**BEA-003105: The asynchronous replication request timed out while attempting to add object {0} to the replication queue. This session has not been replicated to any backup at this point.**

**Cause:** The asynchronous replication request timed out while attempting to add object {0} to the replication queue. Once full, the queue waits until it has space for the object. This wait took longer than the ClusterMBean specified AsyncSessionQueueTimeout, thus the session object was not put into the queue and will not be replicated at this time.

**Action:** This could be due to the secondary server or persistent store slowing down the replication process. To better handle this, the SessionFlushInterval and the SessionFlushThreshold can be reduced to replicate less at a time and to replicate more often. Checking the performance of the secondary server or persistent store is advised.

**Level:** 1

**Type:** ERROR

**Impact:** EJB

**BEA-011084: This EJB class does not support EJB timers and therefore is prohibited from using the TimerService. To use EJB timers, the bean class must implement javax.ejb.TimedObject or have a method that is annotated with @Timeout.**

**BEA-011088: The following error occurred while invoking the ejbTimeout(javax.ejb.Timer) method of EJB {0}.**

**Cause:** This could be caused by erroneous code in the ejbTimeout method or by the failure of a dependent resource.

**Action:** All exceptions that occur while invoking or attempting to invoke the ejbTimeout method should be investigated and resolved. If the ejbTimeout method is non-transactional, that is, has a transaction attribute of NotSupported, or if the bean uses bean-managed transactions, the ejbTimeout method may not be retried, leading to missed timeout notifications.

**BEA-011098: No generated primary key was returned from the database insert statement as expected. Verify that the primary key database column for this EJB is an IDENTITY column as declared in the CMP deployment descriptor for this EJB.**

**Cause:** This is most likely caused by a database configuration error. It may also be caused by a JDBC driver that does not support the getGeneratedKeys() method on java.sql.Statement.

**Action:** Verify that the primary key column in the database is marked as an IDENTITY column (or a functional equivalent is setup for the column such as a database trigger to insert a value into the primary key column).

**Level:** 1

**Type:** ERROR

**Impact:** EJB

**BEA-011099: Multiple generated keys were returned from the database insert statement. The EJB container is unable to determine which generated key corresponds to the primary key column. To use the IDENTITY primary key generator, you must only have a single automatically generated database column per EJB.**

**Cause:** This is most likely caused by a database configuration error. Each EJB may only have a single automatically generated database column.

**Action:** Verify that the database table corresponding to the EJB only has a single generated column.

**BEA-011111: The SEQUENCE named {0} has key-cache-size set to {1} which is greater than the INCREMENT_BY value for the sequence in the database. This is not allowed as it may generate duplicate keys.**

**Cause:** The key-cache-set size for the SEQUENCE is not valid.

**Action:** in the <automatic-key-generation> tag, re-examine the <key-cache-size> and set it to a value less than or equal to the INCREMENT_BY value for the sequence in the database.

**Impact:** EJB

**BEA-011127: Error deserializing one or more EJB timers from the persistent store for the EJB deployment {0}. An incompatible change to the class of a Serializable object associated with the timer may be the cause. If this is the case, you can either undeploy your application entirely to remove the EJB timers from the persistent store or revert the incompatible changes to the Serializable class so the EJB timer can be deserialized. The error was: {1}**

**Cause:** A common cause of this error is an incompatible serializable class change in your application.

**Action:** If the error is due to an incompatible serializable class change in your application, there are two options for dealing with the serialization errors. The first option is to completely undeploy the EJB. which will cause all of the EJB timers in the persistent store to be permanently removed. The second option is to revert changes to the serializable class that is associated with the EJB timer and redeploy the application. This allows the EJB timer to be deserialized.

**Impact:** EJB

**BEA-014003: EJB {0} uses optimistic concurrency and contains a finder or select method, {1}, for which include-updates is true. This combination of features does not work properly with database {2}.**

**Cause:** Optimistic concurrency is implemented by reading data in a local transaction to avoid holding database locks, unless Oracle is used as the database. Oracle read consistency does not hold read locks, so in this case reads are performed using the current JTA transaction. When reads are performed in a local transaction updates that have been flushed prior to commit of the transaction are not visible.

**Action:** Set include-updates for the query to false to avoid this warning message, or if you are using Oracle as your database, set the database-type to Oracle in weblogic-cmp-jar.xml.

**BEA-014005: The configured dispatch policy {1} for Message-Driven Bean (MDB) {0} will be ignored: the MDB is not running in a WebLogic thread.**

**Cause:** The queue MDB is driven asynchronously by a non-WebLogic JMS implementation and runs in a non-WebLogic thread mechanism, so the MDBs application thread pool is not configurable.

**Action:** To disable this warning, remove the dispatch-policy setting from the MDBs WebLogic descriptor file.

**Impact:** EJB

**BEA-014010: The Message-Driven Bean {0} of application {1} will now be suspended, as it listens to global JMS topic {2} and a new application version {3} is being redeployed. Note also that the current Message-Driven Bean is not a durable subscriber to the topic, and messages published by the topic after the currently active version of the Message-Driven Bean is suspended may not be received by the new application version.**

**Cause:** The specified Message-Driven Bean listens to the specified global JMS topic and a new application version is being redeployed.

**Action:** To ensure that the new application version will receive all messages published while the Message-Driven Bean was suspended, set the activation config property "subscriptionDurability" to "durable" in the deployment descriptor or annotation.

**Type:** WARNING

**Impact:** EJB

**BEA-014011: EJB {0} uses optimistic-concurrency and has the use-select-for-update element in the RDBMS deployment descriptor set to true. This combination of features is incompatible. The use-select-for-update is turned off by the EJB container in this case.**

**Cause:** Optimistic concurrency is implemented by reading data in a local transaction to avoid holding database locks. The element use-select-for-update in the RDBMS deployment descriptor when set to true, will cause SELECT ... FOR UPDATE to be used whenever the bean is loaded from the database, thus locking the table. This conflicts with the Optimistic Concurrency strategy.

**Action:** Set use-select-for-update element in the RDBMS deployment descriptor to false to avoid this warning message.

**Level:** 1

**Type:** WARNING

**Impact:** EJB

**BEA-014012: EJB {0} uses optimistic-concurrency and disables cluster invalidation, but does not have verify-rows set to Read. This combination will prevent detection of stale data if the bean is never modified in a transaction.**

**Cause:** Optimistic concurrency beans verify consistency of data only if the bean has been modified, unless verify-rows is set to Read. If some other member of a cluster modifies a bean, other members will not be notified of this modification and will continue to store stale data unless the other members also attempt to modify the bean.

**Action:** Set either of the elements verify-rows to Read or cluster-invalidation-disabled to false in the RDBMS deployment descriptor to avoid this warning message.

**Level:** 1

**Type:** WARNING

**Impact:** EJB

**BEA-014013: EJB {0} does not have a concurrency-strategy of either optimistic or readOnly and disables cluster invalidation. Cluster invalidation is relevant only for these concurrency strategies.**

**Cause:** When an EJB is using either optimistic or readOnly concurrency-strategy and is deployed to a cluster, the container invalidates such beans on modification to avoid throwing OptimisticConcurrencyExceptions. This invalidation can be turned off by setting the cluster-invalidation-disabled to true in the RDBMS deployment descriptor.

**Action:** Set cluster-invalidation-disabled to false in the RDBMS deployment descriptor to avoid this warning message.

**BEA-014014: The Message-Driven Bean (MDB) named {0} has a dispatch policy {1} that refers to an unknown work manager. The default work manager will be used instead.**

**Cause:** The specified MDB has a dispatch policy that refers to an unknown work manager.

**Action:** Create a work manager for the server named {1}, or modify the dispatch-policy attribute in the MDBs WebLogic descriptor file to the name of an already existing work manager.

**Level:** 1

**Type:** WARNING

**Impact:** EJB

**BEA-014016: EJB {0} uses readonly-concurrency and has the use-select-for-update element in the RDBMS deployment descriptor set to true. As the bean is read-only, select-for-update is unnecessary.**

**Cause:** Read-only beans cannot be updated. Therefore, use-select-for-update is unnecessary.

**Action:** Set use-select-for-update element in the RDBMS deployment descriptor to false to avoid this warning message.

**Level:** 1

**Type:** WARNING

**Impact:** EJB

**BEA-014017: EJB {0} uses exclusive-concurrency and has the use-select-for-update element in the RDBMS deployment descriptor set to true. As the bean is locked at the server level during a transaction, select-for-update on the database is unnecessary.**

**Cause:** Exclusive concurrency is implemented by locking the bean at the server level when the bean participates in a transaction. Setting the element use-select-for-update in the RDBMS deployment descriptor to true causes SELECT ... FOR UPDATE to be used whenever the bean is loaded from the database, thus locking the row in the database too. This may be unnecessary, as the bean is locked by the container.

**Action:** Set use-select-for-update element in the RDBMS deployment descriptor to false to avoid this warning message.

**BEA-040456: An entity of type "{3}" with name "{2}" in JMS module "{0}" is not targeted. There is no subdeployment with name "{1}" in the configuration repository (config.xml). Therefore, this entity will not exist anywhere in the domain.**

**Cause:** The entity of the given name and type in the given JMS module does not have a corresponding subdeployment in the configuration repository (config.xml).

In order for this entity to exist in the domain, it must be targeted with a sub-deployment element.

**Action:** Add a sub-deployment stanza to the appropriate deployment descriptor in config.xml. This will either be a jms-system-resource for a system module, or an app-deployment for a stand-alone JMS deployable module. If the JMS module is inside a J2EE application (an EAR file), then you must add the sub-deployment stanza to the subdeployment that represents this JMS module in the J2EE application. You do not necessarily have to target the subdeployment yet. Simply adding the subdeployment with no targets will remove this warning. However, if you wish for this entity to exist somewhere in your domain you must target the sub-deployment.

Without such a stanza, no entities inside the module will be deployed, since the subdeployments inside of the sub-deployment stanza named "{0}" control where JMS entities inside this module are targeted.**

**Cause:** When a JMS module is inside an EAR file, the targeting information for entities inside that module are nested within a sub-deployment named after the name of the JMS module found in the weblogic-application.xml file of the EAR file. If no sub-deployment exists with the name of the JMS module, then no targeted entities inside the module will become available. This is usually an oversight on the part of the administrator.

To use the trusted CAs in the JDK''s cacerts, specify: -Dweblogic.security.TrustKeyStore=JavaStandardTrust -Dweblogic.security.JavaStandardTrustKeyStorePassPhrase=passphrase defaults to no passphrase which means read-only access to the JDK''s cacerts. Server, or is trying to connect using plaintext data from a protocol for which WebLogic Server does not check.

**Action:** Check the peer that is trying to connect. It may be trying to connect using a plaintext protocol over SSL by mistake, or it may be using some newer incompatible version of SSL.

**Level:** 1

**Type:** WARNING

**Impact:** Security

**BEA-090477: Certificate chain received from {0} was not trusted causing SSL handshake failure.**

**Cause:** A peer presented a certificate chain to the server that the server does not trust.

**Type:** WARNING

**Impact:** Security

**BEA-090480: SSL alert ({1}) received from {0}. Check the peer SSL configuration, or enable SSL debug tracing on the peer.**

**Cause:** The peer determined something was not correct, sent an alert, and ended the SSL session.

**Action:** Check the peer to determine why it sent the alert and what alert it believes it sent. This action may require enabling SSL debug tracing to determine the exact cause.

**Level:** 1

**Type:** WARNING

**Impact:** Security

**BEA-090481: NO_CERTIFICATE alert was received from {0}. Verify that the SSL configuration has a proper SSL certificate chain and private key specified.**

**Cause:** The SSL configuration for this server needs to supply a certificate chain.

**Action:** If using one-way SSL, verify that the certificate chain and private key are being specified for the SSL server. If using two-way SSL, verify that the certificate chain and private key are being specified for both the SSL server and the client.

**Level:** 1

**Type:** WARNING

**Impact:** Security

**BEA-090482: BAD_CERTIFICATE alert was received from {0}. Check the peer to determine why it rejected the certificate chain (trusted CA configuration, hostname verification). SSL debug tracing may be required to determine the exact reason for which the certificate was rejected.**

**Cause:** The certificate chain sent to the peer may not be valid, or the peer may not be configured to accept the certificates.

**Action:** Check the peer configuration to see if the certificate chain was rejected because the certificate was not trusted or because there was a hostname violation. Verify that the certificate chain sent to the peer had valid dates and had the correct issuer ordering. This action may require enabling SSL debug tracing to determine the exact cause.

**Level:** 1

**Type:** WARNING

**Impact:** Security

**BEA-090483: CERTIFICATE_REVOKED alert was received from {0}. The certificate chain sent to the peer was rejected because it was revoked by the certificate authority.**

**Cause:** A certificate in the configured certificate chain was revoked by the certificate authority and is no longer valid.

**Level:** 1

**Type:** WARNING

**Impact:** Security

**BEA-090484: CERTIFICATE_EXPIRED alert was received from {0}. A certificate in the certificate chain expired or is not yet valid, or the peer and local machine have a date/time mismatch.**

**Cause:** A certificate in the chain is either expired or is not yet valid. Another possible cause is the peer machine date/time is not set properly causing the check to fail.

**Action:** Verify the certificate validity and expiration dates in the certificate chain are correct. If they are not, obtain new certificates issued by the certificate authority and update the SSL configuration with the new certificates and private key. If the dates are valid, check the peer machine date/time setup.

**Level:** 1

**Cause:** This problem could be caused by an incorrect type of certificate in the certificate chain or the peer not being able to handle certain attributes in a valid certificate.

**Action:** The certificate chain should first be checked to ensure the certificates are all valid X.509 RSA certificates and are using the proper strength. If that is correct, SSL debug tracing may be required on the peer to see if it gives more detail on what was specifically not supported.

**Level:** 1

**Type:** WARNING

**Impact:** Security

**BEA-090487: UNKNOWN_CA alert received from {0}. The peer is rejecting the certificate chain as being untrusted or incomplete.**

**Cause:** The peer is not configured to trust the CA that signed the certificate chain.

**BEA-090547: The certificate chain received from {0} contained a V3 CA certificate which had basic constraints that were not marked critical. This is being rejected due to the strict enforcement of basic constraints.**

**Cause:** Strict basic constraints checking was explicitly enabled, and a certificate chain received by the peer contained a CA that failed due to the strict check but would have passed the strong check.

**Action:** If strict compliance of RFC 2459 for basic constraints is really required, then the peer certificate chain was correctly rejected and needs to be corrected. If strict compliance is not really required, consider setting the constraints checking back to the default value of strong to accept the certificate chain.

**Level:** 1

**Type:** WARNING

**Impact:** Security

**BEA-090548: The certificate chain received from {0} contained a V3 CA certificate that was missing the basic constraints extension**

**Cause:** The certificate chain received by the peer contained a V3 CA certificate that does not contain a basic constraints extension indicating that it really is a CA. This is rejected by the basic constraints checking for strong and strict, which protects against a specific certificate chain attack on SSL.

**Action:** The peer certificate chain needs to be looked at carefully to determine which CA was missing the basic constraints extension. If the certificate chain really is from a valid peer, you should look at updating the peer certificate chain with valid CA certificates. If this is not possible, you can disable the basic constraints checking to allow the certificate chain to be accepted and allows this vulnerability to be exploited.

**Level:** 1

**Type:** WARNING

**Impact:** Security

**BEA-090549: The certificate chain received from {0} contained a V3 CA certificate that did not indicate it really is a CA.**

**Cause:** The certificate chain received by the peer contained a V3 CA certificate that contained a basic constraints extension which was not marked as being a CA. This is rejected by the basic constraints checking for strong and strict, which protects against a specific certificate chain attack on SSL.

**Action:** The peer certificate chain needs to be looked at carefully to determine which CA is not correct. If the certificate chain really is from a valid peer, you should look at updating the peer certificate chain with valid CA certificates. If this is not possible, you can disable the basic constraints checking to allow the certificate chain to be accepted and allows this vulnerability to be exploited.

**Level:** 1

**Type:** WARNING

**Impact:** Security

**BEA-090550: The certificate chain received from {0} contained a V3 CA certificate that indicated a certificate chain path length in the basic constraints that was exceeded.**

**Cause:** The certificate chain received by the peer contained a V3 CA certificate that specified a path length in the basic constraints that was exceeded. This is rejected by the basic constraints checking for strong and strict, which protects against a specific certificate chain attack on SSL.

**Action:** The peer certificate chain needs to be looked at carefully to determine which CA indicated the path length limit that was exceeded. The path length, if specified, limits how many CA certificates are allowed to follow a CA certificate in a certificate chain. A path length of 0 indicates only an end entity certificate may follow it in the chain, positive values indicate how many CA certificates may be in the chain between that CA and the end entity certificate. If the certificate chain really is from a valid peer, you should look at updating the peer certificate chain with valid CA certificates. If this is not possible, you can disable the basic constraints checking to allow the certificate chain to be accepted and allows this vulnerability to be exploited.

**Cause:** The certificate chain received by the peer contained a V3 CA certificate that could not be converted to a format which allows the basic constraints to be checked. This is rejected by the basic constraints checking for strong and strict, which protects against a specific certificate chain attack on SSL.

**Action:** The peer certificate chain needs to be looked at carefully to confirm they are valid. If the certificates are all valid, this indicates an internal coding error or limitation in the server. Contact Oracle support. **BEA-090823: Could not register the WebLogic Server X509CertificateFactory as the default X509CertificateFactory for this JVM.**

**Cause:** The WebLogic Server X509CertificateFactory could not be registered as the default X509CertificateFactory for this JVM.

**Action:** The WebLogic Server X509CertificateFactory orders the certificates in a CertPath that was created from PKCS7. Specify -Dweblogic.security.RegisterX509CertificateFactory=false on the command line for booting this server to indicate that WebLogic Server should not register the WebLogic Server X509CertificateFactory as the default X509CertificateFactory when the server boots (since your JDK does not support this). Also, since the WebLogic Server X509CertificateFactory cannot be registered with the JDK as the

default X509CertificateFactory, the JDK will use its current default X509CertificateFactory. The default one (for example, the SUN implementation) may not properly convert PKCS7 to an ordered CertPath.

**BEA-150000: An error occurred while establishing a connection back to the Adminstration Server {0} during startup. Since bootstrap succeeded, check that {0} uniquely identifies the Administration Server.**

**Cause:** An improper Administration Server URL has been specified, or the Administration Server is not available at the specified URL. Commonly this is because the Managed Server shares an adminstration URL with the Administration Server. Another possibility is that the host identified by {0}, or the local host, is not configured properly. For instance, an /etc/hosts or DNS lookup on the hostname results in a loopback address.

**Action:** Verify that the URL specified for the Administration Server is valid, unique and that the Administration Server is available and listening at the specified URL. A common problem is that the administration port is enabled and both the Administration Server and Managed Server are running on the same machine. In this instance a different administration port should be selected for the Managed Server. Another possibility is that the host identified by {0}, or the local host, is not configured properly. For instance, an /etc/hosts or DNS lookup on the hostname results in a loopback address.

**BEA-220103: Async Web service support is not fully configured. The async response Web service {0} for this server was not fully deployed because the JMS reliability queue was not defined/deployed: {1}. The server will periodically retry completing the deploy for the service. This message can usually be ignored unless there are async Web service applications. To completely disable async Web service support, thus avoiding this message, set -Dweblogic.wsee.skip.async.response=true.**

**Cause:** The JMS queue JNDI name specified in the WebservicesMBean (or allowed to default) was not found on this server. The async response service requires this JMS queue in order to operate. To avoid obscure errors while processing Web service async responses, this service was not fully deployed. Not having this JMS queue available can indicate that Web services have not been configured/enabled for this domain. The server will periodically retry deploying the service, so there is no need to restart the server once the JMS queue is made available.

**Action:** If you do not intend to use async Web services in this domain, no action is required. To avoid seeing this message and completely disable async Web service support, set -Dweblogic.wsee.skip.async.response=true. If you intend to use async Web services in this domain, define a non-distributed JMS queue with the local JNDI name given in WebservicesMBean (which has a default value), and after a short delay, the async response service will be fully deployed to use the newly defined queue. Oracle recommends that the JMS queue be located on a JMS server that is targeted to the same server as the Web service. Note that you can easily add async response Web services support to an existing domain by extending your domain with the Configuration Wizard and applying the wls_webservice.jar extension template. For more information, see the WebLogic Server online documentation in the 'Web Services->Get Started Using JAX-RPC' section.

### BEA-220105: Web services async/reliable invocations for service {0} are NOT available because the async/reliability queue was not found: {1}

**Cause:**  You have deployed a Web service that indicates it can use async/reliable features, but the queue for async/reliable invocations (specified in WebservicesMBean, @Buffer or @ReliabilityBuffer annotations, or allowed to default) is not deployed to the local server. Therefore, async and reliable invocations will fail if attempted. Standard synchronous invocations will still work correctly despite this problem.

**Action:**  Remove any async or reliable features from the Web service (e.g. @AsyncResponse, @Buffer, @ReliabilityBuffer annotations or @Policy annotations specifying reliable policy) or properly configure this server for async/reliable invocations. See the WebLogic Server online documentation in the 'Web Services->Get Started Using JAX-RPC' section for help on fixing this configuration problem. Once you have defined the proper async/reliable resources, you must redeploy your application.

**Cause:** While a WSDL is being retrieved through http protocol, the server requires replacing the service port address in WSDL with the actual address for the server. For any web service which defines one or more service ports bound to https transport, if the domain does not enable SSL functionality then the service port address could not be replaced correctly because https address for the server cannot be resolved.

**BEA-220505: Implicit/generated Client Identity {0} has been used in multiple calls to Service.getPort()/createDispatch() where these calls have used different services and/or sets of features. Monitoring statistics for this client will include all these different usages. Validation failures were: {1}**

**Cause:** WebLogic JAX-WS web service clients are assigned a unique identity that is intended to represent the business purpose of that client. This identity can be specified directly using weblogic.jws.jaxws.client.ClientIdentityFeature or it can be allowed to be implicit. Implicit identity is generated automatically based on environmental information at the point where a Port/Dispatch instance is created. Your code has received an implicit client identity that is getting used (again

implicitly) across multiple services or sets of features. All statistics gathered for a given client instance are rolled up under the client instance's client identity. If client instances using different services and/or feature sets contribute statistics to the same client identity, this can be confusing. It is even possible for clients to behave incorrectly when more advanced web service features are used.

**Action:** Best practice is to create a specific client identity (with a name representing a logical business purpose) for the client and denote this identity by passing weblogic.jws.jaxws.client.ClientIdentityFeature to the call to Service.getPort/createDispatch. Further, it is recommended that you pass a single/global set of web service feature objects to that call (e.g. Create WebServiceFeature instances as static class members or in a method annotated with @PostConstruct for containers compatible with this annotation). The actual call to Service.getPort()/createDispatch() should still be made in any way that makes sense for your uses (e.g. calling getPort on demand in a web service method, with Service created as a static class member).

There is usually no need to configure a custom DDL file unless custom database-specific tuning commands have been added to the file. **Impact:** Store

**BEA-280097: A file store failed to open file "{0}" in the Direct-Write read-buffered/write-unbuffered mode and is instead opening the file in a purely unbuffered mode. When there are high request loads, this may reduce**

Possible causes include: first boot of store (potentially after using a write policy different from Direct-Write-With-Cache), store migration, unclean shutdown, off-line store compression, and manual removal of cache files.**

**Cause:** The cache file is missing, or the signature stored in the cache file does not match the signature of the primary file.

**BEA-280104: The persistent file store "{0}" will use buffered writes instead of direct IO because the configured block size "{2}" is not a multiple of the environment's direct IO alignment "{1}". When there are high request loads, this may reduce file store performance. The store is still operating in a transactionally safe synchronous mode.**

**Cause:** Direct I/O requires the block size to be a multiple of directIO granularity.

**Action:** Reconfigure the store with a block size that is a multiple of the direct I/O alignment for your environment. If the store is not empty and contains useful data, use the store admin compact utility to change block size, otherwise make sure that all store files are removed before starting WebLogic Server again.

**BEA-320111: The elapsed time since the last Harvester cycle ({0} milliseconds) is unacceptably short. Skipping this cycle in order to smooth out the responses.**

**Cause:** The previous Harvesting process consumed a large percentage of the sample period. **BEA-320948: The SNMPTrapDestinationMBean {0} has a higher SecurityLevel {1} than the SNMPAgent's SecurityLevel {2}.**

**Cause:** An invalid combination of authentication and privacy protocols on the SNMPAgentMBean and security level on the SNMPTrapDestinationMBean has been configured.

**BEA-320949: SNMPAgent {0} is configured with a security level of {1}; the security level of {3} for proxy {2} must not exceed that of the SNMP agent.**

**Cause:** A security level on the SNMP proxy was configured that exceeds the security level of the SNMP agent that corresponds to its configured authentication and privacy protocols.

**Action:** Configure a level of security on the proxy that is lower than the security level of the SNMP agent. For example, if the SNMP agent is configured with authentication but no privacy, configure the security level of NOAUTH_NOPRIV or AUTH_NOPRIV on the proxy.

**BEA-320950: Failed to start the SNMP agent. If it failed to bind to the port, check if the port is available or the process has permission to bind to the port.**

**Cause:** Binding to specified UDP and agentX ports is a common problem. The ports to which the agent binds may not be available. Also, on UNIX platforms, ports up to 1023 are protected and can be bound only by processes owned by root.

**Action:** Check whether the specified ports are available. On UNIX, the default UDP port (161) and master AgentX port (705) are protected to be used by processes owned by root. In that case, either start the server as root, or configure the SNMP agent to use port numbers higher than 1023.

**BEA-320951: Failed to initalize the SNMP AgentX master subagent. One possible cause is the failure to bind the Master agentX port. If this is the case, check to see if the specified AgentX port is available, or ensure that the process has permissions to bind to the desired port.**

**Cause:** A common problem is with binding to the specified agentX port. The port to which the agent binds may not be available. Also, on UNIX platforms, ports up to 1023 are protected and can be bound only by processes owned by root.

**Action:** Check whether the specified port is available. On UNIX, the default master AgentX port (705) is protected to be used by processes owned by root. In that case, either start the server as root, or configure the SNMP agent to use port numbers higher than 1023.

**Cause:** The SNMPTrapDestination(s) could be incorrectly configured or the SNMP Manager might not be running at the configured location.

**Action:** Ensure that the SNMP Manager is available at the configured SNMP TrapDestinations.

**Level:** 1

**Type:** ERROR

**Impact:** SNMP

**BEA-320953: The SNMP Agent has been started on port {0}.**

**Cause:** The SNMP Agent tries to bind to the configured port. If this port is not available due to another SNMP Agent being deployed to the same machine on another WebLogic Server instance then the SNMP Agent tries to find the nearest port and binds to it.

**Action:** No action is needed. The port number is also reflected in the UDPListenPort attribute of the SNMPAgentRuntimeMBean interface on this Server.
