Oracle® Fusion Middleware

WLST Command Reference for Infrastructure Components 12c (12.1.2)

E29486-01

June 2013

This document describes all of the Fusion Middleware Infrastructure Component commands that are available to use with the WebLogic Scripting Tool (WLST).

Oracle Fusion Middleware WLST Command Reference for Infrastructure Components, 12c (12.1.2)

	4.3	Application Metadata Management Commands	4-5
	4.3.1	deleteMetadata	4-5
	4.3.2	exportMetadata	4-7
	4.3.3	importMetadata	4-10
	4.3.4	purgeMetadata	4-13
	4.4	Sandbox Metadata Management Commands	4-14
	4.4.1	destroyMDSSandbox	4-14
	4.4.2	exportSandboxMetadata	4-14
	4.4.3	importSandboxMetadata	4-16
	4.4.4	listMDSSandboxes	4-17
	4.5	Application Label Management Commands	
	4.5.1	createMetadataLabel	4-18
	4.5.2	deleteMetadataLabel	4-19
	4.5.3	listMetadataLabels	4-19
	4.5.4	promoteMetadataLabel	4-20
	4.5.5	purgeMetadataLabels	4-21
	4.6	Application Management Deployment Commands	4-22
	4.6.1	getMDSArchiveConfig	4-22
	4.6.2	importMAR	
	4.7	Multitenancy Management Commands	4-25
	4.7.1	deprovisionTenant	4-25
	4.7.2	listTenants	4-26
5	Applic	ation Development Framework (ADF) Custom WLST Co	ommands
	5.1	Overview of WLST Command Categories	5-1
	5.2	ADF-Specific WLST Commands	5-1
	5.2.1	adf_createFileUrlConnection	5-2
	5.2.2	adf_createHttpUrlConnection	5-2
	5.2.3	adf_setURLConnectionAttributes	5-3
	5.2.4	adf_listUrlConnection	5-3
	5.2.5	getADFMArchiveConfig	5-3
	5.2.6	exportJarVersions	
	5.2.7	exportApplicationJarVersions	
	5.2.8	exportApplicationSelectedJarVersions	

6 DMS Custom WLST Commands

	6.1	DMS Configuration Commands	6-1
	6.1.1	listDMSConfigurationParameters	6-1
	6.1.2	setDMSConfigurationParameter	6-2
	6.2	DMS Metric Commands	6-3
	6.2.1	displayMetricTableNames	6-3
	6.2.2	displayMetricTables	6-5
	6.2.3	dumpMetrics	6-8
	6.2.4	reloadMetricRules	6-9
	6.3	DMS Parameter-Scoped Metrics Rules Commands	6-10
	6.3.1	createDMSScopedMetricsParameterConstraint	6-11
	6.3.2	deleteDMSParameterScopedMetricsRules	6-11
	6.3.3	dumpParameterScopedMetrics	6-12
	6.3.4	listDMSContextParameters	6-13
	6.3.5	listDMSParameterScopedMetricsRules	6-13
	6.3.6	resetDMSParameterScopedMetrics	6-14
	6.3.7	sampleDMSContextParameterValues	6-15
	6.3.8	setDMSParameterScopedMetricsRule	6-16
	6.4	DMS Event Tracing Commands	6-17
	6.4.1	addDMSEventDestination	6-18
	6.4.2	addDMSEventFilter	6-19
	6.4.3	addDMSEventRoute	6-22
	6.4.4	enableDMSEventTrace	6-23
	6.4.5	listDMSEventConfiguration	6-24
	6.4.6	listDMSEventDestination	6-25
	6.4.7	listDMSEventFilter	6-26
	6.4.8	listDMSEventRoutes	6-26
	6.4.9	removeDMSEventDestination	6-28
	6.4.10	removeDMSEventFilter	6-28
	6.4.11	removeDMSEventRoute	6-29
	6.4.12	updateDMSEventDestination	6-30
	6.4.13	updateDMSEventFilter	6-30
	6.4.14	updateDMSEventRoute	6-31
7	Loggir	ng Custom WLST Commands	
	7.1	Log Configuration Commands	7-1
	7.1.1	configureLogHandler	
	7.1.2	getLogLevel	
	7.1.3	listLoggers	7-7
	7.1.4	listLogHandlers	
	7.1.5	setLogLevel	
	7.2	Search and Display Commands	
	7.2.1	displayLogs	
	7.2.2	listLogs	
	7.3	Selective Tracing Commands	
	7.3.1	configureTraceProvider	
	-	0	

	7.3.2	configureTracingLoggers	7-14
	7.3.3	listActiveTraces	
	7.3.4	listTraceProviders	7-16
	7.3.5	listTracingLoggers	7-16
	7.3.6	startTracing	7-17
	7.3.7	stopTracing	7-18
8	Diagno	ostic Framework Custom WLST Commands	
	8.1	Incident Commands	8-1
	8.1.1	createAggregatedIncident	8-2
	8.1.2	createIncident	8-4
	8.1.3	getIncidentFile	8-5
	8.1.4	listADRHomes	8-5
	8.1.5	listIncidents	8-6
	8.1.6	listProblems	8-6
	8.1.7	queryIncidents	8-7
	8.1.8	reloadCustomRules	8-8
	8.1.9	showIncident	8-8
	8.2	Diagnostic Dump Commands	8-9
	8.2.1	describeDump	8-9
	8.2.2	executeDump	8-10
	8.2.3	listDumps	8-11
	8.3	Dump Sampling Commands	8-12
	8.3.1	addDumpSample	8-12
	8.3.2	enableDumpSampling	8-13
	8.3.3	getSamplingArchives	8-14
	8.3.4	isDumpSamplingEnabled	8-15
	8.3.5	listDumpSamples	8-15
	8.3.6	removeDumpSample	8-16
	8.3.7	updateDumpSample	8-16
9	User N	Messaging Service (UMS) Custom WLST Commands	
	9.1	UMS WLST Command Group	9-1
	9.1.1	configUserMessagingDriver	9-1
	9.1.2	configUserMessagingServer	9-3
	9.1.3	deployUserMessagingDriver	9-3
	9.1.4	manageUserCommunicationPrefs	9-4
10	Orac	le HTTP Server Custom WLST Commands	
	10.1	Oracle HTTP Server Commands	10-1
	10.1.1	createOHSInstance()	10-1
	10.1.2	deleteOHSInstance()	10-2
	10.1.3	addOHSAdminProperties()	10-3
	10.1.4	addOHSNMProperties()	
	10.1.5	createOHSTestDomain()	

Preface

This guide describes the Fusion Middleware Core Component commands that are available to use with the WebLogic Scripting Tool (WLST).

Audience

This document is intended for administrators and developers who are configuring Oracle Fusion Middleware or developing applications and want to use the WLST commands for Oracle Fusion Middleware Core Components.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at

http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers have access to electronic support through My Oracle Support. For information, visit

http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Related Documents

For more information, see the following documents in the Oracle Other Product One Release 7.0 documentation set or in the Oracle Other Product Two Release 6.1 documentation set:

- Oracle Other Product One Release Notes
- Oracle Other Product One Configuration Guide
- Oracle Other Product Two Getting Started Guide
- Oracle Other Product Two Reference Guide
- Oracle Other Product Two Tuning and Performance Guide

Conventions

The following text conventions are used in this document:

Convention	Meaning
boldface	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.
italic	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
monospace	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

What's New in This Guide

The following topics introduce the new and changed features of the custom WLST commands for Oracle Fusion Middleware Infrastructure components.

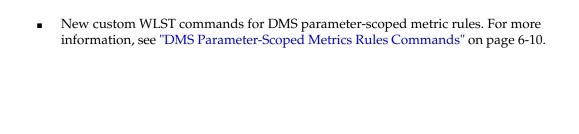

New and Changed Features for 12c (12.1.2)

The following topics introduce new and changed features for this release:

- The following summarize the changes to the Web services WLST commands.
 - Redesigned Web services WLST framework to provide consistency across all Web service stacks. As a result, there are a number of new and deprecated WLST commands for Oracle Infrastructure Web services. Deprecated commands are identified throughout this document. For a complete list of deprecated commands and the 12c equivalents, see "Deprecated Commands for Oracle Infrastructure Web Services" in *Release Notes*.
 - New Web service WLST command categories, including:
 - Session commands for managing a session.
 - * Policy Subject commands for viewing and managing Web service and client policy subjects.
 - * Configuration commands for viewing and managing OWSM domain configuration.

For more information, see "Web Services WLST Command Categories" on page 3-7.

- Command syntax used to identify a policy subject has changed. For more information, see "Specifying Application and Service Names" on page 3-2 and "Identifying the Policy Subject" on page 3-3.
- New OWSM repository WLST commands are provided for exporting application metadata, migrating policy attachments and roles, and upgrading the OWSM repository. For more information, see "OWSM Repository Management Commands" on page 3-96.
- New WLST commands for managing Web service token issuer trust documents are provided, as described in "Token Issuer Trust Configuration Commands" on page 3-109.
- New custom WLST commands for provisioning and managing Oracle HTTP Server instances in WebLogic Server domains. For more information, see "Oracle HTTP Server Custom WLST Commands" on page 10-1.

Introduction and Roadmap

This section describes the audience for and contents and organization of this guide—WLST Command Reference for Infrastructure Components.

- Section 1.1, "Document Scope and Audience"
- Section 1.2, "Guide to This Document"
- Section 1.3, "Related Documentation"

1.1 Document Scope and Audience

This document describes the custom WLST commands for Oracle Fusion Middleware Infrastructure components.

Note: Custom WLST commands for a given Oracle Fusion Middleware component are available for use only if the component is installed.

This document is written for WebLogic Server administrators and operators who deploy Java EE applications using the Java Platform, Enterprise Edition (Java EE) from Oracle. It is assumed that readers are familiar with Web technologies and the operating system and platform where WebLogic Server and Fusion Middleware products are installed.

1.2 Guide to This Document

This document is organized as follows:

- This chapter, "Introduction and Roadmap," introduces the organization of this guide and lists related documentation.
- Chapter 2, "Java Required Files Custom WLST Commands," provides detailed descriptions for each of the custom WLST commands for Java Required Files (JRF).
- Chapter 3, "Web Services Custom WLST Commands," provides detailed descriptions for each of the custom WLST commands for Web services.
- Chapter 4, "Metadata Services (MDS) Custom WLST Commands," provides detailed descriptions for each of the custom WLST commands for Metadata Services (MDS).
- Chapter 5, "Application Development Framework (ADF) Custom WLST Commands," provides detailed descriptions for each of the custom WLST commands for Application Development Framework (ADF).

- Chapter 6, "DMS Custom WLST Commands," provides detailed descriptions for each of the custom WLST commands for the Dynamic Monitoring Service.
- Chapter 7, "Logging Custom WLST Commands," provides detailed descriptions for each of the custom WLST commands for logging.
- Chapter 8, "Diagnostic Framework Custom WLST Commands," provides detailed descriptions for each of the custom WLST commands for the Diagnostic Framework.
- Chapter 9, "User Messaging Service (UMS) Custom WLST Commands," provides detailed descriptions for each of the custom WLST commands for User Messaging Service (UMS).

1.3 Related Documentation

For information about how to use the WebLogic Scripting Tool, refer to *Understanding* the WebLogic Scripting Tool.

For information about the other WLST commands and other WebLogic Server management interfaces, see:

- WLST Command Reference for WebLogic Server describes the WLST commands for WebLogic Server.
- Infrastructure Security WLST Command Reference describes the WLST commands that are available for Oracle Fusion Middleware Infrastructure Security components, including Auditing, SSL, Oracle Identity Federation, Directory Integration Platform, Oracle Access Management (OAM), Oracle Security Token Service, and Oracle Keystore Service.
- SOA Suite WLST Command Reference describes the WLST commands that are available for Oracle SOA Suite and Oracle Business Process Management (BPM).
- "Using Ant Tasks to Configure and Use a WebLogic Server Domain" in Developing Applications for Oracle WebLogic Server, describes using WebLogic Ant tasks for starting and stopping WebLogic Server instances and configuring WebLogic domains.
- "Deployment Tools" in *Deploying Applications to Oracle WebLogic Server* describes several tools that WebLogic Server provides for deploying applications and stand-alone modules.
- Administration Console Online Help describes a Web-based graphical user interface for managing and monitoring WebLogic domains.
- Creating WebLogic Domains Using the Configuration Wizard describes using a graphical user interface to create a WebLogic domain or extend an existing one.
- Creating Templates and Domains Using the Pack and Unpack Commands describes commands that recreate existing WebLogic domains quickly and easily.
- Developing Custom Management Utilities Using JMX for Oracle WebLogic Server describes using Java Management Extensions (JMX) APIs to monitor and modify WebLogic Server resources.
- Monitoring Oracle WebLogic Server with SNMP describes using Simple Network Management Protocol (SNMP) to monitor WebLogic domains.

Java Required Files Custom WLST Commands

Oracle JRF (Java Required Files) consists of those components not included in the WebLogic Server installation that provide common functionality for Oracle business applications and application frameworks. This chapter provides detailed descriptions of custom WLST commands for Java Required Files (JRF), including command syntax, arguments and command examples.

Oracle JRF consists of a number of independently developed libraries and applications that are deployed into a common location. The following components are considered part of Java Required Files: Oracle Application Development Framework, Oracle Fusion Middleware Audit Framework, Dynamic Monitoring Service, Fabric Common, HTTP Client, Infrastructure Security, Java Object Cache, JMX Framework, JPS, logging, MDS, OJSP.Next, Oracle Web Services, Oracle Web Services Manager, Oracle TopLink, UCP, XDK.

2.1 Java Required Files Commands

Use the commands in Table 2–1 to configure a Managed Server or cluster with Java Required Files (JRF) applications and services or to copy the applications and services from one Managed Server or cluster and apply them to another Managed Server or cluster.

In the Use with WLST column, online means the command can only be used when connected to a running server. Offline means the command can only be used when not connected to a running server. Online or offline means the command can be used in both situations.

Note: To use these JRF custom WLST commands, you must invoke the WLST script from the Oracle Common home. See "Using Custom" WLST Commands" in the *Administering Oracle Fusion Middleware*.

JRF Commands Table 2–1

Use this command	То	Use with WLST
applyJRF	Configures a Managed Server or cluster with Java Required Files applications and services.	Online or Offline
cloneDeployments	Copies the applications and services from Managed Server or cluster and applies them to another Managed Server or cluster.	Online or Offline

2.1.1 applyJRF

Use with WLST: Online or Offline

2.1.1.1 Description

Configures a Managed Server or cluster with Java Required Files (JRF). Managed Servers that are added by product templates during the template extension process do not need to be explicitly configured with JRF using this command.

Use the applyJRF command when additional Managed Servers or clusters are added to a domain after it is initially extended with a product template. The applyIRF command is required any time you add a Managed Server to a JRF-only domain, or if you add a Managed Server that has been configured for JRF to a domain that contains other Oracle products.

2.1.1.2 Syntax

applyJRF(target, [domainDir], [shouldUpdateDomain])

Argument	Definition
target	The name of the Managed Server or cluster to be configured with JRF applications and services.
	A value of an asterisk (*) for the target indicates that all clusters and standalone Managed Servers should be configured with JRF.
domainDir	The absolute path of the WebLogic Server domain.
shouldUpdateDomain	An optional boolean flag that controls how domain updates are carried out. When you set it to true (the default), the function implicitly invokes the following offline commands: readDomain() and updateDomain(), or the online commands: edit(), startEdit(), save(), and activate().
	When you set it to false, you must call WLST commands to update the domain.

2.1.1.3 Example

The following example configures the Managed Server server1 with JRF:

wls:/offline> applyJRF('server1', '/my_path/user_templates/domains/my_domain')

2.1.2 cloneDeployments

Use with WLST: Online or Offline

2.1.2.1 Description

Replicates all deployments targeted to a particular Managed Server or cluster on a second Managed Server or cluster. This command is provided as a convenience to configure a new Managed Server or cluster so that it has the same deployments as a pre-existing Managed Server or cluster.

The cloneDeployments command does not create new Managed Servers, and it does not copy properties other than deployment information to the target Managed Server.

2.1.2.2 Syntax

cloneDeployments(domain, source, target, [shouldUpdateDomain])

Argument	Definition
domain	The absolute path of the WebLogic Server domain. Ignored if the domain has been read, or if connected in online mode.
source	The name of the Managed Server or cluster from which you want to clone deployments. This must be the name of a valid Managed Server or cluster.
target	The target Managed Server or cluster that will receive the source server's applications and services. The target Managed Server must already exist.
shouldUpdateDomain	An optional boolean flag that controls how domain updates are carried out. When you set it to true (the default), the function implicitly invokes the following offline commands: readDomain() and updateDomain(), or online commands: edit(), startEdit(), save(), and activate(). When you set it to false, you must call WLST commands to update the domain.

2.1.2.3 Example

The following example replicates the deployments from sourceServer to destinationServer:

wls:/offline> cloneDeployments('/my_path/user_templates/domains/my_domain', 'sourceServer', 'destinationServer', 'false')

	Java	Red	uired	Files	Command	s
--	------	-----	-------	-------	---------	---

Web Services Custom WLST Commands

The following sections describe the WebLogic Scripting Tool (WLST) commands for Oracle Infrastructure Web services (which includes ADF Business Components), Java EE Web services, and RESTful Web services. You can use these commands to manage Web services from the command line.

Note: Only a subset of the custom WLST commands described in this chapter are supported for Java EE Web services.

A subset of WLST commands have been deprecated for Oracle Infrastructure Web services and clients. For a complete list of deprecated commands, see "Deprecated Commands for Oracle Infrastructure Web Services" in Release Notes.

Topics in this chapter include:

- Section 3.1, "Overview of Web Services WLST Commands"
- Section 3.2, "Session Commands"
- Section 3.3, "Policy Subject Commands"
- Section 3.4, "Configuration Commands"
- Section 3.5, "Diagnostic Commands"
- Section 3.6, "Web Service and Client Management Commands"
- Section 3.7, "Policy Management Commands"
- Section 3.8, "Policy Set Management Commands"
- Section 3.9, "OWSM Repository Management Commands"
- Section 3.10, "Token Issuer Trust Configuration Commands"

For additional details about using these WLST commands for Web services, see the following documents:

- Administering Web Services.
- Securing Web Services and Managing Policies with Oracle Web Services Manager

Notes: To use the Web Services custom WLST commands, you must invoke WLST from the Oracle Common home directory. See "Using Custom WLST Commands" in the Administering Oracle Fusion Middleware.

To display the help for the Web service and client management and Java EE Web service policy management commands, connect to a running instance of the server and enter help ('WebServices').

To display the help for the remaining commands, connect to a running instance of the server and enter help ('wsmManage').

3.1 Overview of Web Services WLST Commands

You can use the Web services WLST commands, in online mode, to:

- Perform Web service configuration and OWSM policy management tasks.
- Manage the OWSM repository.
- Check the status of OWSM components.
- View and define trusted issuers and DN lists for SAML signing certificates.

Note: Ensure that the user is mapped to the appropriate OWSM logical roles, based on the WLST operations you wish to perform. For more information, see "Modifying the User's Group or Role" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

The Web services WLST configuration and policy management commands perform many of the same management functions that you can complete using Fusion Middleware Control, such as managing deployed, active, and running Web services applications. They can be executed everywhere in WLST online mode, for example:

```
wls:/domain/serverConfig
wls:/domain/domainRuntime
```

The following sections provide more information about using the WLST commands:

- "Specifying Application and Service Names" on page 3-2
- "Identifying the Policy Subject" on page 3-3
- "Web Services WLST Command Categories" on page 3-7

3.1.1 Specifying Application and Service Names

The Web service WLST commands configure a Web service for a specific application. Therefore, the application path name has to uniquely identify the application and the server instance to which it is deployed.

The following sections describe how to specify the application and service names to uniquely identify the Web service.

- "Specifying a Web Service Application Name" on page 3-3
- "Specifying a Service Name" on page 3-3

3.1.1.1 Specifying a Web Service Application Name

To specify a Web service application in a WLST command, use the following format:

```
[/domain/server/]application[#version_number]
```

Parameters shown in brackets [] are optional. The following examples show the sample format for a Web service application name:

```
/base_domain/AdminServer/HelloWorld#1_0
/base_domain/server1/HelloWorld#1_0
```

If there is only one deployed instance of an application in a domain, you may omit the domain/server parameter, as shown in the following example:

```
HelloWorld#1_0
```

In all other instances, the domain/server parameter is required. If it is not specified and WLST finds more than one deployment of the same application on different servers in the domain, you are prompted to specify the domain and the server names.

Web service and Web service client applications are deployed directly to WebLogic Server server instances. Each application is managed separately. For example, if the application myapp is deployed to both the AdminServer and server1 instances in the domain mydomain, then you need to issue configuration commands to each of the servers using the appropriate application path name:

```
/mydomain/AdminServer/myapp#1_0
/mydomain/server1/myapp#1_0
```

3.1.1.2 Specifying a Service Name

When there are multiple versions (namespaces) of a Web service name for Web Service and Web Service clients, you must specify the namespace and the service name using the following format:

```
{http://namespace/}serviceName
```

Note the following:

- For Web service and client management commands, and policy management commands, you do not need to enter the namespace if there is only one service name qualified. If there are multiple versions of the service and you do not specify the namespace with the service name, an exception is thrown.
- For policy set management commands, both the namespace and service name are required for Web Service and Web Service Client (ws-service and ws-client) resource types.

For more information, see "Determining the Namespace for a Web Service" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

3.1.2 Identifying the Policy Subject

Note: This section applies to Oracle Infrastructure and RESTful Web services. It does not apply to Java EE Web services in this release.

You can navigate to a policy subject in WLST, without having to refer to Fusion Middleware Control. By using the selectWSMPolicySubject command, together with an understanding of the navigation model, you can discover the application, assembly, and subject names by moving down the hierarchy tree.

3.1.2.1 Selecting the Application

You can select a specific application for modification if an application name is provided.

If you know only a part of the application name, the argument can be a pattern containing wildcard characters. In this case, all of the applications matching that pattern will be listed. You can then select that application to proceed further. If no argument is provided then all application names will be listed.

When the application name is known

If you know the name of the application, enter it as the argument to selectWSMPolicySubject command. WLST responds with the names of the assemblies contained in the application.

In the following example, jaxwsejb30ws is entered as the name of the application. WLST responds with #jaxwsejb, the name of the assembly contained in the application.

```
wls:/base_domain/serverConfig> selectWSMPolicySubject('jaxwsejb30ws')
#jaxwsejb
Select any of the assembly name to proceed.
```

When only a part of the application name is known

If you know only a part of the application name, you can enter a pattern with wildcard characters. In the following example, jax* is entered as the name of the application in the selectWSMPolicySubject command. WLST responds with a list of applications that match the string.

```
wls:/base_domain/serverConfig> selectWSMPolicySubject('jax*')
jaxws_provider
jaxwsejb30ws
Select any of the application name to proceed.
wls:/jrfServer_domain/serverConfig> selectWSMPolicySubject('jaxwsejb30ws')
#jaxws3jb
Select any of the assembly name to proceed
```

When the application name is not known

If you do not know the name of the application, enter the selectWSMPolicySubject command with no arguments. WLST responds with the names of all applications known to the system. In the following example, the selectWSMPolicySubject command is entered with no arguments. WLST responds with the names of all applications known to the system.

```
wls:/base_domain/serverConfig> selectWSMPolicySubject()
SimpleRestApp
jaxws_provider
```

```
jaxwsejb30ws
wsm-pm
Select any of the application name to proceed.
wls:/jrfServer_domain/serverConfig> selectWSMPolicySubject('jaxwsejb30ws')
#iaxws3ib
Select any of the assembly name to proceed
```

3.1.2.2 Selecting the Assembly

You can select a specific assembly for modification if an application name and assembly name is provided.

If you know only a part of the assembly name, the argument can be a pattern containing wildcard characters. In this case, all of the assemblies matching that pattern will be listed. You can then select an assembly to proceed further. If no argument is provided then all assembly names will be listed.

Note: For ws-connection type policy subjects, use an empty string '' for the assembly name.

When the assembly name is known

If you know the name of the assembly, enter it with the application name as arguments to the selectWSMPolicySubject command. WLST responds with the names of the subjects contained in the assembly. In the following example, jaxwsejb30ws is entered as the name of the application and #jaxwsejb is entered as the name of the assembly. WLST responds with a list of all of the subjects contained in the assembly.

```
wls:/base_domain/serverConfig> selectWSMPolicySubject ('jaxwsejb30ws','#jaxwsejb')
WS-SERVICE({http://mycompany.com/targetNamespace}EchoEJBService#EchoEJBServicePort
WS-SERVICE({http://mycompany.com/jaxws/tests/concrete}WsdlConcreteService#WsdlConc
WS-SERVICE({http://mycompany.com/jaxws/tests}CalculatorService#CalculatorPort)
WS-SERVICE({http://j2ee.tests.ejb.impl/}JaxwsWithHandlerChainBeanService#JaxwsWith
HandlerChainBeanPort)
Select any of the subject name to proceed.
```

When only a part of the assembly name is known

If you know only a part of the assembly name, you can enter a pattern with wildcard characters. In the following example, #jaxws* is entered as the partial name of the assembly and jaxwsejb30ws is entered as the name of the application in the selectWSMPolicySubject command. WLST responds with #jaxwsejb, the name of the assembly contained in the application.

```
wls:/base_domain/serverConfig> selectWSMPolicySubject('jaxwsejb30ws','#jaxws*')
#iaxwseib
Select any of the assembly name to proceed.
wls:/base_domain/serverConfig> selectWSMPolicySubject ('jaxwsejb30ws','#jaxwsejb')
WS-SERVICE({http://mycompany.com/targetNamespace}EchoEJBService#EchoEJBServicePort
```

```
WS-SERVICE({http://mycompany.com/jaxws/tests/concrete}WsdlConcreteService#WsdlConc
retePort)
WS-SERVICE({http://mycompany.com/jaxws/tests}CalculatorService#CalculatorPort)
WS-SERVICE({http://j2ee.tests.ejb.impl/}JaxwsWithHandlerChainBeanService#JaxwsWith
HandlerChainBeanPort)
Select any of the subject name to proceed.
```

When the assembly name is not known

If you do not know the name of the assembly, enter the name of the application only as an argument to selectWSMPolicySubject. WLST responds with the names of all assemblies known to the system. In the following example, jaxwsejb30ws is entered as the name of the application as an argument in selectWSMPolicySubject command. WLST responds with the names of all assemblies known to the system.

```
wls:/base_domain/serverConfig> selectWSMPolicySubject('jaxwsejb30ws')
#jaxwsejb
Select any of the assembly name to proceed.
```

3.1.2.3 Selecting the Subject

You can select a specific policy subject for modification if an application name, assembly name, and policy subject name is provided.

If you know only a part of the policy subject name, the argument can be a pattern containing wildcard characters. In this case, all of the policy subjects matching that pattern will be listed. You can then select a policy subject to proceed further. If no argument is provided then all policy subject names will be listed.

When the policy subject name is known

If you know the name of the policy subject, enter it with the application name and the assembly name as arguments to the selectWSMPolicySubject command. WLST selects the specified policy subject. In the following example, jaxwsejb30ws is entered as the name of the application, #jaxwsejb is entered as the name of the assembly, and

WS-SERVICE({http://mycompany.com/jaxws/tests/concrete}WsdlConcre teService#WsdlConcretePort) is entered as the name of the policy subject. WLST responds that the policy subject has been selected for modification.

```
wls:/base_domain/serverConfig> selectWSMPolicySubject
('jaxwsejb30ws','#jaxwsejb','WS-SERVICE({http://mycompany.com/jaxws/tests/concrete
}WsdlConcreteService#WsdlConcretePort)')
The policy subject is selected for modification.
```

When only a part of the policy subject name is known

If you know only a part of the policy subject name, you can enter a pattern with wildcard characters. In the following example, jaxwsejb30ws is entered as the name of the application, #jaxwsejb is entered as the name of the assembly, and ws-service(*) is entered as the name of the policy subject in the selectWSMPolicySubject command. WLST responds with the name of the policy subjects contained in the assembly.

```
wls:/base_domain/serverConfig> selectWSMPolicySubject
('jaxwsejb30ws','#jaxwsejb', 'ws-service(*)')
WS-SERVICE({http://mycompany.com/targetNamespace}EchoEJBService#EchoEJBServicePort
WS-SERVICE({http://mycompany.com/jaxws/tests/concrete}WsdlConcreteService#WsdlConc
retePort)
WS-SERVICE({http://mycompany.com/jaxws/tests}CalculatorService#CalculatorPort)
WS-SERVICE({http://j2ee.tests.ejb.impl/}JaxwsWithHandlerChainBeanService#JaxwsWith
HandlerChainBeanPort)
Select any of the subject name to proceed.
```

When the policy subject name is not known

If you do not know the name of the policy subject, enter the name of the application, the name of the assembly as arguments to the selectWSMPolicySubject command. WLST responds with the names of all policy subjects contained in the assembly. In the following example, jaxwsejb30ws is entered as the name of the application, #jaxwsejb as the name of the assembly, and None as the policy subject argument in selectWSMPolicySubject command. WLST responds with the names of all policy subjects contained in the assembly.

```
wls:/base_domain/serverConfig> selectWSMPolicySubject ('jaxwsejb30ws','#jaxwsejb')
WS-SERVICE({http://mycompany.com/targetNamespace}EchoEJBService#EchoEJBServicePort
WS-SERVICE({http://mycompany.com/jaxws/tests/concrete}WsdlConcreteService#WsdlConc
retePort)
WS-SERVICE({http://mycompany.com/jaxws/tests}CalculatorService#CalculatorPort)
WS-SERVICE({http://j2ee.tests.ejb.impl/}JaxwsWithHandlerChainBeanService#JaxwsWith
HandlerChainBeanPort)
Select any of the subject name to proceed.
```

3.1.3 Web Services WLST Command Categories

Web services WLST commands are divided into the categories described in Table 3–1.

Table 3–1 Web Services WLST Command Categories

Command Category	Definition
Section 3.2, "Session Commands"	Manage a session, which is required by some Web service WLST commands, such as those that modify repository documents and policy subject commands, need to be executed in the context of a session.
Section 3.3, "Policy Subject Commands"	View and manage Web service and Web service client policy subjects.
Section 3.4, "Configuration Commands"	View and manage OWSM domain configuration information.
Section 3.5, "Diagnostic Commands"	Check the status of the WSM components that are required for proper functioning of the product.
Section 3.6, "Web Service and Client Management Commands"	View and manage Web services for the service and client.

Table 3-1 (Cont.) Web Services WLST Command Categories

Command Category	Definition
Section 3.7, "Policy Management Commands"	View and manage policy attachment for the service and client. These commands manage both direct policy attachments and global policy attachments in policy sets.
Section 3.8, "Policy Set Management Commands"	View and manage globally available policy sets within sessions.
Section 3.9, "OWSM Repository Management Commands"	Manage the OWSM repository with new predefined policies provided in the latest installation of the software, as well as import and export documents into and from the repository.
Section 3.10, "Token Issuer Trust Configuration Commands"	View and define trusted issuers, trusted distinguished name (DN) lists, and token attribute rule filters for SAML signing certificates.

3.2 Session Commands

Some Web service WLST commands, such as those that modify repository documents and policy subject commands, need to be executed in the context of a session. Use the WLST commands listed in Table 3–2 to manage a session.

Note: The commands in this section apply to Oracle Infrastructure and RESTful Web services. They do not apply to Java EE Web services in this release.

Table 3–2 Session Management WLST Commands

Use this command	То	Use with WLST
abortWSMSession	Abort the current modification session, discarding any changes that were made to the repository during the session.	Online
beginWSMSession	Begin a session to modify a policy subject or the OWSM repository documents.	Online
commitWSMSession	Write the contents of the current session to the OWSM repository.	Online
describeWSMSession	Describe the contents of the current session. This will indicate either that the session is empty or list the name of the document that is being updated, along with the type of update (create, modify, or delete).	Online

3.2.1 abortWSMSession

Note: This command applies to Oracle Infrastructure and RESTful Web services. It does not apply to Java EE Web services in this release.

Command Category: Session

Use with WLST: Online

3.2.1.1 Description

Aborts the current modification session, discarding any changes that were made during the session. Messages are displayed that describe what was aborted.

An error will be displayed if there is no current session.

3.2.1.2 Syntax

abortWSMSession()

3.2.1.3 Examples

The following example aborts the current OWSM session.

wls:/wls-domain/serverConfig>abortWSMSession()

3.2.2 beginWSMSession

Note: This command applies to Oracle Infrastructure and RESTful Web services. It does not apply to Java EE Web services in this release.

Command Category: Session

Use with WLST: Online

3.2.2.1 Description

Begins a session to modify a policy subject, such as a policy set or a Fusion Middleware Web service endpoint. A session can act on a single policy subject only. If a session is already in progress, an error is displayed.

3.2.2.2 Syntax

beginWSMSession()

3.2.2.3 Example

The following example begins an OWSM session.

wls:/wls-domain/serverConfig>beginWSMSession()

3.2.3 commitWSMSession

Note: This command applies to Oracle Infrastructure and RESTful Web services. It does not apply to Java EE Web services in this release.

Command Category: Session

Use with WLST: Online

3.2.3.1 Description

Persists the modifications made within the current session. Messages are displayed that describe what was committed. An error will be displayed if there is no current session.

3.2.3.2 Syntax

commitWSMSession()

3.2.3.3 Example

The following example commits the current repository modification session.

wls:/wls-domain/serverConfig>commitWSMSession()

3.2.4 describeWSMSession

Note: This command applies to Oracle Infrastructure and RESTful Web services. It does not apply to Java EE Web services in this release.

Command Category: Session

Use with WLST: Online

3.2.4.1 Description

Describes the current session. For repository operations, it will either indicate that no actions have been performed in the session, or it will list the name of the document that is being updated, along with the type of update, such as create, modify, or delete. For policy subject operations, it will list the subject identifier.

If there is no current session, the following error is displayed:

No actions in session.

3.2.4.2 Syntax

describeWSMSession()

3.2.4.3 Examples

The following example describes the current session.

wls:/wls-domain/serverConfig>describeWSMSession()

3.3 Policy Subject Commands

Use the WLST commands listed in Table 3–3 to view and manage Web service and Web service client policy subjects. For more information about policy subjects, see "Understanding Policy Subjects" in *Understanding Oracle Web Services Manager*.

> **Note:** For Java EE Web services, no information is displayed. For information about viewing and modifying Java EE Web service policy attachments, see Table 3–7.

Table 3-3 Policy Subject WLST Commands

Use this command	То	Use with WLST
displayWSMEffectivePolicySet	Display the configuration of effective policy set corresponding to a policy subject.	Online
listWSMPolicySubjects	List the policy subjects that match the specified application, assembly, and subject patterns.	Online
previewWSMEffectivePolicySet	Displays the configuration of an effective policy set corresponding to a policy subject. The display will also include any changes made within the current session when it generates the effective policy set.	Online
selectWSMPolicySubject	Select the subject uniquely identified by application, assembly and subject for modification.	Online

3.3.1 displayWSMEffectivePolicySet

Command Category: Policy Subject

Use with WLST: Online

Note: This command is valid for Oracle Infrastructure Web service and clients only. For Java EE Web services, no information is displayed. For information about viewing and modifying Java EE Web service policy attachments, see Table 3–7.

3.3.1.1 Description

Displays the configuration of the actual runtime policy set and global policy attachment information used at the time of policy enforcement. This policy set and global policy attachment information is stored within the policy subject.

You must start a session and select the policy subject (using selectWSMPolicySubject) before initiating the command. If there is no current session and no policy subject selected, an error is displayed.

Compare this command with the "displayWSMPolicySet" on page 3-81 command, which displays only the selected global policy set or the selected local policy set, or with the "previewWSMEffectivePolicySet" on page 3-14, which displays the effective policy set, including changes made to the actual runtime policy set, within the current session.

3.3.1.2 Syntax

displayWSMEffectivePolicySet()

3.3.1.3 Examples

The following example for an Oracle Infrastructure Web service lists that the policies, oracle/wss_username_token_service_policy and oracle/log_policy, are in effect at the time of enforcement.

wls:/jrfServer_domain/serverConfig> selectWSMPolicySubject('/weblogic/jrfServer_

```
domain/jaxws-sut', '#jaxws-sut-service', 'WS-SERVICE({http://service.jaxws.wsm.oracl
e/}TestService#TestPort)')
The policy subject is selected for modification.
```

wls:/jrfServer_domain/serverConfig> displayWSMEffectivePolicySet()

3.3.2 listWSMPolicySubjects

Command Category: Policy Subject

Use with WLST: Online

3.3.2.1 Description

Lists the policy subjects that match the specified application, assembly, and subject patterns. You can use the optional detail argument to include effective policy set information in the output. The command does not require starting a session.

For more information about the pattern used to identify a subject, see Section 3.1.2, "Identifying the Policy Subject."

3.3.2.2 Syntax

listWSMPolicySubjects([application=None], [assembly=None], [subject=None], [detail='f alse'])

Argument	Definition
application	Optional. Pattern identifying applications.
assembly	Optional. Pattern identifying assemblies.
subject	Optional. Pattern identifying subjects.
detail	Optional. Specifies whether to include effective policy set information in the output. The default value is false.

To simplify searching for a particular subject, the application, assembly, or subject argument can specify a pattern containing the wildcard character (*). In this case, all the subjects matching that pattern will be listed.

3.3.2.3 Examples

The following invocation of the listWSMPolicySubjects command with detail='true' returns the application, assembly, and subject information for all subjects being managed in base_domain.

```
wls:/base_domain/serverConfig> listWSMPolicySubjects(detail='true')
Application: /weblogic/base_domain/SimpleRestApp
 Assembly: #SimpleRestApp
    Subject:
WS-SERVICE({http://rest.jaxws.ws.j2ee.oracle/}SimpleRestServiceService#SimpleRestS
ervicePort)
        The web service is not secure in this context.
Application: /weblogic/base_domain/jaxwsejb30ws
 Assembly: #jaxwsejb
    Subject:
```

```
WS-SERVICE({http://mycompany.com/targetNamespace}EchoEJBService#EchoEJBServicePort
       The web service is not secure in this context.
   Subject:
WS-SERVICE({http://mycompany.com/jaxws/tests/concrete}WsdlConcreteService#WsdlConc
retePort)
       The web service is not secure in this context.
   Subject:
WS-SERVICE({http://mycompany.com/jaxws/tests}CalculatorService#CalculatorPort)
       The web service is not secure in this context.
   Subject:
WS-SERVICE({http://soapinterop.org/DoclitWrapperWTJ}DoclitWrapperWTJService#Doclit
WrapperWTJPort)
       The web service is not secure in this context.
   Subject:
WS-SERVICE({http://j2ee.tests.ejb.impl/}JaxwsWithHandlerChainBeanService#JaxwsWith
HandlerChainBeanPort)
       The web service is not secure in this context.
Application: /weblogic/base_domain/wsm-pm
 Assembly: #Diagnostic
   Subject:
WS-SERVICE({http://diagnostic.jaxws.wsmtest/}DiagnosticService#DiagnosticPort)
       URI="oracle/wss_saml_or_username_token_service_policy", category=security,
policy-status=enabled; source=local policy set; reference-status=enabled;
effective=true
       The web service is secure in this context.
Invoking the listWSMPolicySubjects command with ('jax*') as the argument
returns all subjects belonging to the jaxwsejb30ws application:
wls:/base_domain/serverConfig> listWSMPolicySubjects('jax*')
Application: /weblogic/base_domain/jaxwsejb30ws
 Assembly: #jaxwsejb
   Subject:
WS-SERVICE({http://mycompany.com/targetNamespace}EchoEJBService#EchoEJBServicePort
)
   Subject:
WS-SERVICE({http://mycompany.com/jaxws/tests/concrete}WsdlConcreteService#WsdlConc
retePort)
   Subject:
WS-SERVICE({http://mycompany.com/jaxws/tests}CalculatorService#CalculatorPort)
```

3.3.3 previewWSMEffectivePolicySet

Command Category: Policy Subject

Use with WLST: Online

3.3.3.1 Description

Displays the configuration of the effective policy set corresponding to the policy subject. The display will also include any changes made within current session when it generates the effective policy set.

You must start a session and select the policy subject (using selectWSMPolicySubject) before initiating the command. An error will display if no policy subject is selected.

See also "displayWSMEffectivePolicySet" on page 3-11, which displays the actual policy set used at the time of enforcement, but does not display any changes made to the policy set during the current session.

3.3.3.2 Syntax

previewWSMEffectivePolicySet()

3.3.3.3 Examples

wls:/wls-domain/serverConfig>previewWSMEffectivePolicySet()

3.3.4 selectWSMPolicySubject

Command Category: Policy Subject

Use with WLST: Online

3.3.4.1 Description

Within a session, selects a policy subject for modification. You uniquely specify a policy subject by the application, assembly, and policy subject name. Once selected, the policy management commands can be used to modify the directly attached policy set for the policy subject.

You must start a session (beginWSMSession) before performing any policy management edits or policy set transactions. You must also select the policy subject that you want to modify before issuing policy management commands. If there is no current session or there is already an existing modification process, an error is displayed.

For more information on using this command, see "Identifying the Policy Subject" on page 3-3 and "Identifying and Selecting the Policy Subject Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

3.3.4.2 Syntax

selectWSMPolicySubject([application=None], [assembly=None], [subject=None])

Argument	Description
application	Name of the application.
assembly	Name of the assembly. Uniquely identifies the module within an application.

Argument	Description
subject	Name of the policy subject.

Any of the three arguments can specify a pattern containing Note: wildcard character "*". In this case, all the names matching that pattern will be listed. You need to select the name uniquely identifying the subject. The pattern can be specified only for the last unknown entity.

3.3.4.3 Examples

The following example selects the TestService#TestPort port in the jaxws-sut-service module (assembly) that belongs to the jaxws-sut application. See "Identifying the Policy Subject" on page 3-3 for additional examples.

wls:/jrfServer_domain/serverConfiq> selectWSMPolicySubject('/webloqic/jrfServer_ domain/jaxws-sut','#jaxws-sut-service','WS-SERVICE({http://service.jaxws.wsm.oracl e/}TestService#TestPort)')

The policy subject is selected for modification.

3.4 Configuration Commands

Use the WLST commands listed in Table 3–4 to view and configure the OWSM domain.

> **Note:** The setConfiguration command has been deprecated. It is recommended that you use the setWSMConfiguration command described in "setWSMConfiguration" on page 3-18.

Table 3-4 **OWSM Environment WLST Commands**

Use this command	То	Use with WLST
configureWSMKeystore	Set the keystore configuration properties.	Online
displayWSMConfiguration	Display the full configuration properties and their values and groups for the specified product.	Online
setWSMConfiguration	Set the configuration properties of the specified product.	Online

3.4.1 configureWSMKeystore

Command Category: Configuration

Use with WLST: Online

3.4.1.1 Description

Sets the configuration properties for the OWSM keystore.

For more information, see "Configuring the OWSM Keystore Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

Note: Changes to the keystore configuration at the domain level require that you restart the server.

3.4.1.2 Syntax

configureWSMKeystore(context, keystoreType, location, keystorePassword, signAlias, signAliasPassword, cryptAlias, cryptAliasPassword)

Arguments	Description
context	Optional. The context of the configuration document in which the modifications will be done.
keystoreType	Optional. The keystore type category of the property. Valid keystore types are JKS, KSS, PKCS11, and LUNA.
location	Optional. For JKS, it is the absolute location of the keystore or location relative to the fmwconfig directory. For KSS, the format of location should be kss://stripeName/keystoreName The default is kss://owsm/keystore.
keystorePassword	Optional. The keystore password of the keystore configured. It is required for JKS and PKCS11.
signAlias	Optional. The Alias of the sign key. It is required for JKS and PKCS11.
signAliasPassword	Optional. Password of the Alias of the sign key. It is required for JKS and PKCS11.
cryptAlias	Optional. The Alias of the Encryption key. It is required for JKS and PKCS11.
cryptAliasPassword	Optional. Password of the Alias of the Encryption key. It is required for JKS and PKCS11.

3.4.1.3 Examples

The following example configures the JKS keystore default-keystore.jks in the domain myDomain. It provides the keystore password oratest123, the sign alias oraAlias, the sign alias password ora234, the encryption alias oraCryptAlias, the encryption alias password ora123.

```
wls:/jrfServer_domain/serverConfig> configureWSMKeystore ('/WLS/myDomain','JKS',
'./default-keystore.jks','oratest123', 'oraAlias','ora234','oraCryptAlias',
'ora123')
```

The following example configures the KSS keystore at kss://owsm/keystore in the domain myDomain. It provides the sign alias oraAlias, and the encryption alias oraCryptAlias.

```
wls:/jrfServer_domain/serverConfig> configureWSMKeystore
('/WLS/myDomain',keystoreType='KSS', location='kss://owsm/keystore',
signAlias='oraAlias', cryptAlias='encAlias')
```

3.4.2 displayWSMConfiguration

Command Category: Configuration

Use with WLST: Online

3.4.2.1 Description

Displays the full set of configuration properties, and their values and groups, for the product specified in the context. If a property is not defined in the configuration document associated with the context, then the default value defined for the product is displayed. If a context is not specified, then the set of properties matching the current context is displayed.

For more information, see "Managing OWSM Domain Configuration Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

3.4.2.2 Syntax

displayWSMConfiguration([context=None])

Arguments	Description
context	Optional. The context of the configuration document from which property values are displayed. If a <i>context</i> is not specified, then the set of properties matching the current context is displayed.
	To display the default set of properties along with their values, use "/" as the context value."

3.4.2.3 Examples

The following example displays the configuration contained in the configuration document in the repository.

wls:/jrfServer_domain/serverConfig> displayWSMConfiguration()

The following example displays the configuration for the base_domain domain.

wls:/jrfServer_domain/serverConfig> displayWSMConfiguration('WLS/base_domain')

3.4.3 setConfiguration

Command Category: Configuration

Use with WLST: Online

Note: This command has been deprecated. It is recommended that you use the setWSMConfiguration command described in 'setWSMConfiguration" on page 3-18.

3.4.3.1 Description

Sets the configuration properties of a domain. The properties are stored in a configuration document for the domain. If a configuration document does not exist, a new one is created.

A new property with values and/or groups of values can be added inside the configuration document. The set of acceptable properties is determined from the default set of properties supported by the product. Specific property values or groups of values can be removed from the configuration document. The configuration document itself is removed if no properties exist in it.

3.4.3.2 Syntax

setConfiguration(context, category, name, [group=None], [values=None])

Arguments	Description
context	Optional. The context of the configuration document to be modified for the product. If a context is not provided or is set to None, then the configuration document associated with the currently connected domain is used. For example /WLS/base_domain.
category	The category of the property. This is verified against the default set of properties to ensure it is acceptable for the context.
	Use the displayWSMConfiguration command to see the category name associated with each property.
name	The name of the property. This is verified with the default set of properties for acceptability.
group	Optional. A group containing the set of values to add in a property document. If set to None, then the group will be removed, if such a group exists.
values	Optional. The array of values to set for a property or group inside the property document.

3.4.3.3 Examples

The following example resets the entire configuration for the domain myDomain to its default values.

wls:/jrfServer_domain/serverConfig> setConfiguration('/WLS/myDomain')

The following command resets the value of the clock. skew property in myDomain to 500.

```
wls:/jrfServer_domain/serverConfig>
setConfiguration('/WLS/myDomain','Agent','clock.skew',None, ['500'])
```

The following command resets the value of the clock. skew property in myDomain to its default value.

```
wls:/jrfServer_domain/serverConfig>
setConfiguration('/WLS/myDomain','Agent','clock.skew',None,None)
```

3.4.4 setWSMConfiguration

Command Category: Configuration

Use with WLST: Online

3.4.4.1 Description

Sets the configuration properties of a domain. The properties are stored in a configuration document for the domain. If a configuration document does not exist, a new one is created.

A new property with values and/or groups of values can be added inside the configuration document. The set of acceptable properties is determined from the default set of properties supported by the product. Specific property values or groups of values can be removed from the configuration document. The configuration document itself is removed if no properties exist in it.

For more information, see "Managing OWSM Domain Configuration Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

3.4.4.2 Syntax

setWSMConfiguration(context, category, name, [group=None], [values=None])

Arguments	Description
context	Optional. The context of the configuration document to be modified. If a context is not provided or is set to None, then the configuration document associated with the currently connected domain is used. For example /WLS/base_domain.
category	The category of the property. This is verified against the default set of properties to ensure it is acceptable for the context.
	Use the displayWSMConfiguration command to see the category name associated with each property.
name	The name of the property. This is verified against the default set of properties to ensure it is acceptable for the context.
group	Optional. A group containing the set of values to add in a configuration document. If the group exists, and this value is set to None, the group is removed.
values	Optional. The array of values to set for a property or group inside the configuration document.

3.4.4.3 Examples

The following example resets the entire configuration for the domain myDomain to its default values.

wls:/jrfServer_domain/serverConfig> setWSMConfiguration('/WLS/myDomain')

The following command resets the value of the clock.skew property in myDomain to 500.

```
wls:/jrfServer_domain/serverConfig>
setWSMConfiguration('/WLS/myDomain','Agent','clock.skew',None, ['500'])
```

The following command resets the value of the clock.skew property in myDomain to its default value.

```
wls:/jrfServer_domain/serverConfig>
setWSMConfiguration('/WLS/myDomain','Agent','clock.skew',None,None)
```

3.5 Diagnostic Commands

Use the WLST command in this section to check the status of the WSM components that are required for proper functioning of the product.

3.5.1 checkWSMStatus

Command Category: Diagnostic

Use with WLST: Online

3.5.1.1 Description

Checks the status of the OWSM components that are required for proper functioning of the product. The OWSM components that are checked are the Policy Manager (wsm-pm), the agent (agent), and the credential store and keystore configuration. The status of the components can be checked together or individually.

Note: The Policy Manager (wsm-pm) application must be deployed and running for the check status tool to function correctly.

3.5.1.2 Syntax

checkWSMStatus([component=None], [address=None], [verbose=true])

Arguments	Description
component	Optional. All checks will be performed if no value is specified. Valid options are:
	 wsm-pm—Policy Manager. Checks the configuration state of the policy manager component.
	 agent—Enforcement Agent. Checks status of end-to-end service-side enforcement through the wsm agent component. The enforcement check is specific only to the environment from which the command is run.
	 credstore—Credential Store. Checks whether the credentials are configured for the keystore password, signing, and encryption certificates in the keystore.
address	Optional. The HTTP URL of the host running the wsm-pm application. This value is required for checking enforcement through an agent component, for example,
	<pre>checkWSMStatus('agent', 'http://localhost:7001')</pre>
	The address is not required in the WebLogic Server domain where auto-discovery is present.
verbose	Optional. If the value of this flag is true, then the detailed messages (including stack trace, if any) will be displayed. Default is false.

3.5.1.3 Examples

In the following example, the checkWSMStatus command is run without arguments. The status of the credential store, policy manager, and enforcement agent is returned.

```
wls:/base_domain/serverConfig> checkWSMStatus()
Credential Store Configuration:
PASSED.
       Message(s):
            keystore.pass.csf.key: Property is configured and its value is
"keystore-csf-key".
                Description: The "keystore.pass.csf.key" property points to the
CSF alias that is mapped to the username and password of the keystore. Only the
password is used; username is redundant in the case of the keystore.
             keystore-csf-key: Credentials configured.
             keystore.sig.csf.key : Property is configured and its value is
"sign-csf-key".
                Description: The "keystore.sig.csf.key" property points to the
CSF alias that is mapped to the username and password of the private key that is
used for signing.
             sign-csf-key : Credentials configured.
             Sign Key: Key configured.
                Alias - orakey
             Sign Certificate: Certificate configured.
                Alias - CN=weblogic, OU=Orakey Test Encryption Purposes Only,
O=Oracle, C=US
```

```
Expiry - June 28, 2020 11:17:12 AM PDT
            keystore.enc.csf.key : Property is configured and its value is
"enc-csf-key".
                 Description: The "keystore.enc.csf.key" property points to the
CSF alias that is mapped to the username and password of the private key that is
used for decryption.
            enc-csf-key: Credentials configured.
            Encrypt Key: Key configured.
                Alias - orakey
            Encrypt Certificate: Certificate configured.
                Alias - CN-weblogic, OU-Orakey Test Encryption Purposes Only,
O=Oracle, C=US
                Expiry - June 28, 2020 11:17:12 AM PDT
Policy Manager:
PASSED.
        Message(s):
            OWSM Policy Manager connection state is OK.
            OWSM Policy Manager connection URL is "host.example.com:1234".
Enforcement Agent:
PASSED.
        Message(s):
            Enforcement is successful.
             Service URL: http://host:port/Diagnostic/DiagnosticService?wsdl
In the following example, the credential store key keystore-csf-key is deleted and
the checkWSMStatus command is rerun for the credential store credstore. The
status check fails because the csf-key keystore-csf-key is not present in the
credential store:
wls:/base_domain/serverConfig> deleteCred(map="oracle.wsm.security",
key="keystore-csf-key")
wls:/base domain/serverConfig> checkWSMStatus('credstore')
Credential Store Configuration:
FAILED.
       Message(s):
            keystore.pass.csf.key: Property is configured and its value is
"keystore-csf-key".
                Description: The "keystore.pass.csf.key" property points to the
CSF alias that is mapped to the username and password of the keystore. Only the
password is used; username is redundant in the case of the keystore.
             keystore-csf-key: Credentials not configured.
Credential Store Diagnostic Messages:
       Message(s):
                 The csf-key keystore-csf-key is not present in the credential
store.
Perform the following steps to update the credential store (using WLST
commands):-
1. connect()
createCred(map="oracle.wsm.security", key="keystore-csf-key",
user="keystore-csf-key", password="<keystore-password>", desc="Keystore Password
```

```
CSF Kev")
NOTE: - All the above commands are based on the Domain level configurations. The
actual csf key may be overridden at runtime due to config override. See
Documentation for more details.
In the following example, the csf-key keystore-csf-key is configured and the
checkWSMStatus command is rerun. The configuration check passes.
wls:/base_domain/serverConfig> createCred(map="oracle.wsm.security",
key="keystore-csf-key", user="keystore-csf-key", password="welcome1",
desc="Keystore Password CSF Key")
Already in Domain Runtime Tree
wls:/base_domain/serverConfig> checkWSMStatus('credstore')
Credential Store Configuration:
PASSED.
       Message(s):
             keystore.pass.csf.key : Property is configured and its value is
"keystore-csf-key".
                 Description: The "keystore.pass.csf.key" property points to the
CSF alias that is mapped to the username and password of the keystore. Only the
password is used; username is redundant in the case of the keystore.
             keystore-csf-key : Credentials configured.
             keystore.sig.csf.key : Property is configured and its value is
"sign-csf-key".
                 Description: The "keystore.sig.csf.key" property points to the
CSF alias that is mapped to the username and password of the private key that is
used for signing.
             sign-csf-key : Credentials configured.
             Sign Key: Key configured.
                Alias - orakey
             Sign Certificate: Certificate configured.
                 Alias - CN=weblogic, OU=Orakey Test Encryption Purposes Only,
O=Oracle, C=US
                 Expiry - June 28, 2020 11:17:12 AM PDT
             keystore.enc.csf.key : Property is configured and its value is
"enc-csf-key".
                 Description: The "keystore.enc.csf.key" property points to the
CSF alias that is mapped to the username and password of the private key that is
used for decryption.
             enc-csf-key : Credentials configured.
             Encrypt Key: Key configured.
                Alias - orakey
             Encrypt Certificate: Certificate configured.
                Alias - CN=weblogic, OU=Orakey Test Encryption Purposes Only,
O=Oracle, C=US
                 Expiry - June 28, 2020 11:17:12 AM PDT
true
The following example checks the enforcement status of the agent component at the
URL http://localhost:7001.
wls:/test_domain1/serverConfig> checkWSMStatus('agent','http://localhost:7001')
Enforcement Agent:
Note: Enforcement might succeed if OWSM Policy Manager is down due to policy
caching. For such scenarios wsm-pm test must be run prior to this test.
```

PASSED.

Message(s):

Enforcement is successful.

Service URL: http://localhost:7001/Diagnostic/DiagnosticService?wsdl

3.6 Web Service and Client Management Commands

Use the WLST commands listed in Table 3–5 to view and manage Web services for deployed, active, and running Web service applications.

Table 3–5 Web Service and Client Management WLST Commands

Use this command	То	Use with WLST
listWebServiceClientPorts	List Web service client ports information for an application.	Online
listWebServiceClients	List Web service client information for an application or domain.	Online
listWebServiceClientStubProperties	List Web service client port stub properties for an application.	Online
listWebServicePorts	List the Web service ports for a Web service application.	Online
listWebServices	List the Web service information for an application or domain.	Online
setWebServiceClientStubProperties	Configure the set of stub properties of a Web service client port for an application.	Online
setWebServiceClientStubProperty	Set, change, or delete a single stub property of a Web service client port for an application.	Online

3.6.1 listWebServiceClientPorts

Command Category: Web Service and Client Management

Use with WLST: Online

3.6.1.1 Description

Lists the Web service port names and the endpoint URLs for Web service clients in an application.

The output will display the name of the Web service client/reference port. For example:

AppModuleServiceSoapHttpPort

3.6.1.2 Syntax

listWebServiceClientPorts(application,moduleOrCompName,moduleType,serviceRefName)

Argument	Definition
application	Name and path of the application for which you want to list the Web services port information. For example, /domain/server/application#version_number
	To list the client port information for an application, this argument is required.
moduleOrCompName	Name of the Web module for which you want to list the Web service client port information.
moduleType	Module type. Valid options are:
	 web—Oracle Infrastructure Web services packaged as a Web module (including an EJB).
	 wls—Java EE Web services.
	 wsconn—Use with a connection-based Web service client such as an ADF DC Web service client, ADF JAX-WS Indirection Proxy.
serviceRefName	Service reference name of the application for which you want to list the Web service client port information.
	When the client is an asynchronous Web service callback client, the serviceRefName argument must be set to callback.

3.6.1.3 Examples

The following example lists the client ports for the WssUsernameClient Web module in the /base_domain/server1/jwsclient_1#1.1.0 application. Note that the moduleType is set to wsconn, and the serviceRefName is set to WssUsernameClient.

wls:/base_domain/serverConfig> listWebServiceClientPorts ('/base domain/server1/jwsclient 1#1.1.0','WssUsernameClient','wsconn', 'WssUsernameClient')

3.6.2 listWebServiceClients

Command Category: Web Service and Client Management

Use with WLST: Online

3.6.2.1 Description

Lists Web service clients information for an application or domain. If an application is not specified, the command lists information about all Web service clients in all applications for every server instance in the domain.

You can specify the amount of information to be displayed in the output using the detail argument. When specified, the output provides endpoint (port) and policy details for clients in the domain, the secure status of the endpoints, any configuration overrides and constraints, and if the endpoints have a valid configuration. A subject is considered secure if the policies attached to it (either directly or globally) enforce authentication, authorization, or message protection behaviors. Because you can specify the priority of a global or directly attached policy (using the reference.priority configuration override), the effective field indicates if the directly attached policies are in effect for the endpoint.

Note that to simplify endpoint management, all directly attached policies are shown in the output regardless of whether they are in effect. In contrast, only globally attached

policies that are in effect for the endpoint are displayed. For more information, see "How the Effective Set of Policies is Calculated" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

The output is listed by each application deployed as shown in the following examples:

This example shows the output of an *unsecured* endpoint:

wls:/jrfServer_domain/serverConfig> listWebServiceClients(detail=true)

/jrfServer_domain/jrfServer_admin/ADFDCDecoupling_Project1_ADFDCDecoupling : moduleName=testadfbc, moduleType=wsconn, serviceRefName=AppModuleService AppModuleServiceSoapHttpPort

The policy subject is not secure in this context.

This example shows the output for a *secured* endpoint:

wls:/jrfServer_domain/serverConfig> listWebServiceClients(detail=true)

/jrfServer_domain/jrfServer_admin/ADFDCDecoupling_Project1_ADFDCDecoupling : moduleName=testadfbc, moduleType=wsconn, serviceRefName=AppModuleService AppModuleServiceSoapHttpPort

serviceWSDLURI=http://host.example.com:1234/ADFBCDecoupling-ADFBCDecoupling-contex t-root/AppModuleService?wsdl

URI="oracle/wss10_saml_token_with_message_protection_client_ policy", category=security, policy-status=enabled; source=local policy set; reference-status=enabled; effective=true

The policy subject is secure in this context.

3.6.2.2 Syntax

listWebServiceClients(application,[detail])

Argument	Definition
application	Name and path of the application for which you want to list the Web service clients. For example, /domain/server/application#version_number
	If specified, all Web services clients in the application are listed.
detail	Optional. Specifies whether to list port and policy details for the Web service clients.
	Valid values are:
	 true—Output includes details about the clients, ports, policies, and whether the endpoint is secure or not.
	• false—Output lists only the clients. The default is false.

3.6.2.3 Examples

The following example lists information for all Web service clients in the domain.

wls:/wls-domain/serverConfig>listWebServiceClients()

The following example lists the Web service clients for the application jwsclient 1#1.10 for the server server1 in the domain base_domain.

wls:/wls-domain/serverConfig>listWebServiceClients('base domain/server1/jwsclient 1#1.10')

The following example lists details for all of the Web service clients in the domain.

wls:/wls-domain/serverConfig>listWebServiceClients(None,None,true)

3.6.3 listWebServiceClientStubProperties

Note: This command applies to Oracle Infrastructure Web service clients only.

Command Category: Web Service and Client Management

Use with WLST: Online

3.6.3.1 Description

Lists Web service client port stub properties for an application.

3.6.3.2 Syntax

serviceRefName, portInfoName)

Argument	Definition	
application	Name and path of the application for which you want to list the Web services client port stub properties. For example, /domain/server/application#version_number	
	To list the client port stub properties information for an application, this argument is required.	
moduleOrCompName	Name of the Web module for which you want to list the Web services client port stub properties.	
moduleType	Module type. Valid options are:	
	 web—Oracle Infrastructure Web services packaged as a Web module (including an EJB). 	
	 wsconn—Use with a connection-based Web service client such as an ADF DC Web service client, ADF JAX-WS Indirection Proxy. 	
serviceRefName	Service reference name of the application for which you want to list the Web service client port stub properties.	
portInfoName	The name of the client port for which you want to list the stub properties.	

3.6.3.3 Example

The following example lists the client port stub properties for the JRFWssUsernamePort port of the WssUsernameClient Web module in the /base_domain/server1/jwsclient_1#1.1.0 application. Note that the moduleType is set to wsconn, and the serviceRefName is set to WssUsernameClient.

```
wls:/base_domain/serverConfig>listWebServiceClientStubProperties
('/base_domain/server1/jwsclient_1#1.1.0','WssUsernameClient','wsconn',
'WssUsernameClient','JRFWssUsernamePort')
```

3.6.4 listWebServicePorts

Command Category: Web Service and Client Management

Use with WLST: Online

3.6.4.1 Description

Lists the Web service port names and the endpoint URLs for a Web service application.

The output will display the port name and endpoint URL of the Web service port. For example:

JRFWssUsernamePort.

http://localhost:7001/j2wbasicPolicy/WssUsername

3.6.4.2 Syntax

listWebServicePorts(application, moduleOrCompName, moduleType, serviceName)

Argument	Definition	
application	Name and path of the application for which you want to list the Web services port information. For example, /domain/server/application#version_number	
	To list the port information for an application, this argument is required.	
moduleOrCompName	Name of the Web module for which you want to list the Web services port information.	
moduleType	Module type. Valid options are:	
	 web—Oracle Infrastructure Web services packaged as a Web module (including an EJB). 	
	 wls—Java EE Web services. 	
serviceName	Name of the Web service in the application for which you want to list the port information. For example, {http://namespace/}serviceName.	

3.6.4.3 Example

The following example lists the Web service ports and endpoint URLs for the Oracle Infrastructure Web service j2wbasicPolicy service in the base_ domain/AdminServer/HelloWorld#1_0 application. Note that the WssUsernameService module name is specified, and the moduleType is set to web.

wls:/base_domain/serverConfig> listWebServicePorts

('/base_domain/AdminServer/HelloWorld#1_0',

'WssUsernameService','web','{http://namespace/}j2wbasicPolicy')

JRFWssUsernamePort

http://localhost:7001/j2wbasicPolicy/WssUsername

The following example lists the Web service ports and endpoint URLs for the Java EE Web service helloworldJaxws in the

wls-domain/AdminServer/helloWorldJaxws application. Note that the moduleType is set to wls.

wls:/wls-domain/serverConfig> listWebServicePorts

('/wls-domain/AdminServer/helloWorldJaxws', 'helloWorldJaxws#1!helloWorldJaxws', helloWorldJaxws', helloWorldJaxws', helloWorldJaxws, helloWorldJaxws', helloWorldJaxws, helloWorldWorld, helloWorldWorld, helloWorldWorld, helloWorld, helloWorl'wls','helloWorldJaxws')

helloWorldJaxwsSoapHttpPort

3.6.5 listWebServices

Command Category: Web Service and Client Management

Use with WLST: Online

3.6.5.1 Description

Lists the Web service information for an application or domain. If you don't specify a Web service application, the command lists all services in all applications for every server instance in the domain.

You can specify the amount of information to be displayed in the output using the detail argument. When specified, the output provides endpoint (port) and policy details for all applications in the domain, the secure status of the endpoints, any configuration overrides and constraints, and if the endpoints have a valid configuration. A subject is considered secure if the policies attached to it (either directly or globally) enforce authentication, authorization, or message protection behaviors. Because you can specify the priority of a global or directly attached policy (using the reference.priority configuration override), the effective field indicates if the directly attached policies are in effect for the endpoint.

Note that to simplify endpoint management, all directly attached policies are shown in the output regardless of whether they are in effect. In contrast, only globally attached policies that are in effect for the endpoint are displayed. For more information, see "How the Effective Set of Policies is Calculated" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

The output is listed by each application deployed as shown in the following example:

```
/domain/server/application#version number:
    moduleName=helloModule, moduleType=web,
serviceName={http://namespace/}service
```

Notes: For applications assembled prior to 11g Release 1, (11.1.1.6), the namespace is not displayed with the serviceName in the output.

3.6.5.2 Syntax

listWebServices (application,[detail])

Argument	Definition	
application	Name and path of the application for which you want to list the Web services. For example, /domain/server/application#version_number	
	If specified, all Web services in the application are listed.	
detail	Optional. Specifies whether to list port and policy details for the Web service.	
	Valid values are:	
	 true—Output includes details about the service, the port, and the policies. 	
	 false—Output lists only the services. The default is false. 	

3.6.5.3 **Examples**

The following example for an Oracle Infrastructure Web service lists all the Web services in all applications in the domain. Sample output is shown in this example.

```
wls:/base_domain/serverConfig> listWebServices()
/base_domain/AdminServer/jaxwsejb30ws :
       moduleName=jaxwsejb, moduleType=web,
serviceName=JaxwsWithHandlerChainBeanService
       moduleName=jaxwsejb, moduleType=web, serviceName=WsdlConcreteService
        moduleName=jaxwsejb, moduleType=web, serviceName=EchoEJBService
        moduleName=jaxwsejb, moduleType=web, serviceName=CalculatorService
        moduleName=jaxwsejb, moduleType=web, serviceName=DoclitWrapperWTJService
The following example for an Oracle Infrastructure Web service sets the detail
argument to true. Sample output is shown in this example. Note that the reference
priority of the globally attached policy to 10 and the directly attached policy is not in
effect for the endpoint CalculatorPort in the application jaxwsejb30ws. Security
policies are shown in bold text.
wls:/base_domain/serverConfig> listWebServices(detail='true')
/base_domain/AdminServer/jaxwsejb30ws :
moduleName=jaxwsejb, moduleType=web, serviceName=CalculatorService
           CalculatorPort http://host.example.com:1234/jaxwsejb/Calculator

```

The policy subject is secure in this context.

The following example for a Java EE Web service sets the detail argument to true. Sample output is shown in this example. The output lists all the Web services in all applications in the domain.

```
/base_domain/AdminServer/simpleJAXWS :
    moduleName=SimpleJAXWS#1!SimpleEjbService, moduleType=wls,
serviceName=SimpleEjbService
       SimplePort
       The policy subject is not secure in this context.
```

3.6.6 setWebServiceClientStubProperties

Note: This command applies to Oracle Infrastructure Web service clients only.

Command Category: Web Service and Client Management

Use with WLST: Online

3.6.6.1 Description

Configures the set of stub properties of a Web service client port for an application.

This command configures or resets all of the stub properties for the OWSM client security policy attached to the client. Each property that you list in the command is set to the value you specify. If a property that was previously set is not explicitly specified in this command, it is reset to the default for the property. If no default exists, the property is removed.

3.6.6.2 Syntax

setWebServiceClientStubProperties(application, moduleOrCompName, moduleType, serviceRefName, portInfoName, properties)

Argument	Definition	
application	Name and path of the application for which you want to reset the Web services client port stub properties. For example, /domain/server/application#version_number	
	To configure or reset the client port stub properties for an application, this argument is required.	
moduleOrCompName	Name of the Web module for which you want to reset the Web services client port stub properties.	
moduleType	Module type. Valid options are:	
	 web—Oracle Infrastructure Web services packaged as a Web module (including an EJB). 	
	 wsconn—Use with a connection-based Web service client such as an ADF DC Web service client, ADF JAX-WS Indirection Proxy. 	
serviceRefName	Service reference name of the application for which you want to reset the Web service client port stub properties.	
portInfoName	The name of the client port for which you want to reset the stub properties.	

Argument	Definition
properties	The list of properties to be set or changed. Properties must be specified using the following format:
	("property","value")
	For example:
	<pre>[("keystore.recipient.alias","oracle"), ("csf-key","oracle")]</pre>
	To remove a property or clear the value assigned to it, specify a blank " " value. For example:
	[("csf-key","")]
	To remove all the properties of the client port, set this argument to None.
	Sample client port stub properties are as follows:
	<pre>oracle.webservices.auth.username</pre>
	oracle.webservices.auth.password
	keystore.recipient.alias
	<pre>csf-key</pre>
	<pre>saml.issuer.name</pre>
	<pre>javax.xml.ws.session.maintain</pre>

3.6.6.3 Example

The following example resets the client port stub properties ROLE and keystore.recipient.alias to ADMIN and orakey, respectively. Any other properties that were previously set for this client port are either reset to the default or removed. The client port is JRFWssUsernamePort of the WssUsernameClient Web module in the /base_domain/server1/jwsclient_1#1.1.0 application. Note that the moduleType is set to wsconn, and the serviceRefName is set to WssUsernameClient.

```
wls:/base_domain/serverConfig>setWebServiceClientStubProperties('/base_
domain/server1/jwsclient_1#1.1.0',
'WssUsernameClient','wsconn','WssUsernameClient','JRFWssUsernamePort',
[("ROLE","ADMIN"),("keystore.recipient.alias","orakey")] )
```

3.6.7 setWebServiceClientStubProperty

Command Category: Web Service and Client Management

Use with WLST: Online

3.6.7.1 Description

Sets, changes, or deletes a single stub property of a Web service client port for an application.

3.6.7.2 Syntax

setWebServiceClientStubProperty(application, moduleOrCompName, moduleType, serviceRefName,portInfoName,propName,[propValue])

Argument	Definition	
application	Name and path of the application for which you want to set the Web services client port stub property. For example, /domain/server/application#version_number	
	To set a client port stub property for an application, this argument is required.	
moduleOrCompName	Name of the Web module for which you want to set the Web services client port stub property.	
moduleType	Module type. Valid options are:	
	 web—Oracle Infrastructure Web services packaged as a Web module (including an EJB). 	
	w1s—Java EE Web services.	
	 wsconn—Use with a connection-based Web service client such as an ADF DC Web service client, ADF JAX-WS Indirection Proxy. 	
serviceRefName	Service reference name of the application for which you want to set the Web service client port stub property.	
portInfoName	The name of the client port for which you want to set the stub property.	
propName	Stub property name that you want to set, change, or delete. For example, 'keystore.recipient.alias'.	
propValue	Optional. The stub property value, for example, 'orakey'.	
	To remove the property, specify a blank " " value.	

3.6.7.3 Example

The following example sets the client port stub property keystore.recipient.alias to the value orakey for the client port JRFWssUsernamePort. The port is a client port of the WssUsernameClient Web module in the /base_domain/server1/jwsclient_1#1.1.0 application. Note that the module Type is set to wsconn, and the service Ref Name is set to WssUsernameClient.

wls:/base_domain/serverConfig>setWebServiceClientStubProperty ('/base_domain/server1/jwsclient_1#1.1.0','WssUsernameClient','wsconn', 'WssUsernameClient','JRFWssUsernamePort','keystore.recipient.alias','orakey')

3.7 Policy Management Commands

Note: The policy management commands for Java EE Web Services (or clients) listed in Table 3–7 have been deprecated in this release for Oracle Infrastructure Web Services.

For Oracle Infrastructure Web services, to manage OWSM directly attached policies in release 12c, it is recommended that you use the new WLST commands listed in Table 3–6. For a complete list of deprecated commands, see "Deprecated Commands for Oracle Infrastructure Web Services" in Release Notes.

Use the WLST commands listed in Table 3-6 to manage Oracle Infrastructure and RESTful Web Services direct and global policy attachments.

Table 3–6 Oracle Infrastructure and RESTful Web Services and Clients - WLST **Commands for Direct Policy Attachments**

Use this command	То	Use with WLST
attachWSMPolicy	Attach a policy to the selected policy subject or policy set document within a session.	Online
attachWSMPolicies	Attach multiple policies to the selected policy subject or policy set document within a session.	Online
detachWSMPolicy	Detach a policy from the selected policy subject or policy set document within a session.	Online
detachWSMPolicies	Detach multiple policies from the selected policy subject or policy set document within a session.	Online
enableWSMPolicies	Enable or disable multiple policies that are attached to the selected policy subject or policy set document within a session.	Online
enableWSMPolicy	Enable or disable a policy that is attached to the selected policy subject or policy set document within a session.	Online
listAvailableWebServicePolicies	Display a list of all the available OWSM policies by category or subject type.	Online
listWebServiceClientPolicies	List Web service client port policies information for an application.	Online
listWebServicePolicies	List Web service port policy information for a Web service in an application.	Online
setWSMPolicyOverride	Configure override properties for a policy that is attached to the selected policy subject or policy set document within a session.	Online

Use the WLST commands listed in Table 3–7 to manage Java EE Web Services (or clients) directly attached policies.

Table 3–7 Java EE Web Services (or Clients) - WLST Commands for Direct Policy Attachments

То	Use with WLST
Attach multiple policies to a Web service client port of an application.	Online
Attach an OWSM policy to a Web service client port of an application.	Online
Attach multiple policies to a Web service port of an application.	Online
Attach a policy to a Web service port of an application.	Online
Detach multiple policies from a Web service client port of an application.	Online
Detach a policy from a Web service client port of an application.	Online
	Attach multiple policies to a Web service client port of an application. Attach an OWSM policy to a Web service client port of an application. Attach multiple policies to a Web service port of an application. Attach a policy to a Web service port of an application. Detach multiple policies from a Web service client port of an application. Detach a policy from a Web service client port

Table 3-7 (Cont.) Java EE Web Services (or Clients) - WLST Commands for Direct Policy Attachments

Use this command	То	Use with WLST
detachWebServicePolicies	Detach multiple OWSM policies from a Web service port of an application	Online
detachWebServicePolicy	Detach an OWSM policy from a Web service port of an application.	Online
enableWebServiceClientPolicies	Enable or disable multiple policies of a Web service client port of an application.	Online
enableWebServiceClientPolicy	Enable or disable a policy of a Web service client port of an application.	Online
enableWebServicePolicies	Enable or disable multiple policies attached to a port of a Web service application.	Online
enableWebServicePolicy	Enable or disable a policy attached to a port of a Web service application.	Online
listAvailableWebServicePolicies	Display a list of all the available OWSM policies by category or subject type.	Online
listWebServiceClientPolicies	List Web service client port policies information for an application.	Online
listWebServicePolicies	List Web service port policy information for a Web service in an application.	Online

3.7.1 attachWebServiceClientPolicies

Note: Use this command for Java EE Web Services (or clients) only. It has been deprecated for Oracle Infrastructure Web services.

For Oracle Infrastructure Web Services, this command has been deprecated. It is recommended that you use the attachWSMPolicies command, as described in "attachWSMPolicies" on page 3-41. The following examples show how to migrate to use the attachWSMPolicies command.

11g Release:

wls:/wls-domain/serverConfig>attachWebServiceClientPolicies ('/base_domain/server1/jwsclient_ 1#1.1.0', 'WssUsernameClient', 'wsconn', 'WssUsernameClient','JRFWssUsernamePort',["oracle/wss_username_ token_client_policy", "oracle/log_policy"])

12c Release:

wls:/wls-domain/serverConfig>attachWSMPolicies(["oracle/wss_ username_token_client_policy","oracle/log_policy"])

Command Category: Policy Management

Use with WLST: Online

3.7.1.1 Description

Attaches multiple policies to a Web service client port of an application.

The policyURIs are validated through the OWSM Policy Manager APIs if the wsm-pm application is installed on WebLogic Server and is available.

For Java EE (wls) module types only: If the policies that you specify in this command are already attached or exist, then this command enables the policies that are already attached (if they are disabled), and attaches the others.

If the wsm-pm application is not installed or is not available, this command is not executed.

> **Note:** Policy changes made using this WLST command are only effective after you restart your application.

3.7.1.2 Syntax

 $attach \verb|WebServiceClientPolicies| (application, \verb|moduleOrCompName, moduleType|, application, \verb|moduleOrCompName|, moduleType|, application, \verb|moduleOrCompName|, moduleOrCompName|, moduleOrCompName|,$ serviceRefName,portInfoName,policyURIs,[subjectType=None])

Argument	Definition
application	Name and path of the application for which you want to attach OWSM client policies to the Web service client port. For example, /domain/server/application#version_number
	To attach policies to a client port of a Web service application, this argument is required.
moduleOrCompName	Name of the Web module for which you want to attach the policies to the client port.
moduleType	Module type. Valid options are:
	 web—Oracle Infrastructure Web services packaged as a Web module (including an EJB).
	wls—Java EE Web services.
	 wsconn—Use with a connection-based Web service client such as an ADF DC Web service client, ADF JAX-WS Indirection Proxy.
	Note : The web and wsconn module types are deprecated for this release.
serviceRefName	The service reference name of the application.
portInfoName	The client port to which you want to attach the OWSM client policy.
policyURI	The OWSM policy name URIs, for example, ["oracle/log_policy", "oracle/wss_username_token_client_policy"]
	If the policies that you specify in this command are already attached or exist, then this command enables the policies that are already attached (if they are disabled), and attaches the others.
subjectType	Optional. Policy subject type. Valid options are:
	■ P—Port. The default is P.
	 O—Not supported in this release.

3.7.1.3 Examples

The following example attaches the policies oracle/wss10_saml20_token_ client_policy and oracle/wss11_message_protection_client_policy to the client port UpperCaseImplPort in the Java EE Web module owsm_ mbean.resouce_pattern.web.ClientJWS/sei2.

```
wls:/wls-domain/serverConfig>attachWebServiceClientPolicies
('/wls-domain/AdminServer/ClientJWS','owsm_mbean.resouce_
pattern.web.ClientJWS/sei2','wls','owsm_mbean.resouce_
pattern.web.ClientJWS/sei2','UpperCaseImplPort',["oracle/wss10_sam120_token_
client_policy", "oracle/wss11_message_protection_client_policy"])
```

3.7.2 attachWebServiceClientPolicy

Note: Use this command for Java EE Web Services (or clients) only. It has been deprecated for Oracle Infrastructure Web Services.

For Oracle Infrastructure Web Services, it is recommended that you use the attachWSMPolicy command, as described in "attachWSMPolicy" on page 3-42. The following examples show how to migrate to use the attachWSMPolicy command.

11g Release:

```
wls:/wls-domain/serverConfig>attachWebServiceClientPolicy
('/base_domain/server1/jwsclient_
1#1.1.0', 'WssUsernameClient', 'wsconn',
'WssUsernameClient','JRFWssUsernamePort',"oracle/wss_username
token_client_policy")
```

12*c*:

wls:/wls-domain/serverConfig>attachWSMPolicy("oracle/wss_username_ token_client_policy")

Command Category: Policy Management

Use with WLST: Online

3.7.2.1 Description

Attaches an OWSM policy to a Web service client port of an application.

The policy URI is validated through the OWSM Policy Manager APIs if the wsm-pm application is installed on WebLogic Server and is available.

For Java EE (wls) module types only: If the PolicyURI that you specify in this command already is attached or exists, then this command enables the policy if it is disabled.

If the wsm-pm application is not installed or is not available, this command is not executed.

> **Note:** Policy changes made using this WLST command are only effective after you restart your application.

3.7.2.2 Syntax

attachWebServiceClientPolicy(application, moduleOrCompName, moduleType, serviceRefName, portInfoName, policyURI, [subjectType=None])

Argument	Definition
application	Name and path of the application for which you want to attach a policy to the Web service client port. For example, /domain/server/application#version_number.
	To attach a policy to a client port of a Web service application, this argument is required.
moduleOrCompName	Name of the Web module for which you want to attach the policy to the client port.
moduleType	Module type. Valid options are:
	 web—Oracle Infrastructure Web services packaged as a Web module (including an EJB).
	w1s—Java EE Web services.
	 wsconn—Use with a connection-based Web service client such as an ADF DC Web service client, ADF JAX-WS Indirection Proxy.
	Note : The web and wsconn module types are deprecated for this release.
serviceRefName	The service reference name of the application.
portInfoName	The client port to which you want to attach the OWSM client policy.
policyURI	The OWSM policy name URI, for example, oracle/wss_ username_token_client_policy"
	If the policy that you specify is already attached or exists, then this command enables the policy if it is disabled.
subjectType	Optional. Policy subject type. Valid options are:
	■ P—Port. The default is P.
	 O—Not supported in this release.

3.7.2.3 Examples

The following example attaches the oracle/wss_username_token_client_ policy client policy to the Java EE Web service client port UpperCaseImplPort of the Web module owsm_mbean.resouce_pattern.web.ClientJWS/sei2. The Web service is part of the application ClientJWS.

```
wls:/wls-domain/serverConfig> attachWebServiceClientPolicy
('/wls-domain/AdminServer/ClientJWS','owsm_mbean.resouce_
pattern.web.ClientJWS/sei2', 'wls','owsm_mbean.resouce_
pattern.web.ClientJWS/sei2', 'UpperCaseImplPort', "oracle/wss_username_token_
client_policy")
```

3.7.3 attachWebServicePolicies

Note: Use this command for Java EE Web Services (or clients) only. It has been deprecated for Oracle Infrastructure Web Services.

For Oracle Infrastructure Web Services, it is recommended that you use the attachWSMPolicies command, as described in "attachWSMPolicies" on page 3-41. The following examples show how to migrate to use the attachWSMPolicies command.

11*g* Release:

```
wls:/wls-domain/serverConfig> attachWebServicePolicies
('/base_domain/server1/HelloWorld#1_0','j2wbasicPolicy','web',
'{http://namespace/}WssUsernameService','JRFWssUsernamePort',
["oracle/log_policy", "oracle/wss_username_token_service_policy"])
```

12c Release:

```
wls:/wls-domain/serverConfig> attachWSMPolicies["oracle/log_
policy", "oracle/wss_username_token_service_policy"])
```

Command Category: Policy Management

Use with WLST: Online

3.7.3.1 Description

Attaches multiple policies to a Web service port of an application.

The policyURIs are validated through the OWSM Policy Manager APIs if the wsm-pm application is installed on WebLogic Server and is available.

For Java EE (wls) module types only: if any of the policies that you specify in this command are already attached or exist, then this command enables the policies that are already attached (if they are disabled), and attaches the others.

If the wsm-pm application is not installed or is not available, this command is not executed.

> **Note:** Policy changes made using this WLST command are only effective after you restart your application.

3.7.3.2 Syntax

attachWebServicePolicies(application, moduleOrCompName, moduleType, serviceName, subjectName,policyURIs,[subjectType=None])

Argument	Definition
application	Name and path of the application to which you want to attach the Web service policies. For example, /domain/server/application#version_number
	To attach the policies to a port of a Web service application, this argument is required.
moduleOrCompName	Name of the Web module to which you want to attach Web service policies.

Argument	Definition
moduleType	Module type. Valid options are:
	 web—Oracle Infrastructure Web services packaged as a Web module (including an EJB).
	wls—Java EE Web services.
	Note: The web module type is deprecated for this release.
serviceName	Name of the Web service in the application. For example, {http://namespace/}serviceName.
subjectName	Name of the policy subject, port, or operation.
policyURIs	List of OWSM policy name URIs, for example, ["oracle/log_policy", "oracle/wss_username_token_service_policy"]
	If any of the policies that you specify are already attached or exist, then this command enables the policies that are already attached (if they are disabled), and attaches the others.
subjectType	Optional. Policy subject type. Valid options are:
	■ P—Port. The default is P.
	 O—Not supported in this release.

3.7.3.3 Example

The following example attaches the policies 'oracle/binding_authorization_ denyall_policy', 'oracle/wss_username_token_service_policy' to the port helloWorldJaxwsSoapHttpPort of the Web module helloWorldJaxws. The Java EE Web service is part of the application helloworldJaxws for the server AdminServer in the domain wls-domain.

```
wls:wls-domain/ServerConfig>attachWebServicePolicies
('/wls-domain/AdminServer/helloWorldJaxws','helloWorldJaxws#1!helloWorldJaxws',
'wls','helloWorldJaxws', 'helloWorldJaxwsSoapHttpPort, ['oracle/binding_
authorization_denyall_policy', 'oracle/wss_username_token_service_policy'])
```

3.7.4 attachWebServicePolicy

Note: Use this command for Java EE Web Services (or clients) only. It has been deprecated for Oracle Infrastructure Web Services.

For Oracle Infrastructure Web Services, it is recommended that you use the attachWSMPolicy command, as described in "attachWSMPolicy" on page 3-42. The following examples show how to migrate to use the attachWSMPolicy command.

11g Release:

```
wls:/wls-domain/serverConfig> attachWebServicePolicy
('/base_domain/server1/HelloWorld#1_0','j2wbasicPolicy','web',
'{http://namespace/}WssUsernameService','JRFWssUsernamePort','oracl
e/wss_username_token_service_policy')
```

12c Release:

wls:/wls-domain/serverConfig> attachWSMPolicy('oracle/wss_username_ token_service_policy')

Command Category: Policy Management

Use with WLST: Online

3.7.4.1 Description

Attaches a policy to a Web service port of an application.

The policyURI is validated through the OWSM Policy Manager APIs if the wsm-pm application is installed on WebLogic Server and is available.

For Java EE (wls) module types only: If the PolicyURI that you specify in this command already is attached or exists, then this command enables the policy if it is disabled.

If the wsm-pm application is not installed or is not available, this command is not executed.

> **Note:** Policy changes made using this WLST command are only effective after you restart your application.

3.7.4.2 Syntax

attachWebServicePolicy(application, moduleOrCompName, moduleType, serviceName, subjectName, policyURI, [subjectType=None])

Argument	Definition
application	Name and path of the application to which you want to attach a Web service policy. For example, /domain/server/application#version_number
	To attach a policy to a port of a Web service application, this argument is required.
moduleOrCompName	Name of the Web module to which you want to attach a Web service policy.
moduleType	Module type. Valid options are:
	 web—Oracle Infrastructure Web services packaged as a Web module (including an EJB).
	 wls—Java EE Web services.
	Note: The web module type is deprecated for this release.
serviceName	Name of the Web service in the application. For example, {http://namespace/}serviceName.
subjectName	Name of the policy subject, port, or operation.
policyURI	OWSM policy name URI, for example, 'oracle/log_policy'
subjectType	Optional. Policy subject type. Valid options are:
	■ P—Port. The default is P.
	 O—Not supported in this release.

3.7.4.3 Examples

The following example attaches the policy oracle/wss_username_token_ service_policy to the port helloWorldJaxwsSoapHttpPort of the Java EE Web service helloWorldJaxws.

wls:wls-domain/serverConfig> attachWebServicePolicy

('/wls-domain/AdminServer/helloWorldJaxws', 'helloWorldJaxws#1!helloWorldJaxws', 'wls','helloWorldJaxws', 'helloWorldJaxwsSoapHttpPort', 'oracle/wss_username_ token_service_policy')

A Web service cannot contain both a WebLogic Web service policy and an Oracle Web service policy. If you have a Web service with a WebLogic Web service policy, you must first detach it before attaching the Oracle Web service policy. The following example detaches the WebLogic Web service policy

Wssp1.2-2007-Sam12.0-SenderVouches-Wss1.1.xml from the port SimplePort in the Java EE Web service SimpleEjbService and then attaches the Oracle Web service policy oracle/wss_username_token_service_policy.

wls:wls-domain/serverConfig>detachWebServicePolicy('/wls-domain/AdminServer/Simple JAXWS', 'SimpleJAXWS#1!SimpleEjbService', 'wls', 'SimpleEjbService', 'SimplePort', 'policy: Wssp1.2-2007-Saml2.0-SenderVouches-Wss1.1.xml')

wls:wls-domain/serverConfig>attachWebServicePolicy('/wls-domain/AdminServer/Simple JAXWS', 'SimpleJAXWS#1!SimpleEjbService', 'wls', 'SimpleEjbService', 'SimpleFort', 'oracle/wss_username_token_service_policy')

Note: The detachWebServicePolicy WLST command allows you to detach WebLogic Web service policies from a Web service. However, you cannot use the attachWebServicePolicy WLST command to attach WebLogic Web service policies. To attach WebLogic Web service policies to a Web service, you must use the WebLogic Administration Console.

3.7.5 attachWSMPolicies

Note: This command applies to Oracle Infrastructure and RESTful Web services. It does not apply to Java EE Web services in this release.

Command Category: Policy Management

Use with WLST: Online

3.7.5.1 Description

Within a session, attaches multiple policies, identified by specified the URIs, to the selected policy subject.

You must start a session and select the policy set (selectWSMPolicySet) or policy subject (selectWSMPolicySubject) before initiating the command. However, if attachWSMPolicies is issued when creating or cloning a policy set, there is no need to select the policy set because it is already selected. If there is no current session and no policy subject selected, an error is displayed.

3.7.5.2 Syntax

attachWSMPolicies(uris)

Element	Description
uris	List of OWSM policy name URIs, for example, ["oracle/log_policy", "oracle/wss_username_token_service_policy"]

3.7.5.3 Examples

The following example attaches the policies oracle/log_policy and oracle/wss_username_token_service_policy. It assumes that you have already selected a policy subject.

wls:/wls-domain/serverConfig>attachWSMPolicies(["oracle/log_policy", "oracle/wss_ username_token_service_policy"])

3.7.6 attachWSMPolicy

Note: This command applies to Oracle Infrastructure and RESTful Web services. It does not apply to Java EE Web services in this release.

Command Category: Policy Management

Use with WLST: Online

3.7.6.1 Description

Within a session, attaches a policy, identified by the specified URI, to the selected policy subject or policy set.

You must start a session and select the policy set (selectWSMPolicySet) or policy subject (selectWSMPolicySubject) before initiating the command. However, if attachWSMPolicy is issued when creating or cloning a policy set, there is no need to select the policy set because it is already selected. If there is no current session and no policy subject is selected, an error is displayed.

3.7.6.2 Syntax

attachWSMPolicy(uri)

Argument	Definition
uri	OWSM policy name URI, for example, 'oracle/log_policy'

3.7.6.3 Examples

The following example attaches the policy oracle/wss_username_token_ service_policy. It assumes that you have already selected a Web service port, a Web service client port, or a current policy set.

wls:/wls-domain/serverConfig>attachWSMPolicy('oracle/wss_username_token_service_ policy')

3.7.7 detachWebServiceClientPolicies

Note: Use this command for Java EE Web Services (or clients) only. It has been deprecated for Oracle Infrastructure Web Services.

For Oracle Infrastructure Web Services, it is recommended that you use the detachWSMPolicies command, as described in "detachWSMPolicies" on page 3-49. The following examples show how to migrate to use the detachWSMPolicies command.

11g Release:

```
wls:/wls-domain/serverConfig>detachWebServiceClientPolicies
('/base_domain/server1/jwsclient_
1#1.1.0', 'WssUsernameClient', 'wsconn',
'WssUsernameClient','JRFWssUsernamePort',
["oracle/log_policy", "oracle/wss_username_token_client_policy"])
```

12c Release:

wls:/wls-domain/serverConfig>detachWSMPolicies(["oracle/log_ policy","oracle/wss_username_token_client_policy"])

Command Category: Policy Management

Use with WLST: Online

3.7.7.1 Description

Detaches multiple policies from a Web service client port of an application.

Note: Policy changes made using this WLST command are only effective after you restart your application.

3.7.7.2 Syntax

detachWebServiceClientPolicies(application, moduleOrCompName, moduleType, serviceRefName,portInfoName,policyURIs,[subjectType=None])

Argument	Definition
application	Name and path of the application for which you want to detach multiple policies from a Web service client port. For example, /domain/server/application#version_number
	To detach multiple policies from a client port of a Web service application, this argument is required.
moduleOrCompName	Name of the Web module for which you want to detach multiple policies from a client port.

Argument	Definition
moduleType	Module type. Valid options are:
	 web—Oracle Infrastructure Web services packaged as a Web module (including an EJB).
	 wls—Java EE Web services.
	 wsconn—Use with a connection-based Web service client such as an ADF DC Web service client, ADF JAX-WS Indirection Proxy.
	Note : The web and wsconn module types are deprecated for this release.
serviceRefName	The service reference name of the application.
portInfoName	The client port from which you want to detach the OWSM client policy.
policyURI	The OWSM policy name URI, for example, oracle/wss_username_token_client_policy"
	If the policy specified is not attached, an error message is displayed and/or an exception is thrown.
subjectType	Optional. Policy subject type. Valid options are:
	■ P—Port. The default is P.
	 O—Not supported in this release.

3.7.7.3 Example

The following example detaches the client policies oracle/wss10_saml20_token_ client_policy and oracle/wss11_message_protection_client_policy of the port UpperCaseImplPort of the Java EE Web service module owsm_ mbean.resouce_pattern.web.ClientJWS/sei2.

 ${\tt wls:/wls-domain/serverConfig>} {\tt detachWebServiceClientPolicies('/wls-domain/AdminServerConfig>} {\tt detachWebServerConfig>} {\tt detachWeb$ er/ClientJWS','owsm_mbean.resouce_pattern.web.ClientJWS/sei2','wls','owsm_ mbean.resouce_pattern.web.ClientJWS/sei2','UpperCaseImplPort',["oracle/wss10_ saml20_token_client_policy","oracle/wss11_message_protection_client_policy"])

3.7.8 detachWebServiceClientPolicy

Note: Use this command for Java EE Web Services (or clients) only. It has been deprecated for Oracle Infrastructure Web Services.

For Oracle Infrastructure Web Services, it is recommended that you use the detachWSMPolicy command, as described in "detachWSMPolicy" on page 3-50. The following examples show how to migrate to use the detachWSMPolicy command.

11g Release:

```
wls:/wls-domain/serverConfig>detachWebServiceClientPolicy
('/base_domain/server1/jwsclient_
1#1.1.0', 'WssUsernameClient', 'wsconn',
'WssUsernameClient','JRFWssUsernamePort','oracle/wss_username_
token_client_policy')
```

12c Release:

wls:/wls-domain/serverConfig>detachWSMPolicy('oracle/wss_username_ token_client_policy')

Command Category: Policy Management

Use with WLST: Online

3.7.8.1 Description

Detaches a policy from a Web service client port of an application.

Note: Policy changes made using this WLST command are only effective after you restart your application.

3.7.8.2 Syntax

detachWebServiceClientPolicy(application, moduleOrCompName, moduleType, serviceRefName, portInfoName, policyURI, [subjectType=None])

Argument	Definition
application	Name and path of the application for which you want to detach a policy from a Web service client port. For example, /domain/server/application#version_number
	To detach a policy from a client port of a Web service application, this argument is required.
moduleOrCompName	Name of the Web module for which you want to detach the policy from a client port.

Argument	Definition
moduleType	Module type. Valid options are:
	 web—Oracle Infrastructure Web services packaged as a Web module (including an EJB).
	■ wls—Java EE Web services.
	 wsconn—Use with a connection-based Web service client such as an ADF DC Web service client, ADF JAX-WS Indirection Proxy.
	Note : The web and wsconn module types are deprecated for this release.
serviceRefName	The service reference name of the application.
portInfoName	The client port from which you want to detach the OWSM client policy.
policyURI	The OWSM policy name URI, for example, oracle/wss_username_token_client_policy"
	If the policy specified is not attached, an error message is displayed and/or an exception is thrown.
subjectType	Optional. Policy subject type. Valid options are:
	■ P—Port. The default is P.
	 O—Not supported in this release.

3.7.8.3 Examples

The following command detaches the client policy oracle/wss_username_token_ client_policy from the client port UpperCaseImplPort in the Java EE client module wsm_mbean.resouce_pattern.web.ClientJWS/sei2.

wls:/wls-domain/serverConfig>

detachWebServiceClientPolicy('/wls-domain/AdminServer/ClientJWS', 'owsm_ mbean.resouce_pattern.web.ClientJWS/sei2', 'wls', 'owsm_mbean.resouce_ pattern.web.ClientJWS/sei2', 'UpperCaseImplPort', "oracle/wss_username_token_ client_policy")

3.7.9 detachWebServicePolicies

Note: Use this command for Java EE Web Services (or clients) only. It has been deprecated for Oracle Infrastructure Web Services.

For Oracle Infrastructure Web Services, it is recommended that you use the detachWSMPolicies command, as described in "detachWSMPolicies" on page 3-49. The following examples show how to migrate to use the detachWSMPolicies command.

11g Release:

```
wls:/wls-domain/serverConfig>detachWebServicePolicies
('/base_domain/server1/HelloWorld#1_0','j2wbasicPolicy','web',
'{http://namespace/}WssUsernameService','JRFWssUsernamePort',
["oracle/log_policy", "oracle/wss_username_token_service_policy"])
```

12c Release:

wls:/wls-domain/serverConfig>detachWSMPolicies(["oracle/log_ policy","oracle/wss_username_token_service_policy"])

Command Category: Policy Management

Use with WLST: Online

3.7.9.1 Description

Detaches multiple OWSM policies from a Web service port of an application.

If the wsm-pm application is not installed or is not available, this command is not executed.

> **Note:** Policy changes made using this WLST command are only effective after you restart your application.

3.7.9.2 Syntax

detachWebServicePolicies(application, moduleOrCompName, moduleType, serviceName, subjectName, policyURIs,[subjectType=None])

Argument	Definition
application	Name and path of the application from which you want to detach the Web service policies. For example, /domain/server/application#version_number
	To detach policies from a port of a Web service application, this argument is required.
moduleOrCompName	Name of the Web module from which you want to detach the Web service policies.
moduleType	Module type. Valid options are:
	 web—Oracle Infrastructure Web services packaged as a Web module (including an EJB).
	w1s—Java EE Web services.
	Note: The web module type is deprecated for this release.

Argument	Definition
serviceName	Name of the Web service in the application. For example, {http://namespace/}serviceName.
subjectName	Name of the policy subject, port, or operation.
policyURIs	List of OWSM policy name URIs, for example, ["oracle/log_policy", "oracle/wss_username_token_service_policy"]
	If a policyURI specified is not attached, an error message is displayed and/or an exception is thrown.
subjectType	Optional. Policy subject type. Valid options are:
	■ P—Port. The default is P.
	 O—Not supported in this release.

3.7.9.3 Example

The following example detaches the policies "oracle/binding_authorization_ denyall_policy", "oracle/wss_username_token_service_policy" from the port helloWorldJaxwsSoapHttpPort of the Java EE Web module helloWorldJaxws. The Web service is part of the application helloWorldJaxws for the server AdminServer in the domain wls-domain.

```
wls:/wls-domain/serverConfig>detachWebServicePolicies
('/wls-domain/AdminServer/helloWorldJaxws','helloWorldJaxws#1!helloWorldJaxws',
'wls','helloWorldJaxws', 'helloWorldJaxwsSoapHttpPort', ["oracle/binding_
authorization_denyall_policy", "oracle/wss_username_token_service_policy"])
```

3.7.10 detachWebServicePolicy

Note: Use this command for Java EE Web Services (or clients) only. It has been deprecated for Oracle Infrastructure Web Services.

For Oracle Infrastructure Web Services, it is recommended that you use the detachWSMPolicy command, as described in "detachWSMPolicy" on page 3-50. The following examples show how to migrate to use the detachWSMPolicy command.

11g Release:

```
wls:/wls-domain/serverConfig>detachWebServicePolicy('/base_
domain/server1/HelloWorld#1
0','j2wbasicPolicy','web','{http://namespace/}WssUsernameService','
JRFWssUsernamePort','oracle/wss_username_token_service_policy')
```

12c Release:

wls:/wls-domain/serverConfig>detachWSMPolicy('oracle/wss_username_ token_service_policy')

Command Category: Policy Management

Use with WLST: Online

3.7.10.1 Description

Detaches an OWSM policy from a Web service port of an application.

Note: Policy changes made using this WLST command are only effective after you restart your application.

3.7.10.2 Syntax

detachWebServicePolicy(application, moduleOrCompName, moduleType, serviceName, subjectName, policyURI, [subjectType=None])

Argument	Definition
application	Name and path of the application from which you want to detach a Web service policy. For example, /domain/server/application#version_number
	To detach a policy from a port of a Web service application, this argument is required.
moduleOrCompName	Name of the Web module from which you want to detach a Web service policy.
moduleType	Module type. Valid options are:
	 web—Oracle Infrastructure Web services packaged as a Web module (including an EJB).
	wls—Java EE Web services.
	Note: The web module type is deprecated for this release.
serviceName	Name of the Web service in the application. For example, {http://namespace/}serviceName.
subjectName	Name of the policy subject, port, or operation.
policyURI	OWSM policy name URI, for example, 'oracle/log_policy'
	If the policy specified is not attached, an error message is displayed and/or an exception is thrown.
subjectType	Optional. Policy subject type. Valid options are:
	■ P—Port. The default is P.
	 O—Not supported in this release.

3.7.10.3 **Examples**

The following example detaches the policy oracle/wss_username_token_ service_policy from the port helloWorldJaxwsSoapHttpPort of the service helloWorldJaxws in the Java EE Web service wls-domain/AdminServer/helloWorldJaxws.

wls:/wls-domain/serverConfig>detachWebServicePolicy

('/wls-domain/AdminServer/helloWorldJaxws','helloWorldJaxws#1!helloWorldJaxws', 'wls','helloWorldJaxws', 'helloWorldJaxwsSoapHttpPort', 'oracle/wss_username_ token_service_policy')

3.7.11 detachWSMPolicies

Note: This command applies to Oracle Infrastructure and RESTful Web services. It does not apply to Java EE Web services in this release.

Command Category: Policy Management

Use with WLST: Online

3.7.11.1 Description

Within a session, detaches multiple policies, identified by an array of URIs or index values, from the selected policy subject.

You must start a session and select the policy set (selectWSMPolicySet) or policy subject (selectWSMPolicySubject) before initiating the command. If there is no current session and no policy subject selected, an error is displayed.

3.7.11.2 Syntax

detachWSMPolicies(uris)

Argument	Definition
<pre>a policy subject. For example, ["oracle/log_ policy", "oracle/wss_username_token_service policy"]</pre>	policy","oracle/wss_username_token_service_
	If the specified policy URIs are not attached, an error message is displayed and/or an exception is thrown.

3.7.11.3 Examples

The following example detaches the OWSM logging policy and username token service policy from the current policy subject:

wls:/wls-domain/serverConfig>detachWSMPolicies(["oracle/log_policy","oracle/wss_ username_token_service_policy"])

The following example uses the index values of the OWSM logging policy and username token service URIs to detach them from the current policy subject

wls:/wls-domain/serverConfig>detachWSMPolicies('1','3')

3.7.12 detachWSMPolicy

Note: This command applies to Oracle Infrastructure and RESTful Web services. It does not apply to Java EE Web services in this release.

Command Category: Policy Management

Use with WLST: Online

3.7.12.1 Description

Within a session, detaches a policy, identified by the specified URI or index value, from the selected policy subject.

You must start a session and select the policy set (selectWSMPolicySet) or policy subject (selectWSMPolicySubject) before initiating the command. If there is no current session and no policy subject selected, an error is displayed

Issuing this command outside of a session containing a policy subject that is being created or modified will result in an error.

3.7.12.2 Syntax

detachWSMPolicy(uri)

Argument	Definition
uri	URI or index value specifying the policy to detach from a policy subject. For example, 'oracle/log_policy'.
	If the specified policy URI is not attached, an error message is displayed and/or an exception is thrown.

3.7.12.3 Examples

The following example detaches the OWSM logging policy from the current policy subject.

wls:/wls-domain/serverConfig>detachWSMPolicy('oracle/log_policy')

The following example uses the index value of the OWSM logging policy's URI to detach it from the current policy subject.

wls:/wls-domain/serverConfig>detachWSMPolicy('1')

3.7.13 enableWebServiceClientPolicies

Note: Use this command for Java EE Web Services (or clients) only. It has been deprecated for Oracle Infrastructure Web Services.

For Oracle Infrastructure Web Services, it is recommended that you use the enableWSMPolicies command, as described in "enableWSMPolicies" on page 3-58. The following examples show how to migrate to use the enableWSMPolicies command.

11g Release:

```
wls:/wls-domain/serverConfig>enableWebServiceClientPolicies
('/base_domain/server1/jwsclient_
1#1.1.0', 'WssUsernameClient', 'wsconn',
'WssUsernameClient', 'JRFWssUsernamePort',
["oracle/log_policy", "oracle/wss_username_token_client_policy"],
true )
```

12c Release:

wls:/wls-domain/serverConfig>enableWSMPolicies(["oracle/log_ policy", "oracle/wss_username_token_client_policy"], true)

Command Category: Policy Management

Use with WLST: Online

3.7.13.1 Description

Enables or disables multiple policies of a Web service client port of an application.

Note: Policy changes made using this WLST command are only effective after you restart your application

3.7.13.2 Syntax

enableWebServiceClientPolicies(application,moduleOrCompName,moduleType, serviceRefName,portInfoName,policyURIs,[enable],[subjectType=None])

Argument	Definition
application	Name and path of the application for which you want to enable or disable multiple policies of a Web service client port. For example, /domain/server/application#version_number
	To enable or disable multiple policies of a client port of a Web service application, this argument is required.
moduleOrCompName	Name of the Web module for which you want to enable or disable multiple policies of a client port.
moduleType	Module type. Valid options are:
	 web—Oracle Infrastructure Web services packaged as a Web module (including an EJB).
	wls—Java EE Web services.
	 wsconn—Use with a connection-based Web service client such as an ADF DC Web service client, ADF JAX-WS Indirection Proxy.
	Note : The web and wsconn module types are deprecated for this release.
serviceRefName	The service reference name of the application.
portInfoName	The name of the client port to which you want to attach the OWSM client policies.
policyURIs	The list of OWSM policy name URIs, for example, ["oracle/log_policy", "oracle/wss_username_token_client_policy"].
enable	Optional. Specifies whether to enable or disable the policies. Valid options are:
	 true—Enables the policy. The default is true.
	false—Disables the policy.
	If you omit this argument, the policies are enabled.
subjectType	Optional. Policy subject type. Valid options are:
	■ P—Port. The default is P.
	 O—Not supported in this release.

3.7.13.3 Example

The following example enables the client policies oracle/wss10_saml20_token_ client_policy and oracle/wss11_message_protection_client_policy of the port UpperCaseImplPort of the Java EE Web service module owsm_ mbean.resouce_pattern.web.ClientJWS/sei2.

wls:/wls-domain/serverConfig>enableWebServiceClientPolicies('/wls-domain/AdminServ er/ClientJWS','owsm_mbean.resouce_pattern.web.ClientJWS/sei2','wls','owsm_ mbean.resouce_pattern.web.ClientJWS/sei2','UpperCaseImplPort',["oracle/wss10_ saml20_token_client_policy", "oracle/wss11_message_protection_client_policy"], true)

3.7.14 enableWebServiceClientPolicy

Note: Use this command for Java EE Web Services (or clients) only. It has been deprecated for Oracle Infrastructure Web Services.

For Oracle Infrastructure Web Services, it is recommended that you use the enableWSMPolicy command, as described in "enableWSMPolicy" on page 3-59. The following examples show how to migrate to use the enableWSMPolicy command.

11g Release:

```
wls:/wls-domain/serverConfig>enableWebServiceClientPolicy
('/base_domain/server1/jwsclient_
1#1.1.0', 'WssUsernameClient', 'wsconn',
'WssUsernameClient','JRFWssUsernamePort', "oracle/wss_username_
token_client_policy",true)
```

12c Release:

wls:/wls-domain/serverConfig>enableWSMPolicy("oracle/wss_username_ token_client_policy",true)

Command Category: Policy Management

Use with WLST: Online

3.7.14.1 Description

Enables or disables a policy of a Web service client port of an application.

Note: Policy changes made using this WLST command are only effective after you restart your application.

3.7.14.2 Syntax

enableWebServiceClientPolicy(application, moduleOrCompName, moduleType, serviceRefName,portInfoName,policyURI,[enable],[subjectType=None])

Argument	Definition
application	Name and path of the application for which you want to enable or disable a policy of a Web service client port. For example, /domain/server/application#version_number
	To enable or disable a policy of a client port of a Web service application, this argument is required.
moduleOrCompName	Name of the Web module for which you want to enable or disable a policy of a client port.

Argument	Definition
moduleType	Module type. Valid options are:
	 web—Oracle Infrastructure Web services packaged as a Web module (including an EJB).
	wls—Java EE Web services.
	wsconn—Use with a connection-based Web service client such as an ADF DC Web service client, ADF JAX-WS Indirection Proxy.
	Note : The web and wsconn module types are deprecated for this release.
serviceRefName	The service reference name of the application.
portInfoName	The name of the client port to which you want to attach the OWSM client policy.
policyURI	The OWSM policy name URI, for example, oracle/wss_ username_token_client_policy"
enable	Optional. Specifies whether to enable or disable the policy. Valid options are:
	 true—Enables the policy. The default is true.
	false—Disables the policy.
	If you omit this argument, the policy is enabled.
subjectType	Optional. Policy subject type. Valid options are:
	■ P—Port. The default is P.
	 O—Not supported in this release.

3.7.14.3 Examples

The following example disables the client policy oracle/wss_username_token_ client_policy on the client port UpperCaseImplPort in the Java EE Web module owsm_mbean.resouce_pattern.web.ClientJWS/sei2.

wls:/wls-domain/serverConfig>enableWebServiceClientPolicy('/wls-domain/AdminServer /ClientJWS', 'owsm_mbean.resouce_pattern.web.ClientJWS/sei2', 'wls', 'owsm_ mbean.resouce_pattern.web.ClientJWS/sei2', 'UpperCaseImplPort', "oracle/wss_ username_token_client_policy", false)

3.7.15 enableWebServicePolicies

Note: Use this command for Java EE Web Services (or clients) only. It has been deprecated for Oracle Infrastructure Web Services.

For Oracle Infrastructure Web Services, it is recommended that you use the enableWSMPolicies command, as described in "enableWSMPolicies" on page 3-58. The following examples show how to migrate to use the enableWSMPolicies command.

11g Release:

wls:/wls-domain/serverConfig> enableWebServicePolicies ('/base_domain/server1/HelloWorld#1_0','j2wbasicPolicy','web', '{http://namespace/}WssUsernameService','JRFWssUsernamePort',["orac le/log_policy", "oracle/wss_username_token_service_policy"],true)

12c Release:

wls:/wls-domain/serverConfig> enableWSMPolicies(["oracle/log_ policy","oracle/wss_username_token_service_policy"],true)

Command Category: Policy Management

Use with WLST: Online

3.7.15.1 Description

Enables or disables multiple policies attached to a port of a Web service application.

If the policyURIs that you specify in this command are not attached to the port, an error message is displayed and/or an exception is thrown.

Note: Policy changes made using this WLST command are only effective after you restart your application.

3.7.15.2 Syntax

enableWebServicePolicies(application, moduleOrCompName, moduleType, serviceName, subjectName, policyURIs,[enable],[subjectType=None]))

Argument	Definition
application	Name and path of the application for which you want to enable the Web service policies. For example, /domain/server/application#version_number
	To enable policies that are attached to a port of a Web service application, this argument is required.
moduleOrCompName	Name of the Web module for which you want to enable Web service policies.
moduleType	Module type. Valid options are:
	 web—Oracle Infrastructure Web services packaged as a Web module (including an EJB).
	 w1s—Java EE Web services.
	Note: The web module type is deprecated for this release.

Argument	Definition
serviceName	Name of the Web service in the application. For example, {http://namespace/}serviceName.
subjectName	Name of the policy subject, port, or operation.
policyURIs	<pre>List of OWSM policy name URIs, for example, ["oracle/log_ policy", "oracle/wss_username_token_service_ policy"]</pre>
	If the policyURIs that you specify are not attached, an error message is displayed and/or an exception is thrown.
enable	Optional. Specifies whether to enable or disable the policies. Valid options are:
	 true—Enables the policies. The default is true.
	false—Disables the policies.
	If you omit this argument, the policies are enabled.
subjectType	Optional. Policy subject type. Valid options are:
	■ P—Port. The default is P.
	 O—Not supported in this release.

3.7.15.3 Example

The following example disables the policies ["oracle/binding_authorization_ denyall_policy","oracle/wss_username_token_service_policy"] attached to the port helloworldJaxwsSoapHttpPort of the Web module helloWorldJaxws#1!helloWorldJaxws. The Web service is part of the application helloWorldJaxws for the server AdminServer in the domain wls-domain.

wls:/wls-domain/serverConfig>enableWebServicePolicies ('/wls-domain/AdminServer/helloWorldJaxws','helloWorldJaxws#1!helloWorldJaxws', 'wls','helloWorldJaxws', 'helloWorldJaxwsSoapHttpPort', ["oracle/binding_ authorization_denyall_policy", "oracle/wss_username_token_service_policy"], false)

3.7.16 enableWebServicePolicy

Note: Use this command for Java EE Web Services (or clients) only. It has been deprecated for Oracle Infrastructure Web Services.

For Oracle Infrastructure Web Services, it is recommended that you use the enableWSMPolicy command, as described in "enableWSMPolicy" on page 3-59. The following examples show how to migrate to use the enableWSMPolicy command.

11*g* Release:

wls:/wls-domain/serverConfig>enableWebServicePolicy ('/base_domain/server1/HelloWorld#1_0','j2wbasicPolicy','web', '{http://namespace/}WssUsernameService','JRFWssUsernamePort',"oracl e/wss_username_token_service_policy",true)

12c Release:

wls:/wls-domain/serverConfig>enableWSMPolicy("oracle/wss_username_ token_service_policy",true)

Command Category: Policy Management

Use with WLST: Online

3.7.16.1 Description

Enables or disables a policy attached to a port of a Web service application.

If the policy that you specify in this command is not attached to the port, an error message is displayed and/or an exception is thrown.

Note: Policy changes made using this WLST command are only effective after you restart your application.

3.7.16.2 Syntax

enableWebServicePolicy(application, moduleOrCompName, moduleType, serviceName, subjectName, policyURI, [enable], [subjectType=None]))

Argument	Definition
application	Name and path of the application for which you want to enable a Web service policy. For example, /domain/server/application#version_number
	To enable a policy that is attached to a port of a Web service application, this argument is required.
moduleOrCompName	Name of the Web module) for which you want to enable a Web service policy.
moduleType	Module type. Valid options are:
	 web—Oracle Infrastructure Web services packaged as a Web module (including an EJB).
	w1s—Java EE Web services.
	Note: The web module type is deprecated for this release.
serviceName	Name of the Web service in the application. For example, {http://namespace/}serviceName.
subjectName	Name of the policy subject, port, or operation.
policyURI	OWSM policy name URI, for example, 'oracle/log_policy'
	If the policy that you specify is not attached, an error message is displayed and/or an exception is thrown.
enable	Optional. Specifies whether to enable or disable the policy. Valid options are:
	 true—Enables the policy. The default is true.
	false—Disables the policy.
	If you omit this argument, the policy is enabled.
subjectType	Optional. Policy subject type. Valid options are:
	■ P—Port. The default is P.
	 O—Not supported in this release.

3.7.16.3 Examples

The following example disables the policy oracle/wss_username_token_ service_policy attached to the port helloWorldJaxwsSoapHttpPort for the service helloWorldJaxws in the Java EE Web service wls-domain/AdminServer/helloWorldJaxws

wls:/wls-domain/domainRuntime> enableWebServicePolicy ('/wls-domain/AdminServer/helloWorldJaxws','helloWorldJaxws#1!helloWorldJaxws', 'wls', 'helloWorldJaxws', 'helloWorldJaxwsSoapHttpPort', 'oracle/wss_username_ token_service_policy', false)

3.7.17 enableWSMPolicies

Note: This command applies to Oracle Infrastructure and RESTful Web services. It does not apply to Java EE Web services in this release.

Command Category: Policy Management

Use with WLST: Online

3.7.17.1 Description

Within a session, enables or disables multiple policy attachments, identified by the specified URIs, that are attached to a policy subject.

You must start a session and select the policy set (selectWSMPolicySet) or policy subject (selectWSMPolicySubject) before initiating the command. However, if enableWSMPolicies is issued when creating or cloning a policy set, there is no need to select the policy set because it is already selected.

If the optional enable argument is not specified, this command enables the policy attachment by default. If the policy URIs that you specify in this command are not attached to the port, an error message is displayed and/or an exception is thrown.

3.7.17.2 Syntax

enableWSMPolicies(uris,[enable=true]))

Argument	Definition
uris	List of OWSM policy name URIs, for example, ["oracle/log_policy", "oracle/wss_username_token_service_policy"]
	If the policyURIs that you specify are not attached, an error message is displayed and/or an exception is thrown.
enable	Optional. Specifies whether to enable or disable the policy attachments. Valid options are:
	 true—Enables the specified policy attachments. The default is true.
	 false—Disables the specified policy attachments.
	If you omit this argument, the policies are enabled.

3.7.17.3 Examples

The following example enables the policies ["oracle/log_ policy", "oracle/wss_username_token_service_policy"] attached to the port JRFWssUsernamePort of the Web module WssUsernameService. The Web service is part of the application HelloWorld#1_0 for the server server1 in the domain base_domain.

wls:/wls-domain/serverConfig>enableWSMPolicies(["oracle/log_policy","oracle/wss_ username_token_service_policy"],true)

3.7.18 enableWSMPolicy

Note: This command applies to Oracle Infrastructure and RESTful Web services. It does not apply to Java EE Web services in this release.

Command Category: Policy Management

Use with WLST: Online

3.7.18.1 Description

Within a session, enables or disables a policy attachment, identified by a specified URI, that is attached to a policy subject.

You must start a session and select the policy set (selectWSMPolicySet) or policy subject (selectWSMPolicySubject) before initiating the command. However, if enableWSMPolicy is issued when creating or cloning a policy set, there is no need to select the policy set because it is already selected.

If the optional enable argument is not specified, this command enables the policy attachment by default. If the policyURIs that you specify in this command are not attached to the port, an error message is displayed and/or an exception is thrown.

3.7.18.2 Syntax

enableWSMPolicy(uri,[enable=true])

Argument	Definition
uri	URI specifying the policy attachment within the policy set.
enable	Optional. Specifies whether to enable or disable the policy attachment specified by the URI in the policy set. Valid options are:
	 true—Enables the specified policy attachment in the policy set. The default is true.
	 false—Disables specified policy attachment in the policy set.
	If you omit this argument, the policy set attachment is enabled.

3.7.18.3 Examples

The following example enables the policy oracle/wss_username_token_ service policy attached to the port JRFWssUsernamePort of the Web module WssUsernameService. The Web service is part of the application HelloWorld#1_0 for the server server1 in the domain base domain.

wls:/wls-domain/serverConfig>enableWSMPolicy("oracle/wss_username_token_service_ policy", true)

3.7.19 listAvailableWebServicePolicies

Command Category: Policy Management

Use with WLST: Online

3.7.19.1 Description

Displays a list of all the available OWSM policies by category or subject type.

3.7.19.2 Syntax

listAvailableWebServicePolicies([category],[subject])

Argument	Definition
category	Optional. The policy category, for example,: 'security', 'management'.
subject	Optional. The policy subject type, for example,: 'server' or 'client'.

3.7.19.3 Example

The following example lists all the available OWSM server security policies in the domain.

wls:/wls-domain/serverConfig>listAvailableWebServicePolicies('security','server')

3.7.20 listWebServiceClientPolicies

Command Category: Policy Management

Use with WLST: Online

3.7.20.1 Description

Lists Web service client port policies information for an application.

The output will display the Web service client/reference port name, the OWSM policies it has attached to it and details about each attachment such as the policy category, status, the source of the policy attachment, any policy override properties (if applicable), and if the policy is in effect for the subject. It also displays if the policy subject is secure. For example:

test-port:

URI=oracle/wss_username_token_client_policy, category=security, policy-status=enabled

source=local policy set; reference-status=enabled; effective=true The policy subject is secure in this context.

3.7.20.2 Syntax

listWebServiceClientPolicies(application, moduleOrCompName, moduleType, serviceRefName,portInfoName)

Argument	Definition
application	Name and path of the application for which you want to list the Web service client port policy information. For example, /domain/server/application#version_number
	To list the client port policy information for a Web services application, this argument is required.
moduleOrCompName	Name of the Web module) for which you want to list the Web services port policy information.

Argument	Definition
moduleType	Module type. Valid options are:
	 web—Oracle Infrastructure Web services packaged as a Web module (including an EJB).
	wls—Java EE Web services.
	 wsconn—Use with a connection-based Web service client such as an ADF DC Web service client, ADF JAX-WS Indirection Proxy.
serviceRefName	The service reference name of the application.
portInfoName	The client port name.

3.7.20.3 Example

The following example lists the Web service client port policy information for the application jwsclient_1#1.1.0 for the server server1 in the domain base_ domain. In this example, the Web module name is WssUsernameClient, the module type is wsconn, the service reference name is WssUsernameClient, and the client port name is JRFWssUsernamePort.

```
wls:/wls-domain/serverConfig>listWebServiceClientPolicies
('/base_domain/server1/jwsclient_1#1.1.0','WssUsernameClient','wsconn',
'WssUsernameClient','JRFWssUsernamePort')
```

3.7.21 listWebServicePolicies

Command Category: Policy Management

Use with WLST: Online

3.7.21.1 Description

Lists Web service policy information for a Web service port in an application.

The output will display the Web service port name, the OWSM policies it has attached to it and details about each attachment such as the policy category, status, the source of the policy attachment, any policy override properties (if applicable), and if the policy is in effect for the subject. It also displays if the policy subject is secure. For example:

```
CalculatorPort:
```

URI="oracle/wss_username_token_service_policy", category=security, policy-status=enabled;

source=local policy set; reference-status=enabled; effective=true The policy subject is secure in this context.

3.7.21.2 Syntax

list Web Service Policies (application, module Or Comp Name, module Type, service Name, subject Policies (application, module Or Comp Name, module Type, service Name, subject Policies (application, module Or Comp Name, module Or Comp NameName)

Argument	Definition
application	Name and path of the application for which you want to list the Web services port policy information. For example, /domain/server/application#version_number
	To list the port policy information for a Web service application, this argument is required.

Argument	Definition
moduleOrCompName	Name of the Web module for which you want to list the Web services port policy information.
moduleType	Module type. Valid options are:
	 web—Oracle Infrastructure Web services packaged as a Web module (including an EJB).
	wls—Java EE Web services.
serviceName	Name of the Web service in the application for which you want to list the port policy information. For example, {http://namespace/}serviceName.
subjectName	Policy subject, port, or operation name.

3.7.21.3 Examples

The following example lists the Web service policy information for the port CalculatorPort in the application jaxwsejb30ws. In this example, the Web module name is jaxwsejb, and the service name is CalculatorService.

```
wls:/wls-domain/serverConfig>listWebServicePolicies ('/base_
domain/AdminServer/jaxwsejb30ws','jaxwsejb','web',
'{http://namespace/}CalculatorService', 'CalculatorPort')
```

3.7.22 setWebServicePolicyOverride

Note: This command has been deprecated for Oracle Infrastructure Web Services. It is recommended that you use the setWSMPolicyOverride command, as described in "setWSMPolicyOverride" on page 3-63.

This command does not apply to Java EE Web services.

The following examples show how to migrate to use the setWSMPolicyOverride command.

11g Release:

```
wls:/jrfServer_domain/serverConfig> setWebServicePolicyOverride
('/base_domain/server1/HelloWorld#1_0','j2wbasicPolicy', 'web',
'{http://namespace/}WssUsernameService','JRFWssUsernamePort',
'oracle/wss_username_token_service_policy', 'reference.priority',
'10')
```

12c Release (for repository and policy subject operations):

wls:/jrfServer_domain/serverConfig> setWSMPolicyOverride ('oracle/wss_username_token_service_policy', 'reference.priority', '10')

Command Category: Policy Management

Use with WLST: Online

3.7.22.1 Description

Configures the Web service port policy override properties of an application.

3.7.22.2 Syntax

 $\verb|setWebServicePolicyOverride(application, moduleOrCompName, moduleType, serviceName, moduleOrCompName, moduleOrCompNa$ portName,policyURI,properties)

Argument	Definition
application	Name and path of the application for which you want to override the Web service port policy. For example, /domain/server/application#version_number
	To override properties on a policy attached to a port of a Web service application, this argument is required.
moduleOrCompName	Name of the Web module for which you want to override a Web service port policy.
moduleType	Module type. The valid option is web—Oracle Infrastructure Web services packaged as a Web module (including an EJB).
	Note: The module type wls is not supported.
serviceName	Name of the Web service in the application. For example, {http://namespace/}serviceName.
subjectName	Name of the policy subject, port, or operation.
policyURI	OWSM policy name URI, for example, 'oracle/log_policy' to which the override properties will be applied.
	If the policy specified is not attached, an error message is displayed and/or an exception is thrown.
properties	Policy override properties. Properties must be specified using the following format:
	[("name","value")]
	For example: [("myprop","myval")]
	If this argument is set to None, then all policy overrides are removed.

3.7.22.3 Examples

The following example configures the override properties for the policy oracle/wss10_message_protection_service_policy for the port JRFWssUsernamePort of the Web module WssUsernameService. The Web service is part of the application HelloWorld#1_0 for the server server1 in the domain base_domain.

```
wls:/wls-domain/serverConfig>setWebServicePolicyOverride ('/base_
domain/server1/HelloWorld#1_0','j2wbasicPolicy', 'web',
'{http://namespace/}WssUsernameService','JRFWssUsernamePort', "oracle/wss10
message_protection_service_policy", [("keystore.sig.csf.key","sigkey")])
```

3.7.23 setWSMPolicyOverride

Note: This command applies to Oracle Infrastructure and RESTful Web services. It does not apply to Java EE Web services in this release. Command Category: Policy Management

Use with WLST: Online

3.7.23.1 Description

Within a session, adds a configuration override, described by a name-value pair, to a policy identified by the specified URI and attached to the policy set document or policy subject. The value argument is optional. If the value argument is omitted, the property specified by the name argument is removed from the policy subject. If the property specified by the name argument already exists and a value argument is provided, the current value is overwritten by the new value.

You must start a session and select the policy set (selectWSMPolicySet) or policy subject (selectWSMPolicySubject) before initiating the command. If there is no current session and no policy subject selected, an error is displayed.

3.7.23.2 Syntax

setWSMPolicyOverride(uri, name, value)

Argument	Description
uri	String representing the policy URI. For example, 'oracle/wss10_ saml_token_service_policy', to which the override properties will be applied.
name	String representing the name of the override property. For example: ['reference.priority']
value	Optional. String representing the value of the property. If this argument is not specified, the property specified by the name argument, if it exists, is removed.

3.7.23.3 Examples

The following example specifies a configuration override for the reference.priority property for the oracle/wss10_saml_token_service_ policy to a value of 1.

wls:/wls-domain/serverConfig> setWSMPolicyOverride('oracle/wss10_saml_token_ service_policy', 'reference.priority','1')

The following example removes the property reference.priority from the oracle/wss10_saml_token_service_policy in the policy set.

wls:/wls-domain/serverConfig> setWSMPolicyOverride('oracle/wss10 saml token service_policy', 'reference.priority')

3.8 Policy Set Management Commands

Policy sets enhance the security and manageability of an enterprise by providing a mechanism to globally attach one or more policies to a subject type. Using policy sets, an administrator can specify a default set of policies to be enforced even if none are directly attached. For detailed information about determining the type and scope of resources a policy set can be attached to, see "Defining the Type and Scope of Resources for Globally Attached Policies" in the Securing Web Services and Managing Policies with Oracle Web Services Manager.

All policy set creation, modification, or deletion commands must be performed in the context of a session. A session can only act on a single policy set.

Notes: The procedures in this section apply to Oracle Infrastructure and RESTful Web Services only. To view the help for the WLST commands described in this section, connect to a running instance of the server and enter help('wsmManage').

The policy set management commands listed in Table 3–9 have been deprecated in this release for Oracle Infrastructure Web Services.

For Oracle Infrastructure Web Services, Oracle recommends that you use the new WLST commands listed in Table 3–8 to manage OWSM policy sets in release 12*c*. These commands must be executed within the context of a session using the session commands described in Section 3.2, "Session Commands."

For a complete list of deprecated commands, see "Deprecated Commands for Oracle Infrastructure Web Services" in Release Notes.

Use the WLST commands listed in Table 3-6 to manage Oracle Infrastructure and RESTful Web Services globally available policy sets.

Table 3–8 Oracle Infrastructure Web Services Global Policy Set Management WLST Commands

Use this command	То	Use with WLST
cloneWSMPolicySet	Within a session, clone a new policy set from an existing policy set.	Online
createWSMPolicySet	Create a new, empty policy set within a session.	Online
deleteWSMAllPolicySets	Delete all or selected policy sets from within the OWSM repository.	Online
deleteWSMPolicySet	Delete a specified policy set within a session.	Online
displayWSMPolicySet	Display the configuration of a specified policy set.	Online
enableWSMPolicySet	Enable or disable the current policy set within a session.	Online
listWSMPolicySets	Lists the policy sets in the repository. This command will also display a policy set that is being created, modified, or deleted within the current session.	Online
selectWSMPolicySet	Specify a policy set for modification within a session.	Online
setWSMPolicySetConstraint	Specify a run-time constraint value for a policy set selected within a session.	Online
setWSMPolicySetOverride	Configure override properties to a policy set.	Online
setWSMPolicySetDescription	Specify a description for a policy set selected within a session.	Online
setWSMPolicySetScope	Set an expression that attaches a policy set to the specified resource scope.	Online
validateWSMPolicySet	Validate an existing policy set.	Online

Table 3–9 list the WLST commands that are deprecated in this release for managing Oracle Infrastructure Web service global policy sets.

Table 3–9 Deprecated WLST Commands for Global Policy Set Management

Use this command	То	Use with WLST
abortRepositorySession	Abort the current OWSM repository modification session, discarding any changes that were made to the repository during the session.	Online
attachPolicySet	Attach a policy set to the specified resource scope.	Online
attachPolicySetPolicy	Attach a policy to a policy set using the policy's URI.	Online
beginRepositorySession	Begin a session to modify the OWSM repository.	Online
clonePolicySet	Clone a new policy set from an existing policy set.	Online
commitRepositorySession	Write the contents of the current session to the OWSM repository.	Online
createPolicySet	Create a new, empty policy set.	Online
deleteAllPolicySets	Delete all or selected policy sets from within the OWSM repository.	Online
deletePolicySet	Delete a specified policy set.	Online
describeRepositorySession	Describe the contents of the current session.	Online
detachPolicySetPolicy	Detach a policy from a policy set using the policy's URI.	Online
displayPolicySet	Display the configuration of a specified policy set.	Online
enablePolicySet	Enable or disable a policy set.	Online
enablePolicySetPolicy	Enable or disable a policy attachment for a policy set using the policy's URI.	Online
listPolicySets	List the policy sets in the repository.	Online
migrateAttachments	Migrate direct policy attachments to global policy attachments if they are identical.	Online
modifyPolicySet	Specify an existing policy set for modification in the current session.	Online
setPolicySetConstraint	Specify a run-time constraint value for a policy set selected within a session.	Online
setPolicySetDescription	Specify a description for the policy set selected within a session.	Online
setPolicySetPolicyOverride	Add a configuration override to a policy reference in the current policy set.	Online
validatePolicySet	Validate an existing policy set in the repository or in a session.	Online

3.8.1 abortRepositorySession

Note: This command has been deprecated. It is recommended that you use the abortWSMSession command, as described in "abortWSMSession" on page 3-8.

The following examples show how to migrate to use the abortWSMSession command.

11g Release (for Repository operations):

wls:/jrfServer_domain/serverConfig> abortRepositorySession()

12c Release (for both Repository and PolicySubject operations):

wls:/jrfServer_domain/serverConfig> abortWSMSession()

Command Category: Policy Set Management

Use with WLST: Online

3.8.1.1 Description

Aborts the current modification session, discarding any changes that were made to the repository during the session.

3.8.1.2 Syntax

abortRepositorySession()

3.8.1.3 Example

The following example aborts the current OWSM session.

wls:/wls-domain/serverConfig>abortRepositorySession()

3.8.2 attachPolicySet

Note: This command has been deprecated. It is recommended that you use the setWSMPolicySetScope command, as described in "setWSMPolicySetScope" on page 3-94.

The following examples show how to migrate to use the setWSMPolicySetScope command.

11g Release:

wls:/jrfServer_domain/serverConfig> attachPolicySet ('Domain("base_ domain")')

12c Release:

wls:/jrfServer_domain/serverConfig> setWSMPolicySetScope ('Domain("base_domain")')

Command Category: Policy Set Management

Use with WLST: Online

3.8.2.1 Description

Within a session, sets an expression that attaches a policy set to the specified resource scope. The expression must define a valid resource scope in a supported format.

Issuing this command outside of a session containing a policy set that is being created or modified will result in an error.

3.8.2.2 Syntax

attachPolicySet(expression)

Argument	Definition
expression	Expression that attaches the policy set to the specified resource scope.
	For details about specifying the resource scope expression, see "Defining the Resource Scope" in <i>Securing Web Services and Managing Policies with Oracle Web Services Manager</i> .

3.8.2.3 Example

The following example attaches a policy set to the specified base_domain resource.

wls:/wls-domain/serverConfig>attachPolicySet('Domain("base_domain")')

This example attaches a policy set to the specified base_domain and managed_ server resources.

wls:/wls-domain/serverConfig>attachPolicySet('Domain("base_domain") and Server("managed_server")')

3.8.3 attachPolicySetPolicy

Note: For Oracle Infrastructure Web Services, it is recommended that you use the attachWSMPolicy command, as described in "attachWSMPolicy" on page 3-42. The following examples show how to migrate to use the attachWSMPolicy command.

11g Release (for both Repository and PolicySubject operation on policy set):

wls:/jrfServer_domain/serverConfig> attachPolicySetPolicy ('oracle/wss username token service policy')

12c Release:

wls:/jrfServer_domain/serverConfig> attachWSMPolicy('oracle/wss_ username_token_service_policy')

Command Category: Policy Set Management

Use with WLST: Online

3.8.3.1 Description

Within a session, attaches a policy, identified by the specified URI, to the current policy

Issuing this command outside of a session containing a policy set that is being created or modified will result in an error.

3.8.3.2 Syntax

attachPolicySetPolicy(uri)

Argument	Definition
uri	URI specifying the policy to attach to the current policy set. For example, 'oracle/log_policy'.

3.8.3.3 Example

The following example attaches the OWSM logging policy to the current policy set.

wls:/wls-domain/serverConfig>attachPolicySetPolicy('oracle/log_policy')

3.8.4 beginRepositorySession

Note: This command has been deprecated. It is recommended that you use the beginWSMSession command, as described in "beginWSMSession" on page 3-9.

The following examples show how to migrate to use the beginWSMSession command.

11g Release (for Repository operations):

wls:/jrfServer_domain/serverConfig> beginRepositorySession()

12*c* Release (for both Repository and PolicySubject operations):

wls:/jrfServer_domain/serverConfig> beginWSMSession()

Command Category: Policy Set Management

Use with WLST: Online

3.8.4.1 Description

Begins a session to modify the OWSM Repository. A session can only act on a single policy subject, such as a policy set or a Fusion Middleware Web service endpoint. An error will be displayed if there is already a current session.

3.8.4.2 Syntax

beginRepositorySession()

3.8.4.3 Example

The following example begins an OWSM Repository modification session.

wls:/wls-domain/serverConfig>beginRepositorySession()

3.8.5 clonePolicySet

Note: For Oracle Infrastructure Web Services, it is recommended that you use the cloneWSMPolicySet command, as described in "cloneWSMPolicySet" on page 3-71. The following examples show how to migrate to use the cloneWSMPolicySet command.

11g Release:

```
wls:/jrfServer_domain/serverConfig> clonePolicySet
('myNewPolicySet', 'myPolicySet')
```

12c Release:

```
wls:/jrfServer_domain/serverConfig> cloneWSMPolicySet
('myNewPolicySet', 'myPolicySet')
```

Command Category: Policy Set Management

Use with WLST: Online

3.8.5.1 Description

Within a session, clones a new policy set from an existing policy set. When cloning an existing policy set, all values and attachments in the source policy set are copied into the new policy set, although you can supply a different expression identifying the resource scope. The expression must define a valid resource scope in a supported format.

Issuing this command outside of a session will result in an error.

3.8.5.2 Syntax

clonePolicySet(name, source,[attachTo=None],[description=None],[enable='true'])

Argument	Definition
name	Name of the new policy set clone.
source	Name of the source policy set that will be cloned.
attachTo=None	Optional. Expression that attaches the policy set to the specified resource scope. For details about specifying the resource scope expression, see "Defining the Resource Scope" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
	If this argument is set to None, then the expression used in the source policy set to identify the scope of resources is retained.
description=None	Optional. Description for the new policy set.
	If this argument is set to None, then the description used in the source policy set is retained.
enable='true'	Optional. Specifies whether to enable or disable the policy set. Valid options are:
	■ true—Enables the policy set. The default is true.
	■ false—Disables the policy set.
	If you omit this argument, the policy set is enabled.

3.8.5.3 Example

The first example creates a policy set by cloning the existing myPolicySet policy set to create a new mynewPolicySet. The second example also creates a policy set, but narrows the resource scope to policy subjects in the specified jaxwsejb30ws application in the domain.

wls:/wls-domain/serverConfig>clonePolicySet('myNewPolicySet','myPolicySet') wls:/wls-domain/serverConfig>clonePolicySet('myNewPolicySet','myPolicySet','Applic ation("jaxwsejb30ws")')

3.8.6 cloneWSMPolicySet

Note: This command applies to Oracle Infrastructure and RESTful Web services. It does not apply to Java EE Web services in this release.

Command Category: Policy Set Management

Use with WLST: Online

3.8.6.1 Description

Within a session, clones a new policy set from an existing policy set. When cloning an existing policy set, all values and attachments in the source policy set are copied into the new policy set, although you can supply a different expression identifying the resource scope. The expression must define a valid resource scope in a supported format.

Issuing this command outside of a session will result in an error.

3.8.6.2 Syntax

cloneWSMPolicySet(name, source, [scope=None], [description=None], [enable='true'])

Argument	Definition
name	Name of the new policy set clone.
source	Name of the source policy set that will be cloned.
scope=None	Optional. Expression that attaches the policy set to the specified resource scope. For details about specifying the resource scope expression, see "Defining the Resource Scope" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
	If this argument is not specified, then the expression used in the source policy set to identify the scope of resources is retained.
description=None	Optional. Description for the new policy set.
	If this argument is not specified, then the description used in the source policy set is retained.
enable='true'	Optional. Specifies whether to enable or disable the policy set. If you omit this argument, the policy set is enabled. Valid options are:
	■ true—Enables the policy set. The default is true.
	■ false—Disables the policy set.
	If you omit this argument, the policy set is enabled.

3.8.6.3 **Examples**

The first example creates a policy set by cloning the existing myPolicySet policy set to create a new mynewPolicySet. The second example also creates a policy set, but narrows the resource scope to policy subjects in the specified jaxwsejb30ws application in the domain.

wls:/wls-domain/serverConfig>cloneWSMPolicySet('myNewPolicySet','myPolicySet') wls:/wls-domain/serverConfig>cloneWSMPolicySet('myNewPolicySet','myPolicySet','App lication("jaxwsejb30ws")')

3.8.7 commitRepositorySession

Note: This command has been deprecated. It is recommended that you use the commitWSMSession command, as described in "commitWSMSession" on page 3-9.

The following examples show how to migrate to use the commitWSMSession command.

11*g* Release (for Repository operations):

wls:/jrfServer_domain/serverConfig> commitRepositorySession()

12*c* Release (for both Repository and PolicySubject operations):

wls:/jrfServer_domain/serverConfig> commitWSMSession()

Command Category: Policy Set Management

Use with WLST: Online

3.8.7.1 Description

Writes the contents of the current session to the OWSM Repository. Messages are displayed that describe what was committed. An error will be displayed if there is no current session.

3.8.7.2 Syntax

commitRepositorySession()

3.8.7.3 Example

The following example commits the current repository modification session.

wls:/wls-domain/serverConfig>commitRepositorySession()

3.8.8 createPolicySet

Note: For Oracle Infrastructure Web Services, it is recommended that you use the createWSMPolicySet command, as described in "createWSMPolicySet" on page 3-74. The following examples show how to migrate to use the createWSMPolicySet command.

11g Release:

```
wls:/jrfServer_domain/serverConfig> createPolicySet('myPolicySet',
'ws-service', 'Domain("base_domain")')
```

12c Release:

```
wls:/jrfServer_domain/serverConfig> createWSMPolicySet
('myPolicySet', 'ws-service', 'Domain("base_domain")')
```

Command Category: Policy Set Management

Use with WLST: Online

3.8.8.1 Description

Creates a new, empty policy set within a session. When creating a new policy set, you must specify the type of policy subject that the policy set will apply to, and a supported expression that defines a valid resource scope in a supported format.

Issuing this command outside of a session will result in an error.

3.8.8.2 Syntax

createPolicySet(name,type,attachTo,[description=None],[enable='true'])

Argument	Definition
name	Name of the new, empty policy set.
type	The type of policy subject to which the new policy set applies. The type of policy subject must be one of the policy subjects described in "Understanding Policy Subjects" in <i>Understanding Oracle Web Services Manager</i> .
attachTo	Expression that attaches the policy set to the specified resource scope. For details about specifying the resource scope expression, see "Defining the Resource Scope" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
description	Optional. Description of the new policy set. If no description is specified, then the description for a new policy set will be "Global policy attachments for <type>", where <type> is the subject type.</type></type>
enable	Optional. Specifies whether to enable or disable the new policy set. Valid options are:
	 true—Enables the new policy set. The default is true.
	false—Disables the new policy set.
	If you omit this argument, the policy set is enabled.

3.8.8.3 Example

The first example creates a new policy set and specifies the resource scope to only ws-service types (Web Service Endpoint) in the base_domain domain.

wls:/wls-domain/serverConfig>createPolicySet('myPolicySet','ws-service','Domain("b ase_domain")')

3.8.9 createWSMPolicySet

Note: This command applies to Oracle Infrastructure and RESTful Web services. It does not apply to Java EE Web services in this release.

Command Category: Policy Set Management

Use with WLST: Online

3.8.9.1 Description

Within a session, creates a new, empty policy set. When creating a new policy set, you must specify the type of policy subject that the policy set will apply to, and provide a supported expression that defines a valid resource scope in a supported format.

Issuing this command outside of a session will result in an error.

3.8.9.2 Syntax

createWSMPolicySet(name,type,scope,[description=None],[enable='true'])

Argument	Definition
name	Name of the new, empty policy set.
type	The type of policy subject that the new policy set applies to. The type of policy subject must be one of the policy subjects described in "Understanding Policy Subjects" in <i>Understanding Oracle Web Services Manager</i> .
scope	Optional. Expression that attaches the policy set to the specified resource scope. For details about specifying the resource scope expression, see "Defining the Resource Scope" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
	If this argument is not specified, then the expression used in the source policy set to identify the scope of resources is retained.
description=None	Optional. Description of the new policy set. If no description is specified, then the description for a new policy set will be "Global policy attachments for <i><type></type></i> ", where <i><type></type></i> is the subject type.
enable='true'	Optional. Specifies whether to enable or disable the new policy set. Valid options are:
	■ true—Enables the new policy set. The default is true.
	■ false—Disables the new policy set.
<u> </u>	If you omit this argument, the policy set is enabled.

3.8.9.3 Examples

The first example creates a new policy set and specifies the resource scope to only ws-service types (Web Service Endpoint) in the base_domain domain.

wls:/wls-domain/serverConfig>createWSMPolicySet('myPolicySet','ws-service','Domain ("base_domain")')

3.8.10 deleteAllPolicySets

Note: For Oracle Infrastructure Web Services, it is recommended that you use the deleteWSMAllPolicySets command, as described in "deleteWSMAllPolicySets" on page 3-76. The following examples show how to migrate to use the deleteWSMAllPolicySets command.

11g Release:

wls:/jrfServer_domain/serverConfig> deleteAllPolicySets()

12c Release:

wls:/jrfServer_domain/serverConfig> deleteWSMAllPolicySets()

Command Category: Policy Set Management

Use with WLST: Online

3.8.10.1 Description

Deletes all or selected policy sets from within the OWSM repository. You can specify whether to force deletion of all the policy sets, or prompt to select individual policy sets for deletion. If deletion of any policy set fails then this operation throws an exception and no policy sets are deleted.

3.8.10.2 Syntax

deleteAllPolicySets([mode])

Argument	Definition
mode	Optional. The action to be taken for performing policy set deletion. Valid options are:
	 force—Automatically delete all policy sets without prompting.
	prompt—Request user confirmation for each policy set deletion. Available options are yes, no, and cancel. If you select cancel for any property set deletion, the operation is canceled and no policy sets are deleted.
	If no mode is specified, this argument defaults to prompt mode.

3.8.10.3 Examples

The following example automatically deletes all policy sets from the respository without prompting.

wls:/jrfServer_domain/serverConfig> deleteAllPolicySets("force")

Starting Operation deleteAllPolicySets ...

All policy sets were deleted successfully from repository.

deleteAllPolicySets Operation Completed.

The following examples delete selected policy sets from the repository.

```
wls:/jrfServer_domain/serverConfig> deleteAllPolicySets()
wls:/jrfServer_domain/serverConfig> deleteAllPolicySets('prompt')
Starting Operation deleteAllPolicySets ...
Policy Set Name: create_policyset_6
Select "create_policyset_6" for deletion (yes/no/cancel)? no
Policy Set Name: create_policyset_8
Select "create_policyset_8" for deletion (yes/no/cancel)? yes
Policy Set Name: create_policyset_21
Select "create_policyset_21" for deletion (yes/no/cancel)? no
Policy Set Name: create_policyset_10
Select "create_policyset_10" for deletion (yes/no/cancel)? yes
All the selected policy sets were deleted successfully from repository.
deleteAllPolicySets Operation Completed.
```

3.8.11 deleteWSMAllPolicySets

Note: This command applies to Oracle Infrastructure and RESTful Web services. It does not apply to Java EE Web services in this release.

Command Category: Policy Set Management

Use with WLST: Online

3.8.11.1 Description

Deletes all or selected policy sets within a session. You can specify whether to force deletion of all the policy sets, or prompt to select individual policy sets for deletion. If deletion of any policy set fails then this operation throws an exception and no policy sets are deleted.

3.8.11.2 Syntax

deleteWSMAllPolicySets([mode])

Argument	Definition
mode	Optional. The action to be taken for performing policy set deletion. Valid options are:
	 force—Automatically delete all policy sets without prompting.
	prompt—Request user confirmation for each policy set deletion. Available options are yes, no, and cancel. If you select cancel for any property set deletion, the operation is canceled and no policy sets are deleted.
	If no mode is specified, this argument defaults to prompt mode.

3.8.11.3 Examples

The following example automatically deletes all policy sets from the respository without prompting.

```
wls:/jrfServer_domain/serverConfig> deleteWSMAllPolicySets("force")
Starting Operation deleteWSMAllPolicySets ...
All policy sets were deleted successfully from repository.
deleteWSMAllPolicySets Operation Completed.
The following examples delete selected policy sets from the repository.
wls:/jrfServer_domain/serverConfig> deleteWSMAllPolicySets()
or
wls:/jrfServer_domain/serverConfig> deleteWSMAllPolicySets('prompt')
Starting Operation deleteWSMAllPolicySets ...
Policy Set Name: create_policyset_6
Select "create_policyset_6" for deletion (yes/no/cancel)? no
Policy Set Name: create_policyset_8
Select "create_policyset_8" for deletion (yes/no/cancel)? yes
Policy Set Name: create_policyset_21
Select "create_policyset_21" for deletion (yes/no/cancel)? no
Policy Set Name: create_policyset_10
Select "create_policyset_10" for deletion (yes/no/cancel)? yes
All the selected policy sets were deleted successfully from repository.
deleteWSMAllPolicySets Operation Completed.
```

3.8.12 deletePolicySet

Note: For Oracle Infrastructure Web Services, it is recommended that you use the deleteWSMPolicySet command, as described in "deleteWSMPolicySet" on page 3-78. The following examples show how to migrate to use the deleteWSMPolicySet command.

```
11g Release:
```

```
wls:/jrfServer_domain/serverConfig> deletePolicySet('myPolicySet')
```

12*c* Release:

wls:/jrfServer_domain/serverConfig> deleteWSMPolicySet ('myPolicySet')

Command Category: Policy Set Management

Use with WLST: Online

3.8.12.1 Description

Deletes a specified policy set within a session. If the session already contains a different policy set, an error will display. If the session already contains the named policy set, then a creation will be undone or a modification will be converted into a deletion.

Issuing this command outside of a session will result in an error.

3.8.12.2 Syntax

deletePolicySet(name)

Argument	Definition
name	Name of the policy set to be deleted.

3.8.12.3 Example

The following example deletes a specified myPolicySet policy set.

wls:/wls-domain/serverConfig>deletePolicySet('myPolicySet')

3.8.13 deleteWSMPolicySet

Note: This command applies to Oracle Infrastructure and RESTful Web services. It does not apply to Java EE Web services in this release.

Command Category: Policy Set Management

Use with WLST: Online

3.8.13.1 Description

Within a session, deletes a specified policy set. If the session already contains a different policy set, an error will display. If the session already contains the named policy set, then a creation will be undone or a modification will be converted into a deletion.

Issuing this command outside of a session will result in an error.

3.8.13.2 Syntax

deleteWSMPolicySet(name)

Argument	Definition
name	Name of the policy set to be deleted.

3.8.13.3 Examples

The following example deletes a specified myPolicySet policy set.

wls:/wls-domain/serverConfig>deleteWSMPolicySet('myPolicySet')

3.8.14 describeRepositorySession

Note: This command has been deprecated. It is recommended that you use the describeWSMSession command, as described in "describeWSMSession" on page 3-10. The following examples show how to migrate to use the describeWSMSession command.

11*g* Release (for Repository operations):

wls:/jrfServer_domain/serverConfig> describeRepositorySession()

12*c* Release (for both Repository and Policy Subject operations):

wls:/jrfServer_domain/serverConfig> describeWSMSession()

Command Category: Policy Set Management

Use with WLST: Online

3.8.14.1 Description

Describes the contents of the current session. This will either indicate that the session is empty or list the name of the policy subject that is being updated, along with the type of update (create, modify, or delete). An error will be displayed if there is no current session.

3.8.14.2 Syntax

describeRepositorySession()

3.8.14.3 Example

The following example describes the current repository modification session.

wls:/wls-domain/serverConfig>describeRepositorySession()

3.8.15 detachPolicySetPolicy

Note: For Oracle Infrastructure Web Services, it is recommended that you use the detachWSMPolicy command, as described in "detachWSMPolicy" on page 3-50. The following examples show how to migrate to use the detachWSMPolicy command.

11g Release (for both Repository and Policy Subject operations on policy set):

wls:/jrfServer_domain/serverConfig> detachPolicySetPolicy ('oracle/wss_username_token_service_policy')

12c Release:

wls:/jrfServer_domain/serverConfig> detachWSMPolicy('oracle/wss_ username_token_service_policy')

Command Category: Policy Set Management

Use with WLST: Online

3.8.15.1 Description

Within a session, detaches a policy, identified by a specified URI, from the current policy set.

Issuing this command outside of a session containing a policy set that is being created or modified will result in an error.

3.8.15.2 Syntax

detachPolicySetPolicy(uri)

Argument	Definition
uri	URI specifying the policy to detach to the current policy set. For example, oracle/log_policy'.

3.8.15.3 Example

The following example detaches the OWSM logging policy from the current policy set.

wls:/wls-domain/serverConfig> detachPolicySetPolicy('oracle/log_policy')

3.8.16 displayPolicySet

Note: For Oracle Infrastructure Web Services, it is recommended that you use the displayWSMPolicySet command, as described in "displayWSMPolicySet" on page 3-81. The following examples show how to migrate to use the displayWSMPolicySet command.

11g Release:

wls:/jrfServer_domain/serverConfig> displayPolicySet('myPolicySet')

12c Release:

wls:/jrfServer_domain/serverConfig> displayWSMPolicySet ('myPolicySet')

Command Category: Policy Set Management

Use with WLST: Online

3.8.16.1 Description

Displays the configuration of a specified policy set. If the policy set is being modified in the current session, then that version will be displayed; otherwise, the latest version in the repository will be displayed. An error will display if the policy set does not

This command can be issued outside of a session.

3.8.16.2 Syntax

displayPolicySet([name])

Argument	Definition
name	Optional. Name of the policy set to be displayed.
	If a name is not specified, the configuration of the policy set, if any, in the current session is displayed or an error message is displayed.

3.8.16.3 Example

The following example displays the configuration of the myPolicySet policy set.

wls:/wls-domain/serverConfig>displayPolicySet('myPolicySet')

3.8.17 displayWSMPolicySet

Note: This command applies to Oracle Infrastructure and RESTful Web services. It does not apply to Java EE Web services in this release.

Command Category: Policy Set Management

Use with WLST: Online

3.8.17.1 Description

Displays the configuration of a specified policy set. If the policy set is being modified in the current session, then that version will be displayed; otherwise, the latest version in the repository will be displayed. An error will display if the policy set does not exist.

This command can be issued outside of a session.

3.8.17.2 Syntax

displayWSMPolicySet([name])

Argument	Definition
name	Optional. Name of the policy set to be displayed.
	If a name is not specified, the configuration of the policy set, if any, in the current session is displayed or an error message is displayed.

3.8.17.3 Examples

The following example displays the configuration of the myPolicySet policy set.

wls:/wls-domain/serverConfig>displayWSMPolicySet('myPolicySet')

3.8.18 enablePolicySet

Note: For Oracle Infrastructure Web Services, it is recommended that you use the enableWSMPolicySet command, as described in "enableWSMPolicySet" on page 3-84. The following examples show how to migrate to use the enableWSMPolicySet command.

11g Release:

wls:/jrfServer_domain/serverConfig> enablePolicySet(true)

12c Release:

wls:/jrfServer_domain/serverConfig> enableWSMPolicySet(true)

Command Category: Policy Set Management

Use with WLST: Online

3.8.18.1 Description

Enables or disables the current policy set within a session. If not specified, this command enables the policy set.

Issuing this command outside of a session containing a policy set that is being created or modified will result in an error.

3.8.18.2 Syntax

enablePolicySet([enable=True])

Argument	Definition
enable	Optional. Specifies whether to enable or disable the policy set. Valid options are:
	 true—Enables the policy set. The default is true.
	false—Disables the policy set.
	If you omit this argument, the policy set is enabled.

3.8.18.3 Example

The following example enables the current policy set.

wls:/wls-domain/serverConfig>enablePolicySet(true)

3.8.19 enablePolicySetPolicy

Note: For Oracle Infrastructure Web Services, it is recommended that you use the enableWSMPolicySet command, as described in "enableWSMPolicySet" on page 3-84. The following examples show how to migrate to use the enableWSMPolicySet command.

11g Release:

wls:/wls-domain/serverConfig>enablePolicySetPolicy('/oracle/log_ policy',false)

12*c* Release:

wls:/wls-domain/serverConfig>enableWSMPolicy('/oracle/log_ policy',false)

Command Category: Policy Set Management

Use with WLST: Online

3.8.19.1 Description

Within a session, enables or disables the policy attachment, which is identified by the provided URI in the current policy set. If not specified, this command enables the policy set. An error displays if the identified policy is not currently attached to the policy set.

Issuing this command outside of a session containing a policy set that is being created or modified will result in an error.

3.8.19.2 Syntax

enablePolicySetPolicy(uri,[enable=true])

Argument	Definition
uri	URI specifying the policy attachment within the policy set.
enable	Optional. Specifies whether to enable or disable the policy attachment specified by the URI in the policy set. Valid options are:
	 true—Enables the specified policy attachment in the policy set. The default is true.
	 false—Disables specified policy attachment in the policy set.
	If you omit this argument, the policy set attachment is enabled.

3.8.19.3 Example

The following example disables the specified logging policy attachment within the current policy set.

wls:/wls-domain/serverConfig>enablePolicySetPolicy('/oracle/log policy',false)

3.8.20 enableWSMPolicySet

Note: This command applies to Oracle Infrastructure and RESTful Web services. It does not apply to Java EE Web services in this release.

Command Category: Policy Set Management

Use with WLST: Online

3.8.20.1 Description

Within a session, enables or disables the current policy set. If the optional enable argument is not specified, this command enables the policy set by default.

Issuing this command outside of a session containing a policy set that is being created or modified will result in an error.

3.8.20.2 Syntax

enableWSMPolicySet([enable=True])

Argument	Definition
enable	Optional. Specifies whether to enable or disable the policy set. Valid options are:
	 true—Enables the policy set. The default is true.
	false—Disables the policy set.
	If you omit this argument, the policy set is enabled.

3.8.20.3 Examples

The following example enables the current policy set.

wls:/wls-domain/serverConfig>enableWSMPolicySet(true)

3.8.21 listPolicySets

Note: For Oracle Infrastructure Web Services, it is recommended that you use the listWSMPolicySets command, as described in "listWSMPolicySets" on page 3-85. The following examples show how to migrate to use the listWSMPolicySets command.

11g Release:

wls:/wls-domain/serverConfig>listPolicySets('ws-service')

12c Release:

wls:/wls-domain/serverConfig>listWSMPolicySets('ws-service')

Command Category: Policy Set Management

Use with WLST: Online

3.8.21.1 Description

Lists the policy sets in the repository. This command will also display a policy set that is being created, modified, or deleted within the current session. You can list all the policy sets or limit the display to include only those that apply to specific policy subject resource types.

3.8.21.2 Syntax

listPolicySets([type=None])

Argument	Definition
type=None	Optional. Specifies the type of policy subject for which the associated policy sets will be displayed. The type of policy subject must be one of the policy subjects described in "Understanding Policy Subjects" in Understanding Oracle Web Services Manager
	If this argument is set to None, then all the policy sets stored in the repository will be listed.

3.8.21.3 Example

The first two examples list policy sets by either the ws-service or ws-client resource types. The third example lists all the policy sets stored in the repository.

```
wls:/wls-domain/serverConfig>listPolicySets('ws-service')
wls:/wls-domain/serverConfig>listPolicySets('ws-client')
wls:/wls-domain/serverConfig>listPolicySets()
```

3.8.22 listWSMPolicySets

Note: This command applies to Oracle Infrastructure and RESTful Web services. It does not apply to Java EE Web services in this release.

Command Category: Policy Set Management

Use with WLST: Online

3.8.22.1 Description

Lists the policy sets in the repository. This command will also display a policy set that is being created, modified, or deleted within the current session. You can list all the policy sets or use the type argument to limit the display to include only those sets that apply to specific policy subject resource types.

3.8.22.2 Syntax

listWSMPolicySets([type=None])

Argument	Definition
type=None	Optional. Specifies the type of policy subject for which the associated policy sets will be displayed. The type of policy subject must be one of the policy subjects described in "Understanding Policy Subjects" in <i>Understanding Oracle Web Services Manager</i> .
	If this argument is set to None, then all the policy sets stored in the repository will be listed.

3.8.22.3 Examples

The first two examples list policy sets by either the ws-service or ws-client resource types. Whereas, the third example lists all the policy sets stored in the repository.

```
wls:/wls-domain/serverConfig>listWSMPolicySets('ws-service')
wls:/wls-domain/serverConfig>listWSMPolicySets('ws-client')
wls:/wls-domain/serverConfig>listWSMPolicySets()
```

3.8.23 migrateAttachments

Note: This command has been deprecated. It is recommended that you use the migrateWSMAttachments command, as described in "migrateWSMAttachments" on page 3-105. The following examples show how to migrate to use the migrateWSMAttachments command.

11g Release:

wls:/jrfServer_domain/serverConfig> migrateAttachments()

12c Release:

wls:/jrfServer_domain/serverConfig> migrateWSMAttachments()

Command Category: Policy Set Management

Use with WLST: Online

3.8.23.1 Description

Migrates direct (local) policy attachments that are identical to the external global policy attachments that would otherwise be attached to each policy subject in the current domain. You can specify whether to force the migration, prompt for confirmation before each migration, or simply list the migrations that would occur. A direct policy attachment is identical if its URI is the same as one provided by a global policy attachment, and if it does not have any scoped configuration overrides.

Note: A direct attachment with an unscoped override will be migrated but an attachment with a scoped override will not. This is because after running the migrateAttachments() command, the enforcement of the policies on all subjects remains the same, even though some policies are globally attached.

Whether forced or prompted, the command lists each direct policy attachment that is migrated. This output will identify the policy subject that was modified, the URI of the identical policy reference, and the name of the global policy attachment document that duplicated the direct attachment.

3.8.23.2 Syntax

migrateAttachments([mode])

Argument	Definition
mode	The action to be taken for each policy attachment that can be migrated. Valid options are:
	 force—Automatically migrate all identical policy attachments without prompting.
	 preview—List all policy attachments that can be migrated, but does not perform any migration.
	 prompt—Request user confirmation before migrating each policy attachment.
	If no mode is specified, this argument defaults to prompt mode.

3.8.23.3 Example

The following examples describe how to use the repository attachment migration modes.

```
wls:/wls-domain/serverConfig>migrateAttachments()
wls:/wls-domain/serverConfig>migrateAttachments('force')
wls:/wls-domain/serverConfig>migrateAttachments('preview')
wls:/wls-domain/serverConfig>migrateAttachments('prompt')
```

3.8.24 modifyPolicySet

Note: For Oracle Infrastructure Web Services, it is recommended that you use the selectWSMPolicySet command, as described in "selectWSMPolicySet" on page 3-88. The following examples show how to migrate to use the selectWSMPolicySet command.

11g Release:

```
wls:/jrfServer_domain/serverConfig> modifyPolicySet('myPolicySet')
```

12*c* Release:

```
wls:/jrfServer_domain/serverConfig> selectWSMPolicySet
('myPolicySet')
```

Command Category: Policy Set Management

Use with WLST: Online

3.8.24.1 Description

Specifies a policy set for modification in the current session. The latest version of the named policy set will be loaded into the current session. If the session already contains a different policy set, then an error will be displayed; if the session already contains the named policy set, then no action will be taken. Subsequent attempts to modify the named policy set will show the current version in the session.

Issuing this command outside of a session will result in an error.

3.8.24.2 Syntax

modifyPolicySet(name)

Argument	Definition
name	Name of the policy set to be modified in the current session.

3.8.24.3 Example

The following example opens the *myPolicySet* policy set for modification in the current session.

wls:/wls-domain/serverConfig>modifyPolicySet('myPolicySet')

3.8.25 selectWSMPolicySet

Note: This command applies to Oracle Infrastructure and RESTful Web services. It does not apply to Java EE Web services in this release.

Command Category: Policy Set Management

Use with WLST: Online

3.8.25.1 Description

Within a session, specifies a policy set for modification. The latest version of the named policy set is loaded into the current session. If the session already contains a different policy set, then an error will be displayed; if the session already contains the named policy set, then no action will be taken. Subsequent attempts to modify the named policy set will show the current version in the session.

Issuing this command outside of a session will result in an error.

3.8.25.2 Syntax

selectWSMPolicySet(name)

Argument	Description
name	Name of the policy set to be modified in the current session.

3.8.25.3 Examples

The following example selects a policy set in the current session named myPolicySet.

wls:/wls-domain/serverConfig> selectWSMPolicySet('myPolicySet')

3.8.26 setPolicySetConstraint

Note: This command has been deprecated. It is recommended that you use the setWSMPolicySetConstraint command, as described in "setWSMPolicySetConstraint" on page 3-92. The following examples show how to migrate to use the setWSMPolicySetConstraint command.

11*g* Release:

wls:/jrfServer_domain/serverConfig> setPolicySetConstraint ('HTTPHeader("VIRTUAL_HOST_TYPE", "external")')

12c Release:

wls:/jrfServer_domain/serverConfig> setWSMPolicySetConstraint ('HTTPHeader("VIRTUAL_HOST_TYPE", "external")')

Command Category: Policy Set Management

Use with WLST: Online

3.8.26.1 Description

Specifies a run-time constraint value for a policy set selected within a session. Issuing this command outside of a session containing a policy set that is being created or modified will result in an error.

For more information, see "Specifying Run-time Constraints in Policy Sets" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

3.8.26.2 Syntax

setPolicySetConstraint(constraint)

Argument	Definition
constraint	Expression that specifies the run-time context to which the policy set applies. If not specified, the policy set applies to all run-time contexts.

3.8.26.3 Example

The following example specifies that the policy set apply only to requests from external clients.

wls:/wls-domain/serverConfig> setPolicySetConstraint('HTTPHeader("VIRTUAL_HOST_ TYPE", "external")')

The following example specifies that the policy set apply only to requests from non-external clients.

wls:/wls-domain/serverConfig> setPolicySetConstraint('!HTTPHeader("VIRTUAL_HOST_ TYPE", "external")')

3.8.27 setPolicySetDescription

Note: This command has been deprecated. It is recommended that you use the setWSMPolicySetDescription command, as described in "setWSMPolicySetDescription" on page 3-92. The following examples show how to migrate to use the setWSMPolicySetDescription command.

11g Release:

wls:/jrfServer_domain/serverConfig> setPolicySetDescription ('Global policy set for web service endpoint.')

12*c* Release:

wls:/jrfServer_domain/serverConfig> setWSMPolicySetDescription ('Global policy set for web service endpoint.')

Command Category: Policy Set Management

Use with WLST: Online

3.8.27.1 Description

Specifies a description for a policy set selected within a session.

Issuing this command outside of a session containing a policy set that is being created or modified will result in an error.

3.8.27.2 Syntax

setPolicySetDescription(description)

Argument	Definition
description	Describes a policy set.

3.8.27.3 Example

The following example creates a description for a policy set.

wls:/wls-domain/serverConfig>setPolicySetDescription('PolicySetDescription')

3.8.28 setPolicySetPolicyOverride

Note: This command has been deprecated. It is recommended that you use the setWSMPolicyOverride command, as described in "setWSMPolicyOverride" on page 3-63. The following examples show how to migrate to use the setWSMPolicyOverride command.

11g Release:

wls:/jrfServer_domain/serverConfig> setPolicySetPolicyOverride ('oracle/wss_username_token_service_policy', 'reference.priority', 1101)

12c Release:

wls:/jrfServer_domain/serverConfig> setWSMPolicyOverride ('oracle/wss_username_token_service_policy', 'reference.priority', 101)

Command Category: Policy Set Management

Use with WLST: Online

3.8.28.1 Description

Adds a configuration override, described by a name, value pair, to an attached policy reference in the current policy set. The value argument is optional. If the value argument is omitted, the property specified by the name argument is removed from the policy reference in the policy set. If the property specified by the name argument already exists and a value argument is provided, the current value is overwritten by the new value specified with the value argument.

Issuing this command outside of a session containing a policy set that is being created or modified results in an error.

3.8.28.2 Syntax

setPolicySetPolicyOverride(uri,name,[value=None])

Argument	Definition
URI	String representing the OWSM policy URI, for example, 'oracle/wss10_saml_token_service_policy' to which the override properties will be applied.
name	String representing the name of the override property.
	For example: ['reference.priority']
value	Optional. String representing the value of the property. If this argument is not specified, the property specified by the name argument, if it exists, is removed.

3.8.28.3 Example

The following example specifies a configuration override for the reference.priority property for the oracle/wss10_saml_token_service_ policy to a value of 1.

wls:/wls-domain/serverConfig> setPolicySetPolicyOverride('oracle/wss10 saml token service_policy', 'reference.priority','1')

The following example removes the property reference.priority from the oracle/wss10_saml_token_service_policy in the policy set.

wls:/wls-domain/serverConfig> setPolicySetPolicyOverride('oracle/wss10_saml_token_ service_policy', 'reference.priority')

3.8.29 setWSMPolicySetConstraint

Note: This command applies to Oracle Infrastructure and RESTful Web services. It does not apply to Java EE Web services in this release.

Command Category: Policy Set Management

Use with WLST: Online

3.8.29.1 Description

Within a session, specifies a constraint value for a policy set selected within a session. Issuing this command outside of a session containing a policy set that is being created or modified will result in an error.

For more information, see "Specifying Run-time Constraints in Policy Sets" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

3.8.29.2 Syntax

setWSMPolicySetConstraint(constraint)

Argument	Definition
constraint	Expression that specifies the run-time context to which the policy set applies. If not specified, the policy set applies to all run-time contexts.

3.8.29.3 Examples

The following example specifies that the policy set applies only to requests from external clients.

wls:/wls-domain/serverConfig> setWSMPolicySetConstraint('HTTPHeader("VIRTUAL_HOST_ TYPE", "external")')

The following example specifies that the policy set applies only to requests from non-external clients.

wls:/wls-domain/serverConfig> setWSMPolicySetConstraint('!HTTPHeader("VIRTUAL_ HOST_TYPE", "external")')

3.8.30 setWSMPolicySetDescription

Note: This command applies to Oracle Infrastructure and RESTful Web services. It does not apply to Java EE Web services in this release. Command Category: Policy Set Management

Use with WLST: Online

3.8.30.1 Description

Within a session, specifies a description for a policy set. Issuing this command outside of a session containing a policy set that is being created or modified will result in an error.

3.8.30.2 Syntax

setWSMPolicySetDescription(description)

Argument	Definition
description	Describes a policy set.

3.8.30.3 Examples

The following example creates a description for a policy set.

wls:/wls-domain/serverConfig>setWSWPolicySetDescription('PolicySetDescription')

3.8.31 setWSMPolicySetOverride

Note: This command applies to Oracle Infrastructure and RESTful Web services. It does not apply to Java EE Web services in this release.

Command Category: Policy Set Management

Use with WLST: Online

3.8.31.1 Description

Within a session, adds a configuration override, described by a name-value pair, to the currently selected policy set. The override is unscoped to any specific policy reference. The value argument is optional. If the value argument is omitted, a null is assumed for value, and the property specified by the name argument is removed from the policy set. If the property specified by the name argument already exists and a value argument is provided, the current value is overwritten by the new value.

You must start a session and select the policy set (using the selectWSMPolicySet command), before initiating the command. Issuing this command outside of a session containing a policy subject that is being created or modified results in an error.

3.8.31.2 Syntax

setWSMPolicySetOverride(name,[value=None])

Argument	Description
name	String representing the name of the override property. For example: ['on.behalf.of']
value	Optional. String representing the value of the property. If this argument is not specified, a null is assumed and the property specified by the name argument is removed, if one exists with the same name.

3.8.31.3 Examples

The following example specifies a configuration override for the on.behalf.of property for the policy set selected in the session to a value of true.

wls:/wls-domain/serverConfig> setWSMPolicySetOverride('on.behalf.of','true')

The following example removes the property on . behalf . of from the policy set.

wls:/wls-domain/serverConfig> setWSMPolicySetOverride('on.behalf.of')

3.8.32 setWSMPolicySetScope

Note: This command applies to Oracle Infrastructure and RESTful Web services. It does not apply to Java EE Web services in this release.

Command Category: Policy Set Management

Use with WLST: Online

3.8.32.1 Description

Within a session, sets an expression that attaches a policy set to the specified resource scope. The expression must define a valid resource scope in a supported format.

Issuing this command outside of a session containing a policy set that is being created or modified will result in an error.

3.8.32.2 Syntax

setWSMPolicySetScope(expression)

Argument	Definition
expression	Expression that attaches the policy set to the specified resource scope.
	For details about specifying the resource scope expression, see "Defining the Resource Scope" in <i>Securing Web Services and Managing Policies with Oracle Web Services Manager</i> .

3.8.32.3 Examples

The following example attaches a policy set to the specified base_domain resource.

wls:/wls-domain/serverConfig>setWSMPolicySetScope('Domain("base_domain")')

This example attaches a policy set to the specified base_domain and managed_ server resources.

Server("managed_server")')

3.8.33 validatePolicySet

Note: This command has been deprecated. It is recommended that you use the validateWSMPolicySet command, as described in "validateWSMPolicySet" on page 3-95. The following examples show how to migrate to use the validateWSMPolicySet command.

11g Release:

```
wls:/jrfServer_domain/serverConfig> validatePolicySet
('myPolicySet')
```

12c Release:

```
wls:/jrfServer_domain/serverConfig> validateWSMPolicySet
('myPolicySet')
```

Command Category: Policy Set Management

Use with WLST: Online

3.8.33.1 Description

Validates an existing policy set. If a policy set name is provided, the command will validate the specified policy set. If no policy set name is specified, the command will validate the policy set in the current session.

An error message displays if the policy set does not exist, or a name is not provided and the session is not active, or if the OWSM repository does not contain a suitable policy set.

3.8.33.2 Syntax

validatePolicySet([name=None])

Argument	Definition
name	Optional. Name of the policy set to validate. If a name is not provided then the command will validate the policy set being created or modified in the current session.

3.8.33.3 Example

The first example validates the policy set in the current session. The second example validates the specified myPolicySet policy set.

```
wls:/wls-domain/serverConfig>validatePolicySet()
wls:/wls-domain/serverConfig>validatePolicySet('myPolicySet')
```

3.8.34 validateWSMPolicySet

Note: This command applies to Oracle Infrastructure and RESTful Web services. It does not apply to Java EE Web services in this release.

Command Category: Policy Set Management

Use with WLST: Online

3.8.34.1 Description

Within a session, validates an existing policy set. If a policy set name is provided, the specified policy set is validated. If no policy set name is specified, the policy set in the current session is validated.

If the policy set does not exist, if a name is not provided and the session is not active, or if the repository does not contain a suitable policy set, an error message is displayed.

3.8.34.2 Syntax

validateWSMPolicySet([name=None])

Argument	Definition
name	Optional. Name of the policy set to validate. If a name is not provided then the command will validate the policy set being created or modified in the current session.

3.8.34.3 Examples

The first example validates the policy set in the current session. The second example validates the specified myPolicySet policy set.

```
wls:/wls-domain/serverConfig> validateWSMPolicySet()
wls:/wls-domain/serverConfig> validateWSMPolicySet('myPolicySet')
```

3.9 OWSM Repository Management Commands

Use the commands listed in Table 3–10 to manage the Oracle Infrastructure Web Services documents stored in the OWSM repository. For additional information about upgrading or migrating documents in an OWSM repository, see "Upgrading the Repository to 12c" in the Securing Web Services and Managing Policies with Oracle Web Services Manager.

Note: The repository management commands listed in Table 3–11 have been deprecated in this release.

To manage the OWSM repository in release 12c, it is recommended that you use the new WLST commands listed in Table 3–10. For a complete list of deprecated commands, see "Deprecated Commands for Oracle Infrastructure Web Services" in Release Notes.

Additional MDS WLST commands are described in Chapter 4, "Metadata Services (MDS) Custom WLST Commands."

Table 3-10 Oracle Infrastructure Web Services - WLST Commands for Repository Management

Use this command	То	Use with WLST
exportWSMAppMetadata	Export a set of applications metadata from the repository into a supported ZIP archive.	Online
	Note : This command is supported for Oracle Infrastructure and RESTful Web services only. This command is not supported for ADF DC Web service clients and Java EE Web services.	
exportWSMRepository	Export a set of documents from the repository into a supported ZIP archive.	Online
importWSMArchive	Import a set of documents from a supported ZIP archive into the repository.	Online
migrateWSMPMRoles	Migrate the custom roles and policies from the Plan.xml file to the wsm-pm.ear policy store.	Online
migrateWSMAttachments	Migrates direct (local) policy attachments that are identical to the external global policy attachments that would otherwise be attached to each policy subject in the current domain.	Online
resetWSMRepository	Delete the existing policies stored in the repository and refresh it with the latest set of predefined policies that are provided in the new installation of the Oracle Fusion Middleware software.	Online
upgradeWSMRepository	Upgrade the OWSM predefined policies stored in the repository with any new predefined policies that are provided in the latest installation of the Oracle Fusion Middleware software.	Online

Table 3–11 list the WLST commands for managing the OWSM repository that have been deprecated in this release.

Table 3-11 Deprecated WLST Commands for Repository Management

Use this command	То	Use with WLST
exportRepository	Export a set of documents from the repository into a supported ZIP archive. If the specified archive already exists, you can choose whether to overwrite the archive or merge the documents into the existing archive.	Online
importRepository	Import a set of documents from a supported ZIP archive into the repository. You can provide the location of a file that describes how to map a physical information from the source environment to the target environment.	Online

Table 3–11 (Cont.) Deprecated WLST Commands for Repository Management

Use this command	То	Use with WLST
resetWSMPolicyRepository	Delete the existing policies stored in the repository and refresh it with the latest set of predefined policies that are provided in the new installation of the Oracle Fusion Middleware software.	Online
upgradeWSMPolicyRepository	Upgrade the OWSM predefined policies stored in the repository with any new predefined policies that are provided in the latest installation of the Oracle Fusion Middleware software.	Online

3.9.1 exportRepository

Note: This command has been deprecated. It is recommended that you use the exportWSMRepository command, as described in "exportWSMRepository" on page 3-100. The following examples show how to migrate to use the exportWSMRepository command.

11g Release:

```
wls:/jrfServer_domain/serverConfig> exportRepository
("/tmp/repo.zip")
```

12c Release:

wls:/jrfServer_domain/serverConfig> exportWSMRepository ("/tmp/repo.zip")

Command Category: OWSM Repository Management

Use with WLST: Online

3.9.1.1 Description

Exports a set of documents from the OWSM repository into a supported ZIP archive. If the specified archive already exists, the following options are presented:

```
The specified archive already exists. Update existing archive?
Enter "yes" to merge documents into existing archive, "no" to overwrite,
or "cancel" to cancel the operation.
```

You can also specify a list of the documents to be exported, or use a search expression to find specific documents in the repository.

Read only documents, such as predefined policies and assertion templates, will not be included in the export.

3.9.1.2 Syntax

exportRepository(archive,[documents=None],[includeShared='false'])

Argument	Definition
archive	Name of the archive file. If the specified archive already exists, you can choose whether to overwrite the archive or merge the documents into the existing archive.
	During override, the original archive is backed up and a message describes the location of the backup archive.
documents=None	Optional. The documents to be exported to the archive. If no documents are specified, then all assertion templates, intents, policies, and policy sets will be exported. You can specify a list of the documents to be exported, or use a search expression to find specific documents in the repository.
includeShared='f	Optional. Specifies whether the policy references should be expanded during export.

3.9.1.3 Example

The following examples describe repository export sessions. The first example exports all OWSM documents to the policies.zip file.

wls:/wls-domain/serverConfig>exportRepository("/tmp/policies.zip")

This example exports only the MyPolicySet1, MyPolicySet2, and MyPolicySet3 policy sets to the policies. jar file, and also expands all the policy references output during the export process.

wls:/wls-domain/serverConfig>exportRepository("/tmp/policies.jar", ["/policysets/MyPolicySet1","/policysets/MyPolicySet2","/policysets/MyPolicySet3"] , true)

This example exports policy sets using wildcards to the some_global_with_ noreference_2 file.

wls:/wls-domain/serverConfig>exportRepository('./export/some global with noreference_2', ['policysets:global/web_%','policysets:global/web_ref%', 'policysets:global/web_call%'], false)

3.9.2 exportWSMAppMetadata

Note: This command is supported for Oracle Infrastructure and RESTful Web services only. This command is not supported for ADF DC Web service clients and Java EE Web services.

Command Category: OWSM Repository Management

Use with WLST: Online

3.9.2.1 Description

Exports a set of application metadata from the repository into a supported ZIP archive. If the specified archive already exists, you are presented with a set of options: merge the documents into the existing archive, overwrite the archive, or cancel the operation. By default, all metadata for applications in the current domain is exported to the archive, or you can use a search expression to export specific metadata for applications in the repository.

Note: Read only documents, such as predefined policies and assertion templates, will not be included in the export.

3.9.2.2 Syntax

exportWSMAppMetadata(archive,[applications=None],[includeShared='false'])

Argument	Description
archive	Name of the archive file. If the specified archive already exists, you can choose whether to overwrite the archive or merge the documents into the existing archive. During override, the original archive is backed up and a message describes the location of the backup archive.
applications=Non e	Optional. The metadata of applications to be exported to the archive. If no application names are specified, then all metadata for applications in the current domain will be exported. You can specify a list of search expressions to find specific application metadata in the repository, using this syntax: /{PLATFORM_NAME}/{DOMAIN_NAME}/{APPLICATION_NAME}.
includeShared='f alse'	Optional. Specifies whether the shared documents (those that are specified as policy references within wsm-assembly documents) should be included during export. Because read-only documents can not be exported, only custom or cloned shared policies will be included in the export.

3.9.2.3 Examples

The first example exports the application metadata in the repository into the applications.zip file and saves it in the tmp directory.

The second example exports the metadata of the applications whose names begin with SalesApp and TradeApp into the applications.zip file and saves it in the tmp directory.

The third example exports the metadata of the applications whose names begin with SalesApp and TradeApp into the applications.zip file and saves it in the tmp directory. Additionally, shared resources are included in this export.

```
wls:/wls-domain/serverConfig> exportWSMAppMetadata("/tmp/applications.zip")
```

wls:/wls-domain/serverConfig>

exportWSMAppMetadata("/tmp/applications.zip",["/WLS/base_ domain/SalesApp%","WLS/base_domain/TradeApp%"])

wls:/wls-domain/serverConfig>

exportWSMAppMetadata("/tmp/applications.zip",["/WLS/base_ domain/SalesApp%","WLS/base_domain/TradeApp%"], true)

3.9.3 exportWSMRepository

Command Category: OWSM Repository Management

Use with WLST: Online

3.9.3.1 Description

Exports a set of documents from the OWSM repository into a supported ZIP archive. If the specified archive already exists, the following options are presented:

The specified archive already exists. Update existing archive?

Enter "yes" to merge documents into existing archive, "no" to overwrite, or "cancel" to cancel the operation.

You can also specify a list of the documents to be exported, or use a search expression to find specific documents in the repository.

Note: Read only documents, such as predefined policies and assertion templates, will not be included in the export.

3.9.3.2 Syntax

exportWSMRepository(archive,[documents=None],[includeShared='false'])

Argument	Definition
archive	Name of the archive file. If the specified archive already exists, you can choose whether to overwrite the archive or merge the documents into the existing archive.
	During override, the original archive is backed up and a message describes the location of the backup archive.
documents=None	Optional. The documents to be exported to the archive. If no documents are specified, then only shared documents that include policies and policy sets will be exported. If this argument is specified as an empty string [''], then all shared documents that include policies and policy sets, application metadata and configuration documents will be exported. You can specify a list of documents to be exported, or use a search expression to find specific documents in the repository.
includeShared='f alse'	Optional. Specifies whether the shared documents (those that are specified as policy references within policy sets and wsm-assembly documents) should be included during export. Because read-only documents can not be exported, only custom or cloned shared policies will be included in the export.

3.9.3.3 Examples

The following examples describe repository export sessions. The first example exports all OWSM documents to the policies.zip archive.

```
wls:/wls-domain/serverConfig>exportWSMRepository("/tmp/policies.zip")
```

This example exports only the MyPolicySet1, MyPolicySet2, and MyPolicySet3 policy sets to the policies.jar archive, and also expands all the policy references output during the export process.

```
wls:/wls-domain/serverConfig>exportWSMRepository("/tmp/policies.jar",
["/policysets/MyPolicySet1","/policysets/MyPolicySet2","/policysets/MyPolicySet3"]
, true)
```

This example exports policy sets using wildcards to the some_global_with_ noreference_2 archive.

```
wls:/wls-domain/serverConfig>exportWSMRepository('./export/some_global_with_
noreference_2',
['policysets:global/web_%','policysets:global/web_ref%', 'policysets:global/web_
call%'], false)
```

3.9.4 importRepository

Note: This command has been deprecated. It is recommended that you use the importWSMArchive command, as described in "importWSMArchive" on page 3-103. The following examples show how to migrate to use the importWSMArchive command.

11*g* Release (for repository documents):

wls:/jrfServer_domain/serverConfig> importRepository ("/tmp/repo.zip")

12*c* Release (for repository documents):

wls:/jrfServer_domain/serverConfig> importWSMArchive ("/tmp/repo.zip")

Command Category: OWSM Repository Management

Use with WLST: Online

3.9.4.1 Description

Imports a set of documents from a supported ZIP archive into the OWSM repository. You can use the map argument to provide the location of a file that describes how to map physical information from the source environment to the target environment. For example, you can use the map file to ensure that the attachment expression in a policy set document is updated to match the target environment, such as Domain("foo") = Domain("bar").

Read only documents, such as predefined policies and assertion templates, will not be included in the import.

3.9.4.2 Syntax

importRepository(archive, [map=None], [generateMapFile='false'])

Argument	Definition
archive	Path to the archive file that contains the list of documents to be imported. If a document being imported is a duplicate of the current version that already exists in the repository, then it will not be imported and a new version of the document is not created
map=None	Optional. Location of a sample map file that describes how to map physical information from the source environment to the target environment. You can generate a new map file by setting the generateMapFile argument to true.
	If you specify a map file without setting the <code>generateMapFile</code> argument to <code>true</code> , and the file does not exist, the operation fails and an error is displayed.

Argument	Definition
generateMapFile= false	Optional. Specify whether to create a sample map file at the location specified by the map argument. No documents are imported when this argument is set to true. The default is false.
	After the map file is created you can edit it using any text editor. The map file contains the document names given in the archive file and their corresponding attachTo values. The attachTo value can be updated to correspond to the new environment. If a mapping update is not required for a document name, that entry may be either deleted or commented out using the # character.
	Note: When importing documents into the repository, OWSM validates the attachTo values only. If a value is invalid, then the policy set is disabled. Other text in the map file is not validated.

3.9.4.3 Example

The following examples describe repository import sessions.

The first example imports the contents of the policies.zip file into the repository.

```
wls:/wls-domain/serverConfig>importRepository("/tmp/policies.zip")
```

This example uses the generateMapFile argument to generate a map file.

```
wls:/wls-domain/serverConfig>importRepository("./export/some global with
noreference_2', map="./export/some_global_with_noreference_2_map',
generateMapFile=true)
```

Here is an example of a generated map file:

This is an auto generated override file containing the document names given in the archive file and their corresponding attachTo values. The attachTo value can be updated according to the new environment details. If there is no update required for any document name, that entry may be either deleted or commented using the character ("#")

```
[Resource Scope Mappings
]
web_callback_add_1=Application("*")
web_client_add_1=Module("*")
web_reference_add_1=Domain("*")
web_service_add_1=Domain("*domain*") and Server("*soa*") and Application("*ADF*")
ws_service_no_1=Server("*Admin*")
```

This example illustrates how to import documents using a generated map file: /some_ global_with_noreference_2_map.

```
wls:/wls-domain/serverConfig>importRepository('../export/export_all', 'export_all_
map')
```

3.9.5 importWSMArchive

Command Category: OWSM Repository Management

Use with WLST: Online

3.9.5.1 Description

Imports a set of documents from a supported ZIP archive into the OWSM repository. You can use the map argument to provide the location of a file that describes how to

map physical information from the source environment to the target environment. For example, you can use the map file to ensure that the attachment expression in a policy set document is updated to match the target environment, such as Domain("foo") = Domain("bar").

Read only documents, such as predefined policies and assertion templates, will not be included in the import.

3.9.5.2 Syntax

importWSMArchive(archive, [map=None], [generateMapFile='false'])

Argument	Definition
archive	Name of the archive file.
map=None	Optional. Location of a sample map file that describes how to map physical information from the source environment to the target environment. You can generate a new map file by setting the generateMapFile argument to true.
	If you specify a map file without setting the generateMapFile argument to true, and the file does not exist, the operation fails and an error is displayed.
generateMapFile= false	Optional. Specify whether to create a sample map file at the location specified by the map argument. No documents are imported when this argument is set to true. The default is false.
	After the file is created you can edit it using any text editor. The attachTo values can be updated to correspond to the new environment. If a mapping update is not required for a document name, that entry may be either deleted or commented out using the # character.
	Note: When importing documents into the repository, OWSM validates the attachTo values only. If a value is invalid, then the policy set is disabled. Other text in the map file is not validated.

3.9.5.3 Examples

The following examples describe repository import sessions.

The first example imports the contents of the policies.zip file into the repository.

```
wls:/wls-domain/serverConfig>importWSMArchive("/tmp/policies.zip")
```

This example uses the generateMapFile argument to generate a map file.

```
wls:/wls-domain/serverConfig>importWSMArchive("./export/some global with
noreference_2', map="./export/some_global_with_noreference_2_map',
generateMapFile=true)
```

Here is an example of a generated map file:

This is an auto generated override file containing the document names given in the archive file and their corresponding attachTo values. The attachTo value can be updated according to the new environment details. If there is no update required for any document name, that entry may be either deleted or commented using the character ("#")

```
[Resource Scope Mappings
web_callback_add_1=Application("*")
web_client_add_1=Module("*")
web_reference_add_1=Domain("*")
```

```
web_service_add_1=Domain("*domain*") and Server("*soa*") and Application("*ADF*")
ws_service_no_1=Server("*Admin*")
```

This example illustrates how to import documents using a generated map file: /some_ global_with_noreference_2_map.

wls:/wls-domain/serverConfig>importWSMArchive('../export/export_all', 'export_all_ map')

3.9.6 migrateWSMPMRoles

Command Category: OWSM Repository Management

Use with WLST: Online

3.9.6.1 Description

Migrates the custom roles and policies from the Plan.xml file to the wsm-pm.ear policy store. If the Plan.xml file is not used to override default security, then this command will not migrate the wsm-pm.ear policy store.

3.9.6.2 Syntax

migrateWSMPMRoles(domain)

Arguments	Description
domain	Absolute path to the domain home where the ${\tt wsm-pm}$ application is configured.

3.9.6.3 Example

In the following example, custom roles and policies are migrated from the Plan.xml file to the wsm-pm.ear policy store that resides in '/WLS/myDomain.

wls:/wls-domain/serverConfig> migrateWSMPMRoles('/WLS/myDomain')

3.9.7 migrateWSMAttachments

Command Category: OWSM Repository Management

Use with WLST: Online

3.9.7.1 Description

Migrates direct (local) policy attachments that are identical to the external global policy attachments that would otherwise be attached to each policy subject in the current domain. You can specify whether to force the migration, prompt for confirmation before each migration, or simply list the migrations that would occur. A direct policy attachment is identical if its URI is the same as one provided by a global policy attachment, and if it does not have any scoped configuration overrides.

Note: A direct attachment with an unscoped override will be migrated but an attachment with a scoped override will not. This is because after running the migrateAttachments() command, the enforcement of the policies on *all* subjects remains the same, even though some policies are globally attached.

Whether forced or prompted, the command lists each direct policy attachment that is migrated. This output will identify the policy subject that was modified, the URI of the identical policy reference, and the name of the global policy attachment document that duplicated the direct attachment.

3.9.7.2 Syntax

migrateWSMAttachments([mode='prompt'])

Argument	Definition
mode	The action to be taken for each policy attachment that can be migrated. Valid options are:
	 force—Automatically migrate all identical policy attachments without prompting.
	 preview—List all policy attachments that can be migrated, but does not perform any migration.
	 prompt—Request user confirmation before migrating each policy attachment.
	If no mode is specified, this argument defaults to prompt mode.

3.9.7.3 Examples

The following examples describe how to use the repository attachment migration modes.

```
wls:/wls-domain/serverConfig>migrateWSMAttachments()
wls:/wls-domain/serverConfig>migrateWSMAttachments('force')
wls:/wls-domain/serverConfig>migrateWSMAttachments('preview')
wls:/wls-domain/serverConfig>migrateWSMAttachments('prompt')
```

3.9.8 resetWSMPolicyRepository

Note: This command has been deprecated. It is recommended that you use the resetWSMRepository command, as described in "resetWSMRepository" on page 3-107. The following examples show how to migrate to use the resetWSMRepository command.

11g Release:

```
wls:/jrfServer_domain/serverConfig> resetWSMPolicyRepository()
```

12c Release:

wls:/jrfServer_domain/serverConfig> resetWSMRepository()

Command Category: OWSM Repository Management

Use with WLST: Online

3.9.8.1 Description

Deletes the existing policies stored in the OWSM repository and refresh it with the latest set of predefined policies that are provided in the new installation of the Oracle Fusion Middleware software. You can use the clearStore argument to specify whether to delete all policies, including custom user policies, from the OWSM repository before loading the new predefined policies.

3.9.8.2 Syntax

resetWSMPolicyRepository([clearStore='false'])

Argument	Definition
clearStore='false'	Policies to be deleted. Valid values are:
	 true—All policies in the repository, including custom user policies, are deleted.
	 false—Only the predefined policies supplied by Oracle are deleted. The default is false.

3.9.8.3 Example

The following example deletes all the policies in the repository, including user policies, and adds the predefined policies provided in the current product installation:

wls:/wls-domain/serverConfig>resetWSMPolicyRepository(true)

Note: Use integer values 0 (false) or 1 (true) to pass Boolean types on wsadmin and ojbst because the Python version used by these scripting tools may not support Boolean types.

3.9.9 resetWSMRepository

Command Category: OWSM Repository Management

Use with WLST: Online

3.9.9.1 Description

Deletes the existing policies stored in the repository and refresh it with the latest set of predefined policies that are provided in the latest installation of the Oracle Fusion Middleware software. You can use the clearStore argument to specify whether to delete all policies, including custom user policies, from the repository before loading the new predefined policies.

3.9.9.2 Syntax

resetWSMRepository([clearStore='false'])

Argument	Definition	
clearStore='false'	Policies to be deleted. Valid values are:	
	■ true—All policies in the repository, including custom user policies, are deleted. The repository is then recreated with the new set of predefined documents.	
	• false—Only the predefined policies supplied by Oracle are deleted. Custom documents are <i>not</i> deleted when this option is used. The repository is then re-created with the new set of predefined documents. The default is false.	

3.9.9.3 Examples

The following example deletes all the policies in the repository, including user policies, and adds the predefined policies provided in the current product installation:

wls:/wls-domain/serverConfig>resetWSMRepository(true)

3.9.10 upgradeWSMPolicyRepository

Note: This command has been deprecated. It is recommended that you use the upgradeWSMRepository command, as described in "upgradeWSMRepository" on page 3-108. The following examples show how to migrate to use the upgradeWSMRepository command.

11g Release:

wls:/jrfServer_domain/serverConfig> upgradeWSMPolicyRepository()

12c Release:

wls:/jrfServer_domain/serverConfig> upgradeWSMRepository()

Command Category: OWSM Repository Management

Use with WLST: Online

3.9.10.1 Description

Upgrades the OWSM predefined policies stored in the OWSM repository with any new predefined policies that are provided in the latest installation of the Oracle Fusion Middleware software. If the repository is empty, all of the predefined policies included in the installation are loaded into the repository.

This command does not remove any existing predefined and user-defined custom policies in the repository. If a predefined policy has been modified or discontinued in a subsequent release, one of the following occurs:

- For policies that have been discontinued, a message is displayed listing the discontinued policies. In this case, Oracle recommends that you no longer reference the policies and remove them using Oracle Enterprise Manager.
- For policies that have changed in the subsequent release, a message is displayed listing the changed policies. Oracle recommends that you import the latest version of the policies using Oracle Enterprise Manager.

3.9.10.2 Syntax

upgradeWSMPolicyRepository()

3.9.10.3 Example

The following example upgrades the existing installation with policies provided in the latest release:

wls:/wls-domain/serverConfig>upgradeWSMPolicyRepository()

3.9.11 upgradeWSMRepository

Command Category: OWSM Repository Management

Use with WLST: Online

3.9.11.1 Description

Upgrades the OWSM predefined policies stored in the repository with any new predefined policies that are provided in the latest installation of the Oracle Fusion Middleware software. If the repository is empty, all of the predefined policies included in the installation are loaded into the repository.

This command does not remove any existing predefined and user-defined custom policies in the repository. If a predefined policy has been modified or discontinued in a subsequent release, one of the following occurs:

- For policies that have been discontinued, a message is displayed listing the discontinued policies. In this case, Oracle recommends that you no longer reference the policies and remove them using Oracle Enterprise Manager.
- For policies that have changed in the subsequent release, a message is displayed listing the changed policies. Oracle recommends that you import the latest version of the policies using Oracle Enterprise Manager.

3.9.11.2 Syntax

upgradeWSMRepository()

3.9.11.3 Examples

The following example upgrades the existing installation with policies provided in the latest release:

wls:/wls-domain/serverConfig>upgradeWSMRepository()

3.10 Token Issuer Trust Configuration Commands

Use the WLST commands listed in Table 3-12 to view and define trusted issuers, trusted distinguished name (DN) lists, and token attribute rule filters for SAML trusted issuers.

When using WLST to create, modify, and delete token issuer trust documents, you must execute the commands in the context of a session. Each session applies to a single trust document only.

For additional information about using these commands, see "Configuring SAML Trusted Issuers, DN Lists, and Token Attribute Rules Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

> **Note:** The commands in this section apply to Oracle Infrastructure Web Services only.

> To view the help for the WLST commands described in this section, connect to a running instance of the server and enter help('wsmManage').

Web Services Token Issuer Trust Commands Table 3–12

Use this command	То	Use with WLST
createWSMTokenIssuerTrustDocu ment	Create a new token issuer trust document using the name provided.	Online
deleteWSMTokenIssuerTrust	Delete the entry for the issuer, including the DN list in it.	Online
deleteWSMTokenIssuerTrustAttri buteRule	Delete a token attribute rule associated with a trusted DN.	Online

Table 3–12 (Cont.) Web Services Token Issuer Trust Commands

Use this command	То	Use with WLST
deleteWSMTokenIssuerTrustDoc ument	Delete the token issuer trust document, specified by the name argument, from the repository.	Online
displayWSMTokenIssuerTrustDo cument	Display the names of the DN lists associated with a specified issuer.	Online
listWSMTokenIssuerTrustDocum ents	List the token issuer trust documents in the repository.	Online
selectWSMTokenIssuerTrustDocu ment	Select the token issuer trust document, identified by the name argument, to be modified in the session.	Online
setWSMTokenIssuerTrust	Specify a trusted SAML issuer with a DN list.	Online
setWSMTokenIssuerTrustAttribut eFilter	Add, delete, or update token attribute rules for a given token signing certificate DN.	Online
setWSMTokenIssuerTrustDisplay Name	Sets or resets the display name of the Token Issuer Trust document currently selected in the session.	Online

3.10.1 createWSMTokenIssuerTrustDocument

Note: This command applies to Oracle Infrastructure Web services only.

Command Category: Token Issuer Trust Configuration

Use with WLST: Online

3.10.1.1 Description

Within a session, creates a new token issuer trust document using the name provided.

You must start a session (beginWSMSession) before creating or modifying any token issuer trust documents. If there is no current session or there is already an existing modification process, an error is displayed.

For more information on using this command, see "Configuring SAML Trusted Issuers, DN Lists, and Token Attribute Rules Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

3.10.1.2 Syntax

createWSMTokenIssuerTrustDocument(name, displayName)

Arguments	Definition	
name	Name of the document to be created. An error is thrown if a name is not provided.	
displayName	Optional. Display name for the document.	

3.10.1.3 Examples

In the following example, the trust document named tokenissuertrustWLSbase_ domain is created, with a display name of wls_domain Trust Document. In the second example, no display name is provided.

wls:/wls-domain/serverConfig>

createWSMTokenIssuerTrustDocument("tokenissuertrustWLSbase_domain", "wls_domain Trust Document")

wls:/wls-domain/serverConfig>

createWSMTokenIssuerTrustDocument("tokenissuertrustWLSbase_domain")

3.10.2 deleteWSMTokenIssuerTrust

Note: This command applies to Oracle Infrastructure Web services

Command Category: Token Issuer Trust Configuration

Use with WLST: Online

3.10.2.1 Description

Within a session, deletes the list of all the trusted key identifiers matching the type (such as dns.hok or dns.sv) for the issuer specified. This issuer must exist in the token issuer trust document selected in the session for modification. If no trusted key identifiers exist, then the issuer itself is deleted.

To delete a specified list of trusted key identifiers for an issuer, use selectWSMTokenIssuerTrustDocument.

You must start a session (beginWSMSession) and select a token issuer trust document for modification before executing this command. If there is no current session or there is already an existing modification process, an error is displayed.

You cannot modify the default token issuer trust document.

3.10.2.2 Syntax

deleteWSMTokenIssuerTrust(type, issuer)

Arguments	Definition
type	Type of issuer to be deleted, such as dns.hok or dns.sv.
issuer	Name of the issuer whose trusted DN list will be deleted.

3.10.2.3 Examples

In the following example, the issuer www.yourCompany.com and the DN list in the dns.sv trusted SAML sender vouches client list for the issuer are deleted:

wls:/wls-domain/serverConfig> deleteWSMTokenIssuerTrust('dns.sv', 'www.yourCompany.com')

3.10.3 deleteWSMTokenIssuerTrustAttributeRule

Note: This command applies to Oracle Infrastructure Web services only.

Command Category: Token Issuer Trust Configuration

Use with WLST: Online

3.10.3.1 Description

Delete a token attribute rule associated with a trusted DN from the token issuer trust document.

To delete only the list of filter values for an attribute, use the setWSMTokenIssuerTrustAttributeFilter command.

You must start a session (beginWSMSession) and select a token issuer trust document for modification before executing this command. If there is no current session or there is already an existing modification process, an error is displayed.

3.10.3.2 Syntax

deleteWSMTokenIssuerTrustAttributeRule(dn)

Arguments	Description
dn	The DN of the token signing certificate that identifies the rule to be deleted.

3.10.3.3 Examples

In the following example, the token attribute rule associated with the 'CN=weblogic, OU=Orakey Test Encryption Purposes Only, O=Oracle, C=US trusted DN is deleted.

wls:/wls-domain/serverConfiq> deleteWSMTokenIssuerTrustAttributeRule('CN=weblogic, OU=Orakey Test Encryption Purposes Only, O=Oracle, C=US')

3.10.4 deleteWSMTokenIssuerTrustDocument

Note: This command applies to Oracle Infrastructure Web services only.

Command Category: Token Issuer Trust Configuration

Use with WLST: Online

3.10.4.1 Description

Deletes the token issuer trust document, specified by the name argument, from the repository. The default token issuer trust document cannot be deleted.

3.10.4.2 Syntax

deleteWSMTokenIssuerTrustDocument (name)

Arguments	Definition
name	Name of the token issuer trust document to be deleted.

3.10.4.3 Examples

In the following example, the token issuer trust document tokenissuertrustWLSbase_domain trust document is deleted:

wls:/wls-domain/serverConfig>

deleteWSMTokenIssuerTrustDocument('tokenissuertrustWLSbase_domain')

3.10.5 displayWSMTokenIssuerTrustDocument

Note: This command applies to Oracle Infrastructure Web services only.

Command Category: Token Issuer Trust Configuration

Use with WLST: Online

3.10.5.1 Description

Displays the list of all the trusted key identifiers matching the type specified, such as dns.hok or dns.sv, and the issuer name.

You must start a session (beginWSMSession) and select a token issuer trust document for modification before executing this command. If there is no current session or there is already an existing modification process, an error is displayed.

3.10.5.2 Syntax

displayWSMTokenIssuerTrust(type, issuer=None)

Arguments	Definition
type	Type of the trusted key identifiers list to be displayed for the issuer. For example, dns.hok and dns.sv.
issuer	Optional. Name of the trusted issuer for which the trusted key identifiers list is to be displayed. If you do not specify an issuer name, all of the trusted issuers for the given type are listed.

3.10.5.3 Examples

In the following example, the DN lists for the www.oracle.com trusted issuer are displayed:

wls:/wls-domain/serverConfig> displayWSMTokenIssuerTrust('dns.sv', 'www.oracle.com')

3.10.6 listWSMTokenIssuerTrustDocuments

Note: This command applies to Oracle Infrastructure Web services only.

Command Category: Token Issuer Trust Configuration

Use with WLST: Online

3.10.6.1 Description

When used without any arguments, this command lists all the token issuer trust documents in the repository. If the detail argument is set to true, the display name and the status of the document are also displayed.

You can use the wildcard character (*) in combination with other characters. If no wildcard character is specified in the name argument, the document that matches the name argument exactly is displayed. If the detail argument is set to true, the contents of the document are listed.

This command can be executed inside and outside of a session.

3.10.6.2 Syntax

listWSMTokenIssuerTrustDocuments(name=None, detail='false')

Arguments	Definition		
name	Optional. Name of the token issuer trust document. You can use wildcards with this argument.		
detail	Optional. List the details for the requested document. The default is false.		

3.10.6.3 **Examples**

In the following example, the token issuer trust document tokenissuertrustWLSbase_domain trust document is deleted:

wls:/wls-domain/serverConfig> listWSMTokenIssuerTrustDocuments(detail='true')

3.10.7 selectWSMTokenIssuerTrustDocument

Note: This command applies to Oracle Infrastructure Web services only.

Command Category: Token Issuer Trust Configuration

Use with WLST: Online

3.10.7.1 Description

Selects the token issuer trust document, identified by the name argument, to be modified in the session. The name must match the value of the name attribute in the

You must start a session (beginWSMSession) before executing this command. If there is no current session or there is already an existing modification process, an error is displayed.

You cannot modify the default token issuer trust document.

3.10.7.2 Syntax

selectWSMTokenIssuerTrustDocument(name)

Argument	Definition
name	Name of the document to modified in the session. An error is thrown if a name is not provided.

3.10.7.3 Examples

In the following example, the tokenissuertrustWLSbase_domain document is selected for modification:

wls:/wls-domain/serverConfig>

selectWSMTokenIssuerTrustDocument('tokenissuertrustWLSbase_domain')

3.10.8 setWSMTokenIssuerTrust

Note: This command applies to Oracle Infrastructure Web services only.

Command Category: Token Issuer Trust Configuration

Use with WLST: Online

3.10.8.1 Description

Specify a trusted SAML issuer with a DN list. This command behaves as follows:

- If the trusted issuer already exists for the type specified, and you provide a list of DNs or aliases for the trustedKeys argument, the previous list is replaced with the new list. If you enter an empty set ([]) for the trustedDNs argument, then the list of DN values are deleted for the issuer.
- If the trusted issuer does not exist for the type specified and you specify a value for the trustedKeys argument, the issuer is created with the associated DN list. If you do not set the trustedKeys argument, a new issuer is created with an empty DN list.

You must start a session (beginWSMSession) and select a token issuer trust document for modification before executing this command. If there is no current session or there is already an existing modification process, an error is displayed.

You cannot modify the default token issuer trust document.

3.10.8.2 Syntax

setWSMTokenIssuerTrust(type, issuer, [trustedKeys]=None)

Argument	Definition	
type	The type of the tokens issued by the issuer and how the issuer signing the certificates is identified with trusted keys. The following types are supported:	
	 dns.sv—The token type from the issuer is SAML SV and the trusted key identifier type is X509 Certificate DN. 	
	 dns-hok—The token type from the issuer is SAML HOK or Bearer, and the trusted key identifier type is X509 Certificate DN. 	
	 dns.alias.sv—The token type from the issuer is SAML SV and the X509 Certificate alias of the issuer signing certificates in the key store is used for trusted key identifier type. 	
	 dns.alias.hok—The token type from the issuer is SAML HOK or Bearer and the X509 Certificate alias of the issuer signing certificates in the key store is used for trusted key identifier type. 	
issuer	The name of the trusted issuer, for example www.oracle.com.	
trustedKeys	Optional. List of trusted key identifiers values to set for the specified issuer.	

3.10.8.3 **Examples**

In the following example, www.yourcompany.com is set as a trusted issuer and a DN list is not specified:

```
wls:/wls-domain/serverConfig> setWSMTokenIssuerTrust('dns.sv',
'www,yourcompany.com', [])
```

In the following example, the name 'CN=orcladmin, OU=Doc, O=Oracle, C=US' in added to the dns.sv DN list for the www.oracle.com trusted issuer.

```
wls:/wls-domain/serverConfig> setWSMTokenIssuerTrust('dns.sv', 'www.oracle.com',
[['CN=weblogic, OU=Orakey Test Encryption Purposes Only, O=Oracle, C=US',
'CN=orcladmin, OU=Doc, O=Oracle, C=US'])
```

In the following example, the list of DN values in the dns.sv DN list is removed from the www.oracle.com trusted issuer:

```
wls:/wls-domain/serverConfig> setWSMTokenIssuerTrust('dns.sv', 'www.oracle.com',
[])
```

In the following example, the alias orakey is specified as the X509 certificate alias for the SAML SV token type for the www.oracle.com trusted issuer:

```
wls:/wls-domain/serverConfig> setWSMTokenIssuerTrust('dn.alias.sv',
'www.oracle.com', ['orakey'])
```

3.10.9 setWSMTokenIssuerTrustAttributeFilter

Note: This command applies to Oracle Infrastructure Web services only.

Command Category: Token Issuer Trust Configuration

Use with WLST: Online

3.10.9.1 Description

Adds, deletes, or updates token attribute rules for a given token signing certificate DN.

Each rule has two parts: a name ID and an attributes part for user attributes that a DN for a signing certificate can assert. The name ID and the attribute can contain a filter with multiple value patterns.

This command behaves as follows:

- If the attribute specified by the attr-name argument already exists with a list of filter values and you provide a new list of values for the filters argument, the previous list is replaced with the new list. If you enter an empty set ([]) for the filters argument, then the existing list of filter values is deleted.
- If the attribute specified by the attr-name argument does not exist and you specify a list of values for the filters argument, the attribute is created and added to the document with the specified filter values. If you do not provide a value for the filters argument, an error is thrown.

You must start a session (beginWSMSession) and select a token issuer trust document for modification before executing this command. If there is no current session or there is already an existing modification process, an error is displayed.

> Note: You must first use the setWSMTokenIssuerTrust command to configure a list of trusted DN names for an issuer.

3.10.9.2 Syntax

setWSMTokenIssuerTrustAttributeFilter(dn, attr-name, filters)

Argument	Definition	
dn	The DN of the token signing certificate.	
attr-name	The name of the attribute to assert. The value can be as follows:	
	 name-id—assert a subject name ID. 	
filters	Optional. List of filters for the attribute. The list has the format ['value1', 'value2', 'value3, Each value can be an exact name or a name pattern with a wildcard character "*".	
	When name-id is selected for the attr-name argument, then the value of the subject name ID in the incoming SAML assertion must match one of the specified values to go through. If no values are specified, then any value for the subject name ID will go through.	

3.10.9.3 Examples

In the following example, the name ID yourTrustedUser is set as a trusted user for the weblogic trusted DN:

wls:/wls-domain/serverConfig> setWSMTokenIssuerTrustAttributeFilter('CN=weblogic, OU=Orakey Test Encryption Purposes Only, O=Oracle, C=US', 'name-id', ['yourTrustedUser'])

In the following example, the name IDs jdoe is added to the list of trusted users for the weblogic trusted DN:

wls:/wls-domain/serverConfig> setWSMTokenIssuerTrustAttributeFilter('CN=weblogic,

```
OU=Orakey Test Encryption Purposes Only, O=Oracle, C=US', 'name-id',
['yourTrustedUser', 'jdoe'])
```

In the following example, the list of trusted users for the weblogic trusted DN is removed:

wls:/wls-domain/serverConfiq> setWSMTokenIssuerTrustAttributeFilter('CN=weblogic, OU=Orakey Test Encryption Purposes Only, O=Oracle, C=US', 'name-id', [])

3.10.10 setWSMTokenIssuerTrustDisplayName

Note: This command applies to Oracle Infrastructure Web services only.

Command Category: Token Issuer Trust Configuration

Use with WLST: Online

3.10.10.1 Description

Sets or resets the display name of the Token Issuer Trust document currently selected in the session.

You must start a session (beginWSMSession) before creating or modifying any token issuer trust documents. If there is no current session or there is already an existing modification process, an error is displayed.

3.10.10.2 Syntax

setWSMTokenIssuerTrustDisplayName("displayName")

Arguments	Definition
displayName	Name to be set as a display name for the document currently selected for modification in the session.

3.10.10.3 Examples

In the following example, the display name for the trust document being modified is set to Test Document.

wls:/wls-domain/serverConfig> setWSMTokenIssuerTrustDisplayName("Test Document")

Metadata Services (MDS) Custom WLST Commands

This chapter provides detailed descriptions of WLST commands for Oracle Metadata Services (MDS), including command syntax, arguments and command examples.

For additional details about creating and managing an MDS repository, see the chapter "Managing the Oracle Metadata Repository" in the Administering Oracle Fusion Middleware. For information about the roles needed to perform each operation, see "Understanding MDS Operations" in the *Administering Oracle Fusion Middleware*.

Note: To use these MDS custom WLST commands, you must invoke the WLST script from the Oracle Common home. See "Using Custom WLST Commands" in the *Administering Oracle Fusion Middleware*.

Use the Oracle Metadata Services (MDS) commands in the categories listed in Table 4–1 to manage MDS.

Table 4–1 MDS Command Categories

Command category	Description
Repository Management Commands	Manage the MDS repository.
Application Metadata Management Commands	Manage the application metadata in the MDS repository.
Sandbox Metadata Management Commands	Manage the metadata in a sandbox in the MDS repository.
Application Label Management Commands	Manage the labels for the application.
Application Management Deployment Commands	Manage the application deployment.
Multitenancy Management Commands	Manage tenants.

4.1 Common Name Pattern Format

Many commands contain arguments that use name patterns. For example, the restrictCustTo argument use name patterns. The rules for the name patterns are the same for these arguments.

The pattern can contain the following special characters:

- The percent (%) character, which matches any number of characters.
- The underscore (_) character, which matches exactly one arbitrary character.
- The backslash character ('\'), which can be used to escape the percent, the underscore, and the backslash (itself) characters, so they match only %, _, or \.

For example:

```
restrictCustTo="user[scott]"
restrictCustTo="site[site1],user[scott]"
restrictCustTo="site[site1, %_2],user[scott, m%]"
```

4.2 Repository Management Commands

Use the MDS commands listed in Table 4–2 to manage the MDS repository. In the Use with WLST column, online means the command can only be used when connected to a running Administration Server. Offline means the command can only be used when not connected to a running server. Online or offline means the command can be used in both situations.

Table 4 2 Tiepository Management Communication	Table 4–2	Repository	/ Management	Commands
--	-----------	------------	--------------	----------

Use this command	То	Use with WLST
createMetadataPartition	Create a metadata repository partition.	Online
deleteMetadataPartition	Delete a metadata repository partition.	Online
deregisterMetadataDBRepository	Deregister a database-based MDS repository.	Online
registerMetadataDBRepository	Register a database-based MDS repository.	Online

Note: Note the following if you invoke the following WLST commands or comparable MBeans in a script:

- registerMetadataDBRepository
- deregisterMetadataDBRepository

In this release and previous releases, the commands or MBeans, have the following behavior:

- 1. Starts an Oracle WebLogic Server editing session.
- 2. Registers or deregisters the repository.
- Activates the changes.

However, you can start an editing session explicitly. If you do, the automatic activation of the changes are deprecated.

4.2.1 createMetadataPartition

Command Category: Repository Management

Use with WLST: Online

4.2.1.1 Description

A metadata repository is used as a common repository for managing metadata of different applications. Many applications use the MDS repository to manage their metadata. Each deployed application uses a logical partition in metadata repository. This logical partition also helps in maintaining the metadata lifecycle. Before deploying a application, you create a partition for it in MDS repository. This command creates a partition with the given name in the specified repository.

4.2.1.2 Syntax

createMetadataPartition(repository, partition)

Argument	Definition		
repository	The name of the repository where the partition will be created.		
partition	The name of the partition to create in the repository.		

4.2.1.3 Example

The following example creates the metadata partition partition1 in the repository mds-myrepos:

wls:/weblogic/serverConfig> createMetadataPartition(repository='mds-myrepos', partition='partition1')

Executing operation: createMetadataPartition Metadata partition created: partition1 "partition1"

4.2.2 deleteMetadataPartition

Command Category: Repository Management

Use with WLST: Online

4.2.2.1 Description

Deletes a metadata partition in the specified repository. When you delete a repository partition, all of the metadata in that partition is lost.

4.2.2.2 Syntax

deleteMetadataPartition(repository, partition)

Argument	Definition
repository	The name of the repository that contains the partition.
partition	The name of the partition to delete in the repository.

4.2.2.3 Example

The following example deletes the metadata partition partition1 from the repository mds-myrepos:

wls:/weblogic/serverConfig> deleteMetadataPartition(repository='mds-myrepos', partition='partition1')

Executing operation: deleteMetadataPartition Metadata partition deleted: partition1

4.2.3 deregisterMetadataDBRepository

Command Category: Repository Management

Use with WLST: Online

4.2.3.1 Description

Removes the database metadata repository registration as a System JDBC data source in the domain. After this command completes successfully, applications can no longer use this repository.

4.2.3.2 Syntax

deregisterMetadataDBRepository(name)

Argument	Definition
name	The name of the repository to deregister.

4.2.3.3 Example

The following example deregisters the metadata repository mds-myrepos:

wls:/weblogic/serverConfig> deregisterMetadataDBRepository('mds-myrepos') Executing operation: deregisterMetadataDBRepository.

Metadata DB repository "mds-myrepos" was deregistered successfully.

4.2.4 registerMetadataDBRepository

Command Category: Repository Management

Use with WLST: Online

4.2.4.1 Description

A database metadata repository should be registered with WebLogic Server instances before the application can use it. This command registers a System JDBC data source with the domain for use as database-based metadata repository.

4.2.4.2 Syntax

registerMetadataDBRepository(name, dbVendor, host, port, dbName, user, password [, targetServers])

Argument	Definition
name	The name of the repository to register. If the name you supply does not begin with mds-, the commands adds the prefix mds
dbVendor	The database vendor. The acceptable values are ORACLE, MSSQL, IBMDB2, and MYSQL.
host	The host name or the IP address of the database.
port	The port number used by the database.
dbName	The service name of the database. For example, orcl. hostname.com
user	The database user name.
password	The password for the database user.
targetServers	Optional. The WebLogic Server instances to which this repository will be registered. If this argument is not specified, then the repository will be registered only to the Administration Server. To specify multiple servers, separate the names with a comma.
	Register the repository with all Managed Servers to which the application will be deployed.

4.2.4.3 Example

The following example registers the metadata repository myrepos to two servers, and specifies the database parameters:

```
wls:/weblogic/serverConfig> registerMetadataDBRepository('myrepos','ORACLE',
              'test.oracle.com','1521','mds', 'user1','x','server1, server2')
Executing operation: registerMetadataDBRepository.
Metadata DB repository "mds-myrepos" was registered successfully.
'mds-myrepos'
```

4.3 Application Metadata Management Commands

Use the commands in Table 4–3 to manage application metadata.

Table 4–3 Application Metadata Commands

Use this command	То	Use with WLST
deleteMetadata	Deletes the metadata in the application repository.	Online
exportMetadata	Exports metadata for an application.	Online
importMetadata	Imports metadata for an application.	Online
purgeMetadata	Purge metadata.	Online

4.3.1 deleteMetadata

Command Category: Application Metadata

Use with WLST: Online

4.3.1.1 Description

Deletes the selected documents from the application repository. When this command is run against repositories that support versioning (that is, database-based repositories), delete is logical and marks the tip version (the latest version) of the selected documents as "deleted" in the MDS repository partition.

You may want to delete metadata when the metadata is moved from one repository to another. In such a case, after you have exported the metadata, you can delete the metadata in the original repository.

4.3.1.2 Syntax

deleteMetadata(application, server, docs [, restrictCustTo] [, excludeAllCust] [, excludeBaseDocs] [, excludeExtendedMetadata] [, cancelOnException] [, applicationVersion] [, tenantName])

Argument	Definition
application	The name of the application for which the metadata is to be deleted.
server	The target server on which this application is deployed.

Argument	Definition
docs	A list of comma-separated, fully qualified document names or document name patterns, or both. The patterns can have the following wildcard characters: * and **.
	The asterisk (*) represents all documents under the current namespace. The double asterisk (**) represents all documents under the current namespace and also recursively includes all documents in subnamespaces.
	For example, "/oracle/*" will include all documents under "/oracle/" but not include documents under "/oracle/mds/".
	As another example, "/oracle/**" will include all documents under "/oracle/" and also under "/oracle/mds/" and any other documents further in the namespace chain.
restrictCustTo	Optional. Valid values are percent (%) or a list of comma-separated customization layer names used to restrict the delete operation to delete only customization documents that match the specified customization layers. Each customization layer name can contain, within a pair of brackets, optional customization layer values and value patterns separated by commas.
	See Section 4.1 for information about the patterns that you can use with this argument.
	For example:
	<pre>restrictCustTo="user[scott]" restrictCustTo="site[site1],user[scott]" restrictCustTo="site[site1, %_2],user[scott, m%]"</pre>
	If you do not specify this argument, only customization classes declared in the cust-config element of adf-config.xml are deleted. If there is no cust-config element declared in adf-config.xml, all customization classes are deleted.
	If you specify percent (%) as the value of this argument, all customizations are deleted, whether or not they are declared in the cust-config element of adf-config.xml.
	Use this option to delete all customizations or a subset of declared customizations. You can also use this option to delete customizations from customization classes that are not declared in the cust-config element of adf-config.xml.
excludeAllCust	Optional. A Boolean value (true or false) that specifies whether or not to delete all customization documents.
	This argument defaults to false. It overrides the restrictCustTo option.
excludeBaseDocs	Optional. A Boolean value (true or false) that specifies whether or not to delete base documents. This argument defaults to false.
excludeExtendedMetadata	Optional. A Boolean value (true or false) that specifies whether or not to delete the Extended Metadata documents. This argument defaults to false.
cancelOnException	Optional. A Boolean value (true or false) that specifies whether or not to abort the delete operation when an exception is encountered. On abort, the delete is rolled back if that is supported by the target store. This argument defaults to true.
applicationVersion	Optional. The application version, if multiple versions of the same application are deployed.

Argument	Definition
tenantName	A unique name identifying the tenant to use for this operation. This argument is required for a multitenant application and is not applicable for a non-multitenant application. For a non-multitenant application, any specified value will be ignored.

4.3.1.3 **Examples**

The following example deletes metadata files under the package mypackage from mdsApp deployed in the server server1:

```
wls:/weblogic/serverConfig> deleteMetadata(application='mdsapp',
           server='server1', docs='/mypackage/*')
Executing operation: deleteMetadata.
"deleteMetadata" operation completed. Summary of "deleteMetadata" operation is:
List of documents successfully deleted:
/mypackage/jobs.xml
/mypackage/mo.xml
/mypackage/mdssys/cust/site/site1/jobs.xml.xml
/mypackage/mdssys/cust/site/site1/mo.xml.xml
4 documents successfully deleted.
```

The following example deletes metadata files under the package mypackage from mdsApp deployed in the server server1 and excludes extended metadata and all customizations:

```
wls:/weblogic/serverConfig> deleteMetadata(application='mdsapp',
        server='server1', docs='/mypackage/*', cancelOnException='false',
        excludeExtendedMetadata='true',
        excludeAllCust='true')
Executing operation: deleteMetadata.
"deleteMetadata" operation completed. Summary of "deleteMetadata" operation is:
List of documents successfully deleted:
/mypackage/jobs.xml
/mypackage/mo.xml
2 documents successfully deleted.
```

The following example deletes metadata files belonging to tenant tenant1 under the package mypackage from the application app1 deployed in the server server1:

```
wls:/weblogic/serverConfig> deleteMetadata(application='app1', server='server1',
   docs='/mypackage/**', tenantName='tenant1')
Executing operation: deleteMetadata.
deleteMetadata" operation completed. Summary of "deleteMetadata" operation is:
List of documents successfully deleted:
/mypackage/jobs.xml
/mypackage/mdssys/cust/site/site1/jobs.xml.xml
/mypackage/mdssys/cust/site/site2/mo.xml.xml
/mypackage/mdssys/cust/user/user1/mo.xml.xml
```

4.3.2 exportMetadata

Command Category: Application Metadata

Use with WLST: Online

4.3.2.1 Description

Exports application metadata. Use this command and the importMetadata command to transfer application metadata from one server location (for example, testing) to another server location (for example, production).

This command exports application metadata including customizations. However, by default, only those customizations from customization classes that are defined in the cust-config element of adf.config.xml are exported. To export customizations from customization classes not declared, use the restrictCustTo option.

4.3.2.2 Syntax

```
exportMetadata(application, server, toLocation [, docs]
 [, restrictCustTo] [, excludeCustFor] [, excludeAllCust] [, excludeBaseDocs]
 [, excludeExtendedMetadata] [, excludeSeededDocs]
 [, fromLabel][, toLabel] [, applicationVersion] [, remote] [, tenantName])
```

Argument	Definition
application	The name of the application from which the metadata is to be exported.
server	The target server on which this application is deployed.
toLocation	The target directory or archive file (.jar, .JAR, .zip or .ZIP) to which documents selected from the source partition will be transferred. If you export to a directory, the directory must be a local or network directory or file where the application is physically deployed. If you export to an archive, the archive can be located on a local or network directory or file where the application is physically deployed, or on the system on which you are executing the command.
	If the location does not exist in the file system, a directory will be created except that when the names ends with .jar, .JAR, .zip or .ZIP, an archive file will be created. If the archive file already exists, the exportMetadata operation will overwrite the file.
	This argument can be used as temporary file system for transferring metadata from one server to another. For more information, see "Moving Metadata from a Test System to a Production System" in the <i>Administering Oracle Fusion Middleware</i> .
docs	Optional. A list of comma-separated, fully qualified document names or document name patterns, or both. The patterns can have the following wildcard characters: * and **.
	This argument defaults to "/**", which exports all the metadata in the repository.
	The asterisk (*) represents all documents under the current namespace. The double asterisk (**) represents all documents under the current namespace and also recursively includes all documents in subnamespaces.
	For example, "/oracle/*" will include all documents under "/oracle/" but not include documents under "/oracle/mds/".
	"/oracle/**" will include all documents under "/oracle/" and also under "/oracle/mds/" and any other documents further in the namespace chain.

Argument	Definition
restrictCustTo	Optional. Valid values are percent (%) or a list of comma-separated customization layer names used to restrict the export operation to export only customization documents that match the specified customization layers. Each customization layer name can contain, within a pair of brackets, optional customization layer values and value patterns separated by commas.
	See Section 4.1 for information about the patterns that you can use with this argument.
	For example:
	<pre>restrictCustTo="user[scott]" restrictCustTo="site[site1],user[scott]" restrictCustTo="site[site1, %_2],user[scott, m%]"</pre>
	If you do not specify this argument, only customization classes declared in the cust-config element of adf-config.xml are exported. If there is no cust-config element declared in adf-config.xml, all customization classes are exported.
	If you specify percent (%) as the value of this argument, all customizations are exported, whether or not they are declared in the cust-config element of adf-config.xml.
	Use this option to export all customizations or a subset of declared customizations. You can also use this option to export customizations from customization classes that are not declared in the cust-config element of adf-config.xml.
	This argument is ignored if the excludeAllCust argument is also specified.
excludeCustFor	Optional. A list of comma-separated customization layer names used to restrict the export operation to exclude customization documents that match the specified customization layers from being exported.
	This argument is ignored if the excludeAllCust argument is also specified.
excludeAllCust	Optional. A Boolean value (true or false) that specifies whether or not to export all customization documents. This argument defaults to false. This argument overrides the restrictCustTo and excludeCustFor arguments.
excludeBaseDocs	Optional. A Boolean value (true or false) that specifies whether or not to export base documents. This argument defaults to false.
excludeExtendedMetadata	Optional. A Boolean value (true or false) that specifies whether or not to export the Extended Metadata documents. This argument defaults to false.
excludeSeededDocs	Optional. A Boolean value (true or false) that specifies whether all documents or only non-seeded documents are exported. Seeded documents are those documents that are packaged in a MAR.
	To exclude seeded documents, specify true.
	The default is false.
fromLabel	Optional. Transfers the documents from the source partition that is associated with this label.
toLabel	Optional. Works with the fromLabel argument to transfer the delta between fromLabel to toLabel from the source partition.
applicationVersion	Optional. The application version, if multiple versions of the same application are deployed.

Argument	Definition
remote	Optional. A Boolean value (true or false) that specifies whether the archive file will be written to a location where the application is deployed (false) or to the system on which you are executing the command (true).
	The default is false.
tenantName	A unique name identifying the tenant to use for this operation. This argument is required for a multitenant application and is not applicable for a non-multitenant application. For a non-multitenant application, any specified value will be ignored.

4.3.2.3 Examples

The following example exports all metadata files from the application mdsapp deployed in the server server1.

```
wls:/weblogic/serverConfig> exportMetadata(application='mdsapp',
               server='server1',toLocation='/tmp/myrepos',docs='/**')
Location changed to domainRuntime tree. This is a read-only tree with DomainMBean
as the root.
For more help, use help(domainRuntime)
Executing operation: exportMetadata.
"exportMetadata" operation completed. Summary of "exportMetadata" operation is:
List of documents successfully transferred:
/mypackage/write.xml
/mypackage/write1.xml
/sample1.jspx
```

The following example exports only the customization documents under the layer user without any base documents from label label1 to label label2:

```
wls:/weblogic/serverConfig> exportMetadata(application='mdsapp',
                       server='server1',toLocation='/tmp/myrepos',
                       restrictCustTo='user',
                       excludeBaseDocs='true',
                       fromLabel='label1',
                       toLabel='label2',
                       applicationVersion='11.1.1')
List of documents successfully transferred:
/mypackage/mdssys/cust/user/user1/write1.xml.xml
/mypackage/mdssys/cust/user/user2/write2.xml.xml
2 documents successfully transferred.
```

4.3.3 importMetadata

Command Category: Application Metadata

Use with WLST: Online

4.3.3.1 Description

Imports application metadata. Use the exportMetadata command and this command to transfer application metadata from one server location (for example, testing) to another server location (for example, production).

4.3.3.2 Syntax

```
importMetadata(application, server, fromLocation [, docs]
[, restrictCustTo] [, excludeAllCust] [, excludeBaseDocs]
[, excludeExtendedMetadata] [, excludeUnmodifiedDocs]
```

[, cancelOnException] [, applicationVersion] [, remote] [, tenantName])

Argument	Definition
application	The name of the application for which the metadata is to be imported.
server	The target server on which this application is deployed.
fromLocation	The source directory or archive file from which documents will be selected for transfer. If you exported to a directory, the directory must be a local or network directory or file where the application is physically deployed. If you exported to an archive, the archive can be located on a local or network directory or file where the application is physically deployed, or on the system on which you are executing the command.
	This argument can be used as a temporary file system location for transferring metadata from one server to another. For more information, see "Moving Metadata from a Test System to a Production System" in the <i>Administering Oracle Fusion Middleware</i>
docs	Optional. A list of comma-separated, fully qualified document names or document name patterns, or both. The patterns can have the following wildcard characters: * and **.
	This argument defaults to "/**", which imports all of the documents in the repository.
	The asterisk (*) represents all documents under the current namespace. The double asterisk (**) represents all documents under the current namespace and also recursively includes all documents in subnamespaces.
	For example, "/oracle/*" will include all documents under "/oracle/" but not include documents under "/oracle/mds/".
	"/oracle/**" will include all documents under "/oracle/" and also under "/oracle/mds/" and any other documents further in the namespace chain.

Argument	Definition
restrictCustTo	Optional. Valid values are percent (%) or a list of comma-separated customization layer names used to restrict the import operation to import only customization documents that match the specified customization layers, including customization classes that are not declared in the cust-config element of adf-config.xml. Each customization layer name can contain, within a pair of brackets, optional customization layer values and value patterns separated by commas.
	See Section 4.1 for information about the patterns that you can use with this argument.
	For example:
	<pre>restrictCustTo="user[scott]" restrictCustTo="site[site1],user[scott]" restrictCustTo="site[site1, %_2],user[scott, m%]"</pre>
	If you do not specify this argument, only customization classes declared in the cust-config element of adf-config.xml are imported. If there is no cust-config element declared in adf-config.xml, all customization classes are imported.
	If you specify percent (%) as the value of this argument, all customizations are imported, whether or not they are declared in the cust-config element of adf-config.xml.
	Use this option to import all customizations or a subset of declared customizations. You can also use this option to export customizations from customization classes that are not declared in the cust-config element of adf-config.xml.
	This argument is ignored if the excludeAllCust argument is also specified.
excludeAllCust	Optional. A Boolean value (true or false) that specifies whether or not to import all customization documents. This argument defaults to false. This argument overrides the restrictCustTo argument.
excludeBaseDocs	Optional. A Boolean value (true or false) that specifies whether or not to import base documents. This argument defaults to false.
excludeExtendedMetadata	Optional. A Boolean value (true or false) that specifies whether or not to import the Extended Metadata documents. This argument defaults to false.
excludeUnmodifiedDocs	Optional. A Boolean value (true or false) that specifies whether only changed documents are imported.
	If you specify true, only changed documents are imported.
	The default is false.
cancelOnException	Optional. A Boolean value (true or false) that specifies whether or not to abort the import operation when an exception is encountered.
	The default is true.
applicationVersion	Optional. The application version, if multiple versions of the same application are deployed.
remote	Optional. A Boolean value (true or false) that specifies whether the archive file is in a location where the application is deployed (false) or on the system on which you are executing the command (true).
	The default is false.

Argument	Definition
tenantName	A unique name identifying the tenant to use for this operation. This argument is required for a multitenant application and is not applicable for a non-multitenant application. For a non-multitenant application, any specified value will be ignored.

4.3.3.3 Example

The following example imports all metadata available in /tmp/myrepos to the application mdsapp deployed in the server server1:

```
wls:/weblogic/serverConfig> importMetadata(application='mdsapp', server='server1',
                             fromLocation='/tmp/myrepos',docs="/**")
Executing operation: importMetadata.
"importMetadata" operation completed. Summary of "importMetadata" operation is:
List of documents successfully transferred:
/app1/jobs.xml
/app1/mo.xml
2 documents successfully transferred.
```

4.3.4 purgeMetadata

Command Category: Application Metadata

Use with WLST: Online

4.3.4.1 Description

Purges the older (non-tip) versions of unlabeled documents from the application's repository. All unlabeled documents will be purged if they are expired, based on Time-To-Live (the olderThan argument). This command is applicable only for repositories that support versioning, that is, database-based repositories.

4.3.4.2 Syntax

purgeMetadata(application, server, olderThan [, applicationVersion])

Argument	Definition
application	The name of the application, used to identify the partition in the repository on which the purge operation will be run.
server	The target server on which this application is deployed.
olderThan	Document versions that are older than this value (in seconds) will be purged. The maximum value is 2147483647 seconds.
applicationVersion	Optional. The application version, if multiple versions of the same application are deployed.

4.3.4.3 Example

The following example purges the document version history for the application mdsapp deployed in the server server1, if the version is older than 10 seconds:

```
wls:/weblogic/serverConfig> purgeMetadata('mdsapp', 'server1', 10)
Executing operation: purgeMetadata.
Metadata purged: Total number of versions: 10.
Number of versions purged: 0.
```

4.4 Sandbox Metadata Management Commands

Use the commands in Table 4-4 to manage metadata in a sandbox. A sandbox is a temporary location for testing changes before moving them to a production system. Sandboxes are not visible to most users until they are applied.

Table 4–4 Sandbox Metadata Management Commands

Use this command	То	Use with WLST
destroyMDSSandbox	Destroys an MDS sandbox.	Online
exportSandboxMetadata	Exports the metadata from a sandbox.	Online
importSandboxMetadata	Imports metadata into a sandbox.	Online
listMDSSandboxes	Lists sandboxes.	Online

4.4.1 destroyMDSSandbox

Command Category: Sandbox Metadata Management

Use with WLST: Online

4.4.1.1 Description

Destroys the sandbox and its contents.

You can only use this command with a database-based MDS repository.

4.4.1.2 Syntax

destroyMDSSandbox(application, server, sandboxName [, applicationVersion])

Argument	Definition
application	The name of the application.
server	The target server on which this application is deployed.
sandboxName	The name of the sandbox to destroy.
applicationVersion	Optional. The application version, if multiple versions of the same application are deployed.

4.4.1.3 Example

The following example destroys the sandbox sandbox1 from the MDS repository for the application myapp:

```
wls:/weblogic/serverConfig>destroyMDSSandbox('myapp', 'server1',
                   'sandbox1')
Executing operation: destroyMDSSandbox.
```

Sandbox "sandbox1" successfully destroyed.

4.4.2 exportSandboxMetadata

Command Category: Sandbox Metadata Management

Use with WLST: Online

4.4.2.1 Description

Exports the changes to the metadata from a sandbox on a test system.

You can only use this command with a database-based MDS repository.

4.4.2.2 Syntax

```
exportSandboxMetadata(application, server, toArchive, sandboxName
          [, restrictCustTo] [, applicationVersion] [, remote] [, tenantName])
```

Argument	Definition	
application	The name of the application from which the metadata is to be exported.	
server	The target server on which this application is deployed.	
toArchive	The target archive file (.jar, .JAR, .zip or .ZIP) to which the sandbox contents will be transferred. The archive can be located on a local or network directory where the application is physically deployed. If you specify the -remote argument, the archive can be located on the system on which you are executing the command.	
sandboxName	The name of the sandbox to export.	
restrictCustTo	Optional. Valid values are percent (%) or a list of comma-separated customization layer names used to restrict the export operation to export only customization documents that match the specified customization layers. Each customization layer name can contain, within a pair of brackets, optional customization layer values and value patterns separated by commas.	
	See Section 4.1 for information about the patterns that you can use with this argument.	
	For example:	
	restrictCustTo="user[scott]"	
	<pre>restrictCustTo="site[site1],user[scott]" restrictCustTo="site[site1, %_2],user[scott, m%]"</pre>	
	If you do not specify this argument or if you specify percent (%) as the value of this argument, all customizations are exported, whether or not they are declared in the cust-config element of adf-config.xml.	
	Use this option to export all customizations or a subset of declared customizations. You can also use this option to export customizations from customization classes that are not declared in the cust-config element of adf-config.xml.	
	This argument is ignored if the excludeAllCust argument is also specified.	
applicationVersion	Optional. The application version, if multiple versions of the same application are deployed.	
remote	Optional. A Boolean value (true or false) that specifies whether the archive file will be written to a location where the application is deployed (false) or to the system on which you are executing the command (true).	
	The default is false.	
tenantName	A unique name identifying the tenant to use for this operation. This argument is required for a multitenant application and is not applicable for a non-multitenant application. For a non-multitenant application, any specified value will be ignored.	

4.4.2.3 Example

The following example exports sandbox sandbox1 from the MDS repository partition for the application myapp to /tmp/sandbox1.jar:

```
wls:/weblogic/serverConfig>exportSandboxMetadata('myapp', 'server1',
                    '/tmp/sandbox1.jar', 'sandbox1')
```

4.4.3 importSandboxMetadata

Command Category: Sandbox Metadata Management

Use with WLST: Online

4.4.3.1 Description

Imports the contents of a sandbox archive to another sandbox in the MDS repository partition of the specified application. It can also update the contents of a given archive to a sandbox in the MDS repository partition of a given application. All customizations are imported, whether or not they are declared in the cust-config element of adf-config.xml.

You can only use this command with a database-based MDS repository.

4.4.3.2 Syntax

```
importSandboxMetadata(application, server, fromArchive [, forceSBCreation]
               [, useExistingSandbox] [, sandboxName] [, applicationVersion]
               [, remote] [, tenantName])
```

Argument	Definition	
application	The name of the application for which the metadata is to be imported.	
server	The target server on which this application is deployed.	
fromArchive	The source archive file from which documents will be selected for transfer. The archive can be located on a local or network directory where the application is physically deployed. If you specify the -remote argument, the archive can be located on the system on which you are executing the command.	
forceSBCreation	Optional. A Boolean value (true or false) that specifies whether the operation will overwrite an existing sandbox with the same name. When the argument is set to true, if the fromArchive argument specifies a sandbox with the same name as one that already exists in the application's partition, the original sandbox is deleted and a new sandbox is created. When the argument is set to false, if a sandbox with the same name exists, an exception is thrown.	
	The default is false.	
useExistingSandbox	Optional. When set to true , the contents of the archive are imported to the sandbox specified with the sandboxName argument. This argument is ignored if there is no value specified for sandboxName.	
	The default is false.	
sandboxName	Optional. The name of the sandbox to update. This argument is ignored if useExistingSandbox is false.	
applicationVersion	Optional. The application version, if multiple versions of the same application are deployed.	

Argument	Definition
remote	Optional. A Boolean value (true or false) that specifies whether the archive file is in a location where the application is deployed (false) or on the system on which you are executing the command (true).
	The default is false.
tenantName	A unique name identifying the tenant to use for this operation. This argument is required for a multitenant application and is not applicable for a non-multitenant application. For a non-multitenant application, any specified value will be ignored.

4.4.3.3 Examples

The following example imports the contents of sandbox1.jar and creates a sandbox in the MDS repository partition for the application myapp:

```
wls:/weblogic/serverConfig> importSandboxMetadata(application='myapp', 'server1'',
                             '/tmp/sandbox1.jar')
```

The following example updates the existing sandbox sandbox1 in the MDS repository partition for the application myapp with the contents of sandbox1.jar:

```
wls:/weblogic/serverConfig>importSandboxMetadata('myapp', 'server1',
'/tmp/sandbox1.jar', useExistingSandbox='true', sandboxName='sandbox1')
```

4.4.4 listMDSSandboxes

Command Category: Sandbox Metadata Management

Use with WLST: Online

4.4.4.1 Description

Lists sandboxes matching the specified criteria.

You can only use this command with a database-based MDS repository.

4.4.4.2 Syntax

listMDSSandboxes(application, server [, sbNamePattern] [, applicationVersion])

Argument	Definition
application	The name of the application whose sandboxes will be listed.
server	The target server on which this application is deployed.
sbNamePattern	Optional. A pattern that matches the names of one or more sandboxes. When you do not specify this argument, all sandboxes associated with the application's metadata repository partition are listed.
	See Section 4.1 for information about the patterns that you can use with this argument.
applicationVersion	Optional. The application version, if multiple versions of the same application are deployed.

4.4.4.3 Example

The following example lists all sandboxes for the application myapp and that begin with the characters FlexField:

wls:/weblogic/serverConfig>listMDSSandboxes('myapp', 'server1', 'FlexField%') Executing operation: listMDSSandboxes. Following Sandboxes match the selection criteria:

FlexfieldAutoSandbox 1347601004722 FlexfieldAutoSandbox_1347653193237 FlexfieldAutoSandbox_1347691996491

4.5 Application Label Management Commands

Use the commands in Table 4–5 to manage labels for applications.

Table 4–5 Application Label Management Commands

Use this command	То	Use with WLST
createMetadataLabel	Creates a metadata label.	Online
deleteMetadataLabel	Deletes a metadata label from the repository partition.	Online
listMetadataLabels	Lists metadata labels in the repository partition.	Online
promoteMetadataLabel	Promotes the metadata associated with a label to tip.	Online
purgeMetadataLabels	Deletes the labels matching the specified criteria.	Online

4.5.1 createMetadataLabel

Command Category: Application Label Management

Use with WLST: Online

4.5.1.1 Description

Creates a new label for the documents in the application's repository partition. This command is applicable only for repositories that support versioning.

4.5.1.2 Syntax

createMetadataLabel(application, server, name [, applicationVersion] [, tenantName])

Argument	Definition
application	The name of the application for which a label will be created in the partition configured for this application.
server	The target server on which this application is deployed. If the application is deployed to multiple Managed Servers in a cluster, you can use the name of any of the server names. You cannot specify multiple server names.
name	The name of the label to create in the repository partition.
applicationVersion	Optional. The application version, if multiple versions of the same application are deployed.
tenantName	A unique name identifying the tenant to use for this operation. This argument is required for a multitenant application and is not applicable for a non-multitenant application. For a non-multitenant application, any specified value will be ignored.

4.5.1.3 Example

The following example creates the label label1 for the application mdsapp deployed

```
wls:/weblogic/serverConfig> createMetadataLabel('mdsapp','server1','label1')
Executing operation: createMetadataLabel.
Created metadata label "label1".
```

4.5.2 deleteMetadataLabel

Command Category: Application Label Management

Use with WLST: Online

4.5.2.1 Description

Deletes a label for the documents in the application's repository partition. This command is applicable only for repositories that support versioning.

4.5.2.2 Syntax

deleteMetadataLabel(application, server, name [, applicationVersion] [, tenantName])

Argument	Definition
application	The name of the application from whose associated partition the label is to be deleted.
server	The target server on which this application is deployed. If the application is deployed to multiple Managed Servers in a cluster, you can use the name of any of the server names. You cannot specify multiple server names.
name	The name of the label to delete in the repository partition.
applicationVersion	Optional. The application version, if multiple versions of the same application are deployed.
tenantName	A unique name identifying the tenant to use for this operation. This argument is required for a multitenant application and is not applicable for a non-multitenant application. For a non-multitenant application, any specified value will be ignored.

4.5.2.3 Example

The following example deletes the metadata label label1 from the application mdsapp deployed in the server server1:

```
wls:/weblogic/serverConfig> deleteMetadataLabel('mdsapp','server1','label1')
Executing operation: deleteMetadataLabel.
Deleted metadata label "label1".
```

4.5.3 listMetadataLabels

Command Category:

Use with WLST: Online

4.5.3.1 Description

Lists all of the metadata labels in the application's repository partition. This command is applicable only for repositories that support versioning.

4.5.3.2 Syntax

listMetadataLabels(application, server [, applicationVersion] [, tenantName])

Argument	Definition
application	The name of the application for which all of the labels in the repository partition should be listed.
server	The target server on which this application is deployed. If the application is deployed to multiple Managed Servers in a cluster, you can use the name of any of the server names. You cannot specify multiple server names.
applicationVersion	Optional. The application version, if multiple versions of the same application are deployed.
tenantName	A unique name identifying the tenant to use for this operation. This argument is required for a multitenant application and is not applicable for a non-multitenant application. For a non-multitenant application, any specified value will be ignored.

4.5.3.3 Example

The following example lists the metadata labels available for the application mdsapp deployed in the server server1:

wls:/weblogic/serverConfig> listMetadataLabels('mdsapp', 'server1') Executing operation: listMetadataLabels. Database Repository partition contains the following labels: label2 label3

4.5.4 promoteMetadataLabel

Command Category: Application Label Management

Use with WLST: Online

4.5.4.1 Description

Promotes documents associated with a label to the tip version in the repository. This command is useful to achieve rollback capability. This command is applicable only for repositories that support versioning.

4.5.4.2 Syntax

promoteMetadataLabel(application, server, name [, applicationVersion] [, tenantName])

Argument	Definition
application	The name of the application in whose associated repository the metadata is to be promoted to tip.
server	The target server on which this application is deployed. If the application is deployed to multiple Managed Servers in a cluster, you can use the name of any of the server names. You cannot specify multiple server names.
name	The name of the label to promote in the repository partition.
applicationVersion	Optional. The application version, if multiple versions of the same application are deployed.

Argument	Definition
tenantName	A unique name identifying the tenant to use for this operation. This argument is required for a multitenant application and is not applicable for a non-multitenant application. For a non-multitenant application, any specified value will be ignored.

4.5.4.3 Example

The following example promotes the metadata label label1 to tip in the application mdsapp deployed in the server server1:

wls:/weblogic/serverConfig> promoteMetadataLabel('mdsapp', 'server1','label1') Executing operation: promoteMetadataLabel. Promoted metadata label "label1" to tip.

4.5.5 purgeMetadataLabels

Command Category: Application Label Management

Use with WLST: Online

4.5.5.1 Description

Purges or lists the metadata labels that match the given pattern or age, but does not delete the metadata documents that were part of the label. You can delete the documents by executing the purgeMetadata command.

4.5.5.2 Syntax

purgeMetadataLabels(repository, partition [, namePattern] [, olderThanInMin] [, infoOnly] [, tenantName])

Argument	Definition
repository	The name of the MDS repository that contains the partition whose metadata labels will be purged or listed.
partition	The name of the partition whose metadata labels will be purged or listed.
namePattern	Optional. A pattern that matches the names of labels. If you do not specify this argument, all labels in the partition are purged.
	See Section 4.1 for information about the patterns that you can use with this argument.
olderThanInMin	Optional. The age of the labels, in minutes. The default is 525600 (one year).
infoOnly	Optional. Valid values are true or false. If you set it to true, it does not purge the labels, but lists the labels that match the specified pattern.
	The default is false.
tenantName	A unique name identifying the tenant to use for this operation. This argument is required for a multitenant application and is not applicable for a non-multitenant application. For a non-multitenant application, any specified value will be ignored.

4.5.5.3 Examples

The following example lists the labels that match the specified namePattern, but does not delete them:

```
wls:/webloqic/serverConfiq> purgeMetadataLabels(repository='mds-myRepos',
           partition='partition1', namePattern='mylabel*', infoOnly='true' )
```

The following example purges the labels that match the specified namePattern and that are older than a year:

```
wls:/weblogic/serverConfig> purgeMetadataLabels(repository='mds-myRepos',
                   partition='partition1', namePattern='mylabel*')
```

The following example deletes labels that match the specified namePattern and that are older than 30 minutes:

```
wls:/weblogic/serverConfig> purgeMetadataLabels(repository='mds-myRepos',
                   partition='partition1',
                  namePattern='mylabel*', olderThanInMin='30')
```

4.6 Application Management Deployment Commands

Use the commands in Table 4–6 to manage deployment.

Table 4–6 Application Management Deployment Commands

Use this command	То	Use with WLST
getMDSArchiveConfig	Returns an MDSArchiveConfig object.	Offline
importMAR	Imports an MAR.	Online

4.6.1 getMDSArchiveConfig

Command Category: Application Management Deployment

Use with WLST: Offline

4.6.1.1 Description

Returns a handle to the MDSArchiveConfig object for the specified archive. The returned MDSArchiveConfig object's methods can be used to change application and shared repository configuration in an archive.

The MDSArchiveConfig object provides the following methods:

setAppMetadataRepository—This method sets the connection details for the application metadata repository.

If the archive's existing adf-config.xml file does not contain any configuration for the application's metadata repository, then you must provide all necessary arguments to define the target repository. To define a database-based repository, provide the repository, partition, type, and jndi arguments. For a file-based repository, provide the path argument instead of indi.

If the adf-config.xml file already contains some configuration for the application's metadata repository, you can provide only a subset of arguments that you want to change. You do not need to provide all arguments in such a case. However, if the store type is changed, then the corresponding jndi or path argument is required.

setAppSharedMetadataRepository—This method sets the connection details for the shared repository in the application archive that is mapped to specified namespace.

If the archive's existing adf-config.xml file does not contain any configuration for a shared metadata repository mapped to the specified namespace, you must provide all required arguments (in this case, repository, partition, type, and jndi or path). For a database-based repository, provide the jndi argument. For a file-based repository, path is a required argument.

If the adf-config.xml file already contains some configuration for a shared metadata repository mapped to the specified namespace and you want to change some specific arguments, you can provide only a subset of those arguments; all others are not needed.

save—If you specify the toLocation argument, then the changes will be stored in the target archive file and the original file will remain unchanged. Otherwise, the changes will be saved in the original file itself.

4.6.1.2 Syntax

archiveConfigObject = getMDSArchiveConfig(fromLocation)

Argument	Definition
fromLocation	The name of the ear file, including its complete path.

The syntax for setAppMetadataRepository is:

```
archiveConfigObject.setAppMetadataRepository([repository] [, partition]
          [, type] [, jndi] [, path])
```

Argument	Definition
repository	Optional. The name of the application's repository.
partition	Optional. The name of the partition for the application's metadata.
type	Optional. The type of connection, file or database, to the repository. Valid values are 'File' or 'DB' (case insensitive).
jndi	Optional. The JNDI location for the database connection. This argument is required if the type is set to DB. This argument is not considered if the type is set to File.
path	Optional. The directory for the metadata files. This argument is required if the type is set to File. This argument is not considered if the type is set to DB.

The syntax for setAppSharedMetadataRepository is:

```
archiveConfigObject.setAppSharedMetadataRepository(namespace [, repository]
          [, partition] [, type] [, jndi] [, path])
```

Argument	Definition
namespace	The namespace used for looking up the shared repository to set connection details.
repository	Optional. The name of the application's shared repository.
partition	Optional. The name of the partition for the application's shared metadata.
type	Optional. The type of connection, file or database, to the repository. Valid values are 'File' or 'DB' (case insensitive).
jndi	Optional. The JNDI location for the database connection. This argument is required if the type is set to DB. This argument will not be considered if the type is set to File.

Argument	Definition
path	Optional. The location of the file metadata store. This argument is required if the type is set to File. This argument will not be considered if the type is set to DB.

The syntax for save is:

archiveConfigObject.save([toLocation])

Argument	Definition
toLocation	Optional. The file name, including the absolute path to store the changes. If this option is not provided, the changes are written to the archive represented by this configuration object.

4.6.1.3 **Examples**

In the following example, if the adf-config.xml file in the archive does not have the application and shared metadata repositories defined, then you should provide the complete connection information.

```
wls:/offline> archive = getMDSArchiveConfig(fromLocation='/tmp/testArchive.ear')
wls:/offline> archive.setAppMetadataRepository(repository='AppRepos1',
        partition='partition1', type='DB', jndi='mds-jndi1')
wls:/offline> archive.setAppSharedMetadataRepository(namespace='/a',
        repository='SharedRepos1', partition='partition2', type='File',
        path='/temp/dir')
wls:/offline> archive.save()
```

In the following example, if the adf-config.xml file in the archive already has the application and shared metadata repositories defined, all arguments are optional. You can set only the arguments you want to change.

```
wls:/offline> archive = getMDSArchiveConfig(fromLocation='/tmp/testArchive.ear')
wls:/offline> archive.setAppMetadataRepository(partition='MDS-partition2')
wls:/offline> archive.setAppSharedMetadataRepository(namespace='/a',
         repository='SharedRepos2')
wls:/offline> archive.save(toLocation='/tmp/targetArchive.ear')
```

4.6.2 importMAR

Command Category: Application Management Deployment

Use with WLST: Online

4.6.2.1 Description

Imports the metadata from the MAR that is packaged with the application's EAR file. If the MAR had already been imported into the partition, the command deletes the previous version and imports the new version.

4.6.2.2 Syntax

```
importMAR(application, server [, force] [, applicationVersion] )
```

Argument	Definition
application	The name of the application for which the metadata is to be imported.
server	The target server on which this application is deployed.
force	Optional. A Boolean value (true or false) that specifies whether only changed documents and MARs are imported.
	For a database-based repository, if you set this argument to false, only new or changed documents from changed MARs are imported. The command creates a label for each MAR for which documents are imported. The label has the following format:
	postDeploy_application_name_MAR_name_MAR_checksum
	For a file-based repository, if you set this argument to false, only changed MARs are imported. The command does not compare individual documents The command creates a file in the repository for each imported MAR.
	The default is true.
applicationVersion	Optional. The application version, if multiple versions of the same application are deployed.

4.6.2.3 Example

The following example imports metadata from the MAR to the application mdsapp:

```
wls:/weblogic/serverConfig> importMAR('mdsapp','server1')
Executing operation: importMAR.
"importMAR" operation completed. Summary of "importMAR" operation is:
/app1/jobs.xml
/app1/mo.xml
2 documents successfully transferred.
```

4.7 Multitenancy Management Commands

Use the commands in Table 4–7 to manage tenants.

Table 4–7 Multitenancy Management Commands

Use this command	То	Use with WLST
deprovisionTenant	Deprovisions a tenant from the metadata store.	Online
listTenants	Lists the tenants.	Online

4.7.1 deprovisionTenant

Deprovisions a tenant from the metadata store. All metadata associated with the tenant will be removed from the store

4.7.1.1 Syntax

deprovisionTenant(repository, partition, tenantName)

Argument	Definition
repository	The name of the repository that contains the tenant.
partition	The name of the partition that contains the tenant.
tenantName	A unique name identifying the tenant to use for this operation.

4.7.1.2 Example

The following example deprovisions the tenant with tenantName tenant1:

```
wls:/weblogic/serverConfig> deprovisionTenant("mds-myrepos", "part1", "tenant1")
Executing operation: deprovisionTenant.
Tenant "tenant1" has been deprovisioned.
```

4.7.2 listTenants

Lists all tenants in an MDS Repository partition.

4.7.2.1 Syntax

listTenants(repository, partition)

Argument	Definition
repository	The name of the repository that contains the tenants.
partition	The name of the partition that contains the tenants.

4.7.2.2 Example

The following example lists all tenants in the specified repository and partition:

```
wls:/weblogic/serverConfig> listTenants("mds-myrepos", "part1")
Executing operation: listTenants.
```

- 0 GLOBAL
- 1 tenant1
- 2 tenant2
- 3 tenant3

Application Development Framework (ADF) Custom WLST Commands

The following sections describe the WLST custom commands and variables in detail. Topics include:

- Section 5.1, "Overview of WLST Command Categories"
- Section 5.2, "ADF-Specific WLST Commands"

Note: To use these ADF custom WLST commands, you must invoke the WLST script from the Oracle Common home. See "Using Custom" WLST Commands" in the *Administering Oracle Fusion Middleware*.

5.1 Overview of WLST Command Categories

Use the ADF-based URL Connections WLST commands to navigate the hierarchy of configuration or runtime beans and control the prompt display. Use the getADFMArchiveConfig command to manage the ADFMArchiveConfig object.

5.2 ADF-Specific WLST Commands

Use the commands in Table 5–1 to managing URL-based connections.

Table 5–1 Browse Commands for WLST Configuration

Use this command	То	Use with WLST
adf_createFileUrlConnection	Create a new ADF File connection.	Online or Offline
adf_createHttpUrlConnection	Create a new ADF URL connection.	Online or Offline
adf_ setURLConnectionAttributes	Set or edit the attributes of a newly created or existing ADF connection.	Online or Offline
adf_listUrlConnection	List a new URL connection.	Online or Offline
getADFMArchiveConfig	Returns a handle to the ADFMArchiveConfig object for the specified archive.	Online or Offline
exportJarVersions	Export CSV format of jars versions from current ORACLE_HOME at a specified location.	Offline

Table 5–1 (Cont.) Browse Commands for WLST Configuration

Use this command	То	Use with WLST
exportApplicationJarVersions	Export CSV format of runtime jars versions of a specified application at a specified location.	Online
exportApplicationSelectedJarVer sions	Export CSV format of jars versions of selected jars at a specified location in coordination with the Versions.xml file.	Online

5.2.1 adf_createFileUrlConnection

Use with WLST: Online or Offline

5.2.1.1 Description

Use this command to create a new connection based on the oracle.adf.model.connection.url.FileURLConnection connection class.

5.2.1.2 Syntax

adf_createFileURLConnection(appName, name, URL)

Argument	Definition
appName	Application name for which the connection that will be created.
name	The name of the new connection.
URL	The URL associated with this connection.

5.2.1.3 Example

adf_createFileURLConnection('myapp','tempDir','/scratch/tmp')

5.2.2 adf_createHttpUrlConnection

Use with WLST: Online or Offline

5.2.2.1 Description

Use this command to create a new connection based on the oracle.adf.model.connection.url.HttpURLConnection connection type class.

5.2.2.2 Syntax

adf.createHttpURLConnection (appName, name, [URL], [authenticationType], [realm], [user], [password]

Argument	Definition
appName	Application name for which the connection is to be created.
name	The name of the new connection.
url	(Optional) The URL associated with this connection.
authenticationType	(Optional) The default is basic.
realm	(Optional) If this connection deals with authentication, then this should be set. The default is basic.

Argument	Definition
user	(Optional)
password	(Optional)

5.2.2.3 **Example**

adf_createHttpURLConnection('myapp','cnn','http://www.cnn.com')

5.2.3 adf_setURLConnectionAttributes

Use with WLST: Online or Offline

5.2.3.1 Description

Use this command to set or edit the attributes of a newly created or existing ADF connection.

5.2.3.2 Syntax

adf_setURLConnectionAttributes(appname, connectionname, attributes)

Argument	Definition
appname	Application name for which the connection that will be created.
connectionname	The name of the new connection.
attributes	The array containing attributes to set in key/value pairs.

5.2.3.3 **Example**

adf_setURLConnectionAttributes ('myapp','cnn','ChallengeAuthenticationType:digest', 'AuthenticationRealm:XMLRealm'

5.2.4 adf listUrlConnection

Use with WLST: Online or Offline

5.2.4.1 Description

Use this command to list the connections of the application.

5.2.4.2 Syntax

adf_listURLConnection(appname)

Argument	Definition
appname	Application name

5.2.4.3 **Example**

adf_listURLConnection ('myapp')

5.2.5 getADFMArchiveConfig

Use with WLST: Online or Offline.

5.2.5.1 Description

Returns a handle to the ADFMArchiveConfig object for the specified archive. The returned ADFMArchiveConfig object's methods can be used to change application configuration in an archive.

The ADFMArchiveConfig object provides the following methods:

- setDatabaseJboSOLBuilder([value])—Sets the Database jbo.SQLBuilder attribute.
- getDatabaseJboSQLBuilder()—Returns the current value of the jbo.SQLBuilder attribute.
- setDatabaseJboSQLBuilderClass([value])—Sets the Database jbo.SOLBuilderClass attribute. Value is the full name of the custom builder class.
- getDatabaseJboSQLBuilderClass()—Returns the current value of the jbo.SQLBuilderClass attribute.
- setDefaultRowLimit([value])—Sets the defaults rowLimit attribute. Value is a long specifying the row limit (Default -1).
- getDefaultRowLimit()—Returns the current value of the rowLimit attribute.
- save([toLocation])—If you specify the toLocation, then the changes will be stored in the target archive file and the original file will remain unchanged. Otherwise, the changes will be saved in the original file itself.

5.2.5.2 Syntax

archiveConfigObject = ADFMAdmin.getADFMArchiveConfig(fromLocation)

Argument	Definition
fromLocation	The name of the ear file, including its complete path.

The syntax for setDatabaseJboSQLBuilder([value]) is:

archiveConfigObject.setDatabaseJboSQLBuilder([value])

Argument	Definition
value	The value of the jbo.SQLBuilder attribute. Valid values are: 'Oracle' (Default), 'OLite', 'DB2', 'SQL92', 'SQLServer', or 'Custom. If 'Custom' is specified, then the jbo.SQLBuilderClass attribute should also be set.

The syntax for getDatabaseJboSQLBuilder() is:

archiveConfigObject.getDatabaseJboSQLBuilder()

The syntax for setDatabaseJboSQLBuilderClass([value]) is:

archiveConfigObject.setDatabaseJboSQLBuilderClass([value])

Argument	Definition
value	The value of the jbo.SQLBuilderClass attribute.

The syntax for getDatabaseJboSQLBuilderClass) is:

archiveConfigObject.getDatabaseJboSQLBuilderClass()

The syntax for setDefaultRowLimit([value]) is:

archiveConfigObject.setDefaultRowLimit([value])

Argument	Definition
value	The value of the rowLimit attribute.

The syntax for getDefaultRowLimit() is:

archiveConfigObject.getDefaultRowLimit([value])

The syntax for save([toLocation]) is:

archiveConfigObject.save([toLocation])

Argument	Definition	
toLocation	The file name along with the absolute path to store the changes.	

5.2.5.3 Example

In the following example. the jbo.SQLBuilder attribute is set to 'DB2'.

```
wls:/offline> archive =
              ADFMAdmin.getADFMarchiveConfig(fromLocation='/tmp/testArchive.ear')
wls:/offline> archive.setDatabaseJboSQLBuilder(value='DB2')
wls:/offline> archive.save()
```

In the following example, the jbo. SQLBuilder attribute is removed so that application default is used.

```
wls:/offline> archive =
             ADFMAdmin.getADFMarchiveConfig(fromLocation='/tmp/testArchive.ear')
wls:/offline> archive.setDatabaseJboSQLBuilder()
wls:/offline> archive.save(toLocation='/tmp/targetArchive.ear')
```

In the following example, the jbo. SQLBuilder attribute is set to 'Custom', and the jbo.SQLBuilderClass attribute is set to the class 'com.example.CustomBuilder'.

```
wls:/offline> archive =
             ADFMAdmin.getADFMArchiveConfig(fromLocation='/tmp/testArchive.ear')
wls:/offline> archive.setDatabaseJboSQLBuilder('Custom')
wls:/offline> archive.setDatabaseJboSQLBuilderClass('com.example.CustomBuilder')
wls:/offline> archive.save(toLocation='/tmp/targetArchive.ear')
```

In the following example, the rowLimit attribute is set to 100.

```
wls:/offline> archive = getADFMArchiveConfig(fromLocation='/tmp/testArchive.ear')
wls:/offline> archive.setDefaultRowLimit(100)
wls:/offline> archive.save(toLocation='/tmp/targetArchive.ear')
```

5.2.6 exportJarVersions

Use with WLST: Offline.

5.2.6.1 Description

Use to export CSV format of jars versions from current ORACLE_HOME at a specified location. Exported jars versions information can be opened in Oracle OpenOffice or MS Excel.

5.2.6.2 Syntax

exportJarVersions(path)

Argument	Definition
path	Location to extract jars versions.

5.2.6.3 Example

This example shows how jars versions are exported to

/tmp/export-MyApp-Versions.csv. R/W privileges for the CSV file need to be verified.

wls:/offline>exportJarVersions('/tmp/export-MyApp-Versions.csv')

5.2.7 exportApplicationJarVersions

Use with WLST: Online.

5.2.7.1 Description

Used to export CSV format of runtime jars versions of a specified application at a specified location.

5.2.7.2 Syntax

exportApplicationJarVersions(applicationName, path)

Argument	Definition
applicationName	Application name to export jars versions
path	Location to export jars versions.

5.2.7.3 **Example**

This example shows how MyApp runtime jars versions are exported to /tmp/export-MyApp-Versions.csv. R/W privileges for the CSV file need to be verified.

wls:/DefaultDomain/serverConfig>exportApplicationJarVersions('MyApp', '/tmp/export-MyApp-Versions.csv')

5.2.8 exportApplicationSelectedJarVersions

Use with WLST: Online.

5.2.8.1 Description

Used to export CSV format of jars versions of selected jars at a specified location.

5.2.8.2 Syntax

exportApplicationSelectedJarVersions(applicationName, path, jarsLocation)

Argument	Definition
applicationName	Application name to export jars versions.
path Location to extract jars versions.	
jarsLocation	Optional list of selected jars. If not specified, default jars runtime version list from %WLSDOMAIN%/config/fmwconfig/Versions.xml will be exported.
	If the selectedJars property in Versions.xml is empty, version information of adfm.jar, adf-richclient-impl-11.jar, adf-controller.jar, adf-pageflow-impl.jar, adf-share-support.jar and mdsrt.jar will be exported.

5.2.8.3 Example

This example shows how jars versions are exported to

/tmp/export-MyApp-Versions.csv using the selectedJars property of the Versions.xml file. In this case, since the jarsLocation parameter is not specified, the libraries listed in the selectedJars property of the Versions.xml file will be exported. R/W privileges for the CSV file need to be verified.

```
wls:/offline>exportApplicationSelectedJarVersions('MyApp',
'/tmp/export-MyApp-Versions.csv')
Versions.xml
<Diagnostics xmlns="xmlns.oracle.com/adf/diagnostics">
  <Versions xmlns="xmlns.oracle.com/adf/diagnostics/versions"</pre>
   exportVersionsOnApplicationStartup="true"
   selectedJars="$ORACLE_HOME$/modules/oracle.adf.model_11.1.1/adfm.jar;
      $ORACLE_HOME$/modules/oracle.adf.view_11.1.1/adf-richclient-impl-11.jar;
      $ORACLE_HOME$/modules/oracle.adf.controller_11.1.1/adf-controller.jar;
      $ORACLE_HOME$/modules/oracle.adf.pageflow_11.1.1/adf-pageflow-impl.jar;
      $ORACLE_HOME$/modules/oracle.adf.share_11.1.1/adf-share-support.jar;
      $ORACLE_HOME$/modules/oracle.mds_11.1.1/mdsrt.jar" />
</Diagnostics>
```

This example shows how jars versions are exported to

/tmp/export-MyApp-Versions.csv using the jarsLocation parameter. In this case, the libraries passed explicitly in the jarsLocation parameter will be exported. R/W privileges for the CSV file need to be verified.

```
wls:/offline>exportApplicationSelectedJarVersions('MyApp',
'/tmp/export-MyApp-Versions.csv',
'$ORACLE_HOME$/modules/oracle.adf.model_11.1.1/adfm.jar;$ORACLE_
HOME$/modules/oracle.adf.view_11.1.1/adf-richclient-impl-11.jar')
```

DMS Custom WLST Commands

This chapter provides detailed descriptions of custom WLST commands for the Dynamic Monitoring Service (DMS), which you can use to view performance metrics and to configure Event Tracing. This chapter includes command syntax, arguments and command examples.

Note: To use these DMS custom WLST commands, you must invoke the WLST script from the Oracle Common home. See "Using Custom" WLST Commands" in the *Administering Oracle Fusion Middleware*.

Use the DMS commands in the categories in Table 6–1 to view performance metrics and to configure Event Tracing.

Table 6-1 DMS Command Categories

Command category	Description
DMS Configuration Commands	Set and view the DMS system configuration parameters.
DMS Metric Commands	View information about performance metrics.
DMS Parameter-Scoped Metrics Rules Commands	Create a metric, specifying a constraint and rules that associate sets of noun-types with sets of parameter name
DMS Event Tracing Commands	Configure Event Tracing

6.1 DMS Configuration Commands

Use the commands in Table 6–2 to configure system properties and to display system properties.

Table 6-2 DMS Configuration Commands

Use this command	То	Use with WLST
listDMSConfigurationPara meters	Display information about one or more DMS configuration parameters.	Online
setDMSConfigurationPara meter	Set the value of a DMS configuration parameter.	Online

6.1.1 listDMSConfigurationParameters

Use online.

6.1.1.1 Description

Displays information about one or more DMS system configuration parameters.

6.1.1.2 Syntax

listDMSConfigurationParameters([name='parameter_name'][, server='server_name'])

Argument	Definition	
name	The name of the parameter.	
server	The name of the server.	

6.1.1.3 Examples

The following example displays information about all DMS system configuration parameters:

listDMSConfigurationParameters()

```
Server: AdminServer
```

Parameter Config Value Runtime Value DMSClockType DEFAULT DEFAULT SensorActivationLevel NORMAL NORMAL DMSClockUnits MICROSECONDS MICROSECONDS

The following example displays information about the DMS system configuration parameter DMSClockUnits:

listDMSConfigurationParameters(name="DMSClockUnits")

```
Server: AdminServer
```

Parameter Config Value Runtime Value DMSClockUnits MICROSECONDS MICROSECONDS

6.1.2 setDMSConfigurationParameter

Use online.

6.1.2.1 Description

Sets the value of the specified DMS system configuration parameter. This command replaces the existing DMS System Properties, which are now deprecated.

6.1.2.2 Syntax

setDMSConfigurationParameter(name='parameter_name', value='value', server='server_

Argument	Definition
name	The name of the parameter.
value	The value of the parameter.
server	The name of the server.

The following table lists the supported configuration parameters, together with their corresponding system property. These system properties are now deprecated.

Configuration Parameter	Values	Default	Deprecated System Property
DMSClockType	default highres	default	oracle.dms.clock
DMSClockUnits	milliseconds microseconds nanoseconds	microseconds	oracle.dms.clock.unit s
SensorActivationLevel	none normal heavy all	normal	oracle.dms.sensors
DMSPublisherClass	Any string	null (The configuration default)	oracle.dms.publisher. classes
DMSHTTPPort	Any numeric port number	0 (The configuration default)	oracle.dms.httpd.port .start

6.1.2.3 Examples

The following example shows the DMSClockType set to HIGHRES:

setDMSConfigParameter(name= 'DMSClockType', value='HIGHRES', server='mymanaged')

6.2 DMS Metric Commands

Use the commands in Table 6–3 to view information about a specific performance metric, a set of performance metrics, or all performance metrics for a particular server or component.

For additional details about metrics, see the chapter "Monitoring Oracle Fusion Middleware" in Administering Oracle Fusion Middleware and the chapter "Using the Oracle Dynamic Monitoring Service" in *Tuning Performance*.

Table 6-3 DMS Metric Commands

Use this command	То	Use with WLST
displayMetricTableNames	Display the names of the available DMS metric tables.	Online
displayMetricTables	Display the content of the DMS metric tables.	Online
dumpMetrics	Display available metrics.	Online
reloadMetricRules	Reload the metric rules.	Online

6.2.1 displayMetricTableNames

Command Category: DMS Metrics

Use with WLST: Online

6.2.1.1 Description

Displays the names of the available DMS metric tables. The returned value is a list of metric table names.

6.2.1.2 Syntax

displayMetricTableNames([servers])

Argument	Definition
servers	Optional. Specifies the servers from which to retrieve metrics. Valid values are a list of WebLogic Server instance names and system component names.
	To specify one server, use the following syntax:
	servers='servername'
	To specify multiple servers, use one of the following syntax options:
	<pre>servers=['servername1', 'servername2',] servers=('servername1', 'servername2',)</pre>
	If this argument is not specified, the command returns the list of metric table names for all WebLogic servers and system components.
	For system components, such as Oracle HTTP Server, use the following format:
	<pre>servers=['component_name], servertype='component_type')</pre>

6.2.1.3 Examples

The following example displays metric table names for all WebLogic servers and system components:

displayMetricTableNames()

```
ADF
ADFc
ADFc_Metadata_Service
ADFc_Region
ADFc_Taskflow
ADFc_Viewport
BAM_common_connectionpool
BAM_common_connectionpool_main
BAM_common_messaging
BAM_common_messaging_consumers
```

The following example displays metric table names for the WebLogic Managed Server wls_server1:

displayMetricTableNames(servers='wls_server1')

```
ADF
JVM
JVM_ClassLoader
JVM_Compiler
JVM_GC
JVM_Memory
JVM_MemoryPool
JVM_MemorySet
JVM_OS
JVM_Runtime
```

The following example displays metric table names for two WebLogic Managed Servers:

```
displayMetricTableNames(servers=['wls_server1', 'bam-server1'])
ADF
```

```
ADFc
ADFc_Metadata_Service
ADFc_Region
ADFc_Taskflow
ADFc_Viewport
BAM_common_connectionpool
BAM_common_connectionpool_main
BAM_common_messaging
BAM_common_messaging_consumers
```

The following example displays the metric table names for the Oracle HTTP Server instance ohs_1:

displayMetricTableNames(servers='ohs_1', servertype='OHS')

6.2.2 displayMetricTables

Command Category: DMS Metrics

Use with WLST: Online

6.2.2.1 Description

Displays the content of the DMS metric tables.

The returned value is list of DMS metric tables, with the following information about each table:

- The metric table name.
- The metric table schema information.
- The metric table Rows.

The metric table schema information contains the following:

- The name of the column.
- The type of the column value.
- The unit of the column.
- The description of the column.

6.2.2.2 Syntax

```
displayMetricTables([metricTable_1] [, metricTable_2], [...] [, servers]
                    [, variables])
```

Argument	Definition
metricTable_n	Optional. Specifies a list of metric tables. By default, this argument displays all available metrics. The metric table name can contain special characters for simple pattern matching. The character '?' matches any single character. The character '*' matches zero or more characters.
	You specify the metric table name. You can specify multiple metric table names in a comma-separated list.
	These are the same names output by the WLST command displayMetricTableNames.

Argument	Definition
servers	Optional. Specifies the servers from which to retrieve metrics. Valid values are a list of WebLogic Server instance names and system component names.
	To specify one server, use the following syntax:
	servers='servername'
	To specify multiple servers, use one of the following syntax options:
	<pre>servers=['servername1', 'servername2',] servers=('servername1', 'servername2',)</pre>
	If this argument is not specified, the command returns the list of metric tables for all WebLogic servers and system components.
	For system components, such as Oracle HTTP Server, use the following format:
	<pre>servers=['component_name], servertype='component_type')</pre>
variables	Optional. Defines the metric aggregation parameters. Valid values are a set of name-value pairs. It uses the following syntax:
	<pre>variables={name1:value1, name2:value2,}</pre>
	The specific name-value pairs depend on the aggregated metric tables. Each aggregated metric table has its specific set of variable names.

6.2.2.3 Examples

The following example displays the data from the JVM and the weblogic.management.runtime.WebAppComponentRuntimeMBean metric tables, and limits it to data retrieved from wls_server1 and wls_server2:

```
displayMetricTables('JVM','weblogic.management.runtime.WebAppComponentRuntimeMBean',
     servers=['wls_server1','wlsserver2'])
JVM
Host: host.example.com
Name: JVM
Parent: /
Process: wls_server_2:7004
ServerName: wls_server_2
activeThreadGroups.maxValue: 8.0 groups activeThreadGroups.winValue: 7.0 groups activeThreadGroups.value: 8 groups activeThreads.maxValue: 58.0 threads
activeThreads.minValue: 39.0 threads
activeThreads.value: 57 threads
freeMemory.maxValue: 174577.0 kbytes
freeMemory.minValue: 12983.0 kbytes
freeMemory.value: 98562 kbytes startTime.value: 1368467917680 msecs
```

The following example displays the aggregated metric tables with the specified metric aggregation parameters:

displayMetricTables('j2ee_application:webservices_port_rollup',

```
servers=['wls_server1','ls_server1'],
     variables={'host':'hostname', 'servletName':'dms'})
_____
j2ee_application:webservices_port_rollup
_____
Faults: 0
Requests:
            0
Requests.averageTime: 0.0
Requests.totalTime:
                    0.0
ServerName: wls_server1
moduleName: RuntimeConfigService
moduleType: WEBs
portName: RuntimeConfigServicePortSAML
processRequest.active: 0
service.throughput: 0.0
service.time: 0.0
startTime: 1238182359291
webserviceName: RuntimeConfigService
Faults: 0
Requests: 0
Requests.averageTime: 0.0
Requests.totalTime: 0.0
ServerName: wls_server1
moduleName: TaskMetadataService
moduleType: WEBs
portName: TaskMetadataServicePort
processRequest.active: 0
service.throughput:
service.time: 0.0
startTime: 1238182358096
webserviceName: TaskMetadataService
```

The following example displays the metric tables which names match the specified patterns:

```
displayMetricTables('J??', 'JVM_*')
JVM_ThreadStats
Host: hostname.com
JVM: JVM
Name: threads
Parent: /JVM/MxBeans
Process: AdminServer:7001
ServerName: AdminServer
contention.value: enabled in JVM
daemon.value: 85
                         threads
deadlock.value: 0 threads live.value: 89 threads peak.value: 95 threads
started.value: 836 threads
```

DMS Custom WLST Commands 6-7

6.2.3 dumpMetrics

Command Category: DMS Metrics

Use with WLST: Online

6.2.3.1 Description

Displays available metrics in the internal format or in XML. The returned value is a text document.

6.2.3.2 Syntax

dumpMetrics([servers] [, format])

Argument	Definition
servers	Optional. Specifies the servers from which to retrieve metrics. Valid values are a list of WebLogic Server instance names and system component names.
	To specify one server, use the following syntax:
	servers='servername'
	To specify multiple servers, use one of the following syntax options:
	<pre>servers=['servername1', 'servername2',] servers=('servername1', 'servername2',)</pre>
	If this argument is not specified, the command returns the list of metric tables for all WebLogic servers and system components.
	For system components, such as Oracle HTTP Server, use the following format:
	<pre>servers=['component_name], servertype='component_type')</pre>
format	Optional. Specifies the command output format. Valid values are 'raw' (the default), 'xml, and 'pdml'. For example:
	<pre>format='raw' format='xml' format='pdml'</pre>
	DMS raw format is a simple metric display format; it displays one metric per line.

6.2.3.3 Examples

The following example outputs all available metrics, including native WebLogic Server metrics and internal DMS metrics, in the XML format:

dumpMetrics(format='xml')

```
componentId='wls_server1' cacheable='false'>
<row cacheable='false'>
<column name='serverName'><![CDATA[wls_server2]]></column>
<column name='nurserySize.value' type='DOUBLE'>0.0</column>
<column name='jdkVersion.value'><![CDATA[1.6.0_05]]></column>
<column name='jdkVendor.value'><![CDATA[BEA Systems, Inc.]]></column>
<column name='daemonThreads.active' type='LONG'>68</column>
<column name='cpuUsage.percentage' type='DOUBLE'>100.0</column>
<column name='threads.active' type='LONG'>71</column>
<column name='ServerName'><![CDATA[wls_server2]]></column>
<column name='heapUsed.value' type='DOUBLE'>0.0</column>
```

The following example outputs metrics from Server-0 in the default raw format:

```
/JVM/MxBeans/threads/Thread-44 [type=JVM
_Thread]
    ECID.value:
                  null
    RID.value: null
    blocked.value: 0 msec
blockedCount.value: 1 times
    cpu.value: 40 msecs
    lockName.value: null
    lockOwnerID.value: null
    lockOwnerName.value:
                             null
    name.value: LDAPConnThread-0 ldap://host:7001
state.value: RUNNABLE
    state.value: RUNNABLE
waited.value: 0 msec
    waitedCount.value: 0
                            times
   /JVM/MxBeans/threads/Thread-45 [type=JVM_Thread]
    ECID.value: null
    RID.value: null
    blocked.value: 0 msec
```

dumpMetrics(servers='Server-0')

The following example outputs metrics from wls_server1 and wls_server2 in XML format:

```
dumpMetrics(servers=['wls_server1', 'wls_server2'], format='xml')
soainfra composite soainfra composite revision soainfra domain'
componentId='wls server2' cacheable='false'>
<table name='weblogic_j2eeserver:ejb_transaction' keys='ServerName appName
ejbModuleName name serverName' componentId='wls_server2' cacheable='false'>
<row cacheable='false'>
<column name='serverName'><![CDATA[wls_server2]]></column>
<column name='name'><![CDATA[MessagingClientParlayX]]></column>
<column name='ejbTransactionCommit.percentage' type='DOUBLE'>0.0</column>
<column name='ejbTransactionRollback.completed' type='LONG'>0</column>
<column name='ejbTransactionTimeout.throughput' type='DOUBLE'>0.0</column>
<column name='ejbTransactionCommit.completed' type='LONG'>0</column>
<column name='ejbTransactionTimeout.completed' type='LONG'>0</column>
<column name='appName'><![CDATA[usermessagingserver]]></column>
<column name='ejbTransactionRollback.throughput' type='DOUBLE'>0.0</column>
<column name='ServerName'><![CDATA[wls_server2]]></column>
<column name='ejbTransactionCommit.throughput' type='DOUBLE'>0.0</column>
name='ejbModuleName'><![CDATA[sdpmessagingclient-ejb-parlayx.jar]]></column>
</row>
```

6.2.4 reloadMetricRules

Command Category: DMS Metrics

Use with WLST: Online

6.2.4.1 Description

Reloads the metric rules. You must run this command after you deploy system components or after you modify metric rules. Generally, Oracle does not recommend that you modify metric rules.

6.2.4.2 Syntax

reloadMetricRules()

6.2.4.3 Example

The following example reloads metric rules for all servers running in the domain:

reloadMetricRules()

```
Location changed to domainRuntime tree. This is a read-only tree with DomainMBean
as the root.
For more help, use help(domainRuntime)
loaded 'server-mds-11.0.xml'
loaded 'server-weblogic_j2ee_application_webservices-11.0.xml'
loaded 'server-weblogic_j2eeserver_adf-11.0.xml'
loaded 'server-weblogic_soa_composite-11.0.xml'
loaded 'server-weblogic_j2eeserver_webservices-11.0.xml'
loaded 'server-oracle_sdpmessaging-11.0.xml'
loaded 'server-weblogic_j2ee_application_webcenter-11.0.xml'
loaded 'server-weblogic_j2eeserver-11.0.xml'
reloaded metric rules for server 'wls_server_1'
```

6.3 DMS Parameter-Scoped Metrics Rules Commands

Parameter-scoped metrics commands enable you to create a metric, specifying a constraint and rules that associate sets of noun-types with sets of parameter names.

Use the commands in Table 6–4 to manage parameter-scoped metrics.

Table 6-4 DMS Parameter-Scoped Metrics Rules Commands

Use this command	То	Use with WLST
createDMSScopedMetricsP arameterConstraint	Create a parameter constraint that can be used in the setParameterScopedMetricsRule command.	Online
deleteDMSParameterScope dMetricsRules	Delete the specified parameter-scoped metric rules.	Online
dumpParameterScopedMet rics	Display the parameter-scoped metric data for the specified rule id.	Online
listDMSContextParameters	List the set of execution context parameters known to DMS.	Online
listDMSParameterScopedM etricsRules	Display the current parameter-scoped metrics configuration.	Online
resetDMSParameterScoped Metrics	Reset the parameter-scoped metric data associated with the given rule identifiers.	Online

Table 6-4 (Cont.) DMS Parameter-Scoped Metrics Rules Commands

Use this command	То	Use with WLST
sampleDMSContextParame terValues	Collect a sample of the set of values for the named context parameter.	Online
setDMSParameterScopedM etricsRule	Create or update a parameter-scoped metric rule.	Online

6.3.1 createDMSScopedMetricsParameterConstraint

Command Category: DMS Parameter-Scoped Metrics

Use with WLST: Online

6.3.1.1 Description

Creates a constraint that can be used with the setParameterScopedMetricsRule command.

6.3.1.2 Syntax

createDMSScopedMetricsParameterConstraint(name [, values] [,maxnumofvalues])

Argument	Definition
name	The name of the parameter to which the constraint refers.
values	Optional. A list of specific values to be applied by the constraint.
maxmumofvalues	Optional. The maximum number of values that the constraint will use. If omitted, and relevant, a value of 10 is assumed. This value is ignored if the values option is provided.

6.3.1.3 Example

The following example creates the parameter constraint name URI. It applies the values MyApp/advSearch.jspx and MyApp/basicSearch.jspx.

createDMSScopedMetricsParameterConstraint(name="URI", values=["MyApp/advSearch.jspx", "MyApp/basicSearch.jspx"])

6.3.2 deleteDMSParameterScopedMetricsRules

Command Category: DMS Parameter-Scoped Metrics

Use with WLST: Online

6.3.2.1 Description

Deletes the specified parameter-scoped metric rule and its accumulated data.

6.3.2.2 Syntax

deleteDMSParameterScopedMetricsRules([server,] ids)

Argument	Definition
server	Optional. Specifies the server from which to delete the parameter-scoped metrics. Valid values are a list of WebLogic Server instance names and system component names.
	To specify the server, use the following syntax:
	server='servername'
	If this argument is not specified, the command returns the list of metric tables for all WebLogic servers and system components.
	You must be connected to the Administration Server to use this argument.
	For system components, such as Oracle HTTP Server, use the following format:
	<pre>servers=['component_name], servertype='component_type')</pre>
ids	The list of identifiers of the rules to be deleted. To specify more than one identifier, surround the ids with brackets and separate them with commas. For example:
	ids=["id1", "id2"

6.3.2.3 Example

The following example deletes the parameter-scoped metric rules for the Managed Server wls_server1 and with the id of rule1:

deleteDMSParameterScopedMetricsRules(server='wls_server1', rule1)

6.3.3 dumpParameterScopedMetrics

Command Category: DMS Parameter-Scoped Metrics

Use with WLST: Online

6.3.3.1 Description

Displays the parameter-scoped metric data for the specified rule id.

6.3.3.2 Syntax

dumpParameterScopedMetrics([server,]ruleid)

Argument	Definition
server	Optional. Specifies the server for which to dump the parameter-scoped metric data. Valid values are a list of WebLogic Server instance names and system component names.
	To specify the server, use the following syntax:
	server='servername'
	If this argument is not specified, the command returns the list of metric tables for all WebLogic servers and system components.
	You must be connected to the Administration Server to use this argument.
	For system components, such as Oracle HTTP Server, use the following format:
	<pre>servers=['component_name], servertype='component_type')</pre>
ruleid	The id of the parameter-scoped metric rule for which data is to be displayed

6.3.3.3 Example

The following example displays data for the parameter-scoped metric rule regionRule for the Managed Server wls_server1:

dumpParameterScopedMetrics(server="wls_server1", ruleid="regionRule")

6.3.4 listDMSContextParameters

Command Category: DMS Parameter-Scoped Metrics

Use with WLST: Online

6.3.4.1 Description

Lists the set of execution context parameters known to DMS.

6.3.4.2 Syntax

listDMSContextParameters([server][, parameternames] [,verbose])

Argument	Definition
server	Optional. Specifies the server for which to display the execution context parameters. Valid values are a list of WebLogic Server instance names and system component names.
	To specify the server, use the following syntax:
	server='servername'
	If this argument is not specified, the command returns the list of metric tables for all WebLogic servers and system components.
	You must be connected to the Administration Server to use this argument.
	For system components, such as Oracle HTTP Server, use the following format:
	<pre>servers=['component_name], servertype='component_type')</pre>
parameternames	Optional. A list of names of execution context parameters of interest. Any parameter name not found on the server will be ignored (no error will be reported). If this argument is not used, all execution context parameters will be listed.
verbose	Optional. If true, then for each execution context parameter the output will include, where available, the description of the execution context parameter along with its set of possible values and their descriptions.

6.3.4.3 Example

The following example shows the parameter-scoped metric rules for the Managed Server wls_server1:

listDMSContextParameters(server='wls_server1')

Server: ManagedServer1

Module FlowId Action RCID

6.3.5 listDMSParameterScopedMetricsRules

Command Category: DMS Parameter-Scoped Metrics

Use with WLST: Online

6.3.5.1 Description

Displays the current parameter-scoped metric configuration.

6.3.5.2 Syntax

listDMSParameterScopedMetricsRules([server])

Argument	Definition
server	Optional. Specifies the server for which to display the parameter-scoped metric configuration. Valid values are a list of WebLogic Server instance names and system component names.
To specify the server, use the following syntax:	
	server='servername'
	If this argument is not specified, the command returns the list of metric tables for all WebLogic servers and system components.
	You must be connected to the Administration Server to use this argument.
	For system components, such as Oracle HTTP Server, use the following format:
	<pre>servers=['component_name], servertype='component_type')</pre>

6.3.5.3 Example

The following example shows the parameter-scoped metric rules for the Managed Server wls_server1:

listDMSParameterScopedMetricsRules(server='wls_server1')

```
Rule: ruleA
Noun types:
   JDBC_Connection
Context Parameter Constraints:
   Parameter: URI
     Constraining values:
       MyApp/advSearch.jspx
       MyApp/basicSearch.jspx
```

6.3.6 resetDMSParameterScopedMetrics

Command Category: DMS Parameter-Scoped Metrics

Use with WLST: Online

6.3.6.1 Description

Resets the parameter-scoped metric data associated with the given rule identifiers. The operation is not guaranteed to be atomic, that is, metric data will continue to be gathered while the reset operation is in progress.

6.3.6.2 Syntax

resetDMSParameterScopedMetrics([server,] ids)

Argument	Definition
server	Optional. Specifies the server for which to reset the parameter-scoped metrics. Valid values are a list of WebLogic Server instance names and system component names.
	To specify the server, use the following syntax:
	server='servername'
	If this argument is not specified, the command returns the list of metric tables for all WebLogic servers and system components.
	You must be connected to the Administration Server to use this argument.
	For system components, such as Oracle HTTP Server, use the following format:
	<pre>servers=['component_name], servertype='component_type')</pre>
ids	The list of identifiers of the rules to be reset. To specify more than one identifier, surround the ids with brackets and separate them with commas. For example:
	ids=["id1", "id2"

6.3.6.3 Example

The following example resets the rule with the id ruleA for the managed server wls_ server1:

resetDMSParameterScopedMetrics(server="wls_server1", ids="ruleA")

6.3.7 sampleDMSContextParameterValues

Command Category: DMS Parameter-Scoped Metrics

Use with WLST: Online

6.3.7.1 Description

Collects a sample of the set of values for the named context parameter.

6.3.7.2 Syntax

sampleDMSContextParameterValues(parametername [, naxmuofvaleus] [,action])

Argument	Definition	
parametername	Optional. The name of the context parameter to be sampled. This argument must be used in combination with the argument action.	
manmumofvalues	Optional. The maximum number of distinct values to include in the sample. If omitted, a value of 10 is applied. A value of 0 will cause all distinct values to be sampled. Depending on the context parameter, this could mean sampling a set of unbounded size. Only relevant when specifying the action="start".	
action	Optional. The action to be sampled. This argument must be used in combination with the argument parametername.	
	The valid values are:	
	start: Start sampling values	
	stop: Stop sampling values and show the values	
	 show: Display the histogram of sampled values. 	

6.3.7.3 Examples

The following example starts sampling the values for the parameter bespoke.ServiceLevel:

```
{\tt sampleDMSContextParameterValues (parametername="bespoke.ServiceLevel", and the property of the property o
maxnumofvalues=5, action="start")
```

```
Values of the parameter bespoke. ServiceLevel are now being sampled.
List of parameters currently being sampled:
    bespoke. ServiceLevel has been sampled for 0 seconds.
```

The following example stops the sampling and displays the histogram of the values:

sampleDMSContextParameterValues()

```
List of parameters currently being sampled:
                                                 bespoke.ServiceLevel has been
sampled for 87 seconds.
sampleDMSContextParameterValues(parametername="bespoke.ServiceLevel",
action="stop")
 Histogram of values for parameter bespoke. ServiceLevel.
   Gold 21
   Silver 5
   Bronze 37
 Values of the parameter bespoke. ServiceLevel will no longer be sampled.
```

6.3.8 setDMSParameterScopedMetricsRule

Command Category: DMS Parameter-Scoped Metrics

Use with WLST: Online

6.3.8.1 Description

Creates or updates a parameter-scoped metric rule. Only one rule at a time can manage the collection of metrics for a particular noun type and parameter combination. For example, you cannot have two separate rules to attempt to collect parameter-scoped metrics based on the context parameter URI and the noun type **IDBC** Connection.

6.3.8.2 Syntax

setDMSParameterScopedMetricsRule([server,] id, nountypes [, ctxparamconstraints][, actparamconstraints] [,replace={true|false}])

Argument	Definition
server	Optional. Specifies the server for which to set the parameter-scoped metric rule. Valid values are a list of WebLogic Server instance names and system component names.
	To specify the server, use the following syntax:
	server='servername'
	If this argument is not specified, the command returns the list of metric tables for all WebLogic servers and system components.
	You must be connected to the Administration Server to use this argument.
	For system components, such as Oracle HTTP Server, use the following format:
	<pre>servers=['component_name], servertype='component_type')</pre>
id	The identifier of the rule.

Argument	Definition
nountypes	The list of noun types to which the rule applies.
ctxparamconstraints	Optional. The list of context parameter constraints to be used by this rule. You must specify at least one of this argument or actparamconstraints.
	See Section 6.3.1.
actparamconstraints	Optional. The list of activation parameter constraints to be used by the rule. You must specify at least one of this argument or ctxparamconstraints.
	See Section 6.3.1.
replace	Optional. If true, the new rule replaces an existing rule of the same id. If false or if left unset, and a rule with the id already exists an error is raised.

6.3.8.3 Example

The following example creates the rule with the id ruleA, the nountype JDBC_ Connection and the context parameter constraint ctxP1:

setDMSParameterScopedMetricsRule(id="ruleA", nountypes=["JDBC_Connection"], ctxparamconstraints=[ctxP1])

6.4 DMS Event Tracing Commands

Use the commands in Table 6–5 to configure Event Tracing. Event Tracing configures live tracing with no restarts. DMS metrics that were updated using Oracle Fusion Middleware products may be traced using the DMS Event Tracing feature.

For information about using DMS Event Tracing, see "DMS Tracing and Events" in the Tuning Performance.

Table 6-5 DMS Tracing Commands

Use this command	То	Use with WLST
addDMSEventDestination	Add a new destination to the Event Tracing configuration.	Online
addDMSEventFilter	Add a filter to the Event Tracing configuration.	Online
addDMSEventRoute	Add the specified event route to the Event Tracing configuration	Online
enableDMSEventTrace	Enable an event trace and create a filter with a specified condition and destination and an enabled event-route.	Online
listDMSEventConfiguration	Display an overview of the event tracing configuration.	Online
listDMSEventDestination	Display the full configuration for a destination or a list of all destinations.	Online
listDMSEventFilter	Display the configuration of a filter or a list of all filters.	Online
listDMSEventRoutes	Display event routes and their status (enabled or disabled).	Online
removeDMSEventDestination	Remove the specified destination.	Online

Table 6-5 (Cont.) DMS Tracing Commands

Use this command	То	Use with WLST
removeDMSEventFilter	Remove the specified filter.	Online
removeDMSEventRoute	Remove the specified event route.	Online
updateDMSEventDestination	Update configuration of an event destination.	Online
updateDMSEventFilter	Update the configuration of an event filter.	Online
updateDMSEventRoute	Update the configuration of an event route.	Online

6.4.1 addDMSEventDestination

Command Category: DMS Event Tracing

Use with WLST: Online

6.4.1.1 Description

Adds a new destination to the Event Tracing configuration. If a destination with the same ID already exists, the command reports this and does not add the destination. You must be connected to the Administration Server to add a destination. If you are not, an error is returned.

6.4.1.2 Syntax

addDMSEventDestination(id=id [, name=dest_name] ,class=class_name [, props= {'name': 'value'...}] [,server=server_name])

Argument	Definition
id	The unique identifier for the specified destination.
name	Optional. A name for the destination.
class	The full class name of the destination.
	See Table 6–6 for a list of available classes.
props	Optional. The name/value properties to use for the destination. Some destinations require properties. For example, the LoggerDestination class requires the property loggerName.
	See addDMSEventFilter for information about the syntax and allowed values.
server	Optional. The server on which to perform this operation. The default is the server to which you are connected.

Table 6–6 shows the built-in destinations, with the full runtime class name.

Table 6-6 Built-In Destinations

Runtime Destination Class Name	Description	
oracle.dms.trace2.runtime.LoggerDestination	Uses ODL to send the log messages to a file.	
oracle.dms.event.HTTPRequestTrackerDestination	Dumps the set of active HTTP requests, allowing an administrator to get a snapshot of activity.	

Table 6-6 (Cont.) Built-In Destinations

Runtime Destination Class Name	Description
oracle.dms.jrockit.jfr.JFRDestination	Passes events to the JRockit Flight Recorder so that they can be viewed in the context of other data coming from the JRockit JVM and WLDF using JRockit Mission Control.
oracle.dms.jmx.MetricMBeanFactory	Exposes Nouns as MBeans.
oracle.dms.util.StackTraceCollatorDestination	Collates the stack traces that are in play whenever the events of interest occur. This is primarily a debugging tool.
	The collated data is written out on shutdown, and also when an event being handled has not been reported for a certain period of time (defaults to one minute).

6.4.1.3 Examples

The following example adds a destination with the ID destination1, the name File-system, the class oracle.dms.trace2.runtime.LoggerDestination. Because the LoggerDestination requires the property loggerName, it sets the value to trace2-logger:

```
addDMSEventDestination(id='destination1', name='File-system',
                        class='oracle.dms.trace2.runtime.LoggerDestination',
                        props={'loggerName': 'trace2-logger'})
```

Destination "destination1" added.

The following example attempts to add a destination with an ID that already exists:

```
addDMSEventDestination(id='destination1', name='File-system',
                        class='oracle.dms.trace2.runtime.LoggerDestination',
                        props={'loggerName': 'trace2-logger'})
```

Destination "destination1" already exists. Unable to add this.

6.4.2 addDMSEventFilter

Command Category: DMS Event Tracing

Use with WLST: Online

6.4.2.1 Description

Adds a filter to the Event Tracing configuration. If a filter with the same ID already exists, the command returns an error and does not add the filter.

You must be connected to the Administration Server to add an event filter. If you are not, an error message is reported.

6.4.2.2 Syntax

```
addDMSEventFilter(id=id [, name=name] [, etypes]
                   , props= {'prop-name': 'value'...}
                   [, server=server_name])
```

Argument	Definition
id	The unique identifier for specified filter.
name	Optional. The name of the filter.
etypes	Optional. A string containing a comma-separated list of event/action pairs. This argument allows you to create a filter with a broader granularity when used with a condition. It also allows you to create a filter with a broader range of metrics. For example, all nouns or all nouns with the action create.
props	<pre>prop-name: The name of the filter property. <condition> is the only valid property, and only one condition may be specified.</condition></pre>
	value: The value of the property of the filter.
server	Optional. The server on which to perform this operation. The default is the server to which you are connected.

The following shows the syntax for etypes:

```
<etypes>:==
<type>:[<action>]
```

The following lists the valid etypes:

```
NOUN: CREATE | DELETE | TYPE_CHANGE
SENSOR
EVENT_SENSOR: CREATE | DELETE | METRIC_SELECTION_CHANGED,
PHASE_SENSOR: CREATE | DELETE | METRIC_SELECTION_CHANGED | START | STOP | ABORT
STATE_SENSOR: CREATE | DELETE | METRIC_SELECTION_CHANGED | UPDATE
ROLLUP_SENSOR: CREATE | DELETE | METRIC_SELECTION_CHANGED
EXECUTION_CONTEXT: START | STOP | SUSPEND
HTTP_REQUEST:START | STOP | CONTEXT_CHANGED
```

Note the following:

- SENSOR has no associated actions and is expanded to include all related SENSORS and associated actions.
- A type specified with no associated action, will default to all actions for that type. For example, HTTP_REQUEST would default to

HTTP_REQUEST:START,HTTP_REQUEST:STOP, HTTP_REQUEST:CONTEXT_ **CHANGED**

The following shows an etype with two event/action pairs, separated by a comma:

```
etypes='NOUN:DELETE, STATE_SENSOR:DELETE'
```

The following shows the syntax for the <condition> property of the argument props. The arguments are described in the tables following the syntax:

```
<condition>::=
<type> [<operator> <condition>]
<type>::=
<nountype> | <context>
<nountype>::=
NOUNTYPE <nountype-operator> value
<nountype-operator>::=
"equals" | "starts_with" | "contains" | "not_equals"
```

```
<context>::=
CONTEXT <name> <context-operator> [<value>] [IGNORECASE=true | false]
[DATATYPE="string|long|double"
<context-operator>::=
"equals" | "starts_with" | "contains" | "not_equals" | "is_null" | "gt" | "le" |
"ge"
<operator>::=
AND OR
```

The following table describes the arguments for <type>:

Value	Description
according to Nouns. A Noun type is a name that reflects the se metrics being collected. For example, JDBC could be a Noun ty	Each Sensor, with its associated metric, is organized in a hierarchy according to Nouns. A Noun type is a name that reflects the set of metrics being collected. For example, JDBC could be a Noun type. For information about Sensors and Nouns, see "Understanding Common DMS Terms and Concepts" in the <i>Tuning Performance</i>
<context></context>	An Execution Context is an association of the Execution Context ID (ECID), Relationship ID (RID), and Maps of Values. This argument allows the data stored in the map of values to be inspected and used by the filter. For example, if the map contains the key "user", you can create a filter that returns requests with "user" equal to "bruce".

The following table describes the arguments for <nountype>:

Value	Description	
NOUNTYPE	A keyword.	
<pre><nountype-operator></nountype-operator></pre>	The following are valid operators:	
	 equals: Filters only if the Noun type name equals the value. 	
	 starts_with: Filters only if the Noun type name starts with the value. 	
	• contains: Filters only if the Noun type name equals the value.	
	 not_equals: Filters only if the Noun type name does not equal the value. 	
value	The name of the Noun type on which to operate. The name can be any object for which you want to measure performance.	

The following table describes <context>

Value	Description
CONTEXT	A keyword.
name	The name of the context to filter.
value	The name of the context on which to operate.

Value	Description
<pre><context-operator></context-operator></pre>	The following are valid operators:
	• equals: Filters only if the context name equals the value.
	• starts_with: Filters only if the context name starts with the value.
	• contains: Filters only if the context name equals the value.
	 not_equals: Filters only if the context name does not equal the value.
	 is_null: Filters only if the context name is null.
	 lt: Filters only if the context name is less than the value.
	• gt: Filters only if the context name is greater than the value.
	• le: Filters only if the context name is less than or equal to the value.
	 ge: Filters only if the context name is greater than or equal to the value.
IGNORECASE	Optional. If specified, the case of a string data type is ignored. The default is that the case of a context is used.
	The IGNORECASE AND DATATYPE are not dependent on their position in the command.
DATATYPE	Optional. The valid values are string, long, or double. The default is string.
	The IGNORECASE AND DATATYPE are not dependent on their position in the command.

6.4.2.3 Examples

The following example adds a filter with the name MyFilter, specifying a Noun type and context:

```
addDMSEventFilter(id='mds1', name='MyFilter',
       props={'condition': 'NOUNTYPE equals MDS_Connections AND CONTEXT user
equals bruce IGNORECASE'})
Filter "mds1" added.
```

The following example attempts to add a filter with the same id. The command returns an error:

```
addDMSEventFilter(id='mds1', name='MyFilter',
     props={'condition': 'NOUNTYPE equals MDS_Connections AND CONTEXT user equals
bruce'})
```

Unable to add filter "mds1" as a filter with that ID already exists for server "AdminServer".

The following example adds a filter with two event/action pairs:

```
addDMSEventFilter(id='mds2', name='MyFilter',
         etypes='NOUN:CREATE,HTTP_REQUEST:START',
         props={'condition': 'NOUNTYPE equals MDS_Connections
                 AND CONTEXT user equals bruce IGNORECASE=true'})
Filter "mds2" added.
```

6.4.3 addDMSEventRoute

Command Category: DMS Event Tracing

Use with WLST: Online

6.4.3.1 Description

Adds the specified event route to the Event Tracing configuration. If an event route with the same ID already exists, the command returns an error and does not add the event route.

You must be connected to the Administration Server to add an event route. If you are not, an error is returned.

6.4.3.2 Syntax

addDMSEventRoute([filterid=filter_id], destinationid=destination_id, [enable=true | false] [, server=server_name])

Argument	Definition
filterid	Optional. The unique identifier for the filter.
destinationi d	The unique identifier for the specific destination. The destination must exist.
enable	Optional. Enables the filter. Valid values are true and false. The default is true.
server	Optional. The server on which to perform this operation. The default is the server to which you are connected.

6.4.3.3 Examples

The following example adds an event route with the filter id of mds1 and the destination id of destination1:

addDMSEventRoute(filterid='mds1', destinationid='destination1', enable='false') Event-route for filter "mds1", destination "destination1" added for server "AdminServer".

The following example attempts to add an event route that already exists:

addDMSEventRoute(filterid='mds1', destinationid='destination1', enable='false') Unable to add event route as a mapping with filter "mds1" and destination "destination1" already exists for server "AdminServer".

6.4.4 enableDMSEventTrace

Command Category: DMS Event Tracing

Use with WLST: Online

6.4.4.1 Description

Enables an event trace and creates a filter with a specified condition and destination and an enabled event-route. This is a simple way to start filtering, without having to explicitly create a filter, destination and event-route, but with less configuration options. The specified destination must exist.

You must be connected to the Administration Server to enable a DMS event trace. If you are not, an error is returned.

If you require a more complex configuration, use the addDMSEventDestination, addDMSEventFilter, and addDMSEventRoute.

6.4.4.2 Syntax

```
enableDMSEventTrace(destinationid=destinationid [, etypes=etype]
                    [, condition=condition] [, server=server_name])
```

Argument	Definition
destinationid	The unique identifier for the specific destination. Any existing destination is valid.
etypes	Optional. A string containing a comma-separated list of event/action pairs. See addDMSEventFilter for a list of available etypes.
condition	Optional. A condition on which to filter. See addDMSEventFilter for the syntax for a condition.
	If no condition is specified, all DMS events will be passed
server	Optional. The server on which to perform this operation. The default is the server to which you are connected.

6.4.4.3 Example

The following example enables an event trace with a specified condition:

enableDMSEventTrace(destinationid='destination1', condition='CONTEXT username EQUALS Joe AND CONTEXT ip EQUALS 192.168.1.5')

Filter "auto215443800" using Destination "destination1" added, and event-route enabled for server "AdminServer".

6.4.5 listDMSEventConfiguration

Command Category: DMS Event Tracing

Use with WLST: Online

6.4.5.1 Description

Displays an overview of the Event Tracing configuration.

6.4.5.2 Syntax

listDMSEventConfiguration([server=server_name]]

Argument	Definition
server	Optional. The server on which to perform this operation. The default is the server to which you are connected.

6.4.5.3 Example

The following example lists the configuration for the Managed Server to which you are connected:

listDMSEventConfiguration()

Server: AdminServer

Event routes:

Filter : auto215443800 Destination : destination1 Enabled : true

6.4.6 listDMSEventDestination

Command Category: DMS Event Tracing

Use with WLST: Online

6.4.6.1 Description

For a specific destination, display the full configuration. If no destination ID is specified, list the destination ID and name for all the destinations in the Event Tracing configuration.

6.4.6.2 Syntax

listDMSEventDestination([id=id] [, server=server_name)

Argument	Definition	
id	Optional. The unique identifier for the specific destination.	
server	Optional. The server on which to perform this operation. The default is the server to which you are connected.	

6.4.6.3 Examples

The following example displays information about the destinations for the Managed Server to which you are connected:

listDMSEventDestination()

```
Server: AdminServer
```

Id : HTTPRequestTrackerDestination Name : HTTP Request Tracker Destination

ЪТ : mbeanCreationDestination Name : MBean Creation Destination

The following example displays information about the destinations for the Managed Server, wls_server_1:

listDMSEventDestination(server='wls_server_1')

```
Server: wls_server_1
               : HTTPRequestTrackerDestination
  Name
               : HTTP Request Tracker Destination
  Ιd
               : mbeanCreationDestination
               : MBean Creation Destination
```

The following example displays information about the destination destination1:

listDMSEventDestination(id='destination1')

Server: AdminServer

: destination1 Name : File-system

Class : oracle.dms.trace2.runtime.LoggerDestination

```
Class Info : Logs incoming events to the logger configured for the
Destination.
 Properties :
     Name
                             Value
      loggerName
                             trace2-logger
```

6.4.7 listDMSEventFilter

Command Category: DMS Event Tracing

Use with WLST: Online

6.4.7.1 Description

For a specific filter, displays the full configuration. If you do not specify a filter ID, the command displays the filter ID and name for all the filters in the Event Tracing configuration.

6.4.7.2 Syntax

 ${\tt listDMSEventFilter([id=$id] [, server=$server_name])}$

Argument	Definition Optional. The unique identifier for specified filter.	
id		
server	Optional. The server on which to perform this operation. The default is the server to which you are connected.	

6.4.7.3 Example

The following example displays the list of all the filters in the Event Tracing configuration:

listDMSEventFilter()

```
Id
                           Name
auto215443800
                          auto generated using enableEventTrace
JFRFilter
                          JFRFilter
traceFilter
mds2
                           MyFilter
mds1
                           MyFilter
```

The following example displays the configuration of the filter mds1:

listDMSEventFilter(id='mds1')

```
Server: AdminServer
Id : mds1
Name : MyFilter
Properties :
     Condition:
      NOUNTYPE equals MDS_Connections AND CONTEXT user equals bruce IGNORECASE
```

6.4.8 listDMSEventRoutes

Command Category: DMS Event Tracing

Use with WLST: Online

6.4.8.1 Description

List the events routes and their status (enabled or disabled) that are associated with the specified filter or destination. If you do not specify a filterid or destinationid, this command lists all the event routes in the Event Tracing configuration.

6.4.8.2 Syntax

```
listDMSEventRoutes([filterid=filter_id] [, destinationid=destination_id]
                   [, server=server_name])
```

Argument	Definition
filterid	Optional. The unique identifier for the filter.
destinationi d	Optional. The unique identifier for the specific destination. The destination must exist.
server	Optional. The server on which to perform this operation. The default is the server to which you are connected.

6.4.8.3 Examples

The following example lists all event routes:

listDMSEventRoutes()

Server: AdminServer

Filter : auto215443800 Destination : destination1

Enabled : true

Filter : None

 ${\tt Destination} \quad : \quad {\tt HTTPRequestTrackerDestination}$

Enabled : true

The following example lists the event routes with the filter id of filter1:

listDMSEventRoutes(filterid='mds1')

Server: AdminServer

Filter : mds1 Destination : destination1 Enabled : false

The following example lists the event routes with the destination id of destination1:

listDMSEventRoutes(destinationid='destination1')

Server: AdminServer

Filter : auto215443800 Destination : destination1

Enabled : true Filter : mds2

Destination : destination1 Enabled : false

Filter : mds1

Destination : destination1 Enabled : false

6.4.9 removeDMSEventDestination

Command Category: DMS Event Tracing

Use with WLST: Online

6.4.9.1 Description

Removes an existing destination from the Event Tracing configuration. You can remove a destination only if no event route depends on the destination. If an event route that depends on the destination exists, a warning is returned.

You must be connected to the Administration Server to remove a destination. If you are not, an error is returned.

6.4.9.2 Syntax

removeDMSEventDestination(id=id [, server=server_name])

Argument	gument Definition	
id	The unique identifier for the destination to be removed.	
server	Optional. The server on which to perform this operation. The default is the server to which you are connected.	

6.4.9.3 Examples

The following example removes the destination jfr:

removeDMSEventDestination(id='jfr')

Destination "jfr" removed.

The following example attempts to remove the destination styx.inpass.db1. However, because an event route exists for the destination, the command returns an error.

removeDMSEventDestination(id='styx.inpass.db1')

An event-route for destination 'styx.inpass.db1' exists. Unable to remove this destination for server "AdminServer".

6.4.10 removeDMSEventFilter

Command Category: DMS Event Tracing

Use with WLST: Online

6.4.10.1 Description

Removes an existing filter from the Event Tracing configuration. You can remove a filter only if no event route depends on the filter. If an event route that depends on the filter exists, a warning is returned.

You must be connected to the Administration Server to remove an event filter. If you are not, an error is returned.

6.4.10.2 Syntax

removeDMSEventFilter(id=id [, server=server_name])

Argument	Definition	
id	The unique identifier for the filter to be removed.	
server	Optional. The server on which to perform this operation. The default is the server to which you are connected.	

6.4.10.3 Example

The following example removes the filter mds1:

```
removeDMSEventFilter(id='mds1')
```

```
Filter "mds1" removed for server "AdminServer".
```

The following example attempts to remove a filter for which and event-route currently exists:

```
removeDMSEventFilter(id='allaccounts')
```

Filter "allaccounts" cannot be removed. An event-route currently exists for that filter. Remove the event-route first using the command removeDMSEventRoute().

6.4.11 removeDMSEventRoute

Command Category: DMS Event Tracing

Use with WLST: Online

6.4.11.1 Description

Removes the specified event route. You must be connected to the Administration Server to add an event route. If you are not, an error is returned.

6.4.11.2 Syntax

```
removeDMSEventRoute([filterid=filter_id] [, destinationid=destination_id]
                    [, server=server_name])
```

Argument	Definition
filterid	Optional. The unique identifier for the filter.
destinationi d	Optional. The unique identifier for the specific destination. The destination must exist.
server	Optional. The server on which to perform this operation. The default is the server to which you are connected.

6.4.11.3 Example

The following example removes the event route with the filterid mds1 and the destination jfr:

```
removeDMSEventRoute(filterid='mds1', destinationid='jfr')
```

```
Event-route for filter "mds1", destination "jfr" removed for server "AdminServer".
```

The following example removes the event route with the destination destination1:

removeDMSEventRoute(destinationid='destination1')

Event-route for filter "None", destination "destination1" removed for server "AdminServer".

6.4.12 updateDMSEventDestination

Command Category: DMS Event Tracing

Use with WLST: Online

6.4.12.1 Description

Updates an existing destination, allowing a specified argument to be updated. You must be connected to the Administration Server to update a destination. If you are not, an error is returned.

6.4.12.2 Syntax

```
updateDMSEventDestination(id=id [, name=dest_name], class=class_name
                 [,props= {'name': 'value'...}] [, server=server_name)
```

Argument	nt Definition	
id	The unique identifier for the destination to be updated.	
name	Optional. A name for the destination.	
class	The full classname of the destination.	
	See Table 6–6 for a list of available destinations.	
props	Optional. The name/value properties to use for the destination. You can add a new property, or update or remove an existing one. If you update properties, you must specify all properties. If you omit a property, it is removed. For example, if a destination contains the properties LoggerName and severity, and you omit severity, it will be removed from the destination.	
	See addDMSEventFilter for information about the syntax and allowed values.	
server	Optional. The server on which to perform this operation. The default is the server to which you are connected.	

6.4.12.3 Examples

The following example updates the name of the destination ifr:

```
updateDMSEventDestination(id='jfr', name='Alternative Flight-Recorder')
```

```
Destination "jfr" updated for server "AdminServer".
```

The following example attempts to update a destination that does not exist. The command returns an error:

```
updateDMSEventDestination(id='destination1',
          props={'loggerName': 'MyNewTrace2-logger'})
```

Destination "destination1" does not exist for server "AdminServer".

6.4.13 updateDMSEventFilter

Command Category: DMS Event Tracing

Use with WLST: Online

6.4.13.1 Description

Updates an existing filter in the Event Tracing configuration.

You must be connected to the Administration Server to update an event filter. If you are not, an error is returned.

6.4.13.2 Syntax

```
updateDMSEventFilter(id=id [, name=name] [,etypes=etypes],
                    props= {'prop-name': 'value'...}
                     [,server=server_name])
```

Argument	Definition
id	The unique identifier for the filter to be updated.
name	Optional. The name of the filter to be updated.
etypes	Optional. A string containing a comma-separated list of event/action pairs. See addDMSEventFilter for a list of valid values.
props	prop-name: The name of the filter property. <condition> is the only valid property, and only one condition may be specified. See addDMSEventFilter for information on the syntax of prop-name.</condition>
	value: The value of the property of the filter.
server	Optional. The server on which to perform this operation. The default is the server to which you are connected.

6.4.13.3 Examples

The following example updates the filter properties for the filter with the id mds1:

```
updateDMSEventFilter(id='mds1',
props={'condition': 'NOUNTYPE equals XYZ_Total_Connections AND CONTEXT user
equals bruce'})
```

```
Filter "mds1" updated for server "AdminServer".
```

The following example attempts to update a filter that does not exist:

```
updateDMSEventFilter(id='Filter2')
```

```
Filter "Filter2" does not exist for server "AdminServer".
```

6.4.14 updateDMSEventRoute

Command Category: DMS Event Tracing

Use with WLST: Online

6.4.14.1 Description

Enables or disables the specified event route. You must be connected to the Administration Server to update an event route. If you are not, an error is returned.

6.4.14.2 Syntax

```
updateDMSEventRoute([filterid=filter_id], destinationid=destination_id
         [, enable=true|false] [, server=server_name])
```

Argument	Definition
filterid	Optional. The unique identifier for the filter.
destinationi d	Optional. The unique identifier for the specific destination. The destination must exist.
enable	Optional. Enables the filter. Valid values are true and false.

Argument	Definition	
server	Optional. The server on which to perform this operation. The default is the server to which you are connected.	

6.4.14.3 Example

The following example disables the event route with the filterid mds1 and the destinationid jfr:

updateDMSEventRoute(filterid='mds1', destinationid='jfr', enable='false') Event-route for filter "mds1", destination "destination1" updated for server "AdminServer".

Logging Custom WLST Commands

This chapter provides detailed descriptions of custom WLST commands for logging, including command syntax, arguments and command examples. Use the logging commands to configure settings for log files and to view and search log files.

For additional details about configuring and searching log files, see "Managing Log Files and Diagnostic Data" in the *Administering Oracle Fusion Middleware*.

Note: To use these logging custom WLST commands, you must invoke the WLST script from the Oracle Common home. See "Using Custom WLST Commands" in the Administering Oracle Fusion Middleware.

Table 7–1 describes the different categories of logging commands.

Table 7–1 Logging Command Categories

Command category	Description
Log Configuration Commands	Configure settings for log files, such as the level of information written to the file or the maximum file size.
Search and Display Commands	View Oracle Fusion Middleware log files and search log files for particular messages.
Selective Tracing Commands	Configure and use selective tracing, which specifies that messages are traced for specific server, loggers, or users.

7.1 Log Configuration Commands

Use the commands in Table 7–2 to configure settings for log files, such as the level of information written to the file or the maximum file size. In the Use with WLST column, online means the command can only be used when connected to a running server. Offline means the command can only be used when not connected to a running server. Online or offline means the command can be used in both situations.

Table 7–2 Logging Configuration Commands

Use this command	То	Use with WLST
configureLogHandler	Configure an existing log handler, add a new handler, or remove existing handlers.	Online
getLogLevel	Get the level for a given logger.	Online
listLoggers	Get the list of loggers and the level of each logger.	Online

Table 7–2 (Cont.) Logging Configuration Commands

Use this command	То	Use with WLST
listLogHandlers	List the configuration of one of more log handlers.	Online
setLogLevel	Set the level for a given logger.	Online

7.1.1 configureLogHandler

Command Category: Log Configuration

Use with WLST: Online

7.1.1.1 Description

Configures an existing Java logging handler, adds a new handler, or removes an existing handler. It returns a java.util.List with one entry for each handler. Each entry is a javax.management.openmbean.CompositeData object describing the handler.

With this command, you can change the location of the log files, the frequency of the rotation of log files, and other log file properties.

7.1.1.2 Syntax

configureLogHandler(options)

Argument	Definition
----------	------------

options

Comma-separated list of options, specified as name-value pairs. Valid options include:

target—The name of a WebLogic Server instance, or a string describing a system component. For system components, refer to the component's documentation for details.

The default value is the server to which WLST is connected.

- name—The name of a log handler. This option is required.
- maxFileSize—The value of the maximum file size for an ODL handler. The value is a string representing a numeric value, optionally followed by a suffix indicating a size unit (k for kilobytes, m for megabytes, g for gigabytes).

If you do not specify a suffix, the value is returned in bytes.

Note that this option does not apply to the QuickTrace handler.

maxLogSize—The value of the maximum size of the log files for an ODL handler. The value is a string representing a numeric value, optionally followed by a suffix indicating a size unit (k for kilobytes, m for megabytes, g for gigabytes).

Note that this option does not apply to the QuickTrace handler.

rotationFrequency—The value of the rotation frequency for an ODL handler. The value is a string representing a numeric value, optionally followed by a suffix indicating a time unit (m for minutes, h for hours, d for days). The default unit is minutes. The following special values are also accepted and are converted to a numeric value in minutes: HOUR, HOURLY, DAY, DAILY, WEEK, WEEKLY, MONTH, MONTHLY.

Note that this option does not apply to the QuickTrace handler.

baseRotationTime—The base rotation time, to be used with the rotationFrequency option. The value must be a string representing a date/time value. It can be a full date/time in ISO 8601 date/time format, or a short form including only hours and minutes. The default baseRotationTime is 00:00.

Note that this option does not apply to the QuickTrace handler.

Argument	Definition
options (continued)	■ retentionPeriod—The amount of time that the log file is retained. The value must be a string representing a numeric value, optionally followed by a suffix indicating a time unit (m for minutes, h for hours, d for days). The default unit is minutes. The following special values are also accepted and are converted to a numeric value in minutes: HOUR, HOURLY, DAY, DAILY, WEEK, WEEKLY, MONTH, MONTHLY.
	Note that this option does not apply to the QuickTrace handler.
	 format—The format for the ODL handler. Valid values are one of the following strings: "ODL-Text" or "ODL-XML". The default format is ODL-Text.
	 encoding—The character encoding for the log file.
	■ path—The log file path.
	Note that this option does not apply to the QuickTrace handler.
	 handlerType—The name of the Java class that provides the handler implementation. It must be an instance of java.util.logging.Handler or oracle.core.ojdl.logging.HandlerFactory.
	 propertyName—The name of an advanced handler property to be added or updated. The property value is specified with the propertyValue option. See the documentation for the handler for valid properties.
	 propertyValue—The new value for the handler property defined by the propertyName option.
	 addProperty—A Jython boolean value. Used in conjunction with the propertyName and propertyValue options to define that a new property is to be added to the handler.
	 removeProperty—A list of one or more handler properties to be removed.
	 addHandler—A boolean value. If the value is true, then the named handler will be added.
	• removeHandler —A boolean value. If the value is true, then the named handler is removed.
	 level—A Java or ODL level value. The handler level will be set to the given level.
	 addToLogger—A list of logger names. The handler is added to the given logger names.
	 removeFromLogger—A list of logger names. The handler is removed from the given loggers.
	 useParentHandlers—A boolean value. Sets the useParentHandlers flag on the loggers defined by the addToLogger or removeFromLogger options.

The following table lists the properties for the quicktrace-handler. This handler allows you to trace messages from specific loggers and store the messages in memory. For more information, see "Configuring QuickTrace" in the Administering Oracle Fusion Middleware.

QuickTrace Property	Description
bufferSize	The approximate size of the circular QuickTrace buffer, in which log records are stored in memory. Note that actual memory consumption may be less than, but not more than this value.

Description
If specified as true, DMS metrics are enabled for the quicktrace-handler. The default is true.
If specified as true, the handler maintains an individual buffer for each user specified in the reserveBufferUserID property. If the user is not defined in the reserveBufferUserID property, the messages are cached in the COMMON buffer.
If specified as false, the handler maintains only one buffer, COMMON.
The default is false.
If specified as true, the buffer is flushed when you execute the executeDump command. The default is true.
If specified as true, message arguments are included with the formatted log messages that have a message ID. The default is false.
The maximum length, in bytes, for each field in a message. The fields can include the message text, supplemental attributes, thread name, source class name, source method name, and message arguments.
The default is 240 bytes.
A small number can restrict the amount of information returned for a message. An excessively number can reduce the amount of log records in the buffer because each message uses more bytes.
A list of user IDs, separated by a comma. If enableUserBuffer is specified as true, any log messages related to the user are written to a separate buffer.
A list of supplemental attribute names. The attributes are listed in the logging.xml file.
Setting supplemental attributes requires additional memory or CPU time.
If specified as true, default attribute values are added to each log message. The default attributes are HOST_ID, HOST_NWADDR, and USER_ID.
If specified as true, the log message includes DMS logging context attributes. The default is false.
If you enable this option, the trace requires additional CPU time.
If specified as true, the handler attempts to use the real thread ID instead of the thread ID that is provided by the jave.util.logging.logRecord. The default is false.
If you enable this option, the trace requires additional CPU time.
If specified as true, the log message includes the thread name instead of the thread ID. The default is false.

7.1.1.3 Examples

The following example specifies the maximum file size for the odl-handler:

configureLogHandler(name="odl-handler", maxFileSize="5M")

The following example specifies the rotation frequency for the odl-handler:

```
configureLogHandler(name="odl-handler", rotationFrequency="daily")
```

The following example specifies the rotation frequency and the retention period for the odl-handler. It also removes the properties maxFileSize:

```
configureLogHandler(name="odl-handler", rotationFrequency="daily",
         retentionPeriod="week", removeProperty='maxFileSize'])
```

The following example configures the quicktrace-handler, adding the logger oracle.adf.faces, and enabling user buffers for user1 and user2:

```
configureLogHandler(name="quicktrace-handler", addToLogger="oracle.adf.faces",
       propertyName="enableUserBuffer", propertyValue="true",
      propertyName="reserveBufferUserID", propertyValue="user1, user2")
```

The oracle adf logger is associated with the handlers odl-handler, wls-domain, and console-handler. When you set the level of the logger, these handlers will use the same level (TRACE:1) for the logger oracle.adf. As a result, much information will be written to the log files, consuming resources. To avoid consuming resources, set the level of the handlers to a lower level, such as WARNING or INFORMATION. For example:

```
configureLogHandler(name="odl-handler", level="WARNING:1")
configureLogHandler(name="wls-domain", level="WARNING:1")
configureLogHandler(name="console-handler", level="WARNING:1")
```

7.1.2 getLogLevel

Command Category: Log Configuration

Use with WLST: Online

7.1.2.1 Description

Returns the level of a given Java logger.

The returned value is a string with the logger's level, or None if the logger does not exist. An empty string indicates that the logger level is null.

7.1.2.2 Syntax

getLogLevel(options)

Argument	Definition
options	Comma-separated list of options, specified as name-value pairs. Valid options include:
 target—The name of a WebLogic Server instance, or a string des system component. For system components, refer to the compor documentation for details. 	
	The default value is the server to which WLST is connected.
	 logger—A logger name. An empty string denotes the root logger.
	This option is required and has no default.
	■ runtime—A Jython boolean value (0 or 1) that determines if the operation is to list runtime loggers or config loggers. The default value is 1 (runtime).

7.1.2.3 Examples

The following example returns the level for the logger oracle:

```
getLogLevel(logger='oracle')
```

NOTIFICATION: 1

The following example returns the level for the logger oracle, specifying only config loggers, not runtime loggers:

```
getLogLevel(logger='oracle', runtime=0)
```

NOTIFICATION: 1

The following example returns the level for the logger oracle on the Oracle WebLogic Server server2:

getLogLevel(logger='oracle', target='server2') NOTIFICATION: 1

7.1.3 listLoggers

Command Category: Log Configuration

Use with WLST: Online

7.1.3.1 Description

Lists Java loggers and their levels. The command returns a PyDictionary object where the keys are logger names and the associated values are the logger levels. An empty level is used to indicate that the logger does not have the level set.

7.1.3.2 Syntax

listLoggers([options])

Argument	Definition
options	An optional comma-separated list of options, specified as name-value pairs. Valid options include:
	 target—The name of a WebLogic Server instance, or a string describing a system component. For system components, refer to the component's documentation for details.
	The default value is the server to which WLST is connected.
	 pattern—A regular expression pattern that is used to filter logger names. The default value returns all logger names.
	■ runtime—A Jython boolean value (0 or 1) that determines if the operation is to list runtime loggers or config loggers. The default value is 1 (runtime).

7.1.3.3 Examples

The following example lists all of the loggers:

listLoggers()

The following example lists all of the loggers that start with the name oracle.*.

listLoggers(pattern="oracle.*")

The following example list all config loggers:

listLoggers(runtime=0)

The following example list all loggers for the WebLogic Server server1:

listLoggers(target="server1")

7.1.4 listLogHandlers

Command Category: Log Configuration

Use with WLST: Online

7.1.4.1 Description

Lists Java log handlers configuration. This command returns a java.util.List with one entry for each handler. Each entry is a javax.management.openmbean.CompositeData object describing the handler.

7.1.4.2 Syntax

listLogHandlers([options])

Argument	Definition	
options	An optional comma-separated list of options, specified as name-value pairs. Valid options include:	
	 target—The name of a WebLogic Server instance, or a string describing a system component. For system components, refer to the component's documentation for details. 	
	The default value is the server to which WLST is connected.	
	 name—The name of a log handler. If the name is not provided, then all handlers are listed. 	

7.1.4.3 Examples

The following example lists all log handlers:

listLogHandlers()

The following example lists all log handlers named odl-handler:

listLogHandlers(name="odl-handler")

The following example lists all log handlers for the WebLogic Server server1:

listLogHandlers(target="server1")

7.1.5 setLogLevel

Command Category: Log Configuration

Use with WLST: Online

7.1.5.1 Description

Sets the level of information written by a given Java logger to a log file.

7.1.5.2 Syntax

setLogLevel(options)

Argument **Definition**

options

Comma-separated list of options, specified as name-value pairs. Valid options

target—The name of a WebLogic Server instance, or a string describing a system component. For system components, refer to the component's documentation for details.

The default value is the server to which WLST is connected.

- **logger**—A logger name. An empty string denotes the root logger. This option is required and has no default. The command throws an exception if the logger does not exist, unless the addLogger option is also
- addLogger—A Jython boolean value (0 or 1) that determines if the logger should be created if it does not exist. This option is deprecated for runtime mode. Adding a runtime logger may have no effect because the logger may be garbage collected. If you need to set the level for a logger that has not yet been created, use the persist mode.
- level—The level name. It can be either a Java level or an ODL level. Some valid Java levels are: SEVERE, WARNING, INFO, CONFIG, FINE, FINER, OR FINEST. Valid ODL levels include a message type followed by a colon and a message level. The valid ODL message types are: INCIDENT_ ERROR, ERROR, WARNING, NOTIFICATION, TRACE, and UNKNOWN. The message level is represented by an integer value that qualifies the message type. Possible values are from 1 (highest severity) through 32 (lowest severity).

An empty string can be used to set the level to null (inherited from parent).

This option is required; there is no default value.

- **runtime**—A Jython boolean value (0 or 1) that determines if the operation is to list runtime loggers or config loggers. The default value is 1 (runtime). If the target is a system component that does not support changing runtime loggers, this option is ignored.
 - Note: Because runtime loggers may be garbage collected, you should change the level of the runtime logger only if you know that the logger exists and that there is a strong reference to the logger. If the logger is garbage collected, any changes made to the logger level in runtime mode that are not persisted may be lost.
- **persist**—A Jython boolean value (0 or 1) that determines if the level should be saved to the configuration file. The default value is 1.

7.1.5.3 Examples

The following example sets the log level to NOTIFICATION: 1 for the logger oracle.my.logger:

```
setLogLevel(logger="oracle.my.logger", level="NOTIFICATION:1")
```

The following example sets the log level to TRACE:1 for the logger oracle.my.logger and specifies that the level should be saved to the configuration file:

```
setLogLevel(logger="oracle.my.logger", level="TRACE:1", persist=0)
```

The following example sets the log level to WARNING for the config logger oracle.my.logger on the WebLogic Server server1:

setLogLevel(target="server1", logger="oracle.my.logger", level="WARNING", runtime=0)

7.2 Search and Display Commands

Use the commands in Table 7–3 to view Oracle Fusion Middleware log files and to search log files for particular messages.

Table 7–3 Search and Display Commands

Use this command	То	Use with WLST
displayLogs	List the logs for one or more components.	Online or Offline
listLogs	Search and display the contents of log files.	Online or Offline

7.2.1 displayLogs

Command Category: Search and Display

Use with WLST: Online or Offline

7.2.1.1 Description

Search and display the contents of diagnostic log files. The command returns a value only when the returnData option is set to true. By default it will not return any data. The return value depends on the option used.

7.2.1.2 Syntax

displayLogs([searchString,][options])

Argument	Definition
searchString	An optional search string. Only messages that contain the given string (case-insensitive) will be returned.
	Note that the displayLogs command can read logs in multiple formats and it converts the messages to ODL format. The search will be performed in the native format, if possible. Otherwise, it may be performed in the message contents, and it may exclude mark-up. Therefore you should avoid using mark-up characters in the search string.
options	An optional comma-separated list of options, specified as name-value pairs. Valid options include:
	target—The name of a WebLogic Server instance, or a system component.
	For a system component, the syntax for the target is:
	sc:component-name
	In connected mode, the default target is the WebLogic domain. In disconnected mode, there is no default; the target option is required.
	 oracleInstance—Defines the path to the ORACLE_INSTANCE or WebLogic domain home. The command is executed in disconnected mode when you use this parameter.
	■ log —A log file path. The command will read messages from the given log file. If the log file path is not given, the command will read all logs associated with the given target.

Argument Definition

options (continued)

- last—An integer value. Restricts the search to messages logged within the last minutes. The value can have a suffix s (second), m (minute), h(hour), or d (day) to specify a different time unit. (For example, last='2h' will be interpreted as the last 2 hours).
- **tail**—An integer value. Restrict the search to the last *n* messages from each log file and limits the number of messages displayed to *n*.
- pattern—A regular expression pattern. Only messages that contain the given pattern are returned. Using the pattern option is similar to using the searchString argument, except that you can use a regular expression.

The regular expression pattern search is case sensitive (unless you explicitly turn on case-insensitive flags in the pattern). The pattern must follow java.util.regex syntax.

- ecid—A string or string sequence containing one or more Execution Context ID (ECID) values to be used as a filter for log messages.
- **component**—A string or string sequence containing one or more component ID values to be used as a filter for log messages.
- **module**—A string or string sequence containing one or more module ID values to be used as a filter for log messages.
- type—A string or string sequence containing one or more message type values to be used as a filter for log messages.
- app—A string or string sequence containing one or more application values to be used as a filter for log messages.
- query—A string that specifies an expression used to filter the contents of log messages.

A simple expression has the form:

field-name operator value

where field-name is a log record field name and operator is an appropriate operator for the field type (for example, you can specify equals, startsWith, contains or matches for string fields).

A field name is either one of the standard ODL attribute names (such as COMPONENT_ID, MSG_TYPE, MSG_TEXT, and SUPPL_DETAIL), or the name of a supplemental attribute (application specific), prefixed by SUPPL_ATTR. (For example, SUPPL_ATTR.myAttribute).

A few common supplemental attributes can be used without the prefix. For example, you can use APP to filter by application name.

You can combine multiple simple expressions using the boolean operators and, or and not to create complex expressions, and you can use parenthesis for grouping expressions.

See the Administering Oracle Fusion Middleware for a detailed description of the query syntax.

- **groupBy**—A string list. When the groupBy option is used, the output is a count of log messages, grouped by the attributes defined in the string
- orderBy—A string list that defines the sort order for the result. The values are log message attribute names. The name may be extended with an optional suffix :asc or :desc to specify ascending or descending sorting. The default sort order is ascending.

By default, the result is sorted by time.

returnData—A Jython boolean value (0 or 1). If the value is true the command will return data (for example, to be used in a script). The default value is false, which means that the command only displays the data but does not return any data.

Argument	Definition
options (continued)	• format —A string defined the output format. Valid values are ODL-Text, ODL-XML, ODL-complete and simple. The default format is ODL-Text.
	 exportFile—The name of a file to where the command output is written. By default, the output is written to standard output.
	■ follow (f) —Puts the command in "follow" mode so that it continues to read the logs and display messages as new messages are added to the logs (similar to the UNIX tail -f command). The command will not return when the f option is used. This option is currently not supported with system components.

7.2.1.3 Examples

The following example displays the last 100 messages from all log files in the domain:.

displayLogs(tail=100)

The following example displays all messages logged in the last 15 minutes:

displayLogs(last='15m')

The following example displays log messages that contain a given string:

displayLogs('Exception')

The following example displays log messages that contain a given ECID:

displayLogs(ecid='0000H19TwKUCs1T6uBi8UH181kWX000002')

The following example displays log messages of type ERROR or INCIDENT_ERROR:

displayLogs(type=['ERROR','INCIDENT_ERROR'])

The following example displays log messages for a given Java EE application:

displayLogs(app="myApplication")

The following example displays messages for a system component, ohs1:

displayLogs(target="sc:ohs1")

The following example displays a message summary by component and type:

displayLogs(groupBy=['COMPONENT_ID', 'MSG_TYPE'])

The following example displays messages for a particular time interval:

displayLogs(query="TIME from 11:15 and TIME to 11:20")

The following example shows an advanced query:

displayLogs(query="TIME from 11:15 and TIME to 11:20 and (MSG_TEXT contains exception or SUPPL_DETAIL contains exception)")

A similar query could be written as:

displayLogs("exception", query="TIME from 11:15 and TIME to 11:20")

7.2.2 listLogs

Command Category: Search and Display

Use with WLST: Online or Offline

7.2.2.1 Description

Lists log files for Oracle Fusion Middleware components. This command returns a PyArray with one element for each log. The elements of the array are javax.management.openmbean.CompositeData objects describing each log.

7.2.2.2 Syntax

listLogs([options]

Argument	Definition
options	An optional comma-separated list of options, specified as name-value pairs. Valid options include:
	 target—The name of a WebLogic Server instance, or an Oracle Fusion Middleware system component.
	For a system component, the syntax for the target is:
	sc:component-name
	In connected mode, the default target is the WebLogic domain.
	In disconnected mode, there is no default; the target option is required.
	 oracleInstance—Defines the path to the ORACLE_INSTANCE or WebLogic domain home. The command is executed in disconnected mode when you use this parameter.
	■ unit—defines the unit to use for reporting file size. Valid values are B (bytes), K (kilobytes), M (megabytes), G (gigabytes), or H (display size in a human-readable form, similar to the UNIX 1s -h option). The default value is H.
	• fullTime —A Jython Boolean value. If true, reports the full time for the log file last modified time. Otherwise, it displays a short version of the time. The default value is false.

7.2.2.3 Examples

The following example lists all of the log files for the WebLogic domain:

listLogs()

The following example lists the log files for the WebLogic Server server1:

listLogs(target="server1")

The following example lists the log files for the Oracle HTTP Server ohs1:

listLogs(target="sc:ohs1")

The following example, used in disconnected mode, lists the log files for the WebLogic Server server1:

listLogs(oracleInstance="/scratch/Oracle/domains/base_domain", target="server1")

7.3 Selective Tracing Commands

Use the commands in Table 7–4 to configure and use selective tracing. Selective tracing provides fine-grained logging for specified users or other properties of a request. In the Use with WLST column, online means the command can only be used when connected to a running server.

Table 7-4 Tracing Commands

Use this command	То	Use with WLST
configureTraceProvider	Configure a trace provider.	Online
configureTracingLoggers	Configure one or more loggers for selective tracing.	Online
listActiveTraces	List the active traces.	Online
listTraceProviders	List the tracing providers.	
listTracingLoggers	List the loggers that support selective tracing.	Online
startTracing	Start a selective tracing sessions.	Online
stopTracing	Stop one or more selective tracing sessions.	Online

7.3.1 configureTraceProvider

Command Category: Tracing

Use with WLST: Online

7.3.1.1 Description

Configures a trace provider. Currently, the only available option is to enable or disable the provider.

7.3.1.2 Syntax

configureTraceProvider([options])

Argument	Definition
options	A comma-separated list of options, specified as name-value pairs. Valid options are:
	 target—Optional. The name of a WebLogic Server instance, or an array of strings containing one or more target names. By default, the targets are all running server instances in the domain that are JRF-enabled.
	 nameRequired. The trace provider name.
	 actionEnables or disables tracing for the provider. Valid values are enable and disable. This option is required; there is no default value.

7.3.1.3 Examples

The following example disables the DMS trace provider on all running servers in the domain:

configureTraceProvider(name='DMS', action='disable')

The following example enables the DMS trace provider for the server wls_server1:

configureTraceProvider(target='wls_server1', name='DMS', action='enable')

7.3.2 configureTracingLoggers

Command Category: Tracing

Use with WLST: Online

7.3.2.1 Description

Configures one or more loggers for selective tracing. This command also enables or disables a logger for selective tracing.

7.3.2.2 Syntax

configureTracingLoggers([options])

Argument	Definition
options	A comma-separated list of options, specified as name-value pairs. Valid options are:
	 target—Optional. The name of a WebLogic Server instance, or an array of strings containing one or more target names. By default, loggers on all running server instances in the domain that are JRF-enabled will be configured for tracing.
	 pattern—A regular expression pattern that is used to filter logger names. The default value matches all tracing logger names.
	 actionEnables or disables all loggers for tracing. Valid values are enable and disable. This option is required; there is no default value.

7.3.2.3 Examples

The following example configures selective tracing for all loggers beginning with oracle.security:

configureTracingLoggers(pattern='oracle.security.*', action="enable") Configured 80 loggers

The following example disables selective tracing for all loggers:

configureTracingLoggers(action="disable") Configured 969 loggers

7.3.3 listActiveTraces

Command Category: Tracing Use with WLST: Online

7.3.3.1 Description

Lists the active traces.

7.3.3.2 Syntax

listActiveTraces([options])

Argument	Definition
options	A comma-separated list of options, specified as name-value pairs. Valid options are:
	 target—Optional. The name of a WebLogic Server instance, or an array of strings containing one or more target names. By default, loggers on all running server instances in the domain that are JRF-enabled are listed.

7.3.3.3 Example

The following example lists the active traces:

listActiveTraces()

Trace ID		+ Attr. Value			+ Exp.
TIME	+	+	++		+
bf13025b-b8f8-480d-8d92-14200a669b3e	USER_ID	user1	FINE	5/28/13 12:28 PM	İ
a04b47f7-2830-4d80-92ee-ba160cdacf6b	USER_ID	user2	FINE	5/28/13 12:30 PM	

7.3.4 listTraceProviders

Command Category: Tracing

Use with WLST: Online

7.3.4.1 Description

Lists the name, status, description and supported parameters for the available trace providers. The status of a provider can be either enabled meaning that the provider is enabled on all targets, disabled meaning that the provider is disabled on all targets, or mixed meaning that the provider is enabled on some targets.

7.3.4.2 Syntax

listTraceProviders([options])

Argument	Definition
options	A comma-separated list of options, specified as name-value pairs. Valid options are:
	 target—Optional. The name of a WebLogic Server instance, or an array of strings containing one or more target names. By default, providers on all running server instances in the domain that are JRF-enabled will be listed.
	 nameOptional. A trace provider name. If you specify this parameter, only this provider is listed.

7.3.4.3 Example

The following example lists all trace providers for all running servers in the domain:

listTraceProviders()

7.3.5 listTracingLoggers

Command Category: Tracing

Use with WLST: Online or Offline

7.3.5.1 Description

Lists the loggers that support selective tracing. This command displays a table of logger names and their tracing status. The status enabled means that the logger is enabled for tracing on all servers. The status disabled means that the logger is disabled for tracing on all servers. The status mixed means that the logger is enabled for tracing on some servers, but disabled on others.

7.3.5.2 Syntax

listTracingLoggers([options])

Argument	Definition
options	A comma-separated list of options, specified as name-value pairs. Valid options are:
	 target—Optional. The name of a WebLogic Server instance, or an array of strings containing one or more target names. By default, loggers on all running server instances in the domain that are JRF-enabled are listed.
	 pattern—A regular expression pattern that is used to filter logger names. The default value matches all tracing logger names.

7.3.5.3 Example

The following example lists all tracing loggers beginning with oracle.security:

listTracingLoggers(pattern="oracle.security.*")

Logger	Status
oracle.security oracle.security.audit.logger oracle.security.audit.config	enabled enabled enabled

7.3.6 startTracing

Command Category: Tracing

Use with WLST: Online

7.3.6.1 Description

Starts a new selective tracing session for a specified user or DMS context attribute at a specified level of tracing.

7.3.6.2 Syntax

startTracing([options])

Argument	Definition
options	A comma-separated list of options, specified as name-value pairs. Valid options are:
	 target—Optional. The name of a WebLogic Server instance, or an array of strings containing one or more target names. By default, loggers on all running server instances in the domain that are JRF-enabled are included in the trace.
	 traceId—Optional. An identifier for the tracing session. If a traceId is not provided, the command generates a unique traceId.
	 attrName—Optional, unless the user argument is not specified. Valid values are USER_ID, APP, CLIENT_HOST, CLIENT_ADDR, composite_ name, WEBSERVICE.name, WEBSERVICE_PORT.name.
	• attrValue—Required if attrName is specified. The value of the attribute.
	 user—The user name. Messages associated with the user are returned. This is equivalent to passing the USER_ID with the attrName and AttrValue options.
	level—Required. The tracing level. The level must be a valid Java or ODL level. See the table "Mapping of Log Levels Among ODL, Oracle WebLogic Server, and Java" in the Administering Oracle Fusion Middleware.
	 desc—Optional. A description of the tracing session.

7.3.6.3 Example

The following example starts a trace for messages associated with user1 and sets the level of information to FINE:

startTracing(user="user1",level="FINE")

Started tracing with ID: 885649f7-8efd-4a7a-9898-accbfc0bbba3

7.3.7 stopTracing

Command Category: Tracing

Use with WLST: Online

7.3.7.1 Description

Stops one or more selective tracing sessions.

7.3.7.2 Syntax

stopTracing([options])

Argument	Definition
options	A comma-separated list of options, specified as name-value pairs. Valid options are:
	 target—Optional. The name of a WebLogic Server instance, or an array of strings containing one or more target names. By default, loggers on all running server instances in the domain that are JRF-enabled are included in the operation.
	■ stopAll A Jython boolean value (0 or 1) that determines if all of the active traces are stopped. Required if the traceId, user, or attrName and attrValue arguments are not specified. The default value is 0 (false).
	 traceIdAn identifier for the tracing session to be stopped. Required if the stopAll, user, or attrName and attrValue arguments are not specified.
	 attrNameValid values are USER_ID, APP, CLIENT_HOST, CLIENT_ ADDR, composite_name, WEBSERVICE.name, WEBSERVICE_ PORT.name. Required if the traceId, user, stopAll arguments are not specified.
	attrValue Required if attrName is specified. The value of the attribute.
	 userThe user name. All tracing sessions associated with the user are stopped. Required if the stopAll, traceId, or attrName and attrValue arguments are not specified.
	• createIncident A Jython boolean value (0 or 1). If true, an incident will be created for each trace that is stopped. The default value is 0 (false).

7.3.7.3 Examples

The following example stops a tracing session with a specified traceId:

stopTracing(traceId="a04b47f7-2830-4d80-92ee-ba160cdacf6b")

Stopped 1 traces

The following example stops all tracing sessions:

stopTracing(stopAll=1)

Stopped 1 traces

Diagnostic Framework Custom WLST Commands

The Diagnostic Framework aids in capturing relevant and timely diagnostics for critical errors. The diagnostics can be sent to Oracle Support for further analysis. Use the Diagnostic Framework commands to generate incidents, query existing incidents and execute individual diagnostics dumps to gather specific diagnostics data. This chapter provides detailed descriptions of WLST commands for the Diagnostic Framework, including command syntax, arguments and command examples.

For additional information about using the Diagnostic Framework, see "Diagnosing Problems" in the *Administering Oracle Fusion Middleware*.

Note: To use the Diagnostic Framework custom WLST commands, you must invoke the WLST script from the Oracle Common home. See "Using Custom WLST Commands" in the *Administering Oracle Fusion* Middleware.

Table 8–1 lists the different categories of Diagnostic Framework commands.

Table 8-1 Diagnostic Command Categories

Command Category	Description
Incident Commands	View problems and incidents and create incidents.
Diagnostic Dump Commands	Display information about dumps and execute dumps.
Dump Sampling Commands	Capture samples of diagnostic dumps at specified intervals.s

8.1 Incident Commands

Use the commands in Table 8-2 to view problems and incidents and to create incidents.

Table 8-2 Incident Commands

Use this command	То	Use with WLST
createAggregatedIncident	Create an aggregated incident, containing zip files that contain copies of incidents that match the specified criteria.	Online
createIncident	Create a diagnostic incident.	Online

Table 8–2 (Cont.) Incident Commands

Use this command	То	Use with WLST
getIncidentFile	Retrieve the contents of the specified incident file.	Online
listADRHomes	List the set of ADR Home paths.	Online
listIncidents	List a set of diagnostic incidents.	Online
listProblems	List a set of diagnostic problems.	Online
queryIncidents	List the incidents that meet the specified criteria.	Online
reloadCustomRules	Reload all custom diagnostic rules or the specified rule.	Online, Offline
showIncident	Show the details of a specified incident.	Online

8.1.1 createAggregatedIncident

Use with WLST: Online

8.1.1.1 Description

Creates an aggregated incident, containing zip files that contain copies of incidents that match the specified criteria.

8.1.1.2 Syntax

createAggregatedIncident(query [, servers])

Argument	Definition
query	An expression composed of simple expressions, which can be connected by Boolean operators. An expression contains an incident attribute, an operator, and a string, in the following format:
	attribute operator "string"
	Simple expressions can be connected by the Boolean operators AND or OR, grouped by parentheses ()
	The following incident attributes are supported:
	■ TIMESTAMP: Incident creation time. You can use the from and to operators to specify a time range. The date format is YYYY-MM-DD HH: MM.
	■ ECID: Execution Context ID
	■ PROBLEM_KEY: Problem Key
	 MSG_FACILITY: The error message facility, such as ORA or OHS.
	 MSG_NUMBER: The error message ID, such as 600.
	Custom incident attributes are also supported. For example, TRACEID, APP, URI, AND DSID are supported.
	The following operators are supported:
	equals
	notEqual
	startsWith
	endsWith
	contains
	■ isNull
	notNull
servers	The name of one or more servers to query. This argument is optional. If you do not specify it, the command operates on all servers in the domain.
	This option is only valid when you are connected to the Administration Server.

8.1.1.3 Examples

The following example creates an aggregated incident for al incidents that contain the ODL_TRACE_ID of 123456 on the server wls_server1:

createAggregatedIncident(query="ORDL_TRACE_ID equals 123456", servers="wls_ server1")

```
Incident 55 created, containing the following incidents:
Server wls_server1
Incident Id Problem Key
                                                           Incident Time
                 TRACE [123456] [MANUAL]
                                               Mon Apr 15 11:22:12 EDT 2013
```

The following example creates an aggregated incident for al incidents that contain the ODL_TRACE_ID of 123456 on all servers in the domain:

createAggregatedIncident(query="ORDL_TRACE_ID equals 123456", servers="wls_ server1")

```
Incident 55 created, containing the following incidents:
Server wls_server1, wls_server2
Incident Id Problem Key
                                                          Incident Time
                TRACE [123456] [MANUAL] Mon Apr 15 11:22:12 EDT 2013
```

8.1.2 createIncident

Use with WLST: Online

8.1.2.1 Description

Creates a diagnostic incident, using the specified information to determine the set of diagnostic rules and actions to execute.

8.1.2.2 Syntax

```
createIncident([adrHome] [,incidentTime] [,messageId] [,ecid] [,appName]
  [,description] [,server])
```

Argument	Definition	
adrHome	The path for the ADR Home in which to create the incident. The ADR Home must exist. If this argument is not specified, the default ADR Home is used.	
	The default ADR Home is the following location:	
	ADR_BASE/diag/OFM/domain_name/server_name	
incidentTime	The timestamp at which the incident occurred. If this not specified, the current time is used. You can specify the following:	
	■ The time of the current day, in the format HH:MM. For example: 19:45	
	■ The date and time, in the format MM/DD/YYYY HH:MM	
messageId	The ID of the error message. For example, MDS-50400.	
ecid	The Execution Context ID for the error message.	
appNname	The name of the deployed application for which the diagnostics are being gathered.	
	For example, if you have multiple ADF applications deployed, each may register a dump called adf.dump. To execute this command for a specific application, you must specify the application name.	
description	Descriptive text to associate with the incident. This is useful when reviewing the incident at a later time.	
server	The name of the Managed Server from which to collect information. This argument is valid only when you are connected to the Administration Server.	

8.1.2.3 **Example**

The following example creates an incident that is related to messages with the ID MDS-50400:

```
createIncident(messageId="MDS-50400", description="sample incident")
```

```
Incident Id: 3
Problem Id: 2
Problem Key: MDS-50400 [MANUAL]
Incident Time: Tue May 28 11:52:45 PDT 2013
Error Message Id: MDS-50400
Execution Context:null
Flood Controlled: false
Dump Files :
   jvm_threads25_i3.txt
   dms_metrics26_i3.txt
   dfw_samplingArchive28_i3.readme.txt
   odl_logs29_i3.txt
```

8.1.3 getIncidentFile

Use with WLST: Online

8.1.3.1 Description

Retrieves the contents of the specified incident file.

8.1.3.2 Syntax

getIncidentFile(id, name [,outputFile] [,adrHome] [,server])

Argument	Definition	
id	The ID of the incident that you want to retrieve.	
name	The name of the file to retrieve. To find the name of the file, use the showIncident command.	
outputFile	The name of the file to which to write the output.	
adrHome	The path for the ADR Home from which to retrieve the information. If this argument is not specified, the default ADR Home will be queried.	
	The default ADR Home is the following location:	
	ADR_BASE/diag/OFM/domain_name/server_name	
server	The name of the Managed Server from which to collect information. This argument is valid only when you are connected to the Administration Server.	

8.1.3.3 Example

The following example writes the contents of the incident dms_metrics3_i1.dmp to the specified output file:

getIncidentFile(id='1', name='dms_metrics3_i1.dmp', outputFile='/tmp/incident1_

The content of 'dms_metrics3_i1.dmp'is written to /tmp/incident1_dms.txt

8.1.4 listADRHomes

Use with WLST: Online

8.1.4.1 Description

Lists the paths of all of the ADR Homes for the server.

8.1.4.2 Syntax

listADRHomes([server])

Argument	Definition
server	The name of the Managed Server from which to collect information. This argument is valid only when you are connected to the Administration Server.

8.1.4.3 Example

The following example lists the paths of the ADR homes:

listADRHomes()

diag/ofm/base_domain/AdminServer

diag/ofm/EMGC_DOMAIN/EMOMS

8.1.5 listIncidents

Use with WLST: Online

8.1.5.1 Description

Lists the set of diagnostic incidents for the given problem ID, if specified, or all available incidents.

8.1.5.2 Syntax

listIncidents([id] [, adrHome] [,server])

Argument	Definition	
id	The ID of the problem for which you want to list the set of diagnostic incidents.	
adrHome	The path for the ADR Home from which to query incidents. If this argument is not specified, the default ADR Home will be queried.	
	The default ADR Home is the following location:	
	ADR_BASE/diag/OFM/domain_name/server_name	
server	The name of the Managed Server from which to collect information. This argument is valid only when you are connected to the Administration Server.	

8.1.5.3 Example

The following example lists the incidents associated with the problem with the ID 1:

listIncidents(id="1")

Incident Id	Incident Time	Problem Key
2	Tue May 28 11:05:59 PDT 2013	MDS-50500 [MANUAL]
1	Tue May 28 11:02:22 PDT 2013	MDS-50500 [MANUAL]

8.1.6 listProblems

Use with WLST: Online

8.1.6.1 Description

Lists the set of diagnostic problems associated with the specified ADR Home.

8.1.6.2 Syntax

listProblems([adrHome][,server])

Argument	Definition	
adrHome	The path for the ADR Home from which to query problems. If this argument is not specified, the default ADR Home will be queried.	
	The default ADR Home is the following location:	
	ADR_BASE/diag/OFM/domain_name/server_name	
server	The name of the Managed Server from which to collect information. This argument is valid only when you are connected to the Administration Server.	

8.1.6.3 Example

The following example lists the diagnostic problems in the default ADR home:

listProblems()

```
Problem Id
                Problem Key
               MDS-50500 [MANUAL]
        1
               JOC-38922 [AdminServer] [oracle.cache.network]
        2
```

8.1.7 querylncidents

Use with WLST: Online

8.1.7.1 Description

Lists the incidents that meet the specified criteria. You can query for the value of particular attributes across one or more servers, or all servers in a domain.

8.1.7.2 Syntax

queryIncidents(query [,servers])

Argument	Definition
query	An expression composed of simple expressions, which can be connected by Boolean operators. An expression contains an incident attribute, an operator, and a string, in the following format:
	attribute operator "string"
	Simple expressions can be connected by the Boolean operators AND or OR, grouped by parentheses ()
	The following incident attributes are supported:
	■ TIMESTAMP: Incident creation time. You can use the from and to operators to specify a time range. The date format is YYYY-MM-DD HH: MM.
	■ ECID: Execution Context ID
	 PROBLEM_KEY: Problem Key
	 MSG_FACILITY: The error message facility, such as ORA or OHS.
	 MSG_NUMBER: The error message ID, such as 600
	Custom incident attributes are also supported. For example, TRACEID, APP, URI, AND DSID are supported. In addition, the context values, as shown in the incident readme.txt file, are supported. For example, DFW_APP_NAME and DFW_USER_NAME are supported.
	The following operators are supported:
	■ equals
	notEqual
	startsWith
	endsWith
	contains
	isNull
	notNull
servers	The name of one or more servers to query. This argument is optional. If you do not specify it, the command operates on all servers in the domain.
	This option is only valid when you are connected to the Administration Server.

8.1.7.3 Examples

The following example queries all incidents in the domain for the ECID f19wAgN000001:

```
queryIncidents(query="ECID equals f19wAgN000001")
```

The following example queries all incidents that occurred between April 1, 2013 and April 15, 2013, for the server wls_server1:

```
queryIncidents(query="TIMESTAMP from '2013-04-01 00:00'AND TIMESTAMP to
'2013-04-15 00:00'", servers=["wls_server1"])
```

8.1.8 reloadCustomRules

Use with WLST: Online, Offline

8.1.8.1 Description

Reloads all custom diagnostic rules or the specified custom diagnostic rule.

8.1.8.2 Syntax

reloadCustomRules([name] [, server])

Argument	Definition
name	The name of a custom diagnostic rule. This argument is optional. If you specify it, only the named rule is reloaded. If you do not specify this argument, all custom diagnostic rules are reloaded.
	The file containing the custom diagnostic rule must be located in one of the following directories:
	<pre>DOMAIN_HOME/config/fmwconfig/dfw DOMAIN_HOME/config/fmwconfig/servers/server_name/dfw</pre>
server	The name of the server to which to reload the rules. This argument is optional. If you do not specify it, the rules are reloaded to all servers.
	This option is only valid when you are connected to the Administration Server.

8.1.8.3 Example

The following example reloads the custom diagnostic rule myCustomRules.xml:

```
reloadCustomRules(name='myCustomRules.xml')
```

8.1.9 showIncident

Use with WLST: Online

8.1.9.1 Description

Shows the details of the specified incident.

8.1.9.2 Syntax

showIncident(id, [adrHome][, server])

Argument	Definition	
id	The ID of the incident that you want to view.	
adrHome	The path for the ADR Home from which to query the incident. If this argument is not specified, the default ADR Home will be queried.	
	The default ADR Home is the following location:	
	ADR_BASE/diag/OFM/domain_name/server_name	
server	The name of the Managed Server from which to collect information. This argument is valid only when you are connected to the Administration Server.	

8.1.9.3 Example

The following example displays information about the incident with the ID 10:

showIncident(id="10")

```
Incident Id: 10
Problem Id: 10
Problem Key: MDS-50500 [MANUAL]
Incident Time: Tue May 28 11:02:22 PDT 2013
Error Message Id: MDS-50500
Execution Context:
Flood Controlled: false
Dump Files :
  readme.txt
  jvm_threads10_i1.txt
  dms_metrics11_i1.txt
   dfw_samplingArchive13_i1.JVMThreadDump.txt
   dfw_samplingArchive13_i1.readme.txt
   odl_logs14_i1.txt
   dms_metrics20_i1.txt
```

8.2 Diagnostic Dump Commands

Use the commands in Table 8–3 to display information about dumps and to execute dumps.

Table 8–3 Diagnostic Dump Commands

Use this command	То	Use with WLST
describeDump	Display a description of the specified diagnostic dump.	Online
executeDump	Execute the specified diagnostic dump.	Online
listDumps	Display the set of diagnostic dumps that can be executed.	Online

8.2.1 describeDump

Use with WLST: Online

8.2.1.1 Description

Displays a description of the specified diagnostic dump.

8.2.1.2 Syntax

describeDump(name [,appName] [.server])

Argument	Definition	
name	The name of the dump for which to display information.	
appName	The name of the deployed application for which information is gathered	
	For example, if you have multiple ADF applications deployed, each may register a dump called adf.dump. To execute this command for a specific application, you must specify the application name.	
server	The name of the Managed Server from which to collect information. This argument is valid only when you are connected to the Administration Server.	

8.2.1.3 Example

The following example displays information about the dump with the name odl.logs. You use the listDumps command to retrieve the list of available dumps.

describeDump(name="odl.logs")

```
Name: odl.logs
Description: Dump contents of diagnostic logs
Run Mode: asynchronous
Mandatory Arguments:
Optional Arguments:
   Name Type Description
   match_all BOOLEAN Whether to match both ECID and time range or any one of
them.
   timestamp LONG Log message timestamp in milliseconds
   ecid STRING Log message execution context ID (ecid)
   exclude_access_logs BOOLEAN Excludes access logs from dump.
   timerange LONG Time range in minutes
```

8.2.2 executeDump

Use with WLST: Online

8.2.2.1 Description

Executes the specified diagnostic dump.

8.2.2.2 Syntax

executeDump(name [,args] [,outputFile] [,id] [,adrHome] [,server])

Argument	Definition	
name	The name of the diagnostic dump to execute.	
args	Mandatory or optional arguments to pass to the dump.	
outputFile	The name of the file to which to write the dump. If you do not specify this argument, the output is written to the console.	
id	The ID of the incident to which to associate the dump. By default, the specified dump will not be associated with an incident.	

Argument	Definition
adrHome	The ADR home that contains the incident. If you do not specify this argument, the default ADR home is used.
	The default ADR Home is the following location:
	ADR_BASE/diag/OFM/domain_name/server_name
server	The name of the Managed Server from which to collect information. This argument is valid only when you are connected to the Administration Server.

Arguments that are either required or are optional can be specified using the "args" keyword. For example:

```
executeDump("java.sysprops",args={"prop" : "os.name"})
```

8.2.2.3 Examples

The following example executes the dump with the name jvm.threads and writes it to the file dumpout.txt:

```
executeDump(name="jvm.threads", outputFile="/tmp/dumpout.txt")
Diagnostic dump jvm.threads output written to /tmp/dumpoutput.txt
```

The following example executes the dump with the name jvm.threads and the Incident ID for 33 and writes it to the file dumpout.txt:

```
executeDump(name="jvm.threads", outputFile="/tmp/dumpout.txt", id="33")
Diagnostic dump jvm.threads output associated with incident 33 in ADR Home
diag/ofm/base_domain/AdminServer
```

The following example executes a dump with the argument prop set to the value

```
executeDump(name="java.sysprops",args={"prop" : "os.name"})
```

8.2.3 listDumps

Use with WLST: Online

8.2.3.1 Description

Displays the set of diagnostic dumps that can be executed.

8.2.3.2 Syntax

listDumps([appName] [,server])

Argument	Definition
appName	The name of a deployed application for which diagnostics are being gathered.
	For example, if you have multiple ADF applications deployed, each may register a dump called adf.dump. To execute this command for a specific application, you must specify the application name.
	If you specify this argument, the command returns the dumps for the specified application. If you do not specify this argument, the command returns the system dumps.

Argument	Definition
server	The name of the Managed Server from which to collect information. This argument is valid only when you are connected to the Administration Server.

8.2.3.3 **Example**

The following example lists all of the available dumps.

listDumps()

adf.DiagnosticsJarsVersionDump dfw.samplingArchive dms.configuration dms.ecidctx dms.metrics http.requests jvm.classhistogram jvm.threads mds.MDSInstancesDump odl.activeLogConfig odl.logs odl.quicktrace opss.diagTest opss.identityStoreUserRoleApiConfig opss.securityContext

Use the command describeDump(name=<dumpName>) for help on a specific dump.

8.3 Dump Sampling Commands

wls.image

Use the commands in Table 8-4 to capture samples of diagnostic dumps at specified intervals.

Table 8-4 Dump Sampling Commands

Use this command	То	Use with WLST
addDumpSample	Create samplings for Diagnostic Framework dumps.	Online
enableDumpSampling	Enable or disables all dump samplings.	Online
getSamplingArchives	Collect all dump samplings in a zip file containing the individual sampling files and a readme file.	Online
isDumpSamplingEnabled	List whether dump sampling is enabled or disabled.	Online
listDumpSamples	List all dump samplings, a specified dump sampling, or all dump samplings associated with a specified server.	Online
removeDumpSample	Remove the specified dump sampling.	Online
updateDumpSample	Update the specified dump sampling, modifying the settings of the sampling.	Online

8.3.1 addDumpSample

Use with WLST: Online

8.3.1.1 Description

Creates dump samplings for Diagnostic Framework dumps.

8.3.1.2 Syntax

addDumpSample(sampleName, diagnosticDumpName [, appName], samplingInterval, rotationCount [, dumpedImplicitly] [, toAppend] [, args] [, server])

Argument	Definition
sampleName	The name of the sampling.
diagnosticDumpNa me	The name of the diagnostic dump to be sampled.
appName	Optional. The name of the application associated with the specified diagnostic dump. If you do not specify appName, the diagnostic dump has a scope of system.
samplingInterval	The sampling interval in seconds. If you specify zero or a negative value, sampling is suspended.
rotationCount	The maximum number of diagnostic dump samples to be kept in a rotation list. When this limit is reached, the oldest sample is deleted.
dumpedImplicitly	Optional. A Boolean value that specifies whether the diagnostic dump archive will be included in the dfw.samplingArchive. Valid values are true and false. The default is true.
	If the value is false, and you want to include the dump archive in the dfw.samplingArchive, you must pass the sampling name to the executeDump command using the args parameter.
toAppend	Optional. A Boolean value that specifies whether the diagnostic dump samples are appended to its predecessor, resulting in a single archive when you execute dfw.samplingArchive. Valid values are true and false. The default is true. If the value is true, the sample is appended to its predecessor. If the value is false, dfw.sampleArchive returns a zip file containing individual sample files. Specify false if the dump samples contain binary data.
args	Optional. Diagnostic dump arguments to be used by the diagnostic dump at each sampling time. The arguments are expressed as name/value pairs.
server	Optional. The name of the server from which to collect the information. If you do not specify this parameter, this command associates the dump sampling with the Administration Server.

8.3.1.3 Example

The following example adds a sampling for the dump dms.metrics:

addDumpSample(sampleName='dms_metrics', diagnosticDumpName='dms.metrics', samplingInterval=300, rotationCount=10)

dms_metrics is added

8.3.2 enableDumpSampling

Use with WLST: Online

8.3.2.1 Description

Enables or disables all dump samplings. This command affects all configured dump samplings.

8.3.2.2 Syntax

enableDumpSampling(enable [,server])

Argument	Definition
enable	A Boolean value that specifies whether to enable or disable dump samplings. Valid values are true and false.
server	Optional. The name of the server for which to enable or disable dump sampling. If you do not specify this parameter, this command enables or disables the dump sampling for the Administration Server.

8.3.2.3 Example

The following example disables all dump samplings:

enableDumpSampling(enable=false)

Dump sampling disabled

8.3.3 getSamplingArchives

Use with WLST: Online

8.3.3.1 Description

Collects all dump samplings in a zip file containing the individual sampling files and a readme file. This method is particularly useful in dealing with binary format dumps.

8.3.3.2 Syntax

getSamplingArchives([sampleName,] outputFile [,server])

Argument	Definition
name	Optional. The name of a particular dump sampling that you want to retrieve. If you do not specify this argument, the command returns all dump samplings.
outputFile	The absolute path of the file to which the dump samplings will be written.
server	Optional. The name of the server from which to collect the information. If you do not specify this parameter, this command collects the dump samples for the Administration Server.

8.3.3.3 Example

The following example retrieves the dump sampling for the dump JVMThreadDump:

```
getSamplingArchives(sampleName="JVMThreadDump", outputFile="/tmp/jvm_dump.zip")
wrote 63518 bytes to /tmp/jvm_dump.zip
```

The following shows the contents of the zip file:

```
unzip -l jvm_dump.zip
Archive: jvm_dump.zip
Length Date Time Name
 508780 05-21-13 07:25 dfw_
{\tt samplingArchive1065570966467923683.JVMThreadDump.dmp}
  840 05-21-13 07:25 dfw_samplingArchive7749640004639161119.readme.txt
                         -----
  509620
                          2 files
```

8.3.4 isDumpSamplingEnabled

Use with WLST: Online

8.3.4.1 Description

Lists whether dump sampling is enabled or disabled.

8.3.4.2 Syntax

isDumpSamplingEnabled([server])

Argument	Definition
server	Optional. The name of the server to determine if dump sampling is enabled or disabled. This argument is only valid when you are connected to the Administration Server.

8.3.4.3 Example

The following example lists the whether dump sampling is enabled or disabled for the server wls_server_1:

isDumpSamplingEnabled(server="wls_server_1")

true

8.3.5 listDumpSamples

Use with WLST: Online

8.3.5.1 Description

Lists all dump samplings, a specified dump sampling, or all dump samplings associated with a specified server.

8.3.5.2 Syntax

listDumpSamples([sampleName] [, server])

Argument	Definition
sampleName	Optional. The name of the sampling.
server	Optional. The name of the server for which to list the dump samplings. If you do not specify this parameter, this command lists the dump samplings for the Administration Server.

8.3.5.3 Example

The following example lists all dump samplings associated with the server wls_ server_1:

listDumpSamples(server="wls_server_1")

Name : JVMThreadDump
Dump Name : jvm.threads Application Name :

Sampling Interval: 30 Rotation Count : 20 Dump Implicitly : true Append Samples : true

Dump Arguments : context=true, timing=true, progressive=true, depth=20,

threshold=30000

Name : JavaClassHistogram
Dump Name : jvm.classhistogram

Application Name :

Sampling Interval: 1800 Rotation Count : 5 Dump Implicitly : false Append Samples : true
Dump Arguments :

8.3.6 removeDumpSample

Use with WLST: Online

8.3.6.1 Description

Removes the dump sampling.

8.3.6.2 Syntax

removeDumpSample(sampleName [,server])

Argument	Definition
sampleName	The name of the sampling to be removed.
server	Optional. The name of the server from which to remove the sampling. If you do not specify this parameter, the dump sampling is removed from the Administration Server.

8.3.6.3 Example

The following example removes the dump sampling named HTTPSampling, associated with the server wls_server_1:

```
removeDumpSample(sampleName="HTTPSampling", server="wls_server_1")
```

Removed HTTPSampling

8.3.7 updateDumpSample

Use with WLST: Online

8.3.7.1 Description

Updates the specified dump sampling, modifying the settings of the sampling. You cannot change the name of the sampling. Modifications take affect at the next sampling interval.

8.3.7.2 Syntax

```
updateDumpSample(sampleName [, appName], samplingInterval,
    rotationCount [,dumpedImplicitly] [, toAppend] [, arg,]
    [, server])
```

Argument	Definition
sampleName	The name of the dump sampling.

Argument	Definition
appName	Optional. The name of the application associated with the specified diagnostic dump. If you do not specify appName, the diagnostic dump has a scope of system.
samplingInterval	Optional. The sampling interval in seconds. If you specify zero or a negative value, sampling is suspended.
rotationCount	Optional. The maximum number of diagnostic dump samplings to be kept in a rotation list. When this limit is reached, the oldest sampling is deleted
dumpedImplicitly	Optional. A Boolean value that specifies whether the diagnostic dump archive will be included in the dfw.samplingArchive. Valid values are true and false. The default is true.
	If the value is false, and you want to include the dump archive in the dfw.samplingArchive, you must pass the sampling name to the executeDump command using the args parameter.
toAppend	Optional. A Boolean value that specifies whether the diagnostic dump samples are appended to its predecessor, resulting in a single archive when you execute dfw.samplingArchive. Valid values are true and false. The default is true. If the value is true, the sample is appended to its predecessor. If the value is false, dfw.sampleArchive returns a zip file containing individual sampling files. Specify false if the dump samplings contain binary data.
args	Optional. Diagnostic dump arguments to be used by the diagnostic dump at each sampling time. The arguments are expressed as name/value pairs.
server	Optional. The name of the server from which to collect the information. If you do not specify this parameter, the dump sampling is updated for the Administration Server.

8.3.7.3 Example

The following example updates the dump sampling HTTPSampling, modifying the sampling interval, rotation count, and server.

updateDumpSample(sampleName="HTTPSampling", samplingInterval=200, rotationCount=5, server="wls_server1")

HTTPSampling is updated

User Messaging Service (UMS) Custom WLST Commands

Oracle User Messaging Service provides a common service responsible for sending out messages from applications to devices. It also routes incoming messages from devices to applications.

This chapter describes the WLST commands that you can use with Oracle User Messaging Service (UMS).

9.1 UMS WLST Command Group

The UMS WLST commands are listed under the command group "ums".

Use the User Messaging Service commands, listed in Table 9–1, to download user messaging preferences from your backend database.

Note: To use these commands, you must invoke WLST from the Oracle home in which the component has been installed. See "Using Custom WLST Commands" in the *Administering Oracle Fusion* Middleware.

Table 9–1 User Messaging Service for WLST Configuration

Command category	Description
Section 9.1, "UMS WLST Command Group"	Manage Oracle User Messaging Service commands.

9.1.1 configUserMessagingDriver

Command Category: ums Use with WLST: Online

9.1.1.1 Description

configUserMessagingDriver is used to configure messaging drivers.

Specify a base driver type (email, xmpp, voicexml, etc.) and a short name for the new driver configuration. The string "usermessagingdriver-" will be prepended to the specified application name.

9.1.1.2 Syntax

configUserMessagingDriver(baseDriver, appName, driverProperties, clusterName=None propertyGroups=None)

Argument	Definition
baseDriver	Specifies the base messaging driver type.
	Must be a known driver type, such as 'email', 'extension', 'proxy', 'smpp', 'twitter', 'voicexml', 'worklist' or 'xmpp'.
appName	A short descriptive name for the new deployment. The specified value will be prepended with the string <i>usermessagingdriver</i> -
driverProperties	An object with the driver properties. It can be an object of the following classes:
	CommonDriverProperties, EmailDriverProperties, ProxyDriverProperties, SmppDriverProperties, TwitterDriverProperties, VoiceXmlDriverProperties, WorklistDriverProperties or XmppDriverProperties.
	To see all available driver properties for a driver, print the dict field in the class. For example:
	<pre>print CommonDriverPropertiesdict</pre>
	<pre>print EmailDriverPropertiesdict</pre>
clusterName	Optional. The name of the cluster for which this configuration should be valid. If not specified, the configuration will be domain-wide configuration.
propertyGroups	Optional. The list of property groups to add or update. The items in the list must be of class ExtensionDriverProperties.

9.1.1.3 Examples

Example 9–1 To configure a XMPP driver with name 'xmpp'

```
driverProperties = XmppDriverProperties()
driverProperties.SenderAddresses = 'IM:alice@example.com'
driverProperties.IMServerHost = 'example.com'
driverProperties.IMServerUsername = 'alice'
driverProperties.IMServerPassword = 'secret'
configUserMessagingDriver(baseDriver='xmpp', appName='xmpp',
   driverProperties=driverProperties, clusterName='my_cluster')
```

Example 9–2 To configure a Extension driver with name 'extension'

```
driverProperties = CommonDriverProperties()
extensionDriverProperties = ExtensionDriverProperties()
extensionDriverProperties.PropertyGroupName = 'example.com'
extensionDriverProperties.EndpointURL = 'http://domain.example.com/extension'
extensionDriverProperties.MappedDomain = 'example.com'
extensionDriverProperties.Protocol = 'popup'
configUserMessagingDriver(baseDriver='extension', appName='extension',
   driverProperties=driverProperties,
   propertyGroups=[extensionDriverProperties])
```

9.1.2 configUserMessagingServer

Command Category: ums Use with WLST: Online

9.1.2.1 Description

configUserMessagingServer is used to configure the messaging server.

9.1.2.2 Syntax

configUserMessagingServer(serverProperties, clusterName=None)

Argument	Definition
serverProperties	An object with the server properties. It must be an object of the class ServerProperties.
	To see all available properties, print the dict field in the class. For example:
	<pre>print serverPropertiesdict</pre>
clusterName	Optional. The name of the cluster for which this configuration should be valid. If not specified, the configuration will be domain-wide configuration.

9.1.2.3 Examples

Example 9–3 To configure the JPS Context name for the UMS server(s) in the cluster named 'my_cluster'

```
serverProperties = ServerProperties()
serverProperties.JpsContext = 'my_jps_context'
configUserMessagingServer(serverProperties=serverProperties, clusterName='my_
cluster')
```

Example 9-4 To configure the security principal for the UMS server(s) in the domain

```
serverProperties = ServerProperties()
serverProperties.SecurityPrincipal = 'MyUser'
configUserMessagingServer(serverProperties=serverProperties)
```

9.1.3 deployUserMessagingDriver

Command Category: ums Use with WLST: Online

9.1.3.1 Description

deployUserMessagingDriver is used to deploy additional instances of user messaging drivers.

Specify a base driver type (for example: email, xmpp, voicexml, and others) and a short name for the new driver deployment. The string usermessaging driver- will be prepended to the specified application name. Optionally, specify the principal name for the driver to run as to connect securely to JMS resources (default value is 'OracleSystemUser').

Any valid parameters for the *deploy* command can be specified, and will be passed through when the driver is deployed.

9.1.3.2 Syntax

deployUserMessagingDriver(baseDriver, appName, [runAsPrincipalName],[targets], [stageMode], [options])

Argument	Definition
baseDriver	Specifies the base messaging driver type.
	Must be a known driver type, such as 'email', 'proxy', 'smpp', 'voicexml', or 'xmpp'.
appName	A short descriptive name for the new deployment. The specified value will be prepended with the string <i>usermessagingdriver</i> -
runAsPrincipalName	A short descriptive name for the new deployment. The specified value will be prepended with the string <i>usermessagingdriver</i> -
targets	Optional. Additional arguments that are valid for the deploy
stageMode	command can be specified and will be passed through when the new driver is deployed.
options	For more information about the deploy command, see WLST Command Reference for WebLogic Server.

9.1.3.3 Examples

To deploy a second instance of an email driver with name *myEmail*.

```
wls:base_domain/servereConfig> deployUserMessagingDriver(baseDriver='email',
appName='myEmail')
```

To deploy a second instance of an email driver, specifying deployment targets.

wls:base_domain/servereConfig> deployUserMessagingDriver(baseDriver='email', appName='email2', targets='server1,server2')

9.1.4 manageUserCommunicationPrefs

Command Category: ums Use with WLST: Offline

9.1.4.1 Description

manageUserCommunicationPrefs is used to download the user messaging preferences from a backend database to the specified XML file, or to upload the user messaging preferences from an XML file into the backend database.

9.1.4.2 Syntax

```
manageUserCommunicationPrefs (operation={'download' | 'upload'}, filename='file_
name', url='jndi_url', username='username', password='password'
 [, encoding='character_encoding'] [, guid='guid1,guid2, ...'] [, merge={'create_
new' | 'overwrite' | 'append'}] )
```

Argument	Definition
operation	specifies the upload or download operation to be performed.
filename	For download, a unique file name (path) to download the user preferences to. For example, /tmp/download.xml (Linux) or C:\\temp\\download.xml (Windows).
	For upload, the file name (path) from which to upload the user preferences.
url	The JNDI URL to access the User Messaging Server. For example: t3:// <hostname>:<port></port></hostname>
username	The user name with login permission to access the User Messaging Server.
password	The password of the username.
encoding	Character encoding to use to download the user preferences.
guid	The globally unique identifier (guid) of a list of users to use to download their preferences. If no guid is specified, the preferences for all users are downloaded.
merge	This option is for upload only. Valid values are:
	create_new (default): Create new user device, device addresses and/or ruleset entities. An exception will be thrown if an entity with the same primary key already exists and processing will terminate.
	overwrite: Remove all existing entities of a user and then create new entities.
	append: Only upload entities that do not already exist.

9.1.4.3 Examples

To download the user messaging preferences of all users to the specified file.

```
wls:offline> manageUserMessagingPrefs(operation='download',
filename='download.xml', url='t3://localhost:8001', username='weblogic',
password='<password>')
```

To download the user messaging preferences of all users to the specified file using UTF-8 character encoding.

```
wls:offline> manageUserMessagingPrefs(operation='download',
filename='download.xml', url='t3://localhost:8001', username='weblogic',
password='<password>', encoding='UTF-8')
```

To download the user messaging preferences of the user with guid 'john.doe' to the specified file.

```
wls:offline> manageUserMessagingPrefs(operation='download',
filename='download.xml', url='t3://localhost:8001', username='weblogic',
password='<password>', guid='john.doe')
```

To download the user messaging preferences of the users with guid 'john.doe' and 'jane.doe' to the specified file using UTF-8 character encoding.

```
wls:offline> manageUserMessagingPrefs(operation='download',
filename='download.xml', url='t3://localhost:8001', username='weblogic',
password='<password>', guid='john.doe,jane.doe', encoding='UTF-8')
```

To upload the user messaging preferences from the specified file to the backend database.

```
wls:offline> manageUserMessagingPrefs(operation='upload', filename='upload.xml',
url='t3://localhost:8001', username='weblogic', password='<password>')
```

To upload the user messaging preferences from the specified file to the backend database and overwrite existing preferences.

```
wls:offline> manageUserMessagingPrefs(operation='upload', filename='upload.xml',
url='t3://localhost:8001', username='weblogic', password='<password>',
merge='overwrite')
```

Oracle HTTP Server Custom WLST Commands

Five OHS-specific WLST commands are provided for managing Oracle HTTP Server in WebLogic Server domains. Most are online commands, which require a connection between WLST and the administration server for the domain:

Use the commands listed in Table 10–1 to create, start, stop, and delete Oracle HTTP Server components in WebLogic Server domains.

Table 10-1 | IOracle HTTP Server Commands

Use this command	То	Use with WLST
createOHSInstance()	Create a new instance of Oracle HTTP Server.	Online
deleteOHSInstance()	Deletes the specified Oracle HTTP Server instance.	Online
addOHSAdminPropertie s()	Adds the LogLevel property to Oracle HTTP Server Administration server property file.	Online
addOHSNMProperties()	Adds a property to the Oracle HTTP Server Node Manager plug-in property file.	Online
createOHSTestDomain()	Creates a compact domain for testing or other non-production uses of Oracle HTTP Server.	Offline

10.1 Oracle HTTP Server Commands

You should use the createOHSInstance() and deleteOHSInstance() commands to create and delete Oracle HTTP Server instances instead of using the Configuration Wizard or offline WLST, as these custom commands perform additional error checking and, in the case of instance creation, automatic port assignment. The WLST commands described for Oracle HTTP Server will only work if you run the WLST implementation on \$ORACLE_HOME/ohs/common/bin/.

10.1.1 createOHSInstance()

Use with WLST: Online

10.1.1.1 Description

createOHSInstance() creates a new instance of Oracle HTTP Server, allowing critical configuration such as listening ports to be specified explicitly or assigned automatically.

10.1.1.2 Syntax

createOHSInstance(instanceName='xxx', machine='yyy', serverName='zzz', ...)

Argument	Definition
instanceName	The name of the managed instance being created.
machine	The existing machine entry for the instance. This name is set during creation of the WebLogic Server Domain. If you forget the name, you can check \$ORACLE_INSTANCE/config/config.xml and look for the <machine> block. Alternately, in WLST you can find the machine name by running:</machine>
	<pre>serverConfig() cd('Machines') ls()</pre>
listenPort	(Optional) The port number of the non-SSL server. If this value is not specified, a port is automatically assigned. Listen ports typically begin at 7777 and go up from there.
sslPort	(Optional) The port number of the SSL virtual host. If this value is not specified, a port is automatically assigned. SSL ports typically start at 4443 and go up from there.
adminPort	(Optional) The port number used for communication with Node Manager. If this value is not specified, a port is automatically assigned. Administration ports typically begin at 9999 and go up from there.
serverName	(Optional) The value of the ServerName directive of the non-SSL server. If this value is not specified, the host name of the machine and the listen port will be used to construct the value.

10.1.1.3 Example

The following example creates an Oracle HTTP Server instance called ohs1 that runs on the machine abc03.myCorp.com:

createOHSInstance(instanceName='ohs1', machine='abc03.myCorp.com')

10.1.2 deleteOHSInstance()

Use with WLST: Online

10.1.2.1 Description

deleteOHSInstance() deletes a specified Oracle HTTP Server instance. The instance must be stopped before you can delete it. This command will return an error if the instance is in the UNKNOWN or RUNNING state.

10.1.2.2 Syntax

deleteOHSInstance(instanceName='xxx')

instanceName is the only argument deleteOHSInstance() accepts.

10.1.2.3 Example

The following example deletes the Oracle HTTP Server ohs1.

deleteOHSInstance(instanceName='ohs1')

10.1.3 addOHSAdminProperties()

Use with WLST: Online

10.1.3.1 Description

addOHSAdminProperties() adds the LogLevel property to Oracle HTTP Server Administration server property file (ohs_admin.properties); LogLevel is the only parameter addOHSAdminProperties() currently supports. This command is available when WLST is connected to an Administration Server instance.

10.1.3.2 Syntax

addOHSAdminProperties(logLevel = 'value')

Argument	Description
LogLevel	The granularity of information written to the log. The default is INFO other values accepted are:
	ALL
	CONFIG
	■ FINE
	■ FINER
	■ FINEST
	OFF
	SEVERE
	WARNING

10.1.3.3 Example

This example creates a log file with log level is set to FINEST.

addOHSAdminProperties(logLevel = 'FINEST')

10.1.4 addOHSNMProperties()

Use with WLST: Online

10.1.4.1 Description

addOHSNMProperties() adds a property to the Oracle HTTP Server Node Manager plug-in property file (ohs_nm.properties). This command is available when WLST is connected to an Administration Server instance.

10.1.4.2 Syntax

addOHSNMProperties(logLevel = 'value', machine='node-manager-machine-name')

Argument	Description
LogLevel	The granularity of information written to the log. The default is INFO; other values accepted are:
	ALL
	CONFIG
	■ FINE
	■ FINER
	■ FINEST
	 OFF
	SEVERE
	WARNING
machine	The name of the machine on which Node Manage is running.

10.1.4.3 Example

This example creates a log file with name ohs_nm.log under the path <domain_ dir>/system_components/OHS with log level is set to FINEST on the target machine, my_NM_machine. The user need not restart Node Manager.

addOHSNMProperties(logLevel = 'FINEST', machine = 'my_NM_machine')

10.1.5 createOHSTestDomain()

Use with WLST: Offline

10.1.5.1 Description

createOHSTestDomain() creates a compact domain for testing or other non-production uses of Oracle HTTP Server. The domain will include the template for managed Oracle HTTP Server instances. Only collocated instances are supported. This command should be issued offline, when WLST is not connected to an Administration Server instance.

10.1.5.2 Syntax

createOHSTestDomain(domainName = 'domain-name', adminAccountPass = 'password', adminServerPort = nnnn, nmAccountName = 'nm-account', nmAccountPass = 'password', nmPort = nnnn)

Argument	Description
domainName	(Optional) This is the name of the compact domain being created. If this is not specified, 'base_domain' will be used.
adminAccountPass	This is the password for the administration server account.
adminServerPort	(Optional) This is the HTTP and T3 port for the administration server. If this is not specified, 7001 will be used.
nmAccountName	This is the name of the node manager account.
nmAccountPass	This is the password for the node manager account.
nmPort	(Optional) This is the port number for node manager. If this is not specified, 5556 will be used.
nmAccountPass	This is the password for the node manager account. (Optional) This is the port number for node manager. If this is not

10.1.5.3 Example

This example creates an Oracle HTTP Server test domain called testOHS. It also sets log-in credentials for the administration server and Node Manager.

```
createOHSTestDomain(domainName = 'testOHS', adminAccountPass = 'welcome1',
nmAccountName = 'nm', nmAccountPass = 'welcome1')
```
