId']].singleResult}
```

You can use any property of this class in an EL-based query in the format *`property`*`['`*`value`*`']` and in any order. For example, the following two queries return the same result:

```
#{srmContext[wCond['resourceScope']['like']['scopeName']]['and'][wCond['id]['like'
]['resourceId']].singleResult}

#{srmContext[wCond['id']['like']['resourceId']]['and'][wCond['resourceScope']['lik
e']['scopeName']].singleResult}
```

Table G–23 lists EL expressions relevant to assets and describes the types of functionality each provides.

Table G–23 ELs Relevant to Assets

EL	Function
`#{srmContext[wCond['id']['like']['`*`resourceGUID`*`']]}`	Returns the asset with the specified ID
`#{srmContext[wCond['displayName']['like']['`*`resourceDisplayName`*`']]}`	Returns any assets with the specified display name
`#{srmContext[wCond['displayNameKey']['like']['`*`displayNameKey`*`']]}`	Returns any assets with the specified display name key
`#{srmContext[wCond['description']['like']['`*`resourceDescription`*`']].singleResult}`	Returns one result of an asset that contains the specified value in its description To get multiple results, use `resultList` in lieu of `singleResult`.
`#{srmContext[wCond['descriptionKey']['like']['`*`descriptionKey`*`']].singleResult}`	Returns one result of an asset with the specified description key The description key is the key in the `xsrt` file for the asset description. To get multiple results, use `resultList` in lieu of `singleResult`.
`#{srmContext[wCond['createdDate']['like']['`*`resourceCreationDate`*`']]}`	Returns any asset with the specified creation date
`#{srmContext[wCond['modifiedBy']['like']['`*`resourceLastModifiedBy`*`']]`	Returns any asset that was last modified by the user with the specified user name
`#{srmContext[wCond['modifiedDate']['like']['`*`resourceLastModifiedDate`*`']]}`	Returns any asset that was last modified by the specified date

Table G–23 (Cont.) ELs Relevant to Assets

EL	Function
`#{srmContext[wCond['resourceScope']['like']['`*`resourceScope`*`']]}`	Returns any asset that falls within the specified scope
`#{srmContext[wCond['category']['like']['`*`categoryName`*`']]}`	Returns any asset that falls within the specified category For example: `#{srmContext[wCond['category']['like']['siteTemplates']]}` List of possible category names includes: `siteTemplate`, `pageStyle`, `dataPresenter`, `contentPresenter`, `resourceCatalog`, `navigation`, `taskFlow`, `dataControl`, `taskFlowStyle`, and `skin`.
`#{srmContext[wCond['contentDirectory']['like']['`*`contentDirectory`*`']]}`	Returns any asset that is stored within the specified directory
`#{srmContext[wCond['metadataFile']['like']['`*`metadataFileLocation`*`']]}`	Returns asset metadata from the specified metadata file For example, the following expression returns asset metadata from the following file `/home/metadata/data.xml`: `#{srmContext[wCond['metadataFile']['like']['/home/metadat/data.xml']]}`
`#{srmContext[wCond['jspx']['like']['`*`jspxFileLocation`*`']]}`	Returns any `jspx` file in the specified location For example, the following expression returns the `page.jspx` file: `#{srmContext[wCond['jspx']['like']['/home/web/page.jspx']]}`
`#{srmContext[wCond['pageDef']['like']['`*`pageDefinition`*`']]}`	Returns any `jspx` file with the specified page definition
`#{srmContext[wCond['iconURI']['like']['`*`iconURI`*`']]}`	Returns the icon at the specified icon URI
`#{srmContext[wCond['excludeFrom']['like']['`*`excludeFromScopes`*`']]}`	In a larger expression, returns all specified resources except those available in the excluded scopes
`#{srmContext[wCond['usesCustomSecurity']['like']['`*`usesCustomSecurity`*`']]}`	In a larger expression, returns any asset the either does or does not use custom security Set *`usesCustomSecurity`* to `TRUE` or `FALSE`. For example: `#{srmContext[wCond['usesCustomSecurity']['like']['TRUE']]}`
`#{srmContext[wCond['seeded']['like']['`*`seeded`*`']]}`	In a larger expression, returns any asset that is or is not seeded, depending on the provided value Set *`seeded`* to `TRUE` or `FALSE`. For example: `#{srmContext[wCond['seeded']['like']['TRUE']]}`

Table G–23 (Cont.) ELs Relevant to Assets

EL	Function
`#{srmContext[wCond['visibleType']['like']['`*`visibleType`*`']]}`	In a larger expression, returns any asset that is of the specified type of visibility Set *`visibleType`* to `TRUE`, `FALSE`, or `NEVER` to indicate that the asset is never shown. For example, the following expression returns assets that are visible, that is, assets that are set to **Show**: `#{srmContext[wCond['visibleType']['like']['TRUE']]}`
`#{srmContext[wCond['visible']['like']['`*`visible`*`']]}`	In a larger expression, returns one or multiple assets with visibility set to either `TRUE` or `FALSE`
`#{srmContext[wCond['createdBy']['like']['`*`resourceCreator`*`']]}`	In a larger expression, returns any asset created by the specified user
`#{srmContext[wCond['resourceType']['like']['`*`resourceType`*`']]}`	In a larger expression, returns one or multiple assets of the specified type For example, the following expression searches for an asset of the type `SITE_TEMPLATE`: `#{srmContext[wCond['resourceType']['like']['SITE_TEMPLATE']]}` Note that all asset types are listed in *Java API Reference for Oracle WebCenter Portal*, in the `GenericSiteResourceTypes` class.
`#{srmContext[wCond['version']['like']['`*`version`*`']]}`	In a larger expression, returns one or multiple assets available in the application of the specified version
`#{srmContext[wCond['resourceScope']['like']['`*`scopeName`*`']]}`	In a larger expression, returns one or multiple assets available in the specified scope For example, the following expression searches for assets in the scope (in this instance, the portal) `MyPortal`: `#{srmContext[wCond['resourceScope']['like']['MyPortal']]}` To search in the default scope, that is, the application scope, use `defaultScope`.
`#{srmContext[wCond['searchType']['like']['`*`searchType`*`']]}`	In a larger expression, returns one or multiple assets that contain or equal the values set by other included expressions Set *`searchType`* to `CONTAINS` or `EQUALS`.

G.14.4.1 Example: Using EL Expressions for Assets

This section provides an example of using an EL expression to display a page template based on a user's role.

In this example, you will use an EL expression to enable a specific page template to be displayed for moderators so that only they can access the features or links available in that page template.

To display a page template based on a user role:

1. Go to the desired portal's administration settings.

2. In the **Assets** section, for **Page Template** click the Advanced Edit Options icon, and click **Expression Builder**.
3. In the **Type a value or expression**, enter the following expression:

   ```
   #{srmContext[wCond['resourceType']['like']['siteTemplate']][wCond['displayName'
   ]['like'][WCSecurityContext.userInScopedRole['Moderator'] ? 'Fusion Side
   Navigation' : 'WebCenter Spaces Top Navigation']].singleResult.id}
   ```

   Where:

   - `srmContext[wCond['resourceType']['like']['siteTemplate']]`

     Gets a list of all page templates in the scope

   - `[wCond['displayName']['like'][WCSecurityContext.userInScopedRole['Moderator'] ? 'Fusion Side Navigation' : 'WebCenter Portal Top Navigation']]`

     Reduces the list down to one depending on whether the current user is a moderator. If the user is a moderator, the Fusion Side Navigation page template is applied. For all other user roles, the portal is rendered using the WebCenter Portal Top Navigation page template.

   - `singleResult.id`

     Returns the GUID of the required entry.
4. Click **OK**.

G.14.5 EL Expressions Relevant to Specific Portals

Table G–24 lists EL expressions relevant to portals and describes the types of functionality each provides.

> **Note:** The portal *internal name* is the name specified for **Portal URL** on the **Overview** page of a portal's administration settings. The portal *display name* is the name specified for **Name**. Many of the EL expressions in Table G–24 call for the portal internal name.

Table G–24 EL Expressions Relevant to Specific Portals

Expression	Function
`#{spaceContext}`	An `oracle.webcenter.spaces.context.SpacesContext` object that provides an access point in the current web request for all portal-related information. The value of this expression is whatever is returned on invoking the java API: `SpacesContext.getCurrentInstance()`
`#{spaceContext.currentSpace}`	An `oracle.webcenter.spaces.Space` object that represents the portal associated with the current web request. If the current web request is in the Home portal context, it returns a value of `null`. The value of this expression is whatever is returned on invoking the Java API: `SpacesContext.getCurrentInstance().getCurrentSpace()`
`#{spaceContext.currentSpaceName}`	The name of the portal associated with the current web request. If the current web request is in the Home portal context, it returns a value of `null`. The value of this expression is whatever is returned on invoking the java API: `SpacesContext.getCurrentInstance().getCurrentSpace()`

`#{spaceContext.space['`*`portalName`*`']}`
`#{spaceContext.currentSpace}`
	An `oracle.webcenter.spaces.Space` object that represents the portal that is named *`spaceName`* or the current portal (`currentSpace`). For example, `#{spaceContext.space['FinanceProject']}` returns the portal object for the portal called `FinanceProject`.
	The value of this expression is whatever is returned in Java on invoking `.getSpace(...)` on the current `SpacesManager` passing in the `MDSSession` of the current `ADFContext`.

`#{spaceContext.space['`*`portalName`*`'].metadataPath}`
`#{spaceContext.currentSpace.metadataPath}`
	The MDS path of the portal metadata document for the portal with specified name *`portalName`* or the current portal (`currentSpace`). For example, `#{spaceContext.space['FinanceProject'].metadataPath}` evaluates to `/oracle/webcenter/space/metadata/spaces/FinanceProject/space.xml`
	The value of this expression is whatever is returned in java on invoking `.getMetadataPath()` on the portal object for the portal.

`#{spaceContext.space['`*`portalName`*`'].metadata}`
`#{spaceContext.currentSpace.metadata}`
	An `oracle.webcenter.spaces.beans.SpaceType` bean that carries metadata about the portal that is named *`portalName`* or the current portal (`currentSpace`).
	The value of this expression is whatever is returned in java on invoking `.getMetadata()` on the portal object for the portal passing in the `MDSSession` of the current `ADFContext`.

`#{spaceContext.space['`*`portalName`*`'].metadata.displayName}`
`#{spaceContext.currentSpace.metadata.displayName}`
	The display name of the portal that is named *`portalName`* or the current portal (`currentSpace`). For example, if a portal called `Web20Portal` has the display name `web 2.0 Portal`, then `#{spaceContext.space['Web20Portal'].metadata.displayName}` evaluates to `web 2.0 Portal`.

`#{spaceContext.space['`*`portalName`*`'].GSMetadata.groupSpaceURI}`
`#{spaceContext.currentSpace.GSMetadata.groupSpaceURI}`
	The URL of the portal that is named *`portalName`* or the current portal (`currentSpace`).

Table G–24 (Cont.) EL Expressions Relevant to Specific Portals

Expression	Function

`#{WCPrepareImageURL[spaceContext.space['`*`portalName`*`'].metadata.icon]['']}`
`#{WCPrepareImageURL[spaceContext.currentSpace.metadata.icon]['']}`
	A URL to the icon associated with the portal that is named *`portalName`* or the current portal (`currentSpace`).

`#{spaceContext.space['`*`portalName`*`'].metadata.description}`
`#{spaceContext.currentSpace.metadata.description}`
	The description of the portal that is named *`portalName`* or the current portal (`currentSpace`). For example, `#{spaceContext.space['FinanceProject'].metadata.description}` evaluates to *Conglomeration of all teams involved in financial activities*.

`#{spaceContext.space['`*`portalName`*`'].metadata.creationDate}`
`#{spaceContext.currentSpace.metadata.creationDate}`
	A *java.util.Calendar* object representing the date-time on which the portal with specified name *`portalName`* or the current portal (`currentSpace`) was created.

`#{spaceContext.space['`*`portalName`*`'].metadata.createdBy}`
`#{spaceContext.currentSpace.metadata.createdBy}`
	The user-name of the person who created the portal that is named *`portalName`* or the current portal (`currentSpace`).

`#{spaceContext.space['`*`portalName`*`'].metadata.keywords}`
`#{spaceContext.currentSpace.metadata.keywords}`
	A comma-delimited list of searchable keywords associated with the portal with the name *`portalName`* or the current portal (`currentSpace`). For example, if the portal *FinanceProject* has the keywords `finance, project, money,` then `#{spaceContext.space['FinanceProject'].metadata.keywords}` evaluates to *finance, project, money*.

`#{spaceContext.space['`*`portalName`*`'].metadata.offline}`
`#{spaceContext.currentSpace.metadata.offline}`
	Boolean value that indicates whether the portal that is named *`portalName`* or the current portal (`currentSpace`) is offline.

`#{spaceContext.space['`*`portalName`*`'].metadata.closed}`
`#{spaceContext.currentSpace.metadata.closed}`
	Boolean value that indicates whether the portal that is named *`portalName`* or the current portal (`currentSpace`) is closed.

`#{spaceContext.space['`*`portalName`*`'].metadata.selfRegistration}`
`#{spaceContext.currentSpace.metadata.selfRegistration}`
	Boolean value that indicates whether users are allowed to register themselves with the portal that is named *`portalName`* or the current portal (`currentSpace`).

`#{spaceContext.space['`*`portalName`*`'].metadata.discoverable}`
`#{spaceContext.currentSpace.metadata.discoverable}`
	Boolean value that indicates whether users can discover the existence of the portal that is named *`portalName`* or the current portal (`currentSpace`) by searching for it or seeing it listed on the My portals page.

`#{spaceContext.space['`*`portalName`*`'].metadata.publishRSS}`
`#{spaceContext.currentSpace.metadata.publishRSS}`
	Boolean value indicating whether the portal that is named *`portalName`* or the current portal (`currentSpace`) publishes RSS feeds.

`#{spaceContext.space['`*`portalName`*`'].distributionList}`
`#{spaceContext.currentSpace.distributionList}`
	The email address of the mailing list associated with the portal that is named *`portalName`* or the current portal (`currentSpace`).

Table G–24 (Cont.) EL Expressions Relevant to Specific Portals

Expression	Function

`#{spaceContext.space['portalName'].metadata.customAttributes['attributeName']}`
`#{spaceContext.currentSpace.metadata.customAttributes['attributeName']}`
	The value of a specific custom attribute of the name `attributeName` for the portal that is named `portalName` or the current portal (`currentSpace`). For example, if the *FinanceProject* portal has a custom attribute called `stockPrice` with a value of `13.9`, then `#{spaceContext.space['FinanceProject'].metadata.customAttributes['stockPrice']}` evaluates to *13.9*.
	Note: If you use these ELs to provide a value for a field in WebCenter Portal Administration, clicking the **Test** button may return a blank value. However, the value will resolve correctly in the running portal.

`#{WCPrepareImageURL[spaceContext.space['portalName'].metadata.logo]['']}`
`#{WCPrepareImageURL[spaceContext.currentSpace.metadata.logo]['']}`
	Returns the logo URL for the portal named `portalName` or the current portal (`currentSpace`).

`#{spaceContext.spacesQuery.property['value']}`
`#{spaceContext.spacesQuery.property['value'].listSpaces}`
	A means of querying a portal using a query parameter in the form of `property['value']`, where `property` means the name of the property, for example, `unionOf`, `shape`, and so on; and `value` means the criteria to use in fetching the list of all portals, discoverable portals, and so on.
	If `listSpaces` is appended to the expression, the query returns the list of portals of type `GSMetadata`. (For more information, see `Interface GSMetadata` in *Java API Reference for Oracle WebCenter Portal*.)
	For example, the following EL expression returns a list of all discoverable portals.
	`#{spaceContext.spacesQuery.unionOf['DISCOVERABLE'].listSpaces}`
	If `listportals` is not appended to the EL, then the EL evaluates to an object of type `SpacesQueryParameter`. This object type must be evaluated using `SpacesManager.getSpaces(SpacesQueryParameters)`, which in turn returns a list of portals of type `GSMetadata`.
	For example, the following EL expression returns an instance of type `SpacesQueryParameters` with all the query conditions populated.
	`#{spaceContext.spacesQuery.unionOf['DISCOVERABLE']}`

`#{spaceContext.spacesQuery.unionOf['USER_JOINED'].shape['ROOT_LEVEL'].listSpaces}`	Returns a list of all top-level portals of which the current user is a member This EL returns only those portals that do not have a parent, that is, it does not return subportals.
`#{spaceContext.spacesQuery.unionOf['USER_JOINED'].shape['RECURSIVE_FLATTENED'].listSpaces}`	Returns a list of all portals of which the current user is a member This EL also returns all the subportals under each of the parent portals to which the current user has access. To see an example, refer to Section G.14.5.1, "Example: Using EL Expressions for Various Portals".

Table G–24 (Cont.) EL Expressions Relevant to Specific Portals

Expression	Function
`#{spaceContext.spacesQuery.unionOf['ALL_QUERIABLE'].sort['`*`sortBy field picked from WcSpaceHeader`*`']}`	Returns portals sorted into the order specified by the sort criteria For example, the following query returns a list of portals to which the user has access sorted by `discoverable` and `lastUpdateDate` fields. Note that in the following example, the identifier `sp` represents the JPA entity for a portal, `WcSpaceHeader`. `#{spaceContext.spacesQuery.unionOf['ALL_QUERIABLE'].sort['sp.discoverable']['asc']['sp.lastUpdateDate']['desc'].listSpaces}`
`#{spaceContext.spacesQuery.unionOf['ALL_QUERIABLE'].pageNumber[`*`page_num`*`].listSpaces}`	Allows specifying the page number (0-based) to select from the results matching the query criteria For example, the following expression returns a list of all portals to which a user has access and returns the third page of the result set: `#{spaceContext.spacesQuery.unionOf['ALL_QUERIABLE'].pageNumber[2].listSpaces]}`
`#{spaceContext.spacesQuery.unionOf['ALL_QUERIABLE'].itemsPerPage[`*`page_num`*`].listSpaces}`	Allows specifying the number of results to be included in each page when breaking down the result portal into pages For example, the following expression returns a list of all portals to which a user has access, listing 10 records per page. `#{spaceContext.spacesQuery.unionOf['ALL_QUERIABLE'].pageNumber[10].listSpaces]}`

`#{spaceContext.spacesQuery.unionOf.ALL_QUERIABLE.where[wCond['sp.createdBy']['like']['monty%'] ['and']`
`[wCond['sp.selfSubEnabled']['is']['null']`
`['or']`
`[wCond['sp.selfSubEnabled']['=']['N']]`
`['not'] ] ].listSpaces}`
	Returns a list of all portals a user has access which are created by a specified user, and on which self subscription is enabled. (For more information, see `SpacesQueryParameters` and `SpacesQueryFilter` in *Java API Reference for Oracle WebCenter Portal*.)

G.14.5.1 Example: Using EL Expressions for Various Portals

This section provides an example of using EL expressions to query various portals.

In this example, you will use the following EL to display a list of all portals of which you are a member:

```
"#{spaceContext.spacesQuery.unionOf['USER_JOINED'].shape['RECURSIVE_
FLATTENED'].listSpaces}"
```

You will also use the following methods to display the logo, name, description, and number of members of a portal.

- `iconURI` - to display the portal logo
- `displayName` - to display the portal name
- `description` - to display the portal description
- `memberCount` - to display the number of portal members

To query a portal:

1. Create a new task flow, and mark it as available for use, as described in the "Working with Task Flows" section in *Building Portals with Oracle WebCenter Portal*.
2. Edit the source code of the task flow. On the **Assets** tab, select the task flow. From the **Actions** menu, select **Edit Source**.
3. In the Edit Source dialog, on the **Fragment** tab, replace the existing code with the following code:

```
<?xml version='1.0' encoding='UTF-8'?>
<jsp:root xmlns:jsp="http://java.sun.com/JSP/Page" version="2.1"
xmlns:pe="http://xmlns.oracle.com/adf/pageeditor"
xmlns:cust="http://xmlns.oracle.com/adf/faces/customizable"
xmlns:f="http://java.sun.com/jsf/core"
xmlns:af="http://xmlns.oracle.com/adf/faces/rich"
xmlns:c="http://java.sun.com/jsp/jstl/core"
xmlns:fn="http://java.sun.com/jsp/jstl/functions">
   <af:panelGroupLayout id="pgl1">
      <cust:panelCustomizable id="pc1">
         <table border="0" width="100%">
            <af:iterator id="it1" var="row"
value="#{spaceContext.spacesQuery.unionOf['USER_JOINED'].shape['RECURSIVE_
FLATTENED'].listSpaces}">
                  <c:set var="iconURI"
value="#{fn:split(row.iconURI,'}')[1]}"/>
                  <c:set var="displayName" value="#{row.displayName}"/>
                  <c:set var="description" value="#{row.description}"/>
                  <c:set var="numMembers" value="#{row.memberCount}"/>
                       <tr class="PortletText1">
                              <td width="16px" rowspan="3" valign="top">
                                      <af:image id="img1"
source="/webcenter-spaces-resources/oracle/webcenter/siteresources/scopedMD/sha
red#{iconURI}/ICON16"/>
                               </td>
                               <td>
                                    <af:outputText id="otCol1"
                                             value="#{displayName}"

inlineStyle="color:#333333; font-size:12px; font-weight:bold;"/>
                                </td>
                         </tr>
                          <tr>
                              <td>
                                  <af:outputText id="otCol3"
                                                   value="#{description}"

inlineStyle="color:#666666; font-size:12px;"/>
                                </td>
                          </tr>
                          <tr>
                             <td>
                                <af:outputText id="otCol4"
                                              value="members (#{numMembers}) -"

inlineStyle="color:#666666; font-size:10px;"/>
                                     <af:spacer id="spacer1" width="5px"/>
                                     <af:goLink id="gl1"

destination="/spaces/#{row.name}"
```

```
                                                   targetFrame="_blank"
                                                   text="view"/>
                              </td>
                            </tr>
                     </af:iterator>
                   </table>
                 </cust:panelCustomizable>
               </af:panelGroupLayout>
             </jsp:root>
```

4. Add the task flow to a page. In the resource catalog, the custom task flow is available under **UI Components** > **Task Flows**.

   The page should now show a list of all the portals of which you are is a member.

G.14.6 EL Expressions Relevant to Specific Pages

Table G–25 lists EL expressions relevant to portal pages and describes the types of functionality it provides.

Table G–25 EL Expressions Relevant to Specific Pages

Expression	Function
`#{pageDocBean.title}`	Returns the page display name, for example: *FinanceProject*
`#{pageDocBean.createdBy}`	Returns the user name of the person who created the page, for example: *monty*
`#{pageDocBean.createDateString}`	Returns the date and time the page was created, for example: *2008-11-19T10:18:36*
`#{pageDocBean.lastUpdatedBy}`	Returns the user name of the person who last updated the page, for example: *monty*
`#{pageDocBean.lastUpdateDateString}`	Returns the date and time the page was last updated, for example: *2008-11-19T10:18:36*
`#{pageDocBean.pagePath}`	Returns the file directory path to the page relative to the application root directory, for example: */oracle/webcenter/page/scopedMD/s8bba98ff_4cbb_40b8_beee_296c916a23ed/user/Umonty/Page4.jspx*
`#{pageDocBean.name}`	Returns the file name of the page, for example: *Page4.jspx*
`#{pageDocBean.UICSSStyle}`	Returns the name of the style scheme used on the page, for example: *WCSchemeEggShell*
`#{pageDocBean.UISchemeBGImage}`	Returns the directory path and file name of the page scheme background image.
`#{pageDocBean.UISchemeBGColorString}`	Returns the hexadecimal value of the page scheme background color, for example: *#ffa500*

Table G–25 (Cont.) EL Expressions Relevant to Specific Pages

Expression	Function
`#{pageDocBean.pagePermission}`	Returns the permission the current user has on the page, for example: *oracle.webcenter.page.model.security.CustomPagePermission*
`#{pageDocBean.pageSecurityTarget}`	A string of 60 or so characters that uniquely identifies the current page to the security system, for example: *oracle_webcenter_page_scopedMD_s8bba98ff_4cbb_40b8_beee_296c916a23ed_user_Umonty_Page4PageDef*
`#{changeModeBean.inEditMode}`	Returns *true* if current page is in Composer mode. Returns *false* if current page is not in Composer mode

G.14.7 EL Expressions Relevant to Portal Event Contexts

Table G–26 lists EL expressions relevant to the types of portal events that can trigger the passing of payloads (rather than events relevant to the events feature).

You can access all or part of the event payloads provided in Table G–26 once they have been raised.

For example, for the whole payload, use the following EL:

```
#{wcEventContext.events.eventName}
```

For example:

```
#{wcEventContext.events.WebCenterUserSelected}
```

All of the payloads for the ELs in Table G–26 are Maps. To dereference a map entry, use the standard EL for Maps:

```
#{wcEventContext.events.WebCenterUserSelected.UserName}
```

> **See Also:** For more information about event wiring, see the "Wiring Pages, Task Flows, Portlets, and ADF Components" chapter in *Building Portals with Oracle WebCenter Portal*.

Table G–26 EL Expressions Relevant to Event Contexts

Expression	Function

Event Context
#{wcEventContext.events.WebCenterResourceSelected}
Document Name
#{wcEventContext.events.WebCenterResourceSelected.name}
Document Creator
#{wcEventContext.events.WebCenterResourceSelected.createdBy}
Document Last Modified By
#{wcEventContext.events.WebCenterResourceSelected.lastModifiedBy}
	Use in context wiring between producer and consumer task flows. Returns a map that relates some piece of metadata from the producer to some piece of metadata from the consumer, for example, from a document creator to the creator's Profile.
	Producer task flows include:
	■ Document Manager
	■ Recent Documents
	■ Document List Viewer

	Consumer task flows include: ■ Activity Graph - Similar Items (show other documents that may be of interest to the user) ■ Links (show the items that are linked to the selected document) ■ Profile (view the Profile of the document's author) ■ Activity Stream (view activities related to this document) ■ Tags (tags on this document and a means of accessing the Tag Center)

Event Context
#{wcEventContext.events.WebCenterUserSelected}
User Name
#{wcEventContext.events.WebCenterUserSelected.userName}
User GUID
#{wcEventContext.events.WebCenterUserSelected.userGUID}
portal Name
#{wcEventContext.events.WebCenterUserSelected.*portalName*}
portal GUID
#{wcEventContext.events.WebCenterUserSelected.*portalGUID*}
	Use in context wiring between producer and consumer task flows. Returns a map that relates some piece of metadata from the producer to some piece of metadata from the consumer, for example, from a user to the user's connections.
	Producer task flows include:
	■ Connections
	■ Portal Members
	Consumer task flows include:
	■ Connections (show connections of the selected user)
	■ Documents task flows (show documents created by the selected user)
	■ Activity Stream (view this user's activities)
	■ Tags (tags created by this user)
	■ Profile (show this user's Profile)

Table G–26 (Cont.) EL Expressions Relevant to Event Contexts

Expression	Function

Event Context
`#{wcEventContext.events.WebCenterConnectionSelected}`
Profile User Name
`#{wcEventContext.events.WebCenterConnectionSelected.profileUserName}`
Profile User GUID
`#{wcEventContext.events.WebCenterConnectionSelected.profileUserGUID}`
Connected User Name
`#{wcEventContext.events.WebCenterConnectionSelected.userName}`
Connected User GUID
`#{wcEventContext.events.WebCenterConnectionSelected.userGUID}`
	--

`#{wcEventContext.events.WebCenterSpaceSelected.SpaceName}`	Returns the name of the selected portal
`#{wcEventContext.events.WebCenterSpaceSelected.SpaceGUID}`	Returns the GUID of the selected portal

G.14.8 Utilitarian EL Expressions

Table G–27 lists utilitarian EL expressions and describes the types of functionality they provide.

Table G–27 Utilitarian EL Expressions

Expression	Function
`#{userPreferences.currentDate}`	Returns the current date in the format specified in the current user's preferences.
`#{WCTruncator['text']['numberOfChars']}`	Returns a truncation of the string specified as `text` to the number of characters specified as `numberOfChars`, followed by a trailing ellipsis, for example: `#{WCTruncator['abracadabra']['5']}` evaluates to *abrac...*

`#{facesContext.viewRoot.locale}`
`#{facesContext.externalContext.requestLocale}`
	Both of these expressions return the request locale (that is, the browser locale setting).

`#{adfFacesContext.skinFamily}`	Returns the current application skin family. Returns the same value as `#{requestContext.skinFamily}`.

G.15 EL Expressions Related to Device Settings

This section lists ELs for obtaining information about device settings. For information about device settings, see the "Administering Device Settings" chapter in *Administering Oracle WebCenter Portal*.

You can use EL expressions to set assets (skins and page templates) targeted to specific devices For information on using EL with device settings, see the "Administering Device Settings" chapter in *Administering Oracle WebCenter Portal*.

- Table G–28 lists EL expressions for obtaining information about device group mappings.
- Table G–29 lists ELs for obtaining information about devices.
- Table G–30 lists ELs for obtaining information about skins and page templates associated with device groups.
- Section G.15.1, "Sample Task Flow Code for Discovering Device Attributes" presents sample code that can be used in a task flow for discovering the attributes of the device used to access the portal.

For example, a page designer can use the device's attribute to control the width of the content area of a page by using the following EL:

```
#{DeviceAgent.device.attributes['display_resolution_width']
```

Table G–28 EL Expressions Related to Device Agents

Expression	Related Java API	Description
`#{DeviceAgent}`	`DeviceAgent.getInstance()`	The root entry point to all device settings EL.
`#{DeviceAgent.device}`	`DeviceAgent.getInstance().getDevice()`	The device to which the current request is mapped.
`#{DeviceAgent.deviceGroups}`	`DeviceAgent.getInstance().getDeviceGroups()`	A list of device groups to which the current device maps. This operation returns all device groups, whether they are marked as `enabled` or not.
`#{DeviceAgent.currentScopeDeviceGroup}`	`DeviceAgent.getInstance().getCurrentScopeDeviceGroup()`	Gets the device group that the incoming request was mapped to for the given portal. This EL can help the administrator diagnose issues about why a page variant is not getting displayed for a particular device.

Table G–29 EL Expressions Relevant to Devices

Expression	Related Java API	Description
`#{DeviceAgent.device}`	`DeviceAgent.getInstance().getDevice()`	The device to which the current request is mapped.

Table G–29 (Cont.) EL Expressions Relevant to Devices

Expression	Related Java API	Description
`#{DeviceAgent.device.name}`	`DeviceAgent.getInstance().getDevice().getName()`	The name of the device. This is a system friendly identifier that can be used for internal linking.
`#{DeviceAgent.device.displayName}`	`DeviceAgent.getInstance().getDevice().getDisplayName()`	The display name of the device.
`#{DeviceAgent.device.attributes}`	`DeviceAgent.getInstance().getDevice().getAttributes()`	A map of attributes associated with a device - like the screen size, OS version, and so on. For example, the following EL returns the display resolution width that was set when the device was created: `#{DeviceAgent.device.attributes['display_resolution_width']}`

Table G–30 EL Expressions Relevant to Device Groups

Expression	Related Java API	Descriptions
`#{DeviceAgent.currentScopeDeviceGroup}`	`DeviceAgent.getInstance().getCurrentScopeDeviceGroup()`	The device group to which the current request has been mapped. The typical flow for identifying the appropriate device group is as follows: 1. Identify the device to which the current request belongs. 2. Get all the device groups that have been enabled for the current portal. 3. Identify the first device group (from the above list) to which the device belongs.
`#{DeviceAgent.currentScopeDeviceGroup.name}`	`DeviceAgent.getInstance().getCurrentScopeDeviceGroup().getName()`	The name of the device group. For example: `#{DeviceAgent.currentScopeDeviceGroup.name == 'androidTablets'}`
`#{DeviceAgent.currentScopeDeviceGroup.portalPageTemplate}`	`DeviceAgent.getInstance().getCurrentScopeDeviceGroup().getPortalPageTemplate()`	Returns the GUID of the portal page template associated with this device group object. If the method returns NULL, the default page template setting for the portal is in effect. **Note:** For information on the resource ELs used to work with the obtained GUID, see Section G.6, "ELs Related to Portal Resources."

Table G–30 (Cont.) EL Expressions Relevant to Device Groups

Expression	Related Java API	Descriptions
`#{DeviceAgent.currentScopeDeviceGroup.portalSkin}`	`DeviceAgent.getInstance().getCurrentScopeDeviceGroup().getPortalSkin()`	Returns the GUID of the portal skin associated with this device group. If the method returns NULL, the default skin setting for the portal is in effect. **Note:** For information on the resource ELs used to work with the obtained GUID, see Section G.6, "ELs Related to Portal Resources."
`#{DeviceAgent.currentScopeDeviceGroup.default}`	`DeviceAgent.getInstance().getCurrentScopeDeviceGroup().isDefault()`	Returns true if the device group is the default for the current device. Returns false if the device group is not the default for the device. For example, if the default device group is "Desktop Browsers" and you access the portal on an iPad, then the device group will be iPad, but it is not the default device group. In this case, the method returns false.
`#{DeviceAgent.currentScopeDeviceGroup.enabled}`	`DeviceAgent.getInstance().getCurrentScopeDeviceGroup().isEnabled()`	Identifies whether or not this device group has been marked as enabled for the current portal. **Note:** In this invocation, the device group will always state `true`. This EL is useful when working with all the device groups as obtained from the EL `#{DeviceAgent.deviceGroups}`

G.15.1 Sample Task Flow Code for Discovering Device Attributes

Example G–1 lists a JSF page fragment that can be used to create a task flow for discovering device attributes. EL is used to return the attributes. The task flow may be useful for troubleshooting situations where the portal is not rendering properly on a device. By discovering the device attributes, you can take action to correct the rendering problem. Figure G–8 shows output from a task flow created with this sample code.

Example G–1 Task Flow Code for Discovering Device Attributes

```
<?xml version='1.0' encoding='UTF-8'?>

H

WebCenter Portal Analytics Database Schema

This appendix describes the underlying database design for Oracle WebCenter Portal's Analytics for developers building *custom* analytics data queries.

This appendix contains the following topics:

- Section H.1, "Analytics Database Schema Overview"
- Section H.2, "Analytics Fact Table Descriptions"
- Section H.3, "Analytics Dimension Table Descriptions"
- Section H.4, "Analytics System Table Descriptions"
- Section H.5, "Analytics User Properties"
- Section H.6, "Analytics Event and Dimension Data Types"

For more information about building custom analytics data queries, see Section 47.3, "Building Analytics Reports."

H.1 Analytics Database Schema Overview

This section contains the following topics:

- Section H.1.1, "Analytics Database Model Overview"
- Section H.1.2, "Analytics Database Table Overview"

H.1.1 Analytics Database Model Overview

Oracle WebCenter Portal's Analytics database schema is modeled as a star-schema to optimize performance and provide fast response times.

Analytics data is stored in fact and dimension fact tables:

- **Analytics Fact Tables** are created when the Analytics Collector runs for the first time. Each fact table stores a specific event type, for example, page views, portal views, document uploads, blog views, wiki edits, and so on. Columns in these fact tables mostly contain integer IDs that reference descriptive data stored in dimension tables.

  Table H–1, " Analytics Facts Tables (Prefixed ASFACT_WC)" lists types of analytics events that can be collected and stored, and the associated tables.

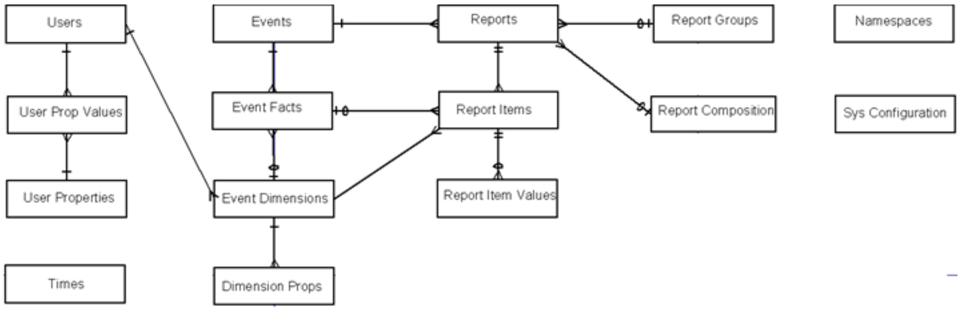
- **Analytics Dimension Tables** are also created when the Analytics Collector runs for the first time. Dimension tables store redundant descriptive data associated with analytics events. When a value is not found in these tables, a new record is added. Typical analytics dimension data includes: page name, browser name, document name, portal name, and so on.

Table H–2, " Analytics Dimension Tables (Prefixed ASDIM_WC)" lists the different types of analytics dimensions that can be collected and stored, and the associated table names.

The Analytics database schema also contains a few application tables that store information such as system configuration parameters. Application tables are created during installation.

Figure H–1 shows the relationship between predefined fact, dimension, and application tables in the analytics database schema.

Figure H–1 Analytics Database Model



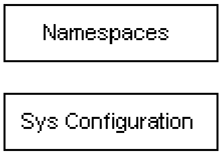
Tables shown in Figure H–1 store the following analytics data:

- Application configuration
- Event metadata
- Report metadata

Application Configuration

Figure H–2 shows which entities are used to store system parameters for Analytics.

Figure H–2 Application Configuration Entities

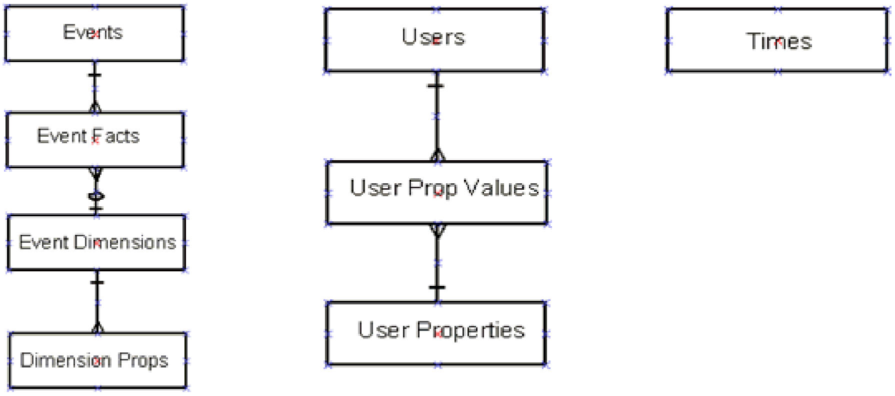


Event Metadata

Figure H–3 shows which entities are used to store event data. The Users and Times entities are mainly dimensions that provide user/time oriented views of the event data.

Event metadata records which events are collected, the tables where events are stored, as well as dimensions that are saved each time an event occurs.

Figure H–3 Event Metadata Entities

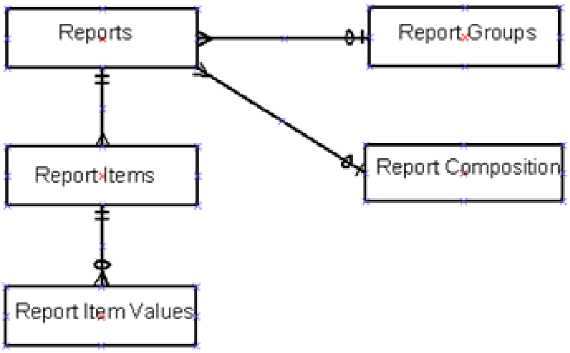


Report Metadata

Figure H–4 shows which entities represent out-of-the-box analytics reports. Metadata in these tables are the primary source for information such as report metrics, report structure, and columns listed.

Report metadata stores out-of-the-box report configurations for Oracle WebCenter Portal's Analytics. Each report contains many columns to display in the report and which filters to apply. Some reports are composed from other reports.

Figure H–4 Report Metadata Entities



H.1.2 Analytics Database Table Overview

This section lists and describes database tables in the analytics schema:

- Table H–1, " Analytics Facts Tables (Prefixed ASFACT_WC)"
- Table H–2, " Analytics Dimension Tables (Prefixed ASDIM_WC)"
- Table H–3, " Analytics System Tables (Prefixed ASSYS)"

Note: Table names for analytics event and dimension tables are automatically generated based on analytics event and dimension names. The mapping between analytics event and dimension names and their corresponding table names is defined in the ASSYS_EVENTS and ASSYS_EVENTDIMENSIONS tables.

Some table names include **double underscores**, for example, `ASFACT_WC_DOCLIB__0`. This is because all the table names include a component value that is 7 characters long, and in some cases one of those characters is an underscore (for example, `DOCLIB_`).

For an example of how to use a query to return the table names associated with a specific event, see Section H.1.2.1, "Sample SQL Query: Finding Table Names Associated with Specific Events".

Table H–1 Analytics Facts Tables (Prefixed ASFACT_WC)

Event Object	Table Name	Event Table Description
Pages	ASFACT_WC_PAGECRE_0	Stores event information captured by Analytics when a page is created.
	ASFACT_WC_PAGEDEL_0	Stores event information captured by Analytics when a page is deleted.
	ASFACT_WC_PAGEEDI_0	Stores event information captured by Analytics when a page is edited.
	ASFACT_WC_PAGETAG_0	Stores event information captured by Analytics when a page is tagged.
	ASFACT_WC_PAGEVIE_0	Stores event information captured by Analytics when a page is viewed.
Discussions	ASFACT_WC_DISCUSS_0	Stores event information captured by Analytics when a discussion topic is viewed.
	ASFACT_WC_DISCUSS_1	Stores event information captured by Analytics when an announcement is viewed.
	ASFACT_WC_DISCUSS_2	Stores event information captured by Analytics when a discussion forum is created.
	ASFACT_WC_DISCUSS_3	Stores event information captured by Analytics when a discussion forum is deleted.
	ASFACT_WC_DISCUSS_4	Stores event information captured by Analytics when a discussion topic is created.
	ASFACT_WC_DISCUSS_5	Stores event information captured by Analytics when a discussion topic is edited.
	ASFACT_WC_DISCUSS_6	Stores event information captured by Analytics when a discussion topic is deleted.
	ASFACT_WC_DISCUSS_7	Stores event information captured by Analytics when a discussion topic is tagged.
	ASFACT_WC_DISCUSS_8	Stores event information captured by Analytics when someone replies to a discussion topic message.
	ASFACT_WC_DISCUSS_9	Stores event information captured by Analytics when a discussion topic message is liked.
	ASFACT_WC_DISCUSS_A	Stores event information captured by Analytics when an announcement is created.

Table H–1 (Cont.) Analytics Facts Tables (Prefixed ASFACT_WC)

Event Object	Table Name	Event Table Description
	ASFACT_WC_DISCUSS_B	Stores event information captured by Analytics when an announcement is edited.
	ASFACT_WC_DISCUSS_C	Stores event information captured by Analytics when an announcement is deleted.
Documents - Blog - Wikis	ASFACT_WC_DOCLIB__0	Stores event information captured by Analytics when a document is viewed.
	ASFACT_WC_DOCLIB__1	Stores event information captured by Analytics when a document is downloaded.
	ASFACT_WC_DOCLIB__2	Stores event information captured by Analytics when a document is created.
	ASFACT_WC_DOCLIB__3	Stores event information captured by Analytics when a document is edited.
	ASFACT_WC_DOCLIB__4	Stores event information captured by Analytics when a document is tagged.
	ASFACT_WC_DOCLIB__5	Stores event information captured by Analytics when a document is liked.
	ASFACT_WC_DOCLIB__6	Stores event information captured by Analytics when a document is commented.
	ASFACT_WC_DOCLIB__7	Stores event information captured by Analytics when a document is deleted.
Portal Events	ASFACT_WC_EVENT_C_0	Stores event information captured by Analytics when a portal event is created.
	ASFACT_WC_EVENT_D_0	Stores event information captured by Analytics when a portal event is deleted.
	ASFACT_WC_EVENT_E_0	Stores event information captured by Analytics when a portal event is edited.
Portals	ASFACT_WC_GROUPSP_0	Stores event information captured by Analytics when a portal is viewed.
	ASFACT_WC_GROUPSP_1	Stores event information captured by Analytics when a portal is created.
	ASFACT_WC_GROUPSP_2	Stores event information captured by Analytics when someone joins a portal.
	ASFACT_WC_GROUPSP_3	Stores event information captured by Analytics when a portal is deleted.
Lists	ASFACT_WC_LIST_CR_0	Stores event information captured by Analytics when a list is created.
	ASFACT_WC_LIST_DE_0	Stores event information captured by Analytics when a list is deleted.
	ASFACT_WC_LIST_ED_0	Stores event information captured by Analytics when a list is edited.
Logins	ASFACT_WC_LOGINS_0	Stores event information captured by Analytics when a user logs in to the site.
People	ASFACT_WC_PEOPLEC_0	Stores event information captured by Analytics when someone adds a connection.
	ASFACT_WC_PEOPLEC_1	Stores event information captured by Analytics when someone posts on a wall.

Table H–1 (Cont.) Analytics Facts Tables (Prefixed ASFACT_WC)

Event Object	Table Name	Event Table Description
	ASFACT_WC_PEOPLEC_2	Stores event information captured by Analytics when someone edits a profile.
	ASFACT_WC_PEOPLEC_3	Stores event information captured by Analytics when someone edits status information.
Portlets	ASFACT_WC_PORTLET_0	Stores event information captured by Analytics when a portlet is viewed.
Searches	ASFACT_WC_SEARCHE_0	Stores event information captured by Analytics when a search is performed.

Table H–2 Analytics Dimension Tables (Prefixed ASDIM_WC)

Dimension Name	Table Name	Dimension Table Description
Applications	ASDIM_WC_APPLICA_0	Stores names of WebCenter Portal applications accessing analytics data.
IP Clients	ASDIM_WC_CLIENT__0	Stores client IP addresses received in analytics events.
Discussion Topics	ASDIM_WC_DISCUSS_0	Stores discussion topic details received in analytics events.
Discussion Forums	ASDIM_WC_DISCUSS_1	Stores discussion forum details received in analytics events.
Discussion Messages	ASDIM_WC_DISCUSS_2	Stores discussion message details received in analytics events.
Announcements	ASDIM_WC_DISCUSS_3	Stores announcement details received in analytics events.
Documents	ASDIM_WC_DOCUMENT_0	Stores document details received in analytics events.
Lists	ASDIM_WC_LISTS_0	Stores list details received in analytics events.
Pages	ASDIM_WC_PAGES_0	Stores WebCenter Portal page details received in analytics events.
Portlets	ASDIM_WC_PORTLET_0	Stores portlet information received in analytics events.
Portlet Instances	ASDIM_WC_PORTLET_1	Stores portlet instance information received in analytics events.
Portlet Producers	ASDIM_WC_PRODUCE_0	Stores producers associated with portlet.
Referrers	ASDIM_WC_REFERRE_0	Stores referred URLs where analytics events come from.
Searches	ASDIM_WC_SEARCHE_0	Stores search phrases received in analytics events.
Portal Events	ASDIM_WC_EVENTS_0	Stores portal event details, received in analytics events.
Portals	ASDIM_WC_GROUPSP_0	Stores portal information received in analytics events.
Tags	ASDIM_WC_TAGS_0	Stores tags received in analytics events.
Browsers	ASDIM_WC_USER_AG_0	Stores information about which browsers are used to access analytics.
Times	ASDIM_TIME	Stores times used to group analytics reports.

Table H–2 (Cont.) Analytics Dimension Tables (Prefixed ASDIM_WC)

Dimension Name	Table Name	Dimension Table Description
Users	ASDIM_USERS	Stores user details received in analytics events.
User Properties	ASDIM_USERPROPERTIES	Stores user properties.
User Property Values	ASDIM_USERPROPERTYVALUES	Stores user property values.

Table H–3 Analytics System Tables (Prefixed ASSYS)

Entity Name	Table Name	Table Description
Configuration	ASSYS_CONFIG	Stores system configuration details.
Dimension Properties	ASSYS_DIMENSIONPROPS	Stores configuration details for each dimension.
Event Dimensions	ASSYS_EVENTDIMENSIONS	Stores dimensions associated with each event.
Event Facts	ASSYS_EVENTFACTS	Stores facts associated with each event.
Events	ASSYS_EVENTS	Stores the different types of analytics events that are collected by Analytics. An analytics event represents a single user action, such as document view, user login, and so on.
Namespaces	ASSYS_NAMESPACES	Stores the namespace in which analytics events are registered.
Report Composition	ASSYS_REPORTCOMPOSITION	Stores out-of-the-box composite analytics reports.
Report Group	ASSYS_REPORTGROUP	Stores out-of-the-box analytics report groups, such as portlets, services, and so on.
Report Items	ASSYS_REPORTITEMS	Stores items included in each analytics report.
Report Item Values	ASSYS_REPORTITEMVALUES	Stores values associated with each item in an analytics report.
Reports	ASSYS_REPORTS	Stores out-of-the-box analytics reports.

H.1.2.1 Sample SQL Query: Finding Table Names Associated with Specific Events

This section provides a sample SQL query to return the names of tables associated with a specific event. This query uses a filter to return tables associated with documents.

```
SELECT tablename "Table Name",
       displayname "Event Display Name"
FROM   assys_events
WHERE tablename like 'ASFACT_WC_DOCLIB%'
ORDER BY 1;
```

Sample Report Output

```
Table Name            Event Display Name
-----------------------------------------
ASFACT_WC_DOCLIB__0   {HTTP://WWW.ORACLE.COM/ANALYTICS/WC}DOCLIB_DOCUMENTVIEWS
ASFACT_WC_DOCLIB__1   {HTTP://WWW.ORACLE.COM/ANALYTICS/WC}DOCLIB_DOCUMENTDOWNLOADS
ASFACT_WC_DOCLIB__2   {HTTP://WWW.ORACLE.COM/ANALYTICS/WC}DOCLIB_DOCUMENTCREATE
ASFACT_WC_DOCLIB__3   {HTTP://WWW.ORACLE.COM/ANALYTICS/WC}DOCLIB_DOCUMENTEDIT
```

```
ASFACT_WC_DOCLIB__4    {HTTP://WWW.ORACLE.COM/ANALYTICS/WC}DOCLIB_DOCUMENTTAG
ASFACT_WC_DOCLIB__5    {HTTP://WWW.ORACLE.COM/ANALYTICS/WC}DOCLIB_DOCUMENTLIKE
ASFACT_WC_DOCLIB__6    {HTTP://WWW.ORACLE.COM/ANALYTICS/WC}DOCLIB_DOCUMENTCOMMENT
ASFACT_WC_DOCLIB__7    {HTTP://WWW.ORACLE.COM/ANALYTICS/WC}DOCLIB_DOCUMENTDELETES
```

H.2 Analytics Fact Table Descriptions

Analytics fact tables are created when the Analytics Collector runs for the first time. Each fact table stores a specific event type, for example, page views, portal views, document uploads, blog views, wiki edits, and so on. Columns in these fact table mostly contain integer IDs that reference descriptive data stored in dimension tables.

This section describes each of the tables listed in Table H–1, " Analytics Facts Tables (Prefixed ASFACT_WC)".

H.2.1 ASFACT_WC_PAGECRE_0

Fact table that stores event information captured by Analytics when someone creates a page.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time the dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
PAGE_	NULL	NUMBER(38)	Page ID dimension.	ASDIM_WC_PAGES_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_GROUPSP_0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID.	ASDIM_WC_APPLICA_0.ID

H.2.2 ASFACT_WC_PAGEDEL_0

Fact table that stores event information captured by Analytics when someone deletes a page.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time the dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_GROUPSP_0.ID

Column Name	NOT NULL?	Data Type	Description	Foreign Key
PAGE_	NULL	NUMBER(38)	Page ID dimension.	ASDIM_WC_PAGES_0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID

H.2.3 ASFACT_WC_PAGEEDI_0

Fact table that stores event information captured by Analytics when someone edits a page.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_GROUPSP_0.ID
PAGE_	NULL	NUMBER(38)	Page ID dimension.	ASDIM_WC_PAGES_0.ID

H.2.4 ASFACT_WC_PAGETAG_0

Fact table that stores event information captured by Analytics when someone tags a page.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_GROUPSP_0.ID
TAG_	NULL	NUMBER(38)	Tag ID dimension.	ASDIM_WC_USER_AG_0.ID
PAGE_	NULL	NUMBER(38)	Page ID dimension.	ASDIM_WC_PAGES_0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID

H.2.5 ASFACT_WC_PAGEVIE_0

Fact table that stores event information captured by Analytics when someone views a page.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
RESPONSE_ TIME_	NULL	NUMBER(16)	Response time (ms).	
CLIENT_IP_	NULL	NUMBER(38)	Client IP ID dimension.	ASDIM_WC_ CLIENT__0.ID
SESSION_ID_	NULL	NVARCHAR2(25 4)	Session ID.	
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_ GROUPSP_0.ID
REFERRER_	NULL	NUMBER(38)	Referrer ID dimension.	ASDIM_WC_ REFERRE_0.ID
PAGE_	NULL	NUMBER(38)	Page ID dimension.	ASDIM_WC_ PAGES_0.ID
USER_AGENT_	NULL	NUMBER(38)	User agent.	ASDIM_WC_USER_ AG_0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID

H.2.6 ASFACT_WC_DISCUSS_0

Fact table that stores event information captured by Analytics when someone views a discussion topic.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
CLIENT_IP_	NULL	NUMBER(38)	Client IP ID dimension.	ASDIM_WC_ CLIENT__0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID
USER_AGENT_	NULL	NUMBER(38)	User agent.	ASDIM_WC_ USER_AG_0.ID

Column Name	NOT NULL?	Data Type	Description	Foreign Key
FORUM_	NULL	NUMBER(38)	Discussion forum associated with the event.	ASDIM_WC_DISCUSS_1.ID
SESSION_ID_	NULL	NVARCHAR2(254)	Session ID.	
TOPIC_	NULL	NUMBER(38)	Discussion topic associated with the event.	ASDIM_WC_DISCUSS_0.ID
REFERRER_	NULL	NUMBER(38)	Referrer ID dimension.	ASDIM_WC_REFERRE_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_GROUPSP_0.ID

H.2.7 ASFACT_WC_DISCUSS_1

Fact table that stores event information captured by Analytics when someone views an announcement.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
CLIENT_IP_	NULL	NUMBER(38)	Client IP ID dimension.	ASDIM_WC_CLIENT__0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_GROUPSP_0.ID
REFERRER_	NULL	NUMBER(38)	Referrer ID dimension.	ASDIM_WC_REFERRE_0.ID
USER_AGENT_	NULL	NUMBER(38)	User agent.	ASDIM_WC_USER_AG_0.ID
SESSION_ID_	NULL	NVARCHAR2(254)	Session ID.	
ANNOUNCEMENT_	NULL	NUMBER(38)	Announcement associated with the event.	ASDIM_WC_DISCUSS_3.ID

H.2.8 ASFACT_WC_DISCUSS_2

Fact table that stores event information captured by Analytics when someone creates a discussion forum.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID

Column Name	NOT NULL?	Data Type	Description	Foreign Key
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_ GROUPSP_0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID
DISCUSSION_ FORUM_	NULL	NUMBER(38)	Discussion forum ID dimension.	ASDIM_WC_ DISCUSS_0.ID

H.2.9 ASFACT_WC_DISCUSS_3

Fact table that stores event information captured by Analytics when someone deletes a discussion forum.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_ GROUPSP_0.ID
DISCUSSION_ FORUM_	NULL	NUMBER(38)	Discussion forum ID dimension.	ASDIM_WC_ DISCUSS_0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID

H.2.10 ASFACT_WC_DISCUSS_4

Fact table that stores event information captured by Analytics when someone creates a discussion topic.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
DISCUSSION_ TOPIC_	NULL	NUMBER(38)	Discussion topic ID dimension.	ASDIM_WC_ DISCUSS_0.ID
DISCUSSION_ MESSAGE_	NULL	NUMBER(38)	Discussion message ID dimension.	ASDIM_WC_ DISCUSS_2.ID

Column Name	NOT NULL?	Data Type	Description	Foreign Key
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_GROUPSP_0.ID

H.2.11 ASFACT_WC_DISCUSS_5

Fact table that stores event information captured by Analytics when someone edits a discussion topic.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_GROUPSP_0.ID
DISCUSSION_TOPIC_	NULL	NUMBER(38)	Discussion topic ID dimension.	ASDIM_WC_DISCUSS_0.ID

H.2.12 ASFACT_WC_DISCUSS_6

Fact table that stores event information captured by Analytics when someone deletes a discussion topic.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_GROUPSP_0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID
DISCUSSION_TOPIC_	NULL	NUMBER(38)	Discussion topic ID dimension.	ASDIM_WC_DISCUSS_0.ID

H.2.13 ASFACT_WC_DISCUSS_7

Fact table that stores event information captured by Analytics when someone tags a discussion topic.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
TAG_	NULL	NUMBER(38)	Tag ID dimension.	ASDIM_WC_TAGS_0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID
DISCUSSION_TOPIC_	NULL	NUMBER(38)	Discussion topic ID dimension.	ASDIM_WC_DISCUSS_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_GROUPSP_0.ID

H.2.14 ASFACT_WC_DISCUSS_8

Fact table that stores event information captured by Analytics when someone replies to a discussion topic message.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
DISCUSSION_MESSAGE_	NULL	NUMBER(38)	Discussion message ID dimension.	ASDIM_WC_DISCUSS_2.ID
DISCUSSION_TOPIC_	NULL	NUMBER(38)	Discussion topic ID dimension.	ASDIM_WC_DISCUSS_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_GROUPSP_0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID

H.2.15 ASFACT_WC_DISCUSS_9

Fact table that stores event information captured by Analytics when someone likes a discussion topic message.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
DISCUSSION_MESSAGE_	NULL	NUMBER(38)	Discussion message ID dimension.	ASDIM_WC_DISCUSS_2.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID
DISCUSSION_TOPIC_	NULL	NUMBER(38)	Discussion topic ID dimension.	ASDIM_WC_DISCUSS_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_GROUPSP_0.ID

H.2.16 ASFACT_WC_DISCUSS_A

Fact table that stores event information captured by Analytics when someone creates an announcement.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_GROUPSP_0.ID
DISCUSSION_ANNOUNCEMENT_	NULL	NUMBER(38)	Announcement ID dimension.	ASDIM_WC_DISCUSS_3.ID

H.2.17 ASFACT_WC_DISCUSS_B

Fact table that stores event information captured by Analytics when someone edits an announcement.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
DISCUSSION_ANNOUNCEMENT_	NULL	NUMBER(38)	Announcement ID dimension.	ASDIM_WC_DISCUSS_3.ID
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_GROUPSP_0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID

H.2.18 ASFACT_WC_DISCUSS_C

Fact table that stores event information captured by Analytics when someone deletes an announcement.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_GROUPSP_0.ID
DISCUSSION_FORUM_	NULL	NUMBER(38)	Discussion forum ID dimension.	ASDIM_WC_DISCUSS_1.ID

H.2.19 ASFACT_WC_DOCLIB__0

Fact table that stores event information captured by Analytics when someone views a document.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	DATE	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
RESPONSE_TIME_	NULL	NUMBER(16)	Response Time (ms).	
CLIENT_IP_	NULL	NUMBER(38)	Client IP ID dimension.	ASDIM_WC_CLIENT__0.ID
SESSION_ID_	NULL	NVARCHAR2(254)	Session ID.	
GROUPSPACE	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_GROUPSP_0.ID
REFERRER	NULL	NUMBER(38)	Referrer ID dimension.	ASDIM_WC_REFERRE_0.ID
DOCUMENT	NULL	NUMBER(38)	Document ID dimension.	ASDIM_WC_DOCUMENT_0.ID
USER_AGENT	NULL	NUMBER(38)	User agent.	ASDIM_WC_USER_AG_0.ID
APPLICATION	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID

H.2.20 ASFACT_WC_DOCLIB__1

Fact table that stores event information captured by Analytics when someone downloads a document.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	DATE	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID

Column Name	NOT NULL?	Data Type	Description	Foreign Key
DOCUMENT	NULL	NUMBER(38)	Document ID dimension.	ASDIM_WC_DOCUMENT_0.ID
REFERRER_	NULL	NUMBER(38)	Referrer ID dimension.	ASDIM_WC_REFERRE_0.ID
CLIENT_IP_	NULL	NUMBER(38)	Client IP ID dimension.	ASDIM_WC_CLIENT__0.ID
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_GROUPSP_0.ID
USER_AGENT_	NULL	NUMBER(38)	User agent.	ASDIM_WC_USER_AG_0.ID
SESSION_ID_	NULL	NVARCHAR2(254)	Session ID.	
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID

H.2.21 ASFACT_WC_DOCLIB__2

Fact table that stores event information captured by Analytics when someone creates document.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	DATE	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID
WEBCENTER_RESOURCE_	NULL	NUMBER(38)	WebCenter Portal resource ID.	
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_GROUPSP_0.ID

H.2.22 ASFACT_WC_DOCLIB__3

Fact table that stores event information captured by Analytics when someone edits a document.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_ USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_ GROUPSP_0.ID
WEBCENTER_ RESOURCE_	NULL	NUMBER(38)	WebCenter Portal resource ID.	
APPLICATION _	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID

H.2.23 ASFACT_WC_DOCLIB__4

Fact table that stores event information captured by Analytics when someone tags a document.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_ USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.I D
TAGS	NULL	NUMBER(38)	Tag added to the document.	
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_ GROUPSP_0.ID
WEBCENTER_ RESOURCE_	NULL	NUMBER(38)	WebCenter Portal resource ID.	
APPLICATION _	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID

H.2.24 ASFACT_WC_DOCLIB__5

Fact table that stores event information captured by Analytics when someone "likes" a document.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_GROUPSP_0.ID
WEBCENTER_RESOURCE_	NULL	NUMBER(38)	WebCenter Portal resource ID.	

H.2.25 ASFACT_WC_DOCLIB__6

Fact table that stores event information captured by Analytics when someone comments on a document.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_GROUPSP_0.ID
WEBCENTER_RESOURCE_	NULL	NUMBER(38)	WebCenter Portal resource ID.	
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID

H.2.26 ASFACT_WC_DOCLIB__7

Fact table that stores event information captured by Analytics when someone deletes a document.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_GROUPSP_0.ID
WEBCENTER_RESOURCE_	NULL	NUMBER(38)	WebCenter Portal resource ID.	

H.2.27 ASFACT_WC_EVENT_C_0

Fact table that stores event information captured by Analytics when someone creates an event in a portal.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
EVENT_	NULL	NUMBER(38)	Event Identifier.	ASDIM_WC_EVENTS_0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_GROUPSP_0.ID

H.2.28 ASFACT_WC_EVENT_D_0

Fact table that stores event information captured by Analytics when someone deletes an event from a portal.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID

Column Name	NOT NULL?	Data Type	Description	Foreign Key
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
EVENT_	NULL	NUMBER(38)	Event Identifier.	ASDIM_WC_EVENTS_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_GROUPSP_0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID

H.2.29 ASFACT_WC_EVENT_E_0

Fact table that stores event information captured by Analytics when someone edits and event in a portal.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_GROUPSP_0.ID
EVENT_	NULL	NUMBER(38)	Event Identifier.	ASDIM_WC_EVENTS_0.ID

H.2.30 ASFACT_WC_GROUPSP_0

Fact table that stores event information captured by Analytics when someone views a portal.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID

Column Name	NOT NULL?	Data Type	Description	Foreign Key
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
CLIENT_IP_	NULL	NUMBER(38)	Client IP ID dimension.	ASDIM_WC_CLIENT__0.ID
SESSION_ID_	NULL	NVARCHAR2(254)	Session ID.	
RESPONSE_TIME_	NULL	NUMBER(16)	Response time (ms).	
REFERRER_	NULL	NUMBER(38)	Referrer ID dimension.	ASDIM_WC_REFERRE_0.ID
USER_AGENT_	NULL	NUMBER(38)	User agent.	ASDIM_WC_USER_AG_0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_GROUPSP_0.ID

H.2.31 ASFACT_WC_GROUPSP_1

Fact table that stores event information captured by Analytics when someone creates a portal.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_GROUPSP_0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID

H.2.32 ASFACT_WC_GROUPSP_2

Fact table that stores event information captured by Analytics when someone joins a portal.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_GROUPSP_0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID

H.2.33 ASFACT_WC_GROUPSP_3

Fact table that stores event information captured by Analytics when someone deletes a portal.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_GROUPSP_0.ID

H.2.34 ASFACT_WC_LIST_CR_0

Fact table that stores event information captured by Analytics when someone creates a list.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID

Column Name	NOT NULL?	Data Type	Description	Foreign Key
LIST_	NULL	NUMBER(38)	List ID.	ASDIM_WC_LISTS_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_GROUPSP_0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID

H.2.35 ASFACT_WC_LIST_DE_0

Fact table that stores event information captured by Analytics when someone deletes a list.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID
LIST_	NULL	NUMBER(38)	List ID.	ASDIM_WC_LISTS_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_GROUPSP_0.ID

H.2.36 ASFACT_WC_LIST_ED_0

Fact table that stores event information captured by Analytics when someone edits a list.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID

Column Name	NOT NULL?	Data Type	Description	Foreign Key
LIST_	NULL	NUMBER(38)	List ID.	ASDIM_WC_LISTS_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_GROUPSP_0.ID

H.2.37 ASFACT_WC_LOGINS_0

Fact table that stores login event information captured by Analytics with related data for each event.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID
SESSION_ID_	NULL	NVARCHAR2(254)	Session ID	
USER_AGENT_	NULL	NUMBER(38)	User agent.	ASDIM_WC_USER_AG_0.ID
REFERRER_	NULL	NUMBER(38)	Referrer ID dimension.	ASDIM_WC_REFERRE_0.ID
CLIENT_IP_	NULL	NUMBER(38)	Client IP ID dimension.	ASDIM_WC_CLIENT__0.ID

H.2.38 ASFACT_WC_PEOPLEC_0

Fact table that stores event information captured by Analytics when someone adds a people connection.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
TARGET_USER	NULL	NUMBER(38)	User ID	

H.2.39 ASFACT_WC_PEOPLEC_1

Fact table that stores event information captured by Analytics when someone posts on a wall.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
TARGET_USER	NULL	NUMBER(38)	User ID.	

H.2.40 ASFACT_WC_PEOPLEC_2

Fact table that stores event information captured by Analytics when someone edits a profile.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID

H.2.41 ASFACT_WC_PEOPLEC_3

Fact table that stores event information captured by Analytics when someone edits status information.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID

Column Name	NOT NULL?	Data Type	Description	Foreign Key
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID

H.2.42 ASFACT_WC_PORTLET_0

Fact table that stores information captured by Analytics when portlets are accessed by end users.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
CACHED_	NULL	NUMBER(5)	Indicates whether the portlet was displayed from the cache.	
PORTLET_	NULL	NUMBER(38)	Portlet.	ASDIM_WC_PORTLET_1.ID
REFERRER_	NULL	NUMBER(38)	Referrer ID dimension.	ASDIM_WC_REFERRE_0.ID
PRODUCER_	NULL	NUMBER(38)	Portlet producer.	ASDIM_WC_PRODUCE_0.ID
PAGE_	NULL	NUMBER(38)	Page ID dimension.	ASDIM_WC_PAGES_0.ID
SESSION_ID_	NULL	NVARCHAR2 (254)	Session ID.	
CLIENT_IP	NULL	NUMBER(38)	Client IP ID dimension.	ASDIM_WC_CLIENT__0.ID
PORTLET_INSTANCE_	NULL	NUMBER(38)	Portlet instance.	
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_GROUPSP_0.ID
RESPONSE_TIME_	NULL	NUMBER(16)	Response time (ms).	
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID
USER_AGENT_	NULL	NUMBER(38)	User agent.	ASDIM_WC_USER_AG_0.ID

H.2.43 ASFACT_WC_SEARCHE_0

Fact table that stores event information captured by Analytics when someone performs a search.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
PAGE_	NULL	NUMBER(38)	Page ID dimension.	ASDIM_WC_PAGES_0.ID
USER_AGENT_	NULL	NUMBER(38)	User agent.	ASDIM_WC_USER_AG_0.ID
CLIENT_IP_	NULL	NUMBER(38)	Client IP ID dimension.	ASDIM_WC_CLIENT__0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID
SESSION_ID_	NULL	NVARCHAR2 (254)	Session ID.	
REFERRER_	NULL	NUMBER(38)	Referrer ID dimension.	ASDIM_WC_REFERRE_0.ID
SEARCHED_PHRASE	NULL	NUMBER(38)	Search phrase.	
GROUPSPACE_	NULL	NUMBER(38)	Portal ID dimension.	ASDIM_WC_GROUPSP_0.ID

H.3 Analytics Dimension Table Descriptions

Analytics dimension tables are created when the Analytics Collector runs for the first time. Dimension tables store redundant descriptive data associated with analytics events. When a value is not found in these tables, a new record is added. Typical analytics dimension data includes: page name, browser name, document name, portal name, and so on.

This section describes each of the tables listed in Table H–2, " Analytics Dimension Tables (Prefixed ASDIM_WC)".

H.3.1 ASDIM_WC_APPLICA_0

Dimension table that stores the names of WebCenter Portal applications accessing analytics data, for example `webcenter` (a portal).

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
NAME_	NOT NULL	NVARCHAR2(254)	Application name.	

H.3.2 ASDIM_WC_CLIENT__0

Dimension table that stores client IP address details captured by Analytics when an analytics event is received.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
IP	NOT NULL	NVARCHAR2(15)	Client IP address	

H.3.3 ASDIM_WC_DISCUSS_0

Dimension table that stores discussion topic details captured by Analytics when an analytics event is received.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
ICONURL_	NULL	NVARCHAR2(254)	Icon URL	
NAME_	NULL	NVARCHAR2(254)	Discussion topic name.	
DESCRIPTION_	NULL	NVARCHAR2(254)	Discussion topic description.	
RESOURCEID_	NOT NULL	NVARCHAR2(254)	WebCenter Portal resource ID.	

H.3.4 ASDIM_WC_DISCUSS_1

Dimension table that stores discussion forum details captured by Analytics when an analytics event is received.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
ICONURL_	NULL	NVARCHAR2(254)	Icon URL	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
DESCRIPTION_	NULL	NVARCHAR2(254)	Discussion forum description.	
RESOURCEID_	NOT NULL	NVARCHAR2(254)	WebCenter Portal resource ID.	
NAME_	NULL	NVARCHAR2(254)	WebCenter Portal resource name, that is, the name of the discussion forum.	

H.3.5 ASDIM_WC_DISCUSS_2

Dimension table that stores discussion message details captured by Analytics when an analytics event is received.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date records last modified.	
NAME_	NULL	NVARCHAR2(254)	WebCenter Portal resource name, that is, the name of the discussion message.	
RESOURCEID_	NOT NULL	NVARCHAR2(254)	WebCenter Portal resource ID.	
DESCRIPTION_	NULL	NVARCHAR2(254)	Discussion message description.	
ICONURL_	NULL	NVARCHAR2(254)	Icon URL	

H.3.6 ASDIM_WC_DISCUSS_3

Dimension table that stores announcement details captured by Analytics when an analytics event is received.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
DESCRIPTION_	NULL	NVARCHAR2(254)	Announcement description.	
ICONURL_	NULL	NVARCHAR2(254)	Icon URL	
RESOURCEID_	NOT NULL	NVARCHAR2(254)	WebCenter Portal resource ID.	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
NAME_	NULL	NVARCHAR2(254)	WebCenter Portal resource name, that is, name of the announcement.	

H.3.7 ASDIM_WC_DOCUMENT_0

Dimension table that stores information captured by Analytics when documents are accessed by end users.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
CONTENTTYPE _	NULL	NVARCHAR2(254)	Document content type.	
CONTEXT	NULL	NVARCHAR2(512)	Document prefix (for identification purposes): ■ Document prefix - Folder URL for parent portal ■ Blog prefix - Blog title name ■ Wiki prefix - Wiki title name	
NAME_	NULL	NVARCHAR2(254)	Document name.	
RESOURCEID_	NOT NULL	NVARCHAR2(254)	WebCenter Portal resource ID.	
DESCRIPTION_	NULL	NVARCHAR2(254)	Document description.	
ICONURL_	NULL	NVARCHAR2(254)	Icon URL	
PATH_	NULL	NVARCHAR2(512)	Document path.	
OBJECTTYPE_	NULL	NVARCHAR2(254)	Object type.	

H.3.8 ASDIM_WC_EVENTS_0

Dimension table that stores information about portal events captured by Analytics when a user creates an event in his or her calendar.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
RESOURCEID_	NOT NULL	NVARCHAR2(254)	WebCenter Portal resource ID.	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
NAME_	NULL	NVARCHAR2(254)	WebCenter Portal resource name, that is, the name of the portal event.	

H.3.9 ASDIM_WC_GROUPSP_0

Dimension table that stores information captured by Analytics when a portal is accessed by an end user (WebCenter Portal only).

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
ICONURL_	NULL	NVARCHAR2(254)	Icon URL	
DESCRIPTION_	NULL	NVARCHAR2(254)	Description.	
PERSONAL_	NULL	NUMBER(5)	Indicates whether the portal is the Home portal (0) or a group space (1).	
RESOURCEID_	NOT NULL	NVARCHAR2(254)	WebCenter Portal resource ID.	
NAME_	NULL	NVARCHAR2(254)	Name of the portal.	

H.3.10 ASDIM_WC_LISTS_0

Dimension table that stores list details captured by Analytics when an analytics event is received.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
NAME_	NULL	NVARCHAR2(254)	WebCenter Portal resource name, that is, the name of the list.	
RESOURCEID_	NOT NULL	NVARCHAR2(254)	WebCenter Portal resource ID.	

H.3.11 ASDIM_WC_PAGES_0

Dimension table that stores information captured by Analytics when pages are accessed by end users.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
PERSONAL_	NULL	NUMBER(5)	Indicates whether the page is a personal page (in the Home portal) or belongs to a portal.	
RESOURCEID_	NOT NULL	NVARCHAR2(254)	WebCenter Portal resource ID. The full page path, for example, `/oracle/webcenter/page/sda254765_f950/Home.jspx`	
NAME_	NULL	NVARCHAR2(254)	Name of the page.	

H.3.12 ASDIM_WC_PORTLET_0

Dimension table that stores information captured by Analytics when portlets are accessed by end users.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record modified.	
DEFAULT_TITLE_	NULL	NVARCHAR2(254)	Default portlet title.	
RESOURCEID_	NOT NULL	NVARCHAR2(512)	WebCenter Portal resource ID.	

H.3.13 ASDIM_WC_PORTLET_1

Dimension table that stores portlet instance information captured by Analytics when an analytics event is received.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
TITLE_	NULL	NVARCHAR2(254)	Portlet title.	
RESOURCEID_	NOT NULL	NVARCHAR2(512)	WebCenter Portal resource ID.	

H.3.14 ASDIM_WC_PRODUCE_0

Dimension table that stores portlet producer information captured by Analytics when an analytics event is received.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record modified.	
RESOURCEID_	NOT NULL	NVARCHAR2(512)	WebCenter Portal resource ID.	
NAME_	NULL	NVARCHAR2(254)	Producer name.	

H.3.15 ASDIM_WC_REFERRE_0

Dimension table that stores information captured by Analytics related to the location (URL) to which the user was navigating when the analytics event was captured.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
URL	NOT NULL	NVARCHAR2(2000)	Referred URL	

H.3.16 ASDIM_WC_SEARCHE_0

Dimension table that stores search phrases captured by Analytics when an analytics event is received.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
PHRASE	NOT NULL	NVARCHAR2(254)	Search phrase.	

H.3.17 ASDIM_WC_TAGS_0

Dimension table that stores tag information captured by Analytics when an analytics event is received.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
VALUE	NOT NULL	NVARCHAR2(254)	Tag value.	

H.3.18 ASDIM_WC_USER_AG_0

Dimension table that stores information about which browsers are used to access analytics data.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
OS	NULL	NVARCHAR2(100)	Operating system.	
AGENT	NOT NULL	NVARCHAR2(512)	User agent ID.	
BROWSER	NULL	NVARCHAR2(255)	Name of the browser.	
BROWSER_VERSION	NULL	NVARCHAR2(30)	Browser version.	

H.3.19 ASDIM_TIME

Dimension table that stores times used to group analytics reports. An entry is created every hour. analytics reports use this table to group data within a specific time frame.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
PERIODSTART	NULL	DATE	Current period start.	
PERIODEND	NULL	DATE	Current period end.	
HOUROFDAY	NULL	NUMBER(5)	Hour corresponding to this time period.	
DAYOFMONTH	NOT NULL	NUMBER(5)	Current day of the month.	
DAYOFYEAR	NULL	NUMBER(5)	Current day of the year.	
WEEKOFYEARSUNDAY	NULL	NUMBER(5)	Week number of Sunday year.	
WEEKOFYEARMONDAY	NULL	NUMBER(5)	Week number of Monday year.	
WEEKOFYEARSATURDAY	NULL	NUMBER(5)	Week number of Saturday year.	
MONTHOFYEAR	NOT NULL	NUMBER(5)	Month corresponding to the period's year.	
YEAR	NOT NULL	NUMBER(5)	Current year.	

H.3.20 ASDIM_USERS

Dimension table that stores user details captured by Analytics when an analytics event is received.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
USERID	NOT NULL	NVARCHAR2(255)	User ID. For example: `weblogic`	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	

H.3.21 ASDIM_USERPROPERTIES

Dimension table that stores user properties, such as Title, Department, and so on.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
PROPERTYID	NOT NULL	NUMBER(38)	Property ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NULL	DATE	Date record last modified.	
NAME	NOT NULL	NVARCHAR2(255)	Property name.	

H.3.22 ASDIM_USERPROPERTYVALUES

Dimension table that stores values for user properties.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
USERID	NOT NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
PROPERTYID	NOT NULL	NUMBER(38)	Property ID.	ASDIM_USERPROPERTIES.ID
VALUE	NULL	NVARCHAR2(255)	Property ID value.	
TYPE	NULL	NUMBER(38)	Property type.	

H.4 Analytics System Table Descriptions

System tables are created during installation to store application information such as system configuration parameters. Each table is described in this section.

H.4.1 ASSYS_CONFIG

System table that stores system configuration information. Each row contains value pairs—configuration type/value.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
NAME	NULL	NVARCHAR2(510)	Name of configuration parameter, for example, collector_port.	
CONFIGTYPEID	NOT NULL	NUMBER(38)	Configuration type ID.	
INTVAL	NULL	NUMBER(38)	Integer value associated with the configuration.	
STRVAL	NULL	NVARCHAR2(2000)	String value associated with the configuration.	

H.4.2 ASSYS_DIMENSIONPROPS

System table that stores dimension configuration information. Each row represents property values for a dimension.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
DIMENSIONID	NOT NULL	NUMBER(38)	Dimension ID.	ASSYS_EVENTDIMENSIONS.ID
DISPAYNAME	NOT NULL	NVARCHAR2(510)	Dimension property display name.	
COLUMNNAME	NOT NULL	NVARCHAR2(510)	Column name.	
COLUMNTYPE	NULL	NUMBER(38)	Column type.	
COLUMNLENGTH	NULL	NUMBER(38)	Column length.	
ISKEY	NULL	NUMBER(38)	Indicates whether this is a key dimension property.	

H.4.3 ASSYS_EVENTDIMENSIONS

System table that stores dimensions associated with each analytics event.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
DISPAYNAME	NOT NULL	NVARCHAR2(510)	Dimension event display name.	
TABLENAME	NOT NULL	NVARCHAR2(510)	Table name associated with the dimension.	
ISUNIQUE	NULL	NUMBER(38)	Deprecated.	
IDENTIFYINGUSER	NOT NULL	NUMBER(38)	User ID.	ASDIM_USERS.ID

H.4.4 ASSYS_EVENTFACTS

System table that stores facts associated with each analytics event.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASDIM_WC_EVENTS_0.ID
DISPAYNAME	NOT NULL	NVARCHAR2(510)	Event fact display name.	
COLUMNNAME	NOT NULL	NVARCHAR2(510)	Event fact column name.	
COLUMNTYPEID	NULL	NUMBER(38)	Indicates the data type of the event fact: INTEGER (1), STRING (2), DATE (3), FLOAT (4), BOOLEAN (5) If the event fact is a dimension, COLUMNTYPEID is -1.	
COLUMNLENGTH	NULL	NUMBER(38)	User ID.	
EVENTDIMENSIONID	NULL	NUMBER(38)	Dimension ID.	ASSYS_EVENTDIMENSIONS.ID

H.4.5 ASSYS_EVENTS

System table that stores the different analytics events representing *one* user action that is captured. Both out-of-the-box analytics events and custom (user-defined) analytics events are stored. Each row represents the event captured with its associated data such as active status, and table name where data is stored.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
DISPAYNAME	NOT NULL	NVARCHAR2(510)	Event fact display name.	
DESCRIPTION	NULL	NVARCHAR2(510)	Event description.	
TABLENAME	NOT NULL	NVARCHAR2(510)	Table name.	
ISCUSTOM	NOT NULL	NUMBER(38)	Indicates whether or not the event is a custom event. (0/1)	
ISACTIVE	NOT NULL	NUMBER(38)	Deprecated.	
ISPERSISTENT	NOT NULL	NUMBER(38)	Indicates whether or not to create a fact table for the event. (0/1)	
ISACTION	NOT NULL	NUMBER(38)	Not used.	

H.4.6 ASSYS_NAMESPACES

System table that stores the different namespaces in which analytics events are registered.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
PREFIX	NOT NULL	NVARCHAR2(510)	Namespace prefix.	
URI	NOT NULL	NVARCHAR2(510)	Universal resource identifier for the namespace.	

H.4.7 ASSYS_REPORTCOMPOSITION

System table that stores the composition for reports provided by Analytics.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
PARENTREPORTID	NOT NULL	NUMBER(38)	Reference to parent report ID.	ASSYS_ REPORTS.ID
CHILDREPORTID	NOT NULL	NUMBER(38)	Reference to child report ID.	ASSYS_ REPORTS.ID
SEQUENCE	NULL	NUMBER(10)	Sequence of report composition.	
NAME	NOT NULL	NVARCHAR2(510)	Name of report composition.	
DESCRIPTION	NULL	NVARCHAR2(510)	Description of report composition.	

H.4.8 ASSYS_REPORTGROUP

System table that stores the report groups included for Analytics. Report groups enable end users to display analytics data in a specific way.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record was last modified.	
NAME	NOT NULL	NVARCHAR2(510)	Report group name.	
DESCRIPTION	NULL	NVARCHAR2(510)	Report group description.	
SEQUENCE	NULL	NUMBER(10)	Sequence.	

H.4.9 ASSYS_REPORTITEMS

System table that stores item information in each report. Each row represents a specific item belonging to one report.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
REPORTID	NOT NULL	NUMBER(38)	Report ID.	ASSYS_ REPORTS.ID
ITEMTYPE	NOT NULL	VARCHAR2(30)	Item type.	
ITEMDESCRIPTION	NULL	NVARCHAR2(510)	Item description.	
ITEMVALUE	NULL	NUMBER(5)	Item value.	
EVENTDIMENSIONID	NULL	NUMBER(38)	Dimension ID.	ASSYS_ EVENTDIMENSIONS.ID

Column Name	NOT NULL?	Data Type	Description	Foreign Key
EVENTDIMENSIONNAME	NULL	NVARCHAR2(510)	Dimension name.	
EVENTFACTID	NULL	NUMBER(38)	Event fact ID.	ASSYS_EVENTFACTS.ID
EVENTFACTNAME	NULL	NVARCHAR2(510)	Event fact name.	
PROPERTYNAME	NULL	NVARCHAR2(510)	The name of the column in the dimension table to be selected in the query performed, for example, name or ID.	
AGGREGATEFUNCTION	NULL	VARCHAR2(60)	SQL function for grouping purposes (AVG, MIN, MAX, COUNT, COUNT DISTINCT).	
DISPLAYFLAG	NOT NULL	NUMBER(5)	Indicates whether or not to display the item in the report. (0/1)	
IDENTIFIERFLAG	NOT NULL	NUMBER(5)	Indicates whether or not to use this item as an identifier (SQL: whether or not to group by this column). (0/1)	

H.4.10 ASSYS_REPORTITEMVALUES

System table that stores the values associated to each item in a report. Each row represents a specific value (char, float or date) for one report item instance.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
REPORTITEMID	NOT NULL	NUMBER	Report item ID.	ASSYS_REPORTITEMS.ID
VALUETYPE	NOT NULL	VARCHAR2(30)	Value type: CVALUE, NVALUE or DVALUE.	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
CVALUE	NULL	NVARCHAR2(510)	Char value.*	
NVALUE	NULL	NUMBER	Numeric value.*	
DVALUE	NULL	DATE	Date value.*	

*Only one of CVALUE, NVALUE or DVALUE has a value.

H.4.11 ASSYS_REPORTS

System table that stores the different out-of-the-box reports to be provided by Analytics. Each row represents a single report and the report's configuration.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
NAME	NOT NULL	NVARCHAR2(510)	Report item ID.	
DESCRIPTION	NULL	NVARCHAR2(255)	Report description.	
SEQUENCE	NULL	NUMBER(10)	Sequence.	
GROUPID	NULL	NUMBER (38)	Group ID for the report.	ASSYS_REPORTGROUP.ID
EVENTTYPEID	NULL	NUMBER(38)	Associated event ID.	ASSYS_EVENTS.ID
EVENTDISPLAYNAME	NULL	NVARCHAR2(510)	Denormalized. Display name of associated event.	
GROUPSPACEFILTERENABLED	NOT NULL	VARCHAR2(1)	Indicates whether users can filter the report 'by portal'. If set to true (1), the report displays the portal selector UI.	
DEFAULTCHARTSTYLE	NULL	NVARCHAR2(255)	Default chart style for the report.	
DEFAULTCHARTTYPE	NULL	NUMBER(2)	Default chart type.	
DEFAULTDISPLAYCOUNT	NULL	NUMBER(2)	Default display count.	
DEFAULTTIMEFRAME	NULL	NUMBER(2)	Default time frame.	
DEFAULTGROUPBYTIMEINTERVAL	NULL	NUMBER(2)	Default group time interval.	
DEFAULTGROUPBYUSERPROPERTY	NULL	NUMBER(38)	Default "group by user" property.	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
SHOWMETRICSELECTOR	NOT NULL	NVARCHAR2(1)	Indicates whether or not to display selector UI for this metric. (Y/N)	
SHOWCHARTTYPEOPTIONS	NOT NULL	NVARCHAR2(1)	Indicates whether or not to display chart type options in the UI. (Y/N)	
SHOWDISPLAYOPTIONS	NOT NULL	NVARCHAR2(1)	Indicates whether or not the field to select display options will be shown in the UI. (Y/N) (The field is a drop-down list to select between: Top n, Bottom n, All records, or List of specific records.)	
SHOWDISPLAYTOPOPTION	NOT NULL	NVARCHAR2(1)	Indicates whether or not users will be able to select the "Top n" option. (Y/N) If N, the "Top n" option will not be available in the combo box.	
SHOWDISPLAYBOTTOMOPTION	NOT NULL	NVARCHAR2(1)	Indicates whether or not users will be able to select the "Bottom n" option. (Y/N) If N, the "Bottom n" option will not be available in the combo box.	
SHOWDISPLAYALLOPTION	NOT NULL	NVARCHAR2(1)	Indicates whether or not users will be able to select the "All records" option. (Y/N) If N, the "All records" option will not be available in the combo box, and users will only be able to select from Top n, Bottom n or a list of specific records.	
SHOWOBJECTPICKER	NOT NULL	NVARCHAR2(1)	Indicates whether or not users will be able to select a list of specific records option. (Y/N) If N, the "Select ..." option will not be available in the combo box. If Y the "Select ..." option will be available and a picker dialog will be displayed to select the list of objects to be included in the report.	
SHOWTIMEFRAMEFILTER	NOT NULL	NVARCHAR2(1)	Indicates whether or not to display time frame filter. (Y/N)	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
SHOWUSERPROPERTYFILTER	NOT NULL	NVARCHAR2(1)	Indicates whether or not to display user property filter (Y/N).	
SHOWGROUPBYOPTIONS	NOT NULL	NVARCHAR2(1)	Indicates whether or not to display "group by" options. (Y/N)	
COMPOSEDREPORT	NOT NULL	NVARCHAR2(1)	Indicates whether this is a composed report.	
PORTLETTYPEID	NULL	NUMBER(38)	Portlet type ID.	

H.5 Analytics User Properties

Analytics uses several tables to store information about users who are triggering analytics events in WebCenter Portal applications. This section contains the following topics:

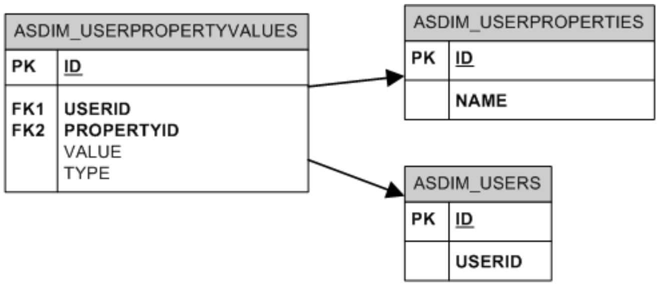
- Section H.5.1, "User Property Tables - Overview"
- Section H.5.2, "User Property Dimension Tables"
- Section H.5.3, "Out-of-the-Box User Properties for WebCenter Portal"

For sample queries related to user properties, see Section 47.3.3, "Sample Queries for User Metrics" in Chapter 47, "Integrating Analytics."

H.5.1 User Property Tables - Overview

Figure H–5 shows the database model used by Analytics to store information about users. The user dimension table has a single property column (USERID). In addition, there are two other tables (ASDIM_USERPROPERTIES and ASDIM_USERPROPERTYVALUES) that store user properties as key-value data. This model enables additional user properties to be added without changing the user dimension definition.

Figure H–5 User Property Dimensions for Analytics



The ASDIM_USERPROPERTIES table stores the names of user properties received by Analytics. User properties (attributes of the user including name, position, email, address, etc.) are captured by Analytics as an event when a user logs in to WebCenter Portal, not when the properties are modified. If a user changes a property, the value of the property will be updated in analytics the next time the user logs in.

The ASDIM_PROPERTYVALUES table stores one row per property, per user, where each row corresponds to a value for a property associated with a specific user.

H.5.2 User Property Dimension Tables

User property dimension tables are described in the following topics:

- Section H.5.2.1, "ASDIM_USERPROPERTIES"
- Section H.5.2.2, "ASDIM_USERPROPERTYVALUES"

H.5.2.1 ASDIM_USERPROPERTIES

Dimension table that stores the names of user properties received by Analytics.

Column Name	Data Type	Description
ID	NUMBER(38,0)	Table primary key. Value obtained from the sequence.
NAME	VARCHAR(255)	Name of the user property. Names are converted to uppercase and whitespace characters are removed.

H.5.2.2 ASDIM_USERPROPERTYVALUES

Dimension table that stores one row per property per user, where each row corresponds to a value for a property associated with a specific user.

Column Name	Data Type	Description
ID	NUMBER(38,0)	Table primary key. Value obtained from the sequence.
USERID	NUMBER(38,0)	Foreign key to the ASDIM_USERS table.
PROPERTYID	NUMBER(38,0)	Foreign key to the ASDIM_USERPROPERTIES table.
VALUE	VARCHAR(255)	The value of a particular property (identified by the PROPERTYID column) for a particular user (identified by the USERID column). For example, if the property is "CITY" and the user "weblogic", this column will be storing the city name where that user works (for example "San Francisco").
TYPE	NUMBER(38,0)	User property value type. (Property values are always stored as strings.)

H.5.3 Out-of-the-Box User Properties for WebCenter Portal

WebCenter Portal applications send a specific set of user properties to Analytics, as shown in Table H–4.

Note: WebCenter Portal applications can only send properties that are set by the user or available in the user directory. If a property value is blank, no row is created for it in the ASDIM_USERPROPERTYVALUES table for that user.

Table H–4 Out-of-the-Box User Properties for WebCenter Portal

Property Name	Property Label (displayed in reports)	Example Value
IMUSER	IM User	dfrabott
DISPLAYNAME	Display	Diego Frabotta
PHONE	Phone	+5411-2222-1234
TITLE	Title	Software Engineer
DEPARTMENT	Department	Analytics
MANAGER	Manager	uid=dsabaris,cn=users,dc=us,dc=myco,dc=com
COMPANY	Company	MyCo
STREET	Street	Parque Austral, Edificio Insignia M3
ZIPCODE	ZIP Code	12345
STATEORPROVINCE	State or Province	Buenos Aires
COUNTRY	Country	Argentina
EMPLOYEEID	Employee Id	55555
CITY	City	Pilar

H.6 Analytics Event and Dimension Data Types

Table H–5 shows how analytics event and dimension data types map to data types in Oracle, Microsoft SQL Server, and IBM DB2 databases.

Table H–5 Analytics Event and Dimension Data Types

Analytics Event and Dimension Type	Oracle	Microsoft SQL Server	IBM DB2
INTEGER	NUMBER	BIGINT	INTEGER
STRING	NVARCHAR	NVARCHAR	VARGRAPHIC
DATE	DATE	DATETIME	TIMESTAMP
FLOAT	FLOAT	FLOAT	DECFLOAT
BOOLEAN	NUMBER(5)	TINYINT	SMALLINT

I

WebCenter Portal Accessibility Features

This appendix describes the accessibility features of WebCenter Portal.

This appendix contains the following topic:

- Section I.1, "Overview of WebCenter Accessibility Features"

I.1 Overview of WebCenter Accessibility Features

Accessibility involves making your application usable by persons with disabilities such as low vision or blindness, deafness, or other physical limitations. In the simplest of terms, this means creating applications that can be used without a mouse (keyboard only), used with a screen reader for blind or low-vision users, and used without reliance on sound, color, or animation and timing.

Oracle software implements the standards of Section 508 and WCAG 1.0 AA using an interpretation of the standards at `http://www.oracle.com/accessibility/standards.html`.

This section describes accessibility features that are specific to WebCenter Portal. For general information about creating accessible ADF Faces pages, see the "Specifying Component-Level Accessibility Properties" section in *Web User Interface Developer's Guide for Oracle Application Development Framework.* For information about accessibility features in JDeveloper, see the help topics available by selecting the JDeveloper Accessibility node under JDeveloper Basics in the online help table of contents.

I.1.1 Generating Accessible HTML

WebCenter Portal provides several Composer components that you can add to your application pages to make them editable at runtime. These components provide attributes that are used to generate accessible HTML. To ensure that the pages you create are accessible, you must set these attributes, listed in Table I–1.

Table I–1 Accessibility Attributes for WebCenter Portal's Composer Components

Component	Accessibility Attributes
`pe:changeModeButton`	No accessibility attributes.
`pe:changeModeLink`	No accessibility attributes.
`pe:imageLink`	`shortDesc`—Mandatory. This attribute transforms into an HTML `alt` attribute. `accessKey`—Optional. This attribute sets the mnemonic character used to gain quick access to the component.
`pe:pageCustomizable`	No accessibility attributes

Table I–1 (Cont.) Accessibility Attributes for WebCenter Portal's Composer Components

Component	Accessibility Attributes
`pe:layoutCustomizable`	`shortDesc`—Mandatory. This attribute transforms into an HTML `alt` attribute. `accessKey`—Optional. This attribute sets the mnemonic character used to gain quick access to the component.
`cust:panelCustomizable`	No accessibility attributes
`cust:showDetailFrame`	`shortDesc`—Mandatory. This attribute transforms into an HTML `alt` attribute.

I.1.2 Accessibility Features at Runtime

When you enable users to customize a page at runtime, you must ensure that any customizations are also accessible to all users. For all components that users can create at runtime, all accessibility-related attributes are shown in the Property Inspector where users can set them appropriately.

For a list of accessibility-related attributes for WebCenter Portal-specific components, see Table I–1. For a list of accessibility-related attributes for other components, see the "Specifying Component-Level Accessibility Properties" section in *Web User Interface Developer's Guide for Oracle Application Development Framework.*

I.1.3 Accessibility Considerations for Portlets

IFrames are not very well accommodated by today's screen readers and so are not permitted by some accessibility standards.

> **Note:** Portlets created using the Oracle JSF Portlet Bridge have the `requireIFrame` container runtime option set to `true` as these portlets are too complex to render directly on Oracle ADF pages due to JavaScript issues.

WebCenter Portal provides an optional attribute in the `adf:portlet` tag called `renderPortletInIFrame`. You can set this attribute to false to avoid ever using IFrames. For detailed information, see Section 63.5.4, "What You May Need to Know About Inline Frames."
